Recently, there has been an augmented focus on the increasing amount of pesticides, drug residues and endocrine disruptors present in waste and drinking water<sup>1</sup>. These pollutants represent a challenge in water purification since they may be hazardous to human health even in low doses<sup>2</sup>.

Cyclodextrins (CDs) are known to be able to form inclusion complexes with a large range of the unwanted pollutants<sup>e.g. 3</sup> but in order to utilise this ability to purify water, the CDs must be immobilised on a surface, for instance, a membrane filter.

We have developed a simple and fast method for the functionalization of otherwise inert textiles with amphiphilic CDs using relatively non-harmful organic solvents and an easy setup. The method relies on the self-assembly properties of amphiphilic CDs and can be applied *in situ* by as various methods as spray and kiss-roll yielding multi-layers on the surface of the textile fibers.

In this study we present the ability of amphiphilic CD coated polypropylene nonwovens to trap 8 different polycyclic aromatic hydrocarbons/endocrine disruptors from aqueous solutions thus demonstrating the potential of using the amphiphilic cyclodextrins for water purification.
