OBJECTIVES: Prompt access to effective health care is a priority in the developmental agenda of Ghana yet only 20% of people who actually need health care have it. Evidence on the determinants of prompt access to health care in these CHPS programme is woefully inadequate. The study sought to assess the factors that influence prompt access to health care in CHPS settings. **METHODS:** A descriptive cross sectional study was conducted in 2011 with 230 respondents within the CHPS zones of Bawjiase Sub-district, Central region of Ghana. Data was collected on using structured questionnaire and analyzed using SPSS version 19 software. Logistic regression was run to access the correlation of the determinants on prompt access to health care in CHPS settings at 95% confidence interval. **RESULTS:** We identified that, factors which play a major role in prompt access of CHPS programme within the CHPS zones of Bawjiase sub - district include geographical accessibility (chi square = 33.57; p = 0.000) and service characteristics (chi square = 19.17; p = 0.001). Economic accessibility however, had no influence (chi square = 123; p = 0.975) on prompt access to CHPS programme. Factors which had strong influence on prompt access of CHPS programmes were age (chi square =12.39; p = 0.015), sex (chi square =15.25; p = 0.000), marital status (chi square =31.56; p = 0.000), education level (chi square =28.49; p = 0.000) and occupation (chi square =33.56; p = 0.000). **CONCLUSIONS:** The study concludes that geographical proximity, service characteristics and individuals' background factors influence prompt access to quality health care in rural CHPS setting.

PHP147

ASTROLOGICAL SIGNS AND HEALTH PROBLEMS; DEMONSTRATING THE MULTIPLE COMPARISONS PROBLEM

Vegter S, van Boven JF, Pechlivanoglou P, Rozenbaum MH, Stevanovic J, Le HH
University of Groningen, Groningen, The Netherlands

OBJECTIVES: Astrological signs have been linked to numerous health problems, not only in pseudoscientific but also in high impact, peer-reviewed scientific literature. The aim of this study was to use a large prescription database to assess associations between astrological star signs and health problems. This study may demonstrate important statistical issues that arise when doing multiple comparisons. **METHODS:** For this cross-sectional study, patient and drug data were collected from a large prescription database in The Netherlands. Patients were followed for one year, starting from their birthday in 2010. Outcomes were drug prescriptions for one of four health problems: cardiovascular disease, depression, erectile dysfunction in men and fertility problems in women. The "determinant" was patients' astrological sign (based on Western-culture horoscope). Differences in prevalence rates between star signs were tested using logistic regression, adjusted for age and gender. Significance was set at P=0.05. **RESULTS:** Almost 300,000 persons were included for analysis. In our analysis, persons born under the star sign Aquarius were less likely to suffer from cardiovascular disease (P=0.001), whereas patients born under Scorpio or Sagittarius were more likely (P=0.011 and P=0.017). There were no effects on depression or erection dysfunctions. Women born under Gemini were 37% less likely to use fertility drugs (P=0.016). **CONCLUSIONS:** This study found several associations between star signs and health problems, none of which had any biologic plausibility. Interestingly, datasets filled with randomly generated star sign data also resulted in significant findings. Multiple comparisons without prespecified hypotheses, biological plausibility and adjustments for familywise error rates, can lead to false-positive findings. Multiple comparisons are common in outcomes research, appropriate use of statistics therefore is important.

PHP148
SELF- ASSESMENT OF HEALTH PROFESSIONALS' COMMUNICATION SKILLS WITH PATIENTS
Jocic D, Krajnovic D, Tadic I
University of Belgrade – Faculty of Pharmacy, Belgrade, Serbia and Montenegro
OBJECTIVES: Effective communication helps us to clearly understand patients or situation and enable us to make differences, build trust and respect. If a health professional does not have communication skills, it may reduce compliance and decrease the quality of health care. The aim of this study was to self-assess the communication skills during daily work in delivering care to patients by pharmacists and physicians at community settings. **METHODS:** This study is a pilot project of an ongoing Research Project aiming to investigate social and behavioral insights of pharmaciesy and physicians working in community settings in Serbia, started in November 2011. The rating scale is used to test pharmacists' skills and in-patient communication designed for the needs of the research consisted of 31 claims. **RESULTS:** The questionnaire completed 157 health professionals (physician, pharmacists) from the southeastern and central part of Serbia (75.3 % of which were females). The average age of participants were 40.42±9.38 and the average years of work experience were 12.92 ± 9.10 years.There is a correlation between the age of pharmacists and the following variables: assertiveness ($r = 0.456$, $p < 0.01$), active listening skills of patient ($r = 0.443$, $p < 0.01$), questioning patient ($r = 0.455$, $p < 0.01$), rhetoric skills ($r = 0.540$, $p<0.01$). ANOVA examined the effects of age on empathy ($F(4.64) = 1.52$, $p = 0.01$), assertiveness ($F(4.64) = 3.54$, $p = 0.01$), rhetoric skills ($F(4.64) = 2.48$, $p = 0.01$) and adherence to ethical principles ($F(4.64) = 1.53$, $p = 0.01$). **CONCLUSIONS:** Elder health professionals with greater empathy are more assertive having better rhetoric skills and adherence to ethical principles in communication. There is a need to improve the communication skills of young health professionals.

PHP149
REGULATORY AND GENERAL EPIDEMIOLOGICAL KNOWLEDGE ABOUT RARE DISEASES AND ACCESS TO TREATMENT FOR RARE DISEASES: HEALTH PROFESSIONALS' VIEW IN SERBIA
Krajnovic D[1], Jocic D[1], Arsic J[2], Petrova G[3], Tadic I[1], Tasic L[1], Jocic-Milosavljevic B[4]
[1]*University of Belgrade – Faculty of Pharmacy, Belgrade, Serbia and Montenegro,* [2]*Apoteka Vranje, Vranje, Serbia and Montenegro,* [3]*Medical University in Sofia - Faculty of Pharmacy, Sofia, Bulgaria,* [4]*Apoteka Pancevo, Belgrade, Serbia and Montenegro*
OBJECTIVES: To assess the knowledge of health professionals about epidemiological and national regulatory issues concerning rare diseases (RD) and access to orphan drugs. **METHODS:** This paper reports some of the results from an ongoing KAP study on rare diseases and orphan drugs in the Republic of Serbia (RS). A prospective cross-sectional study was conducted from May to June 2013, on a convenient sample of licensed pharmacists and physicians from two, large cities' and its suburbies in the central parts of RS. A specially designed KAP instrument in a form of three-part questionnaire was applied and these results were related to the assessment of concerning knowledge (8 multiple-choice questions) and self-assessment of the participants (one question). **RESULTS:** The study population included 214 health workers (151 pharmacists and 63 physicians); the average age of participants was 40.80±9.45 and the average years of professional practice was 13.14 ± 9.68. Majority of the participants (57%) knew the true prevalence of RD and slightly less than third of the samples (26.2%) responded correctly to the question of the extent of European population suffering from RD. There are major differences in regulatory knowledge about access to treatment for rare diseases, as participants answered correctly in a wide range of 21% to 67.4%. Most of the health professionals self-estimated that possessed little (31.3%) or enough (43.5%) knowledge related to general epidemiological and legislative issues concerning RD and orphan drugs. The average level of overall knowledge assessment for all questions and self-assessmentin general was 3.53 ± 1.58 and 2.04± 0.87 respectively. **CONCLUSIONS:** The majority of respondents estimated that possess less knowledge on RD (general information) and drugs to treat RD, or insufficiently. The average level of respondents' knowledge on RD and drugs to treat RD was below the average.

PHP150
TIMING OF DISCHARGE MAKES A DIFFERENCE: THE EFFECTS OF LENGTH OF STAY AND DAY OF DISCHARGE ON 30-DAY READMISSIONS
Flaks-Manov N[1], Shadmi E[2], Bitterman H[3], Balicer RD[4]
[1]*Clalit Health Services, Tel-Aviv, Israel,* [2]*University of Haifa, Haifa, Israel,* [3]*Clalit Health Sevi, Technion City, Haifa, Israel,* [4]*Clalit Health Services, Tel Aviv, Israel*
OBJECTIVES: The evidence on the influence of timing of discharge on readmission risk is inconsistent, showing that both increased length of stay (LOS) and early discharge are associated with an increased risk of readmission. We aimed to test whether LOS and day of discharge (i.e., weekend vs. work days) are associated with the risk of 30-day emergency readmission. **METHODS:** Data on first admission to internal medicine departments during January – March 2010 was retrieved from Clalit Health Services' data warehouse. Inclusion criteria: LOS of >= 2 nights, age 18+, readmitted to an internal medicine demartment or ICU. Predictors: LOS, ACG morbidity categories, age, socioeconomic status, and prior health care use. Logistic regression was used to model the effect of discharge day and LOS on 30-day emergency readmission, controlling for known risk factors. **RESULTS:** After adjustment for morbidity, clinical and demographic factors, there is an increased risk for 30-day readmissions associated with increased length of stay (OR=1.56 when LOS is 8+ days vs. 2-3 days, p<0.001). Focusing on 2-7 day hospitalizations, the same association is found (OR=1.47 for LOS > 5 days, p<0.001). Being discharged over the weekend increases the odds of readmission by 11% (p=0.04), controlling for all known risk factors. Modeling for an outcome of readmission or death, or for a 7-day readmission outcome, resulted in similar findings. **CONCLUSIONS:** Our study showed that contrary to some of the evidence, longer hospital stays were associated with increased risk of unplanned readmission. Being discharged over the weekend incurs mild additional risk for readmission, especially at shorter LOS. These findings suggest that despite short LOS in Israel, increasing LOS as a readmissions reduction strategy may be ineffective, unless the specific need and care content of these additional days is assured.

PHP151
MEDICATION ERRORS-INCIDENCE, CAUSES AND POSSIBLE PREVENTION STRATEGIES IN INDIAN HEALTH CARE SETTING
Patel H, Parthasarathi G, Shashank C, Adithyanath B, Shwetha D, Doney J
JSS College of Pharmacy, JSS University, Mysore, India
OBJECTIVES: Medication errors (MEs) frequently contribute for patient's morbidity and mortality in health care settings. The present study was aimed to identify and assess the pattern of occurrence of MEs and to develop strategies to prevent these MEs. **METHODS:** It was a prospective study conducted in a teaching hospital over a period of 6 months. Trainee clinical pharmacists followed the patients admitted to general surgery (GS) wards. MEs occurred and the cause for ME was identified by reviewing medical records, interviewing patients and concerned health care professionals (HCPs). All identified MEs were documented electronically and were evaluated for its nature, extent, cause and outcome. Prevention strategies were developed accordingly. **RESULTS:** A total of 417 MEs were identified in 313 patients from 1125 patients followed. Calculated incidence of MEs in GS wards was 27.8%. The majority of them were prescribing errors (60.4%), followed by administration errors (38.6%) and dispensing errors (9.8%). The common reasons observed for MEs were omission error (25%), incorrect drug selection (14%), wrong frequency (10%), poor patient adherence to medicines (7%), drug use without indication (7%), improper dose (6%), wrong administration (4%) and wrong time (3%). Pantoprazole (27.5%), Ceftriaxone (9.8%), Piperacillin-Tazobactum (6.7%), Diclofenac (6.4%) and Tramadol (6.2%) were drugs commonly involved in MEs. Majority of MEs (96%) that reached to patients were not harmful but 32% of them needed monitoring/intervention to ensure patient safety. Around 60% of MEs were due to inappropriate prescribing by clinicians followed by patient non-adherence to therapy (14%), improper follow up by ward clinical pharmacists (15%) and nursing workload (11%). Strategies were designed to prevent commonly identified MEs. **CONCLUSIONS:** MEs can be minimized if patients are monitored correctly on time. Appropriate team work from all HCPs can certainly reduce the occurrence of MEs.

