Absolute And Relative Visibility Of Issues In UNFCCC Negotiations, 1995-2013

Studying science and technology in society

Particularly:

- controversies about new science and technology
- and often about datafication, machine learning, AI, algorithms etc.
- as they play out on digital media

With anthropological and computational methods

Combining:

- Ethnography
- Big sociocultural data
- Machine learning
- Natural Language Processing
- And exploratory data viz

And thus developing:

- New computational SSH research practices
- Plus the tools and technical competencies to support them

In collaboration with partners and stakeholders

As participatory data design

Through sprints and similar formats

To engage publics

Ensure democratic robustness

And build capacity

TO FORM A COMPLETE PICTURE, BOTH BIG AND THICK DATA ARE CRITICAL BECAUSE THEY PRODUCE DIFFERENT TYPES OF INSIGHTS AT VARYING SCALES AND DEPTHS

Wang, T. (2013). **Big data needs thick data.**
Ethnography matters

Beyond big vs. thick

“**Ethnography needs to create a new paradigm** that shifts from shaping its identity by claiming to understand the ‘whys’ around cultural behaviour to one where it and **Big Data are actually focusing on the same epistemological field**, one that is situated within human behaviour and crucially cultural interpretation. **Both should therefore be seen as interpretive epistemological approaches to analysis for human behaviour and cultural dispositions.**”

Curran, J. (2013). **Big data or ‘big ethnographic data’? Positioning big data within the ethnographic space.** *Ethnographic praxis in industry conference proceedings*

Beyond big vs. thick

“The shifts within machine-learning algorithm development give impetus for incorporating **quantitative techniques that are abductive, local, and interpretive**. The debate between universal and proscriptive versus local and bottom-up knowledge production may not—or at least no longer—need to divide quantitative and qualitative techniques. **Machine learning algorithms “leave open the possibility of situated knowledge production, entangled with narrative,”** a clear parallel to qualitative ethnographic techniques”

Paff, S. (2022). **Anthropology by Data Science**.
Annals of Anthropological Practice

Quoting Knox, H., & Nafus, D. (2018). **Introduction: Ethnography for a data-saturated world**. *Ethnography for a data-saturated world*

A photograph of a man in a dark suit and light-colored tie speaking at a wooden podium. He is looking slightly to his right. Behind him, a large audience of people in formal attire is seated, some looking towards the speaker. The setting appears to be a formal event or conference.

**ASK NOT WHAT DATA
SCIENCE CAN DO FOR ANTHROPOLOGY**

**BUT WHAT ANTHROPOLOGY
CAN DO FOR DATA SCIENCE**

Mock algebra

“Where W.H.R. Rivers had enthused in Melanesian Society about a future in which kinship studies would “resemble a work on mathematics in which the results will be expressed by symbols, in some cases even in the form of equations,” Malinowski was skeptical. “I must frankly confess,” he wrote, “that there is not a single account of kinship in which I do not find myself puzzled by some of this **spuriously scientific and stilted mathematization** of kinship facts.”

Seaver, N. (2015). **Bastard algebra**. *Data, now bigger and better*

Boyd, J.P. (1969). **The algebra of group kinship**. *Journal of Mathematical Psychology*

(or $XM = Y$). Since $F = F^{-1}$ for the Arunta, the arrow is given two heads, to suggest the symmetry. By convention M -arrows will be solid; and F -arrows dotted since paternity is conjectural.

FIG. 1. The graph of the Arunta marriage class system. M -arrows are solid; and F -arrows, dotted.

Since G is regular, we can choose an arbitrary point and label it 1. Then the other points can be labeled with their unique representations $P \in G$. This has also been done in Fig. 1. Table 1 is the “Cayley multiplication table” for the group G of the Arunta tribe.

