³Dep. Of Chemistry and Bioscience, Aalborg University

AALBORG
UNIVERSITY

OUTLINE

- ▶ Project participants
- ▶ Context on LCA of fish products
- ▶ Can we feed the world with wild fish?
- ▶ OBJECTIVE 1: Constraints to fish supply
- ▶ Do ecolabels and climate impact conflict?
- ▶ OBJECTIVE 2: Trade-offs
- ▶ Project outcome

Project team

Giovanni Codotto
PhD fellow
Department of Planning
Aalborg university

Massimo Pizzol
Professor
Department of Planning
Aalborg university

Troels Jacob Hegland
Associate Professor
Department of Planning
Aalborg university

Niels Madsen
Professor
Department of Chemistry
and Biosciences
Aalborg University

Michel Kaiser
Professor
The Lyell Centre
Heriot Watt University

FUND DENMARK

LCA OF FISH PRODUCTS

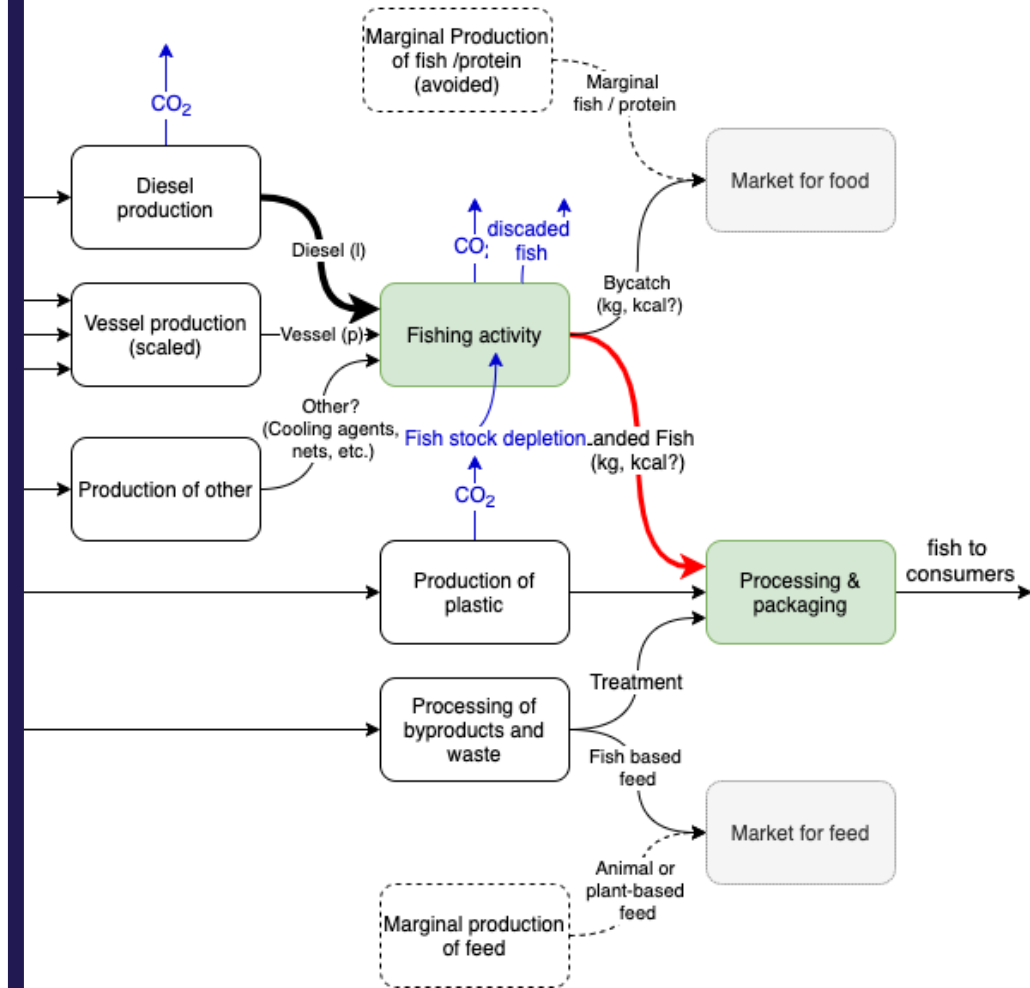

- ▶ Consumers demand sustainable food products
- ▶ Producers rely on LCA to evaluate and communicate the sustainability of products
- ▶ Increasingly for fish too (EPD, PEF)

Credit: <https://www.futureoffish.org/>

LCA IN A NUTSHELL

- ▶ Account for material and energy inputs over a life cycle
- ▶ High data requirements
- ▶ Uncertainty and variability
- ▶ Different questions require different models

CAN WE FEED THE WORLD WITH WILD CATCH?

- ▶ Marine capture fisheries are have reached a “constraint” (plateau)
- ▶ Increasing consumption of fish per capita [FAO, 2020]
- ▶ Who (which suppliers) can respond to such an increasing demand?
- ▶ What is **the impact** of such increase?

NEED TO TRACE IMPACTS FORWARD IN TIME

- ▶ Current LCA approaches are **retrospective** (“can we trace back the impact of fishing this product?”)
- ▶ This project investigates the use **prospective** approach (“Can we trace forward the impact of increasing demand for this product?”)

CHALLENGES IN USING A PROSPECTIVE APPROACH

- ▶ Measuring when an activity is constrained and its effects on shifting the demand
- ▶ Difficult to establish solid cause-effect
- ▶ Substitution issues
- ▶ Results sensitive to modelling choices

PROJECT OBJECTIVE 1: Constraints to supply and climate impact

- ▶ Develop methods that assess the climate impacts of fisheries accounting for constraints in supply
- ▶ Calculating the impact of increasing the demand for specific seafood products

SUSTAINABLE PRACTICES AND LABELLING

- ▶ Fisheries management focus on sustainable fishing practices [Ruiz-Salmón et al., 2020)]
- ▶ Eco-labels of fish products have gained market share and increased the sustainability of fisheries
- ▶ Certification schemes do not include climate impacts indicators

DO SUSTAINABLE FISHING AND CLIMATE IMPACT CONFLICT?

- ▶ Sustainable fishing may induce savings in fuel if stocks are healthy
- ▶ At the same time species-selective gear might require more fuel
- ▶ Are there trade-off between the objective of preservings stocks and the objective of reducing climate impacts?

PROJECT OBJECTIVE 2:

Climate vs marine environment labelling

- ▶ Analyze sustainable practices and eco-labels requirements, are they climate friendly?
- ▶ Identify the trade-offs between sustainable fisheries practices and reduction of carbon emissions

EXPECTED OUTCOME

- ▶ Produce evidence-based LCA model
- ▶ Identify climate-friendly practices, gears, labels
- ▶ Contribute to the green transition of fisheries to inform current fisheries policies, practice, and labelling
- ▶ Advise consumption in the direction of climate change mitigation