PHP152
THE RELATIONSHIP BETWEEN SCIENTIFIC RESEARCH, CLINICAL TRIALS AND FDA DRUG APPROVAL
Burgon J[1], Hamerslag L[2]
[1]*Costello Medical Consulting Ltd., Cambridge, UK,* [2]*Costello Medical Consulting Ltd., Cambridge, UK*
OBJECTIVES: An important aim of medical research is often to identify potential novel therapeutic targets for disease treatment. Here we investigated whether the amount of scientific research (measured as papers published) in a given disease area correlated with the number of clinical trials, and whether an increased amount of research in a disease area resulted in a higher number of FDA approved drugs. **METHODS:** FDA drugs approved between 2000-2013 were identified using the online database 'CenterWatch', and the number of papers and clinical trials for each disease area was established by running comprehensive searches on PubMed from 1975-2013, and ClinicalTrials.gov from 1999-2013, respectively. The total numbers of approved drugs, published papers and clinical trials were compared for each of 17 disease areas and, to analyse the correlations between these factors, simple regression analyses were performed. **RESULTS:** Analysis for correlation between the number of papers published and the number of clinical trials per disease area revealed a strong correlation between these two variables (R square: 0.69, p<0.001); thus, increasing numbers of published papers were associated with increasing numbers of clinical trials. Further analyses were carried out to investigate the relationship between the number of papers published, or clinical trials, and the number of drugs approved by the FDA. Interestingly, these analyses revealed that both clinical trials (R square: 0.05, p=0.41) and published papers (R square: 0.09, p=0.25) correlated poorly with the number of FDA approved drugs per disease area. **CONCLUSIONS:** These data suggest that the amount of research significantly correlates with the number of clinical trials in a given disease area. However, neither research nor clinical trials correlated with the number of drugs approved by the FDA. This may suggest that some disease areas could face a bottle neck at the drug approval stage, perhaps through difficulties in demonstrating efficacy.

PHP153
EFFECTS OF CHANGING HEALTH POLICY ON PHARMACOECONOMICS AND HEALTH OUTCOME STUDIES FROM 2000 TO 2012 IN TURKEY
Kockaya G[1], Daylan Kockaya P[2], Ergin G[1]
[1]*Health Economics and Policy Association, Ankara, Turkey,* [2]*Zirve University, Gaziantep, Turkey*
OBJECTIVES: Health policy chances may effect the conducted studies in all fields. Pharmacoeconomics dossiers for the reimbursement applications for new medicines were not mandatory before year 2008. New molecules need to show cost-effectiveness and possible budget effect with their applications for reimbursement to Social Security Institution from 2008. This policy changing may effect pharmacoeconomics and health outcome studies in Turkey. The aim of the study is to evaluate the improvement of pharmacoeconomics and health outcome studies which are specific for Turkey in years. **METHODS:** Database of ISPOR Outcome Research Digest were searched online from the begining of database (1998) to 2011 with the key words "Turkey" and "Turkish". The inclusion criteria were taken as study must be specific for Turkey and first author must be from Turkey. Included abstract evaluated for increasing in years, distribution in study topics and diseases areas. **RESULTS:** 121 abstracts were matched with inclusion criteria. First abstracts were published in 2000. There were only 16 abstracts in total until 2008. After year 2008, published abstracts numbers were increased year by year and reached up to 40 per year in 2012. 58.7% of all abstracts were Cost Studies(CS). It was followed by Health Care Use & Policy Studies(HP) (15.7%) and Patient Reported Outcomes & Preference-Based Studies (PRO) (12,7%). 49.3% of all Cost Studies were Cost-Effectiveness studies.

17.4% of all abstracts were in the Alergy diseases area. It was followed by Multiple Diseases (14%). **CONCLUSIONS:** It was shown that the policy changing in 2008 as to require pharmacoeconomics dossiers in the reimbursement application effected Turkey specific pharmacoeconomic and health outcome studies positively. In other words, pharmaceutical ýndustry and the government started to invest in pharmacoeconomics and health outcome studies after 2008.

PHP154

LONG TERM ANALISYS OF THE HUNGARIAN HOSPITAL BED CAPACITIES

Ágoston I, Szarka E, Endrei D, Zemplényi A, Molics B, Vas G, Boncz I
University of Pécs, Pécs, Hungary

OBJECTIVES: To provide a long term analysis of the Hungarian hospital bed capacities. **METHODS:** During the preparation we performed bibliographic review including research of related statistical data collections, historical hospital works. Data were derived from the database of the Hungarian Central Statistical Office and from historical documents. The study covered the period between 1800-2010. The following indicators were used: number of hospitals and hospital beds. **RESULTS:** The first data available for hospital statistics dates back to 1800 and showed that there were 34 hospitals and 1590 hospital beds in Hungary. For 1867 the number of hospitals and hospital beds increased up to 46 and 4684 respectively. Shortly after the introduction of compulsory health insurance in 1891, the number of hospitals was 344 and the number of hospital beds was 16497 in 1895. After the First World War hospital number decreased to 183, and bed number increased to 26451. Since 1945 to 1990 the number of hospitals varied between 147-287, while the number of hospital beds continuously increased from 33162 to 105097. After the social and political changes in 1990, hospital bed number showed strong decrease to 71216 in 2010 with varying number of hospitals between 148-174. As a consequence in the changes of numbers of hospitals and hospital beds, the average bed number per one hospital continuously increased from 47 in 1800, 107 in 1915, 182 in 1950 and 710 in 1990. **CONCLUSIONS:** The definition and function of hospitals significantly changed during the past 200 years in Hungary. The former old fashioned small poor houses of the early 19th century have been replaced by hospitals with large number of hospital beds by 1990. After social and political changes in 1990, the number of hospitals beds in Hungary decreased and got closer to EU average.

PHP155

'BIG DATA' IN HEALTH CARE. WHAT DOES IT MEAN AND WILL IT MAKE A DIFFERENCE?

Velthuis EJ[1], Malka ES[2], Richards MS[2]
[1]*PPD, Bennekom, The Netherlands,* [2]*PPD, Morrisville, NC, USA*

BACKGROUND: With the evolution from data on paper into electronically available data, the term Big Data has made its entrance. This term is widely used and refers to the four V's: Volume, Velocity, Variety and Veracity. Big Data is being used in many sectors such as retail and banking, and also in the health care sector. However, within the health care sector, this term is ill defined. **OBJECTIVES:** The main purpose of this study is to get an understanding of the definition of Big Data in health care. Further, it's value and challenges will be explored. **METHODS:** : First, an attempt has been made to clarify the term Big Data in health care using the term "Big Data" in combination with 'health' in PubMed searches. Also, the internet and social media have been searched for definitions of Big Data in health care. Further, the potential use of Big Data in health care has been reviewed using these sources. **RESULTS:** In the medical literature, the term Big Data is rarely used in health care research and no standard definitions of Big Data big data are available. The term is used in combination with electronic health care records (EHR), claims data, registries, pharmacy utilization records, and linkages between these databases. On the internet and social media, various definitions for Big Data in the health care sector can be found." Values are: increased medical knowledge, improved quality of care, improved personalized medicine, better health outcome prediction, and lower costs. Challenges with Big Data in Healthcare are of technical (different data structures), ethical (patient privacy) and scientific (quality issues, biases, causality assessment) magnitude. **CONCLUSIONS:** Healthcare Big Data has poorly been defined. Use of Big Data can be beneficial in terms of better care and lower costs despite the challenges to be faced.

PHP156

DISEASE BECOMES SOCIAL. HEALTH RESEARCH CONDUCTED ON, OR USING, WEB 2.0 MEDIA: A SYSTEMATIC REVIEW

Martin A, Lombard L
Evidera, London, UK

OBJECTIVES: To assess the range and focus of health research that has involved interactive internet and mobile technology ("social media"; SM). **METHODS:** We conducted a systematic review of studies that investigated the use of SM, or used SM as a research tool, published in English since 2003 and indexed in MEDLINE and EMBASE. **RESULTS:** We identified 3,773 unique studies, of which 304 reported primary research or were systematic reviews of such studies. Of these, 192 (63%) were surveys of actual or potential users of SM, including health care professionals (20%), patients with a specific disease or problem (46%), or the general public (34%); 40 (13%) were articles describing SM tools or sites; 71 (23%) assessed the potential of SM to increase knowledge or improve clinical outcomes, of which 22 compared SM with more traditional support or information; 71 (23%) described SM users; 53 (17%) sought their views on the benefits of SM; 24 (8%) discussed the potential harm its use could do to professional-patient relationships; and 25 (8%) analysed SM content. SM were also used as a tool to recruit participants into research (85 articles, 28%), especially on topics such as sexual practices, intimate partner violence, or substance abuse, or involving groups typically underrepresented in clinical research. Of the various types of SM studied or used to recruit participants into research, Facebook was cited in 73 articles (24%); mobile apps in 40 papers (13%); PatientsLikeMe and Twitter in 13 articles (4%) each; MySpace in 3 articles (1%); and other online forums in 70 articles (23%). **CONCLUSIONS:** SM is a rich source of data on patients and health care professionals. It may be particularly useful in targeting patients with rare diseases, and studying attitudes and behaviours relating to taboo subjects. SM may also increase recruitment into research studies, especially from hard-to-reach groups.

PHP157

PHARMACO-ECONOMIC EDUCATION NEEDS INVESTIGATED BY ISPOR CHAPTER – EXAMPLE FROM BULGARIA

Nikolov I[1], Petrova G[2]
[1]*Glaxo SmithKline, Sofia, Bulgaria,* [2]*Medical University of Sofia, Sofia, Bulgaria*

OBJECTIVES: Education in pharmacoeconomics is one of the primary goals of ISPOR. This study is aiming to explore the needs for pharmacoeconomic educations by national chapter among different pharmaceutical stakeholders. **METHODS:** Inquiry research was performed among the participants in 2 educational initiatives of the Bulgarian ISPOR chapter. In both seminars attended representatives of payers - Bulgarian government (MoH, NHIF), as well as from pharmaceutical business, non-governmental organizations and academia. On total 48 individuals left feedback from over 60 participants in both seminars. The questionnaires focused on the topics covered in the seminars, organizational matters and needs of new educational themes. Preferred themes were assessed and results are consolidated **RESULTS:** Both seminars target the same groups of individuals – institutions, academia, pharmaceutical business, and non-governmental organizations. The first seminar was focused mainly on the pricing and reimbursement of the pharmaceuticals with international lecturers, while the second one covered basic pharmacoeconomic methods with national lectures. The overall satisfaction score from both seminars was very high (25%) and excellent (55%). The most preferred topic was the pricing and reimbursement of pharmaceuticals by 53%, followed by different modeling techniques (47%). Participants wanted to know more about the way of regulatory usage of pharmacoeconomics in pricing and reimbursement (70%). Focus groups discussion (98%) and practical of pharmacoeconomic were also a matter of high preference (30%). **CONCLUSIONS:** This study proves the necessity for education in the field of pharmacoeconomic, modeling, core models explanations and pharmaceuticals assessment. They also pointed out the place of national chapters as providers of education and independent organizers able to gather different stakeholders' point of view in non-formal discussions. Having in mind that BG is in the beginning of the HTA process obviously willingness to be educated among the whole Pharma environment is definitely high.