TABLE 1
THE ARUNTA MULTIPLICATION TABLE^a

	1	M	M ²	M ³	F	FM	FM ²	FM ³
1	1	M	M ²	M ³	F	FM	FM ²	FM ³
M	M	M ²	M ³	1	FM ³	F	FM	FM ²
M ²	M ²	M ³	1	M	FM ²	FM ³	F	FM
M ³	M ³	1	M	M ²	FM	FM ³	FM ²	F
F	F	FM	FM ²	FM ³	1	M	M ²	M ³
FM	FM	FM ²	FM ³	F	M ³	1	M	M ²
FM ²	FM ²	FM ³	F	FM	M ²	M ³	1	M
FM ³	FM ³	F	FM	FM ³	M	M ²	M ³	1

^a Row elements are multiplied on the right by column elements. That is, xy is the entry of row x , column y .

Since only two of the set \mathcal{A} of basic Arunta kinship terms have been used thus far, we must now investigate how the entire network of relations on E relates to G . Recall

Ethnographic logic

“It is first of all an **abductive** logic, taking surprises seriously, and creating new explanations for them. It is also **iterative**, something that is applied over and over again in the course of a piece of work. And it is **recursive**, calling on itself to solve a problem that comes up even as it is solving a problem.

(...)

An initial view of X from **POV₁**, *changes* through the iterative and recursive application of abductive logic. It changes to a **different** view of X that takes into account **contexts** and **meanings** of **POV₂**”

Agar, M. (2006). **An Ethnography by Any Other Name...**
Forum for Qualitative Social Research/Sozialforschung

Ethnographic logic

“Once again a major difference between ethnography and the usual social science: **The usual approach**, once it spots something interesting in a particular event, what does it want to do? It wants to **isolate** it, figure out how to **abstract** it from what’s going on, and then **measure** it in some way. That way a larger number of events can be compared.

But when an **ethnographer** focuses on something in an event, the question isn’t, “How do I isolate and measure that?” The question is the context question summarized above. “What else in the event is the sign connected with?” Look around and see what’s going on. Traditional social science is on the lookout for **variables**; ethnographers are on the lookout for **patterns**.”

Agar, M. (2006). **An Ethnography by Any Other Name...**
Forum for Qualitative Social Research/Sozialforschung