PHP158

PHARMACOECONOMIC EDUCATION FOR HEALTH CARE STUDENTS IN BOSNIA AND HERZEGOVINA

Catic T
ISPOR Bosnia and Herzegovina, Sarajevo, Bosnia

OBJECTIVES: In order to examine the current situation related to education in the field of pharmacoeconomics and Health-economics, we investigate which universities and colleges provide such training. The study included pharmaceutical, medical and dentistry faculties and departments as well as the health care colleges. Information on health care colleges and faculties in B&H are taken from State register of accredited higher education institutions. **METHODS:** We have analyzed the on-line availability of the curricula at official websites of health care faculties, its content for each program of study at the undergraduate and postgraduate level. All programs are qualitatively analyzed in terms if they include pharmacoeconomics/health economics as a separate subject (mandatory or elective) **RESULTS:** Twenty-two high health care institutions are identified; 5 medical, 4 dentistry, 9 pharmaceutical faculties, 13 nursing and 6 othe. Seventeen of them have on-line available curricula, 3 are not available and 2 faculties do not have available websites, so we included 77,7% of all health care faculties program. In undergraduate courses pharmacoeconomics/health-economics is included in curricula at 5 faculties. Pharmacoeconomics as separate mandatory subject is included in curricula at 1 medical and 1 pharmacy faculty while at 3 health care colleges this area is covered through health-economics or health-management courses. In postgraduate programs (master and doctoral studies) just 3 faculties included health economics in its curricula; 1 medical faculty as mandatory subject, and 2 medical colleges as elective subject. **CONCLUSIONS:** Pharmacoeconomic education for health care students in Bosnia and Herzegovina is poorly organized and not satisfactory. There is growing need to educate health care professional and stakeholders in this field to ensure proper understanding and implementation in practice and decision-making process. Limitation of this study is that detail programs and structure of courses could not be examined since it is not on-line available. Further research is recommended to get deep insight into curricula.

HEALTH CARE USE & POLICY STUDIES – Health Technology Assessment Programs

PHP159

WORKSHOP IN PHARMACOECONOMICS: AN ITALIAN EXPERIENCE OF MULTI-STAKEHOLDER HTA CONSENSUS

Cicchetti A[1], Gasbarrini A[2], Ruggeri M[1], Sacchini D[2], Lanati EP[3]
[1]*Università Cattolica del Sacro Cuore, Rome, Italy,* [2]*Università Cattolica del Sacro Cuore, Rome, Italy, Italy,* [3]*MA Provider, Milano, Italy, Italy*

OBJECTIVES: To validate an innovative experience that aims at being recognized by Institutions as a national and independent HTA assessor, thus supporting both national and regional health care decison makers. This experience consists of a multi-stakeholder working group that, in the field of new technologies proposed for critical clinical areas, discusses and develops guide-lines and decision rules and comparatively examines local data. **METHODS:** The working method consists of a series of meetings (4 per year) of a scientific board (composed by high-profile experts covering all HTA domains) that carries out a nationwide analysis of the topic under examination and focuses on the main clinical, economic, organizational, social, and ethical aspects. Questionnaire-based surveys and Delphi panel are the main operational tools. WEF adopts standard HTA pro-

cedures according to the EUnetHTA Core Model. To avoid any conflict of interests, no fee is paid to any member. **RESULTS:** Since 2011, three HTA reports have been completed focusing in 2011-2012 on hepatology (HCV/HBV screening and treatments) and extending in 2013 to other topics including hepatocellular carcinoma and inflammatory bowel diseases; HIV is coming up next year. Along with 4 publications in international journals (mean impact factor 5.73), there have been auditions at the Italian Drug Agency (AIFA) and at the Healthcare Commission in Parliament that have facilitated the approval of new HCV drugs. Furthermore, delays in approvals by regional formularies have been reduced by about 65% (from 212 days after national marketing authorization to 74 days; Farmindustria data). **CONCLUSIONS:** This new multidisciplinary and multistakeholder approach proved to be well-accepted, and the "WEF method" is already recognized as a milestone in the Italian HTA landscape, by both Institutions (e.g. AIFA and Italian MoH) and Scientific Societies, thus helping payers in making rational decisions based on HTA methods.

PHP160

EXPLORING THE KEY DECISION DRIVERS PROVIDED BY HTA AGENCIES ACCEPTING SUBMISSIONS WITH ICERS HIGHER THAN THE THRESHOLD

Goodrich K, Walsh SCM
HERON Evidence Development Ltd., London, UK

OBJECTIVES: Health technology assessment (HTA) agencies use an incremental cost-effectiveness ratio (ICER) threshold, generally understood to be £30,000 for NICE (England), £20,000 for the SMC (Scotland), CAN$50,000 for CADTH (Canada), and AUS$42,000 for PBAC (Australia). To help inform future submissions, we assessed the rationale provided by the four HTA agencies when submissions were accepted despite the reported ICERs being higher than these thresholds. **METHODS:** All HTA appraisals from January 2000 to May 2013 from NICE, SMC, CADTH, and PBAC were included in the analysis. Multiple technology appraisals, resubmissions, vaccination programmes, requests for advice, and submissions for which an ICER could not be determined were excluded from the analysis. The full responses of the remaining appraisals were reviewed, with the submitted ICER (with and without proposed PAS), recommendation, and reasoning behind the recommendation extracted. **RESULTS:** A total of 594 submissions met the inclusion criteria and 240 included a higher-than-threshold ICER, with 75 (31.6%) accepted. The key rationale for acceptance was a lack of alternative treatments (25/75). Submissions were also accepted based on the inclusion of a PAS (21/75), a demonstrated cost-effectiveness in a restricted patient population (16/75), and a robust economic evaluation resulting in a certain ICER (13/75). The agencies consistently based their rationale on clinical need and cost-effectiveness, although the proportions varied between the agencies: NICE (53.3%), SMC (59.4%), CADTH (70.0%), PBAC (81.8%). **CONCLUSIONS:** The majority of submissions reporting ICERs greater than the threshold ICER were rejected. ICERs over the threshold ICER were either brought in line with the threshold ICER through PASs or restricting the patient population; or accepted in spite of the high ICER based a clear clinical need or a robust and certain economic analysis. This highlights the importance for manufacturers to provide robust and appropriately justified economic evaluations, even at the expense of an ICER lower than threshold.

PHP161

ARE CONDITIONALLY APPROVED THERAPIES SUCCESSFUL IN GAINING MARKET ACCESS?

Sweeney N[1], Nijhuis T[1], Haigh J[2]
[1]*Quintiles, Hoofddorp, The Netherlands,* [2]*Quintiles, Reading, UK*

OBJECTIVES: To evaluate all medicines that received a conditional regulatory approval in Europe and to compare these decisions with the products current market access status through the evaluation of Health Technology Assessments (HTAs). **METHODS:** A manual search of the European Medicines Agencies (EMA) website was carried out to identify all pharmaceuticals that received a conditional approval (January 2007 to May 2013). Of the medicines identified, the statutory funding status was checked by reviewing the websites of the key HTA agencies in the EU 5 countries-: HAS (France), G-BA (Germany), AIFA (Italy), DGFPS (Spain) and AWMSG, NICE, SMC (UK). **RESULTS:** A total of 15 pharmaceuticals were found that had received an EMA conditional approval. Of these, 10 met the inclusion criteria and were analysed further: etravirine, everolimus, fampridine, lapatinib, ofatumumab, panitumumab, pixantrone, pazopanib, stiripentol and vandetanib. Of the 10 pharmaceuticals, a total of 50 HTA assessments were conducted by the 7 agencies, with 31 (62%) of the HTAs reaching a positive funding decision. Both NICE and AWMSG recommended only 1 of the conditionally approved drugs for funding, G-BA recommended 2, SMC 3, DGFPS 6, AIFA 6 and HAS 8. Of the 10 drugs, everolimus was the most successful and is funded by 6 (of the 7) HTA agencies. The key reasons for the success of everolimus were due to convincing efficacy (prolonging progression-free survival), combined with an economic case that was considered demonstrated despite some uncertainties. **CONCLUSIONS:** Whilst regulatory bodies recognise the need to grant marketing authorisation on the basis of less complete data, this does not necessarily mean a straight forward path through market access. Although the majority of HTA agencies did provide a positive funding decision; sound health economic evidence remains essential for new medicines to increase the chances of market access approval.

PHP162

ARE HEAD-TO-HEAD DATA NECESSARY TO GAIN REIMBURSEMENT IN THE FRENCH NATIONAL HEALTH CARE SYSTEM?

Patel A[1], Grosfeld D[1], Conti CC[2], Zaidi Q[1], Furniss SJ[3]
[1]*GfK Bridgehead, New York, NY, USA,* [2]*GfK Bridgehead, London, UK,* [3]*GfK Bridgehead, Melton Mowbray, UK*

BACKGROUND: Since December 2011, pharmaceutical companies are required by law to provide the Haute Autorité de Santé with head-to-head (H2H) data against standard of care when available to be entitled for reimbursement. However, France is a market where health authorities rarely deny reimbursement to innovative drugs but rather where list prices are lower than in comparable countries. **OBJECTIVES:** The aim of this research is to understand the impact of H2H data on the Service Médical Rendu (SMR) and Amélioration du Service Médical Rendu (ASMR) ratings following passage of the law. **METHODS:** Transparency Commission (TC) reports for new drugs or indication expansions of existing drugs published between January 1, 2012 and March 31, 2013 were reviewed. The following data were gathered: 1) study type (placebo-controlled vs active H2H comparator); 2) comparator (if H2H); 3) availability of appropriate comparators in the marketplace; and 4) SMR/ASMR ratings. **RESULTS:** A total of 110 TC assessments of 88 drugs were identified and examined. Ninety-four of the 110 assessments were of drugs where an appropriate comparator existed in the marketplace. Of these 94 assessments, H2H trials were conducted in 54 assessments. The percentage of assessments in the H2H group obtaining an SMR of important (78%) was similar to those that did not conduct H2H trials (75%). In contrast, the percentage of assessments in the H2H group obtaining an ASMR of III or IV was greater than the non-H2H group (15% vs. 26%). **CONCLUSIONS:** The conduct of H2H trials does not guarantee an SMR of important for new drugs or indication extensions, but may improve ASMR rating. Although the TC mentions the lack of comparative data as a major contributing factor for an SMR of insufficient in their assessments of some products (Daxas, Xiapex), other factors, such as adverse events or efficacy data vs placebo are equally important.

PHP163

INFLUENCE OF PATIENT-REPORTED OUTCOMES ON HTA REIMBURSEMENT DECISIONS

Kulich K[1], Versoza L[2], Jaksa A[2], Demuro-Mercon C[3], Gnanasakthy A[4]
[1]*Novartis Pharma AG, Basel, Switzerland,* [2]*Context Matters, Inc., New York, NY, USA,* [3]*RTI Health Solutions, Research Triangle Park, NC, USA,* [4]*Novartis Pharmaceuticals, East Hanover, NJ, USA*

OBJECTIVES: To understand how patient-reported outcomes (PROs) influence decisions made by Health Technology Assessment (HTA) agencies. **METHODS:** Reports from five HTA agencies that make reimbursement decisions (NICE, HAS, SMC, PBAC and CADTH's CDR) were selected. The reports, taken from January 2005-April 2013, cover disease conditions in neurological and respiratory therapeutic areas. PROs within the HTA reports were identified and four analysts independently examined the stated rationales for the agencies' decisions to determine whether PROs had a positive, negative, or neutral influence on the decision. Discrepancies between the analysts were discussed in-depth until consensus was reached. **RESULTS:** A total of 262 HTA reports were analyzed from the five agencies selected. PROs were mentioned in 34% of the HTA reports, and were the primary endpoint in 6%. Twenty-five (10%) reports mentioned PRO in the clinical rationale for their decisions. Twelve of the 25 HTA reports (48%) contained PRO as a primary outcome, indicating that a PRO is more likely to influence the decision-making process if it is a primary outcome ($p < 0.001$). In 12 out of the 25 HTA reports, the clinical rationale for the decision stated that, for the PRO, the drug performed better than placebo or comparator. Ten (83%) of these reports resulted in a positive decision. In eight reports, the drug compared equivalently or unfavorably to placebo or comparator for the PRO and resulted in four (50%) positive decisions. There was no significant difference in agency decisions between the reports that positively reported PROs and the reports with negative or similar PRO results ($p=0.16$). **CONCLUSIONS:** In respiratory and neurological diseases, the use of PROs is more likely to influence decision-making by HTA agency when PROs are specified as primary outcomes. Future research directions include comparing these findings to the effect other clinical outcomes have on reimbursement decisions.

PHP164

HEALTH ECONOMIC (HE) DATA REQUIREMENTS AND AVAILABILITY IN THE EUROPEAN UNION. RESULTS OF A SURVEY

Skoupa J[1], Annemans L[2], Hájek P[3]
[1]*1st Medical Faculty, Charles University, Prague, Czech Republic,* [2]*Ghent University & Brussels University, Ghent, Belgium,* [3]*Pfizer, Praha, Czech Republic*

OBJECTIVES: To compare data requirements and their availability for HE evaluations in 5 countries in Central/Eastern Europe - Poland, Czech Republic, Slovakia, Hungary, Romania (CEE) and 5 in Western Europe – UK, France, Germany, The Netherlands, Sweden (WE). **METHODS:** A questionnaire was developed and distributed to market access representatives from Pfizer who were asked to complete the questionnaire with opinion leader's support. The questionnaire focused on the obligation to conduct HE assessment for reimbursement submissions, local HE guidelines, applied discount rates for future costs and effects, willingness to pay (WTP) thresholds and available data sources. **RESULTS:** HE is mandatory in all CEE and 3 WE participating countries for reimbursement applications of innovative drugs. Usually cost-effectiveness (CEA) and budget-impact (BIA) analyses are required. The preferred outcome of CEA is quality-adjusted-life years. In Romania, France and Czech Republic guidelines could not be identified at the time of the survey. HE evaluations are usually prepared by the applicant; in Sweden, UK, The Netherlands and Poland unlocked models have to be presented for scrutiny. Discount rates vary from 1.5% to 5%; usually the same for costs and outcomes (except in The Netherlands and Poland). Only UK, Poland and Slovakia have an explicit WTP threshold. In Poland it is based on GDP per capita, in Slovakia on multiples of average monthly wages. Differences were found on data availability. In WE data can be acquired easier compared to CEE. Health insurance funds do not provide their data, unless they were published. Patient registries are either not available in CEE or difficult to access, so applicants mostly rely on retrospective medical chart data, hospital information systems or expert panels. **CONCLUSIONS:** We found similar requirements for HE analyses in CEE and WE but differences in data availability. This results in less accurate inputs across the CEE influencing analyses' outcomes.

PHP165

KEY DRIVERS OF PBAC DECISIONS FOR THE REIMBURSEMENT OF ORPHAN DRUGS ON THE LIFE SAVING DRUGS PROGRAM

Maguire B, Tilden D
THEMA Consulting Pty. Limited, Pyrmont, Australia

OBJECTIVES: In Australia, the decision process for the reimbursement of orphan drugs on the Life-Saving Drugs Program (LSDP) is centred on a drug's ability to meet strict criteria as specified and assessed by both the Pharmaceutical Benefits Advisory Committee (PBAC) and the LSDP Advisory Committees. The objective of this research was to investigate the key determinants of PBAC decisions with respect to the LSDP criteria in order to understand the key challenges facing new treatments seeking LSDP funding. **METHODS:** A systematic search was conducted of all available Public Summary Documents (PSDs) from July 2005 to April 2013, to identify products that have sought listing on the LSDP. The selected PSDs were reviewed and data extracted according to categories defined by the LSDP criteria. Data were then qualitatively analysed within and across categories to identify key themes and concepts influencing decisions. Quantitative analyses were also conducted on the number of submissions, rejections, deferrals and the time from when a product first sought reimbursement to when funding was initiated. **RESULTS:** Since the LSDP was created in 1995 only 12 products have sought LSDP funding, 10 are currently reimbursed covering 7 disease areas. Of the applications reviewed, 58% of submissions were immediately referred from the PBAC to LSDP for funding, 17% were initially rejected and after subsequent submissions have been funded, and 25% of applications are yet to receive funding. The average time from the first PBAC consideration of a product until funding on the LSDP is 19.7months. The most common reason for rejection was around uncertainty in a drug's ability to significantly prolong life and the appropriateness of surrogate outcomes to accurately predict long-term survival. **CONCLUSIONS:** This analysis shows there is a pathway to reimbursement of high cost orphan drugs when there is a reasonable level of evidence supporting survival gains.

PHP166

HOW DOES THE UNCERTAINTY AROUND THE EXPECTED ICER AFFECT NICE DECISIONS?

Barber R, Steeves S, Kusel J, Wilson T, Hamerslag L
Costello Medical Consulting Ltd., Cambridge, UK

OBJECTIVES: In the UK, NICE assesses health technologies based on clinical and cost-effectiveness evidence. Recommendations ensure NHS patients have access to the most clinically effective treatments, whilst using NHS resources cost-effectively. Nevertheless, cost-effectiveness analyses are susceptible to limitations which make the true value of a technology uncertain. This study investigates what other factors NICE considers when making recommendations under uncertainty. **METHODS:** All Single Technology Appraisals (STAs) published by NICE between 2011-2013 inclusive were reviewed. Recommendations were identified as being made under uncertainty if there was a less than 50% probability that the intervention was cost-effective at a willingness-to-pay threshold of £20,000 per QALY gained. NICE committee reports for these appraisals were reviewed to determine the factors taken into account when making a recommendation. **RESULTS:** Of 64 STAs published in the studied period, 31 interventions were identified with uncertainty at the willingness-to-pay threshold of £20,000, of which 18 (58%) were recommended by NICE. Moreover, only 4 (22%) recommended STAs with uncertainty at £20,000 had a greater than 50% probability of being cost-effective at a threshold of £30,000. Of the STAs recommended under uncertainty, 13 (72%) had a patient access scheme (PAS) in place, while 3 (17%) fulfilled end-of-life treatment criteria. Health-related benefits not captured in the manufacturer's economic model that were likely to lower the ICER, innovative technologies, or interventions satisfying an unmet clinical need were also taken into account. For example, fingolimod was recommended by NICE for treatment of multiple sclerosis based on its oral rather than intravenous formulation and because benefits from a reduced caregiving need were not accounted for in the manufacturer's economic model. **CONCLUSIONS:** Even under uncertainty, NICE often recommends new technologies, particularly if a PAS is in place or if additional costs are deemed to be justified by the benefit provided to patients or their families.

PHP167

ANALYSIS OF THE IQWIG COMMENTS ON THE EVIDENCE SEARCHES OF DOSSIERS IN THE GERMAN AMNOG PROCESS

Witt B[1], Bakker K[2], Volmer T[1]
[1]*SmartStep Consulting GmbH, Hamburg, Germany,* [2]*Hochschule Fresenius, University of Applied Sciences, Hamburg, Germany*

OBJECTIVES: The benefit assessment of new drugs in Germany requires the submission of a value dossier including systematic searches. The majority of dossiers are methodically inspected and assessed by the German Institute for Quality and Efficiency in Healthcare (IQWiG). The study's objective was the analysis of common deficiencies in systematic searches and their consequences for the IQWiG assessment. **METHODS:** A total of 37 IQWiG assessment reports were analysed with regard to all comments made on the presented systematic searches in the dossier of the pharmaceutical company. A distinction was made between literature and study searches. The respective IQWiG comments were categorized and listed. Inadequate searches were examined in terms of consequences for the assessment by the IQWiG. Consequences were divided into those affecting the search required for the substance itself and those carried out for indirect comparisons/ further investigations. **RESULTS:** A total of 4 of the 37 dossiers passed the IQWiG assessment without deficiencies. Out of all analysed searches a total of 104 deficiencies were found, of which the most frequent ones referred to the search strings (32%) and the documentation of the search (25%). In the consistency check on the number of hits deviations were found by the IQWiG in 13%; 92% of the inconsistencies occurred in study-registry versus 8% in literature searches. There were no consequences in 62% (23/37) for the substance-search and in 22% (8/37) for indirect comparisons/ further investigations. Non-consideration of study results, which was the most frequent consequence of an inadequate search, occurred in 24% for the substance-search and in 32% for indirect comparisons/further analyses. **CONCLUSIONS:** The methodological requirements for systematic searches to be accepted by the IQWiG are not achieved in the majority of dossiers. An adequate design and a careful documentation of the searches is crucial to ensure the best possible acceptance of evidence in the AMNOG process.