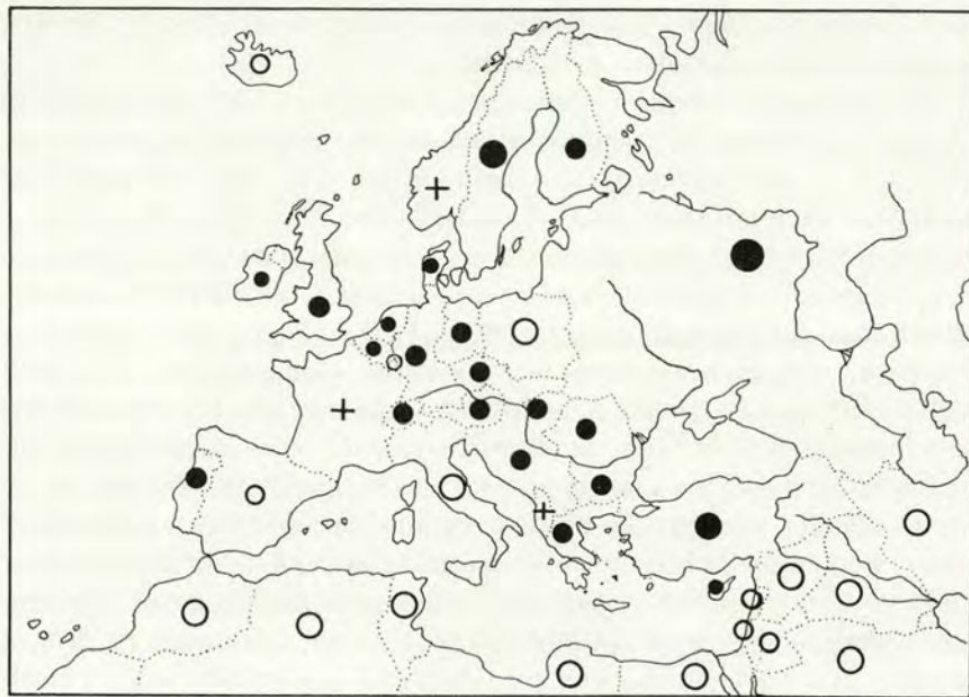

Data science as anthropology

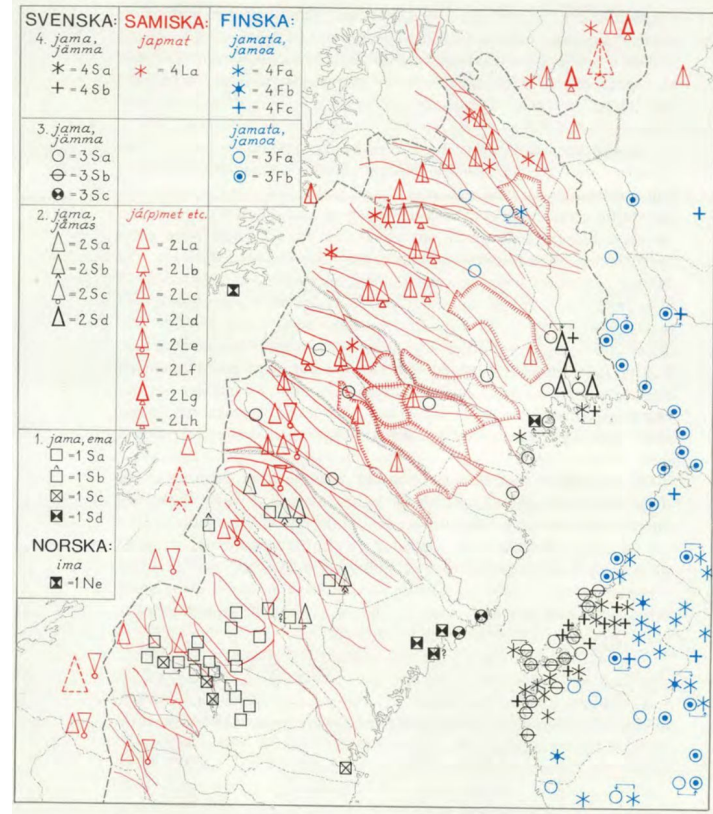

Should help us

- Discover new questions rather than settle the ones we're already asking
- Explore and attune to different POVs rather than eliminate bias
- Provide layers upon layers of interpretation rather than strive for abstract explanations or indeed to be universally explainable.

Karta ritad till SIA-konferensen i Zagreb 1966 visande: ● vid konferensen företrädde länder; + skriftligen företrädde länder; ○ andra i planen medtagna länder.

Narcissism in Scandinavia

Parklumme: Har din partner narcissistiske træk, så beskyt dig selv og din værdighedsfølelse

Mennesker med stærke narcissistiske træk har ingen reel indfølelse med andre og har kun fokus på deres egne behov for at føle sig beundret, betydningsfuld og i kontrol. Hvis en narcissists partner bider på krogen og fortæller om sine dybe følelser, kan han eller hun være sikker på at få sin sjæl balløst og bagerter endda få tilføjet skyld og skam. Derfor er følelsesmæssigt selvforsvar vigtigt. Illustration: Coloutbox og Inis Lind Pivkretz

Nya perspektiv på psykisk ohälsa behövs

Debatt och insändare • Psykisk ohälsa är ett mångfacetterat begrepp och omfattar ett brett spektrum av symtom. Beroende på vem som definierar psykisk ohälsa, och i vilket sammanhang detta sker, kan innebörden av begreppet se väldigt olika ut. Vilken syn vi utgår ifrån har en avgörande betydelse för utgången av våra ansträngningar för att både förebygga och behandla de symtom som vi idag kallar för psykisk ohälsa.