PHP168

ANALYSIS OF PUBLISHED HEALTH TECHNOLOGY ASSESSMENTS (HTA) IN RUSSIA AND ITS PLACE IN RUSSIAN REIMBURSEMENT SYSTEM

Kalbasko A, Heemstra L, Nijhuis T
Quintiles, Hoofddorp, The Netherlands

OBJECTIVES: Currently there is no formal HTA agency in Russia, although the need for HTA as an evidence tool for policy makers is increasing due to budget constraints. However, there are HTA bodies which to some extent influence decison makers through publications of pharmacoeconomic studies. The objective of the present study was to gain insights into the current activities of existing HTA organizations and research trends in developing HTA in Russia. **METHODS:** A manual search of four Russian HTA organizations' websites was conducted to find pharmacoeconomic assessments published from 1998 onwards. Per agency, all relevant reports were categorized by therapeutic area and publication date. Any revealed patterns in the HTA topics were in-depth analyzed and compared with the World Health Organization (WHO) country profile of Russia. **RESULTS:** In total, 180 pharmacoeconomic assessments published by four Russian HTA organizations were identified. Overall, the majority of studies were performed in cardiovascular (n=45; 25%) and oncology (n=32; 18%) disease areas, which are according to the WHO, the two leading causes of death, both in Russia and globally. The total number of pharmacoeconomic publications per year has been constantly increasing from one study in 1998 to 26 in 2009, however with fewer reports published in 2010-2013 (32 HTAs in three years). When reported, the potential willingness-to-pay (WTP) threshold for cost-effectiveness was suggested to be 3*Gross Domestic Product (GDP) per capita as recommended by WHO, which equals to approximately 30,000 euro per Quality Adjusted Life Year (QALY) gained. **CONCLUSIONS:** Although formally Russia does not have a transparent HTA based reimbursement process, existing HTA organizations are constantly developing and gaining HTA experience by conducting assessments in the therapeutic areas with the highest burden on Russian population. These areas of interest, as well as an approach to define WTP threshold, match with WHO data and recommendations.

PHP169

SYSTEMATIC LITERATURE REVIEWS AT THE HEART OF HEALTH TECHNOLOGY ASSESSMENT: A COMPARISON ACROSS MARKETS

Rycroft CE[1], Fernandez M[2], Copley-Merriman C[3]
[1]*RTI Health Solutions, Manchester, UK,* [2]*RTI Health Solutions, RTP, NC, USA,* [3]*RTI Health Solutions, Ann Arbor, MI, USA*

OBJECTIVES: Requirements for systematic literature reviews (SLRs) within a Health Technology Assessment (HTA) submission vary across the world. The objective of this study is to compare clinical and economic SLR requirements issued by eight HTA agencies in the UK (England and Wales, Wales, Scotland), Ireland, Germany, Sweden, Canada, and Australia. **METHODS:** SLR requirements issued by the National Institute for Health and Care Excellence (NICE), All Wales Medicines Strategy Group (AWMSG), Scottish Medicines Consortium (SMC), National Centre for Pharmacoeconomics (NCPE), Gemeinsamer Bundesausschuss (G-BA) (Federal Joint Committee), The Dental and Pharmaceutical Benefits Agency (TLV), Canadian Agency for Drugs and Technologies in Health (CADTH), and Pharmaceutical Benefits Advisory Committee (PBAC) were compared, and a checklist of requirements was compiled. **RESULTS:** SLRs of the clinical and economic evidence underpin the HTA process. However, HTA agencies vary on the specific requirements for each and the need for critical appraisal of identified clinical studies and economic analyses. NICE requirements are the most prescriptive, whereas AWMSG and TLV have few stated SLR requirements. All agencies require a clinical SLR, although AWMSG does not specify outright but requires a clinical SLR to determine economic model inputs. Four agencies require both a clinical SLR and critical appraisal of the included studies (NICE, NCPE, G-BA, and PBAC), although recommended appraisal tools vary. NICE and CADTH require both an SLR and a critical appraisal of existing economic evaluations for the intervention of interest; PBAC requires an SLR of only economic evaluations. NICE, SMC, AWMSG, and NCPE require an SLR of utility data, and only NICE and SMC specify the need for an SLR of cost and resource use data. A more detailed analysis of specific methodology requirements will be presented. **CONCLUSIONS:** Although SLR requirements vary between HTA agencies, a clinical SLR is a key requirement for all eight agencies investigated.

PHP170

ANALYSIS OF TRANSPARENCY AMONGST INTERNATIONAL HEALTH TECHNOLOGY ASSESSMENT ORGANIZATIONS

Jebrail F[1], Duong M[2], Shum D[2]
[1]*University of Toronto, Toronto, ON, Canada,* [2]*Hoffmann-La Roche Limited, Mississauga, ON, Canada*

OBJECTIVES: To assess the level of transparency of health technology assessment (HTA) organizations in eight countries (Australia, Canada, Brazil, France, Germany, Italy, Spain, and the UK). **METHODS:** Nine national review bodies carrying out HTAs for the purposes of reimbursement and funding decisions within their respective countries were assessed according to 33 transparency parameters. The parameters were designed to assess the level of transparency in the HTA processes, clinical and economic reviews, and stakeholder involvement. Using a modified Delphi process, each parameter was weighted based on its importance to transparency and given a score from one to ten. A review of each national body was conducted to determine whether or not they included each of the 33 parameters. Data from public sources (i.e., organization websites) were utilized and interviews with international experts were conducted to verify the information. Total scores were calculated and converted to a transparency index, with 100% being the most transparent. The score was adjusted for review bodies that did not require economic evaluations for their HTA process. **RESULTS:** The level of transparency varies greatly amongst the HTA organi-

zations studied. The transparency index scores were as follows: Institut für Qualität und Wirtschaftlichkeit im Gesundheitswesen/Gemeinsamen Bundesausschusses (Germany), National Institute for Health and Care Excellence (UK), pan-Canadian Oncology Drug Review (Canada), Common Drug Review (Canada), Pharmaceutical Benefits Advisory Committee (Australia), Comissão Nacional de Incorporação de Tecnologias (Brazil), Haute Autorité de Santé (France), Agencia de Evaluación de Tecnologias Sanitarias (Spain), and Agenzia Italiana del Farmaco (Italy) were 97%, 96%, 91%, 83%, 78%, 70%, 67%, 53%, and 25%, respectively. **CONCLUSIONS:** Transparency amongst HTA organizations is progressively becoming the international standard. However, the extent of transparent processes and procedures proves to be heterogeneous amongst international review organizations.

PHP171

EXPLORING THE KEY DECISION DRIVERS PROVIDED BY HTA AGENCIES REJECTING SUBMISSIONS WITH ICERS LOWER THAN THE THRESHOLD

Walsh SCM, Goodrich K
HERON Evidence Development Ltd., London, UK

OBJECTIVES: Health technology assessment (HTA) agencies use an incremental cost-effectiveness ratio (ICER) threshold generally understood to be £30,000 for NICE (England), £20,000 for the SMC (Scotland), CAN$50,000 for CADTH (Canada), and AUS$42,000 for PBAC (Australia). To help inform future submissions, we assessed the rationale provided by the four HTA agencies when submissions were rejected despite the reported ICERs being lower than these thresholds. **METHODS:** All HTA appraisals from January 2000 to May 2013 from NICE, SMC, CADTH, and PBAC were included in the analysis. Multiple technology appraisals, resubmissions, vaccination programmes, requests for advice, and submissions for which an ICER could not be determined were excluded from the analysis. The full responses of the remaining appraisals were reviewed, with the submitted ICER, recommendation, and reasoning behind the recommendation extracted. **RESULTS:** A total of 594 submissions met the inclusion criteria. 354 submissions across the four HTA bodies included a lower-than-threshold ICER, with 107 (30.2%) of these submissions rejected. Across the agencies, the most common reasons for rejection were use of an inappropriate patient population or comparator (45/107), uncertainty regarding the clinical benefits (32/107), and use of economic evidence that was not sufficiently robust (40/107). The reasons for rejection were consistent across the four agencies, with a similar proportion basing their decision at least partly on one of the three reasons provided above: NICE (92.9%), SMC (92.0%), CADTH (93.3%), PBAC (93.8%). **CONCLUSIONS:** A large proportion of submissions were rejected despite ICERs below the threshold. In instances where decisions went against the ICER thresholds, there was a clear tendency for identifiable problems with the clinical and economic assumptions to diminish the reliability of the ICERs presented. This result highlights that a lower-than-threshold ICER is not enough for a positive recommendation and manufacturers must support their submission with accurate and reliable data to achieve a favourable outcome.

PHP172

CROSS-MARKETS VARIABILITY OF INNOVATION BENEFIT'S EVALUATIONS. HOW ITALY COMPARES TO FRANCE, GERMANY AND THE UNITED STATES

Savi L, Conti CC, Tangari M, Lim A
GfK Bridgehead, London, UK

OBJECTIVES: A new drugs' innovation benefit is commonly evaluated, both in Europe and the USA. Most of the new pharmaceutical launches have to be evaluated on the level of innovation that they offer as part of the market access process. The objective of this abstract is to give an example of the variability that emerges in the innovation scores given by the Italian agency, AIFA, as compared to those of France, Germany and the USA. **METHODS:** Drugs listed on the AIFA website as showing potential or important innovation, were used as a benchmark to measure how innovation benefit assessments performed in France, Germany and the USA deviate. The innovation benefit was measured through: the ASMR score (Amélioration du Service Médical Rendu) in France, as published on the HAS website (Haute Autorite' de Sante'); the level of additional benefit in Germany, as published on the G-BA website (Gemeinsame Bundesausschuss); the type of approval procedure as published on the FDA (Food and Drug administration) website. In the case of the USA, standard approval vs. priority review was used as a proxy measure of the level of innovation. **RESULTS:** The results of the innovation benefit's evaluations performed in France, Germany and the USA differ from those performed by AIFA in 74%, 33% and 58% of cases respectively. The lower percentage in Germany is due to limited available information compared to other markets. **CONCLUSIONS:** The level of variability that exists between the outcomes of the innovativeness evaluation performed in different countries suggests that although the definition of innovation may appear straightforward, it is open to different interpretations by different health care systems.

PHP173

NICE STA DECISIONS: AN ANALYSIS OF HOW ADVICE DIFFERS BETWEEN PRELIMINARY AND FINAL GUIDANCE

Murray G, McLeod C, Howells R
Abacus International, Manchester, UK

OBJECTIVES: The National Institute for Health and Care Excellence (NICE) established the Single Technology Appraisal (STA) programme to evaluate the clinical and cost-effectiveness of medical technologies and provide mandatory guidance on how they should be used within the National Health Service (NHS) in the UK. The objective of this analysis is to explore how NICE advice differs between preliminary and final guidance in the STA process and identify actions manufacturers could take to increase their chances of a successful submission. **METHODS:** For STAs published between February 2010 and May 2013, the appraisal consultation document (ACD) and final appraisal determination (FAD) were identified. The guidance issued in these documents was compared and contrasted, and the key clinical and economic evidence that affected recommendations were extracted into an Excel workbook. **RESULTS:** Of the 71 STAs published, ACDs were produced for 60 technologies, while 11 (15%) proceeded straight to FAD. All submissions which proceeded directly to FAD were recommended (full or optimised) in the final guidance. Twelve STAs (20%) received a "minded no" at ACD; however, 11 of these (92%) were reversed within the FAD on the basis of additional data provided by the manufacturers in the form of economic analyses (n=5) or patient access schemes (PAS) (n=6). Of the 35 "not recommended" at ACD, 15 (43%) were ultimately recommended within the FAD through the introduction or revision of a PAS and/or submission of additional analyses. **CONCLUSIONS:** If manufacturers can demonstrate a robust clinical and economic argument in their initial submission the chances of a FAD being produced without the requirement of an ACD are greatly increased. Furthermore, ACD decisions can also be overturned; technologies which receive a "minded no" or "not recommended" at ACD stage can achieve a recommendation at FAD by presenting additional analyses or introducing/modifying a PAS.

PHP174

COMPARISON OF DRUG ASSESSMENTS IN FRANCE, GERMANY AND THE UNITED KINGDOM: IS EUROPEAN HTA A REALITY?

Troubat A, Perrin L
IMS Health, PARIS LA DEFENSE, France

OBJECTIVES: In 2006, the EUnetHTA project was launched. One of its main strategic objectives was to strengthen the link between HTA and health care policy making in the EU. Seven years after EUnetHTA establishment, the objective of this study was to compare HTA agencies' assessments in France, Germany and UK, focusing on method and outcomes. **METHODS:** Scope of the study was all the products getting a positive opinion from CHMP during two years, starting at January 1, 2011. Comparison between assessments was made for products assessed by the three HTA agencies: IQWiG, NICE, and HAS. **RESULTS:** A total of 87 drugs were included in this study. 11 (13%) have been assessed by the three agencies. Among these drugs, more than 50% (6) were cancer treatment. HAS was the first to assess drug in 6 cases (mean delay between CHMP positive opinion and assessment: 223 days), followed closely by IQWiG (242 days), then by NICE (354 days). IQWiG segmented the patient population defined by the manufacturer into different sub-populations in 6 assessments, HAS in 2, NICE never. NICE was the only agency who did not recommend a drug for cost-effectiveness reasons (2 assessments). In three assessments, IQWiG concluded that there was no benefit proven for the whole population; regarding the same drugs, HAS concluded there was minor improvement in actual benefit twice. **CONCLUSIONS:** Some major trends emerge in the assessments studied: use of indirect comparisons, added therapeutic value weighted by severity and frequency of side effects and uncertainty. Nevertheless, comparator choices, perception of clinical benefits and risks, budget impact and overall method still differ between the three HTA agencies studied, leading to different outcomes for drugs assessed.

PHP175

USING THE DELPHI METHOD FOR SELECTING MEDICAL TECHNOLOGIES UNDER BUDGET CONSTRAINTS: A FEASIBILITY STUDY

Daichman S[1], Greenberg D[2], Triki N[3], Hammerman A[4], Luxenburg O[5], Pliskin JS[6]
[1]*SCE- Shamoon College of Engineering, Beer-Sheva, Israel*, [2]*Ben-Gurion University of the Negev, Beer-Sheva, Israel*, [3]*Maccabi Healthcare Services, Tel Aviv, Israel*, [4]*Clalit Health Services Headquarters, Tel Aviv, Israel*, [5]*Ministry of Health, Jerusalem, Israel*, [6]*Ben Gurion University of the Negev, Beer-Sheva, Israel*

OBJECTIVES: To examine whether the Delphi method can provide a convenient tool for selecting medical technologies for inclusion in the National List of Health Services (NLHS) in Israel under a pre-defined budget constraint. **METHODS:** The Delphi method was applied in two groups: medical specialists (oncologists and cardiologists) and observers in the NLHS committee. Participants in each group were anonymously asked to choose five of ten suggested technologies from the list of technologies submitted for inclusion in the 2012 NLHS and rank them according to importance. Subsequently, the participants repeated the experiment after receiving aggregated feedback on the relative ranking of each technology within the same group after the first round. Comparison of the results was performed using descriptive statistics and non-parametric tests. **RESULTS:** After two rounds of the experiment, observers and medical specialists reached agreement on four of the five highest ranked technologies in each field (oncology and cardiology) regarding their importance to be included in the NLHS. Three of these four technologies were indeed included in the NLHS for 2012. **CONCLUSIONS:** The Delphi method is one of the best-known techniques to control group interaction and reach a consensus by utilizing the expertise of committee members. The study demonstrated the feasibility using the Delphi method for ranking health care technologies.

PHP176

WHICH SHOULD BE THE CORRECT NMA TO BE USED? A REVIEW OF HTA RECOMMENDATIONS

Solozabal M[1], Roset M[1], Rojas-Farreras S[1], González-Rojas N[2], Gil A[2]
[1]*IMS Health, Barcelona, Spain*, [2]*Boehringer Ingelheim, Sant Cugat del Vallès (Barcelona), Spain*

OBJECTIVES: In the lack of head-to-head comparative trials to demonstrate the efficacy of new treatments, it is common to use network meta-analysis (NMA), including indirect treatment comparison (ITC) or combine direct and indirect evidence through mixed treatment comparison (MTC). Due to the increasing number of drugs approved for the same indication and the increasing complexity of networks for treatments comparisons, new methods of MTC taking into account all the comparisons have aroused. Health Technology Assessment (HTA) bodies increasingly demand NMA although different recommendations about the methodologies to be applied exist. This study aims to review recommendations regarding ITCs and MTCs among the main HTA bodies. **METHODS:** A review of methodologies for drug comparison recommended by the main HTA bodies was performed. Recommendations related to evidence identification methods, assessment of homogeneity of studies and populations to be combined and statistical approach for the analysis were also reviewed. **RESULTS:** A systematic literature search is a prerequisite for most HTA bod-

ies, as well as demonstrating homogeneity and consistency among studies. Regarding to the statistical analysis, Bucher's method is the most commonly used and is recommended by most HTA bodies for indirect comparisons. Nevertheless, some HTA bodies (e.g. HAS, SMC), EUnetHTA and ISPOR Task Force on Indirect Treatment Comparisons consider that even if some direct evidence is available it is appropriate to validate the results using MTCs. According to these institutions, Bucher's method is not appropriate for the analysis of complex networks, while Bayesian approach is a more comprehensive method that can include meta-regression and study-level covariates. The use of the non-appropriate methods can derive to biased results. **CONCLUSIONS:** Methodology used for NMA should include all available evidence. Due to the increasing complexity of network patterns, Bayesian analysis better meets HTA needs than the Bucher's method, and is also a stronger evidence-deriving tool.

PHP177

SCANDINAVIAN DRUG REIMBURSEMENT AND COVERAGE DECISIONS: THE ROLE OF HTA

Grepstad ML[1], Kanavos P[2]

[1]*London School of Economics and Political Science, London, UK,* [2]*London School of Economics and Political Science, London, UK*

OBJECTIVES: To examine and explain differences and similarities in coverage decisions for outpatient pharmaceuticals in Denmark, Norway and Sweden, and to provide a better understanding of the current and future role of HTA in these countries. **METHODS:** A comparative analysis of all outpatient drug appraisals carried out between 2009 and 2012, including an analysis of divergent coverage decisions for outpatient drug-indication pairs appraised by all three countries was performed. Agreement levels between HTA agencies were measured using kappa scores. Primary data collection through consultation with decision makers and academics in the three countries was carried out to obtain insight on how coverage decisions are made and why reimbursement outcomes differ in the three countries. **RESULTS:** A total of 19 outpatient drug-indication pairs appraised in each of the three countries were identified, of which six pairs (32%) had divergent coverage decisions. An uneven distribution of coverage decisions was observed, with the highest number of overlap in appraisals in Norway and Sweden (freemarginal kappa 0.89). Similarities were found in the criteria for reimbursement and the reasoning for coverage decisions. Differences in the appraisal methods applied and the interpretation of the evidence considered may explain divergent decisions. **CONCLUSIONS:** The study suggests that Norway and Sweden employ similar methods for outpatient drug appraisals and have less divergent reimbursement outcomes, while health economic evaluation is less prominent in Danish outpatient drug appraisal, leading to a lower percentage of reimbursements with restrictions or criteria.

PHP178

THE IMPORTANCE OF SAFETY ASPECTS IN THE AMNOG PROCESS IN GERMANY: IS THE G-BA ASSESSMENT CONSISTENT WITH THAT OF THE CHMP?

Kuphal L, Witt B, Volmer T

SmartStep Consulting GmbH, Hamburg, Germany

OBJECTIVES: To assess the role of safety aspects in the overall AMNOG benefit assessment in Germany. Special attention was given to two aspects: (1) Are adverse events (AE) used systematically to change the benefit assessment in any direction? (2) Are safety aspects considered in the assessment in accordance with the scientific CHMP opinion? **METHODS:** Twenty-six benefit assessments decided and published by the Federal Joint Committee (G-BA) between Jan 1st 2011 and Jun 6th2013 were analyzed regarding the extent of harm. For each drug the extent of harm included with the consecutive influence on the overall benefit rating including potential changes in the overall rating scores was determined. Additionally, the safety aspects considered in the G-BA decision were compared to the CHMP assessments. **RESULTS:** For 19 of 26 drugs (73.1%), a greater or less harm vs. the comparator determined by the G-BA was considered. In 12 of these 19 substances (63.2%) the rating of the additional benefit drawn from efficacy results remained unaltered due to safety aspects. In 5 procedures (26.3%) the G-BA rated the additional benefit solely on the basis of less harm vs. the comparator. In 2 procedures (10.5%) the G-BA found a greater harm vs. the comparator which negatively impacted the overall rating. Statistically significant results of 'overall incidence of AE', 'AE grade 3-4', 'serious AE' and 'AE leading to study withdrawal' were always considered by the G-BA. In 8 cases (42.0%), the G-BA weighted safety aspects differently from the EMA in its overall rating process. **CONCLUSIONS:** The AE profile is of major importance in the AMNOG process. It changed in more than one third of the drug assessments (7 cases; 36.8%) the efficacy based benefit ratings. In 8 cases (42.0%) the G-BA assessment deviated from the conclusions considered by the EMA.

PHP179

ARE MONOCLONAL ANTIBODIES STILL CONSIDERED AS INNOVATIVE BY THE FRENCH HEALTH CARE SYSTEM? A RETROSPECTIVE ANALYSIS 2000-2012

Conti CC[1], Kostakis A[1], Furniss SJ[2]

[1]*GfK Bridgehead, London, UK,* [2]*GfK Bridgehead, Melton Mowbray, UK*

OBJECTIVES: To understand the dynamics of the Transparency Committee (TC) assessments of monoclonal Antibodies (mAbs) through the improvement in therapeutic benefit (known as "ASMR") ratings from 2000 to 2012. ASMR ratings are divided into two main groups by the French health care system. ASMR I to III allow manufacturers to notify price to the pricing committee based on the innovative character of the product and on the improvement provided over standard of care. This allows pricing at the "European" level. ASMR IV and V are given to non-innovative products adding at best minor improvement to standard of care. **METHODS:** mAbs (excluding radiotherapeutics) online published reports from the TC from 2000 to 2012, including new indications and reassessments, were analysed. The TC has evaluated a total of 26 mAbs, leading to 105 ASMR ratings during the period studied. **RESULTS:** From 2000 to 2006, 83% (n = 29) of the TC evaluations of mAbs led to ASMR I, II or III and only 17% of the TC evaluation lead to ASMR IV or V (n = 6). During the following period, from 2006 to 2012, the TC granted only 30% (n = 21) of the assessments with an ASMR I, II or III. 70% (n = 49) of the remaining evaluations where ASMR IV or V. **CONCLUSIONS:** In the first six years mAbs were perceived as a disruptive innovation to a significant proportion of ASMRs between I and III as a reward for research and development efforts of the manufacturer. This research suggest that mAbs manufacturers no longer benefit from a 'first mover' advantage and may face higher scrutiny from the TC and greater price pressure from the French pricing committee.