TABLE I. SUBANUN DRINKING TALK

Encounter Stages	Discourse Stages	Focus of Speech Acts	Function
1. Tasting	1. Invitation—permission	Role expression	Assignment of role distances and authority relations to participants
2. Competitive drinking	2. Jar talk	Role expression and context definition	Allocation of encounter resources (turns at drinking and talking)
	3. Discussion 3.1. Gossip 3.2. Deliberation	Topic	Exchange of information; disputation, arbitration; deciding issues on basis of cogent argument
3. Game drinking	4. Display of verbal art	Stylistic	Establishment of euphoria. Deciding issues on basis of skill in use of special styles of discourse (singing, verse)

Segments of a drinking encounter:

1. A turn (continuous drinking by one person)
2. A round (a set of related turns)
3. Encounter stage (a set of related rounds)

Segments of drinking talk:

1. An utterance (continuous speech by one person)
2. An exchange (a set of related utterances)
3. Discourse stage (a set of related exchanges)

Explainable AI?

“[Ethnoscience] holds that culture is composed of psychological structures by means of which individuals or groups of individuals guide their behavior. [...] from this view of what culture is follows a view, equally assured, of what describing it is—the writing out of systematic rules, an ethnographic algorithm, which, if followed, would make it possible so to operate, to pass (physical appearance aside) for a native.”

Geertz, C. (1973). **Thick description.** *The Interpretation of Cultures.*

Frake, C.O. (1964). **How to ask for a drink in Subanun.** *American Anthropologist.*

POST (translated):

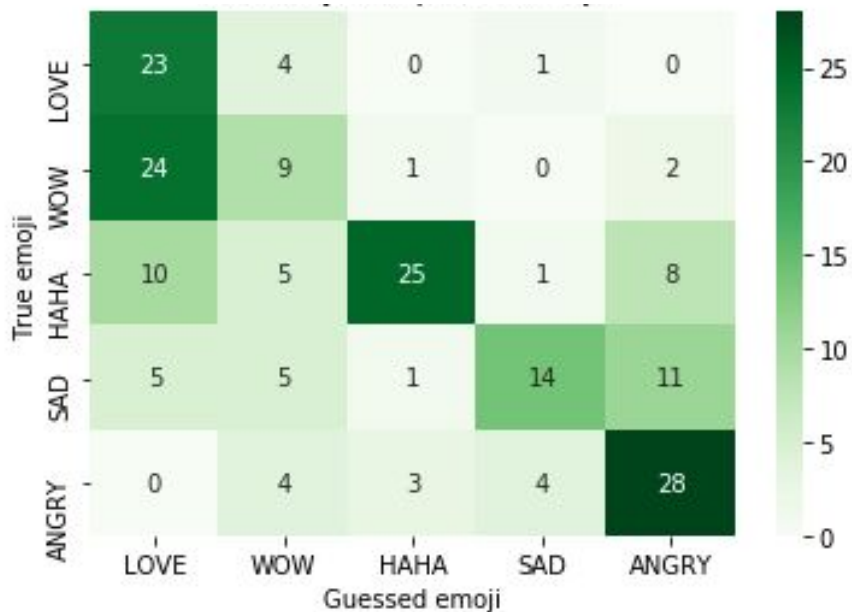

For the Prince, the decision not to be buried next to the Queen is the natural consequence of not receiving the same treatment as his spouse when it comes to the title and function he has always desired, says chief of communications for the Royal House, Lene Balleby.

COMMENT (translated):

I will gladly swap problems with him. Happy to refrain from a royal title in exchange for 8 mio a year. Or just the 29 mio for the sarcophagus. Then he can fight my f***ing ex and the system without getting as much as a penny from me in return. Get a real problem, King Carrot.

Reaction: 😂

Machine learning is not really (no longer) an explanatory science in search of law

- Is it an interpretative one in search of meaning?
- If so, how should we talk to our machines?
- And what should we expect them to tell us?