PHP180

HEALTH TECHNOLOGY ASSESSMENTS OF MEDICAL DEVICES: IS HELP OUT THERE?

Green W, Wood H

University of York, York, UK

OBJECTIVES: Small-Medium Enterprises (SMEs) should assess the potential profitability of new medical devices early in their development. This can be achieved via early-stage health technology assessments (HTAs). However, many SMEs will not have the skills necessary to undertake these HTAs, so tools and frameworks that aid this process are likely to be beneficial. A systematic review of the literature was undertaken to identify resources that can facilitate early-stage HTAs. **METHODS:** Electronic databases, such as MEDLINE and ECONLIT, were searched in February 2013. Papers were included if they met all of the five selection criteria used. **RESULTS:** Of the 4729 papers identified, ten were included in the final analysis. Only one interactive tool, a decision analytic model which is operational via Microsoft Excel, was identified. Of the remaining nine articles, five were classified as frameworks. Of these five articles, the most comprehensive outlines a multi-criteria decision analysis (MCDA) value matrix. The final three articles included in the final analysis contained descriptive methods with information that was considered useful. **CONCLUSIONS:** The resources available to aid the undertaking of early-stage HTAs is very limited. Ideally, an interactive spreadsheet tool that generates intuitive results would be available. However, the one identified tool is too inflexible and most users would struggle to find accurate data to populate it. Unfortunately, these issues are likely to be endemic to any interactive tool for early modelling. As such other guidance, including frameworks, may be more useful if they are comprehensive. Only the MCDA framework article contained methods that the authors of this article considered comprehensive, and the use of MCDA for early-stage HTAs has its own issues. Therefore, there may be a place in the literature for more complete pieces of guidance to undertaking early-stage HTAs.

PHP181

THE NICE MEDICAL TECHNOLOGY EVALUATION PROGRAMME (MTEP) – INSIGHTS FOR MANUFACTURERS CONSIDERING NOTIFICATION

McLeod C[1], Howells R[1], Harrison L[2]

[1]*Abacus International, Manchester, UK,* [2]*Abacus International, Bicester, UK*

OBJECTIVES: The Medical Technologies Evaluation Programme (MTEP) was established to promote the uptake of innovative medical technologies through the publication of Medical Technology Guidance (MTG) by the National Institute for Health and Care Excellence (NICE) to the National Health Service (NHS) in the UK. The objective of this analysis is to report data on the MTEP, which are not currently collated on the NICE website, in order to provide insights to manufacturers on the process, outcomes and implementation of guidance. **METHODS:** Information published on the NICE website was used to identify notified technologies, the proportion routed to the MTEP, and the subsequent NICE recommendations. **RESULTS:** Between January 2010 and December 2012, 102 technologies were notified to the MTEP. Of these notifications, 21 technologies were routed to MTEP and 15 were routed to the diagnostics assessment programme (DAP), giving a routing rate of 20% and 15%, respectively. Of the 21 technologies routed to MTEP, 13 technologies have had guidance issued: 10 (77%) had a positive recommendation and 3 (23%) were not recommended for use in the NHS. Whilst a positive recommendation for use is likely to encourage uptake, it is not guaranteed. Following a positive MTEP recommendation for CardioQ-oesophageal doppler monitor (ODM), the implementation levels were relatively low (31% increase in use). **CONCLUSIONS:** Many of the notified technologies are not selected at notification stage. However, once selected and routed to MTEP, most technologies receive some form of positive recommendation. Evidence on implementation levels following a positive recommendation by the NICE MTEP indicates that the implementation of guidance by the NHS may not always be optimal. The new NICE Health Technology Adoption Programme should help to improve implementation levels in the future. To ensure optimal implementation, manufacturers should consider developing tools to support the uptake of technologies alongside a NICE positive recommendation.

PHP182

NUMBER OF SUBMISSIONS NEEDED TO REACH A POSITIVE REIMBURSEMENT DECISION FROM SMC, CADTH, AND PBAC

Jaksa A, Ho YS, Daniel K

Context Matters, Inc., New York, NY, USA

OBJECTIVES: Often positive reimbursement decisions are only achieved after multiple submissions. Multiple submissions can delay patient access to necessary therapies and be costly for the manufacturer. This study analyzes the number of submissions needed to gain a positive decision and determines the lag time between the first submission and the positive decision. **METHODS:** The data covered three agencies: SMC, PBAC, and CADTH's Common Drug Review. The reviews spanned 23 disease conditions and included 396 Health Technology Assessments (HTAs). **RESULTS:** A positive decision was achieved after the first submission in 50% of the HTAs analyzed. At 1.57 submissions, PBAC had the highest average number of submissions needed to achieve a positive decision. PBAC's average was statistically higher than that of both CADTH and SMC ($p<0.001$). On average, CADTH and SMC needed 1.17 and 1.16 submissions, respectively, to obtain a positive decision. Also, for drugs that were resubmitted, it took on average 430, 924 and 1,189 days to gain a positive decision from SMC, CADTH, and PBAC. For CADTH and SMC, there appears to be a modest linear relationship between the number of resubmissions needed

to obtain a positive decision and the number of unique drugs reviewed within the disease condition (r= .46 and .41, respectively). This relationship was not observed for PBAC (r=0.01). **CONCLUSIONS:** PBAC required a greater number of submissions to gain a positive decision and the lag time to a positive decision is longer compared to SMC and CADTH. The number of submissions needed to gain a positive decision by CADTH and SMC were similar, but CADTH's lag time was double that of SMC. For both SMC and CADTH, the number of drugs reviewed in a disease condition was positively correlated with the number of times a drug had to be submitted in order to gain a positive decision.

PHP183

DRAFT VERSUS FINAL GUIDANCE IN NICE'S DRUG TECHNOLOGY APPRAISAL PROCESS

McGee MA[1], Izmirlieva M[2], Ando G[2]
[1]*IHS Global Insight, London, UK,* [2]*IHS, London, UK*

OBJECTIVES: The study sought to establish the pattern by which draft versus final technology appraisal's (TA) for drugs have been issued by UK's NICE. In particular, the study focused on variations between the draft versus final guidance, and the rationale for any changed recommendations during the appraisal process. **METHODS:** The current study is based on a review of NICE's 13 draft guidance and subsequent final guidance issued over the time period from November 2010 to mid June 2013. **RESULTS:** NICE issued five recommendations, four rejections and four recommendations subject to restriction, on drugs for use within the NHS in England and Wales. Four out of the five final recommendations had been overturned from an initial non- recommendation, to gaining a positive decision in final guidance. Meanwhile, all four final rejections corresponded to the recommendations made in its respective draft guidance. With one exception, all recommended drugs had an ICER below GBP30,000. None of the drugs rejected in the final guidance had a Patient Access Scheme offered. **CONCLUSIONS:** One-third of the 13 decisions were positive recommendations, a trend that is significantly lower than the average between 1 March 2000 to 31 May 2013, when 62% of TA's gained a positive final recommendation. Aside from clinical issues, the overriding rationale for the rejections were attributed to the high ICERs, coupled with the lack of PAS. This is compared to the case of, for example, ipilimumab, where a PAS offered in the final guidance lowered the ICER from GBP54,000 - GBP70,000 per QALY gained to GBP42,200 and essentially overturned NICEs initial non-recommendation. As seen in half of the initial rejections, NICE has overturned several decisions in favour of the manufacturer prior to final guidance.

PHP184

ACCEPTANCE OF SURROGATE ENDPOINTS BY HTA AGENCIES IN EUROPE

Es-Skali IJ, Nijhuis T
Quintiles, Hoofddorp, The Netherlands

OBJECTIVES: To compare how different European HTA agencies assess surrogate endpoints to demonstrate efficacy. **METHODS:** We identified 8 therapies with surrogate endpoints that were evaluated in the last 6 years by NICE and/or SMC (UK), HAS (France) and G-BA (Germany). The acceptability of the use of surrogate endpoints and any specific comments made by these agencies were analysed. **RESULTS:** Commonly used surrogate endpoints such as glycated haemoglobin (HbA1c) in diabetes, progression free survival (PFS) in oncology and forced expiratory volume (FEV1) for respiratory diseases have been generally accepted as sufficient evidence to gain reimbursement by HTA agencies. Especially when a surrogate endpoint has been accepted by EMA, it is usually considered a valid outcome measure. Less well-accepted were several surrogate cardiovascular endpoints such as 6 minute walk test, blood pressure and LDL cholesterol. For G-BA it is important that surrogate endpoints have been properly validated and are patient relevant but they did accept endpoints such as sustained virological response (SVR) for hepatitis treatments, FEV1 and body mass index (BMI) based on minor evidence. NICE and SMC also strongly value evidence to demonstrate the correlation between surrogate endpoints and clinical outcomes. Interestingly SMC has recently become more cautious in accepting widely established endpoints such as HbA1c. With regards to the HAS, they often did not comment on the use of surrogate endpoints at all in their published reports. **CONCLUSIONS:** The use of surrogate endpoints in the assessment of clinical benefit is still controversial; however, attempts are made to establish clearer regulations such as the recently published EUnetHTA guidelines regarding surrogate endpoints. In the absence of evidence on final patient-relevant clinical endpoints, several commonly used biomarkers and intermediate endpoints will be considered as valid surrogate endpoints by HTA agencies. Newer, less established surrogate endpoints will be more subject to strict validation requirements.

PHP185

A COMPARISON OF GERMAN BENEFIT ASSESSMENTS BY G-BA, IQWIG AND MANUFACTURERS

Eheberg D[1], Lebioda A[2], Hülsebeck M[2], Plantör S[2]
[1]*IMS Health, Munich, Germany,* [2]*IMS Health GmbH & Co. OHG, Munich, Germany*

OBJECTIVES: In the German HTA process (AMNOG) the choice of the patient-relevant endpoint, the appropriate comparator and the method of analysis are known to be decisive for the G-BA's resolution of an additional benefit. Therefore, we aimed to analyze differences between manufacturer's dossiers and G-BA / IQWiG assessments. **METHODS:** The analysis will take into account all completed AMNOG assessment procedures. We analyzed all G-BA resolutions in comparison to IQWiG assessments and the manufacturer. **RESULTS:** One major point of discrepancies occurred in the declaration of patient-relevant endpoints. By June 2013, 58 surrogate endpoints were declared by IQWiG and manufacturers mainly in the indications oncology, infectious diseases and diabetes. The G-BA clearly states that only valid patient relevant endpoints are to be considered. However, there remains uncertainty around the term "patient-relevant" and which criteria have to be met for the IQWiG to accept an endpoint as patient-relevant. To date, 54 comparisons were made in the dossiers to show an additional benefit of a new agent. The pharmaceutical manufacturer and the IQWiG often disagree when it comes to the choice of the method of analysis. Cases of disagreement between G-BA and IQWiG are rarer in this area. In the case of Belimumab, the manufacturer chose to demonstrate the additional benefit by showing the add-on effect of the agent on-top of the appropriate comparator and not against it. This resulted in diverging benefit assessment by IQWiG and G-BA. **CONCLUSIONS:** The analysis of the assessment for all new active agents shows disparities between the assessments of all parties involved. The AMNOG legislation has been in place for about two years and still, there are uncertainties in the choice of patient-relevant endpoints, comparators and method of analysis in the German benefit assessment process. Discussion is necessary to resolve diverging expectations about required methods and following assessments.

PHP186

THE IMPACT OF COST EFFECTIVENESS ON REIMBURSEMENT APPROVALS IN FRANCE: A COMPARISON OF FRANCE AND THE UNITED KINGDOM

Purchase JL[1], Nijhuis T[2]
[1]*Quintiles, Reading, UK,* [2]*Quintiles, Hoofddorp, The Netherlands*

OBJECTIVES: To estimate the potential impact of the new health economic assessment requirement on innovative products that came into law in October 2012 in France, by comparing the outcomes of recent Health Technology Assessments (HTA) in France (HAS) and the UK (NICE, SMC, AWMSG, JCVI). The hypothesis is that reimbursed products that achieved a high benefit score in France may have been rejected if the health economic case had to be demonstrated, as is required in the UK. **METHODS:** A search was conducted to identify all therapies evaluated by HAS which were given a significant, important or moderate therapeutic improvement score (ASMR I, II or III) between January 2010-June 2013. We then identified the assessments of the same product in the UK and compared the outcome of the assessment and the role of the economic evidence that was submitted. **RESULTS:** Thirty-six therapies rated an ASMR I-III by HAS were found. Out of these 36, 19 products had not (yet) been evaluated in the UK. For the remaining 17 that had been assessed by both countries, only one was not recommended by at least one of the UK agencies. NICE's primary reason for rejecting the said intervention was due to the 'clinical and cost effectiveness'. Similarly the SMC stated the economic case of the drug had 'not been demonstrated', and the long term clinical effect remains unknown. **CONCLUSIONS:** Initially, it doesn't appear that economic evaluations based on QALYs considerably influence the outcomes of HTAs. Only one assessment was rejected by both UK agencies based on economic grounds but was awarded an ASMR III. Since most products have been endorsed by the UK agencies, the French system's incorporation of health economics will not necessarily be an additional hurdle that cannot be overcome.

PHP187

WEB-BASED OF TOPIC SELECTION FOR COMPARATIVE EFFECTIVENESS RESEARCH IN KOREA

Kim HS, Lee DS, You JH
National Evidence-based Healthcare Collaborating Agency, Seoul, South Korea

OBJECTIVES: As the only health technology evaluation institution in Korea, National Evidence-based Healthcare Collaborating Agency has made efforts to establish the topic selection model of comparative effectiveness research which corresponds to Korean situations in order to revitalize it since 2012. **METHODS:** As a result of preparing thetopic selection process of the comparative effectiveness research according to these efforts and of conducting model operations in 2012, solution to access to the proposal process of research topics and a close examination of research methodologies was proposed as improvement point. **RESULTS:** Accordingly, web-based research topic proposal systems(www.necacer.re.kr) were designed in order to solve access to the proposal process of research topics and to increase transparency of the early stage of research in 2013. To make a close examination of the possibility of research performance in multidisciplinary fashion, evaluation systems of three stages were divided to operate but web-based design which is the same as topic proposal systems was done reflecting the evaluator's geographical access etc. Concretely, web-systems for topic proposal are composed of writing proposed research topic, writing proposed content of a topic, and confirming and submitting stages after writing basic information after login, and evaluative web systems were composed as follows: Step 1 is composed of quantitative evaluation based on 6 standards, step 2 qualitative evaluation based on 6 standards, and step 3 investigation process based on 4 standards in relation to research topics refined. **CONCLUSIONS:** It is conceived that Korean web-based topic selection systems of comparative effectiveness research prepared systematically taking Korean situation into consideration will be able to contribute to improving qualitative aspects of research and enhancing researchers' credibility by transparent opening the whole process of proposing, selecting and confirming topics.

PHP188

RELEVANCE OF INDIRECT COMPARISONS IN THE GERMAN EARLY BENEFIT ASSESSMENT (AMNOG)

Lebioda A[1], Gasche D[1], Dippel FW[2], Plantör S[1]
[1]*IMS Health GmbH & Co. OHG, Munich, Germany,* [2]*Universität Leipzig, Leipzig, Germany*

OBJECTIVES: Early benefit assessment in Germany under the AMNOG legislation requires a direct comparison with the appropriate comparator determined by the Federal Joint Committee (G-BA). In case no head-to-head studies are available, submission of indirect comparisons is permitted to assess the additional benefit of the new drug. The aim of this study was to comprehensively analyze the submissions of indirect comparisons reviewed so far by the Institute for Quality and Efficiency in Health Care (IQWiG) from January 2011 until May 2013. **METHODS:** A systematic review of all 48 published assessment reports was performed. **RESULTS:** There is a mismatch between the original intention of the early benefit assessment and its actual outcome. Until May 2013, 14 indirect comparisons have been conducted and submitted by manufacturers regarding the early benefit assessment. Only one indirect comparison has been accepted in a subindication by the IQWiG. However

the results did not cause an added value of the drug in this respective application. In seven cases the indirect comparison was declined due to a different comparator as determined by the G-BA. Three indirect comparisons were declined because of methodological deficiencies and another three indirect comparisons were declined because non-adjusted indirect comparisons were performed. **CONCLUSIONS:** The IQWiG only accepts adjusted indirect comparisons. The application of the correct methodology is necessary to gain valid results and shall not be questioned. The IQWiG approach is accurate with regard to contents and correct in a legal sense. However the procedure shows, that the external preconditions and methodological requirements are demanding and almost impossible to fulfill. Main reason for denial is the divergence from the prespecified appropriate comparator set by the G-BA. To get back to the original aim of the early benefit assessment, a more realistic and reasonable determination of the appropriate comparator would be desirable.

PHP189

THE ADOPTION OF HEALTH TECHNOLOGIES: A SURVEY OF BRAZILIAN POLICY MAKERS

Elias FTS[1], Souza KM[2], Silva MT[3], Willer ACDM[4], Gonçalves L[5]
[1]*Oswaldo Cruz Foundation MoH, Brasília, Brazil,* [2]*Brazilian MoH, Brasilia, Brazil,* [3]*Brazilian Ministry of Health, Brasília, DF, Brazil,* [4]*CNPq, Brasília, Brazil,* [5]*Brazilian Ministry of Health, Brasília-DF, Brazil*

OBJECTIVES: Policy makers of municipalities decided to adopt health technology into the Brazilian Public Health System (SUS). This group met during national conferences. The last conference, "The XXVIII National Congress of Municipal Health Secretariats (CONASEMS)", took place during June 11 to 14, 2012. The aim was describe the views of participants at the CONASEMS event regarding technology assessment criteria for the Brazilian Public Health System (SUS). **METHODS:** A survey applied at the Ministry of Health's exhibition booth, June 11 to 14, 2012. Three variables were studied for the survey: "Participant Profile", "Knowledge of Health Technology Assessment for Adoption by the SUS" and pre-selected criteria for assessing health technologies (where 1=most important and up to 9=least important) **RESULTS:** The survey encompassed 5.6% (244/4.328) of all conference participants. Of these, 43% represented policy makers; 35% health professionals and 22% others. Of the total amount of participants, 67% have little or average knowledge of HTA and 14% declared having no knowledge of the area. The values in the adoption of health technologies were ranked by delegates. The score of one was: evidence on patient safety, improved quality of life and patient survival, impact on the population's health. The score nine was: relationship between benefits and costs, health system costs and patient costs. **CONCLUSIONS:** Considering the results, the value related to criteria regarding quality of life and survival were the most important in detriment to cost criteria. It is important to involve the Brazilian Network for Health Technology Assessment (REBRATS) as an additional contribution to the application of the new Brazilian law regarding the incorporation of health technologies.

PHP190

ORPHAN DRUGS IN THE GERMAN EARLY BENEFIT ASSESSMENT– REAL WORLD VERSUS G-BA BUREAUCRACY

Lebioda A, Hülsebeck M, Plantör S
IMS Health GmbH & Co. OHG, Munich, Germany

OBJECTIVES: Early benefit assessment pursuant to AMNOG was introduced to cut costs and illustrate the additional benefit of new pharmaceuticals including orphan drugs at launch in Germany. In this process orphan drugs have a special status. The EMA orphan drug designation implies the assumption that at least a not-quantifiable additional benefit is set by law. However the extent of the additional benefit still has to be demonstrated by the manufacturer. **METHODS:** By June 2013 seven orphan drug dossiers have been submitted and assessed. Only one product has been admitted an important additional benefit. Four substances had a minor additional benefit and two substances had a not-quantifiable additional benefit. **RESULTS:** An additional benefit needs to be proven against a comparator. But the G-BA will not define an appropriate comparator as for non-orphan drugs. Instead, the assessment of orphan drugs is based on the pivotal trial; the comparator will be derived from this trial. Due to the early phase of pivotal trials in rare diseases, using a comparator is not common. Furthermore, phase II trials often do not meet requirements in terms of evidence level requested: randomized controlled trials with large patient populations are unusual in orphan diseases as well as investigation of valid patient relevant endpoints or validated surrogate endpoints. **CONCLUSIONS:** The G-BA requirements for HTA assessments are drawn from phase III trials and demonstration of an additional benefit over an appropriate comparator, which also serves as price benchmark. The requirements derived for all newly launched products do not reflect orphan drug reality, which is indication and not agent based. In summary the EMA declaration of early admission of orphan drugs in phase II conflicts with the G-BA's methodological requirements for the quantification of an additional benefit. In fact, manufacturers of orphan drugs face an additional barrier before launch in Germany.

HEALTH CARE USE & POLICY STUDIES – Population Health

PHP191

VARIATIONS IN THE HEALTH STATUS OF IRISH REGIONS

Kenneally M, Lynch B
University College Cork, Cork, Ireland

OBJECTIVES: This paper constructs a composite index that is sufficiently comprehensive to rank the overall health status of Irish regions and sufficiently detailed to identify the principal sources of varying regional health status. **METHODS:** We draw on the CSO (Central Statistics Office), PCRS (Primary Care Reimbursement Service) and IPH (Institute of Public Health) health and medicines databases to construct a composite index of the health status of the 8 HSE regions in Ireland in 2010. Our composite health index (CHI) has 6 component indices. Each maps the regional prevalence of major health conditions for which an ATC (Anatomical Therapeutic Classification) group of drugs was prescribed. Our composite health index, CHI, is a coverage-weighted average of the separate indices we construct for persons covered by each community drug scheme in each region. **RESULTS:** Respiratory health status varies most across Irish regions but Cardiovascular, Central Nervous System and 'Other' health conditions have higher CHI weights and contribute more to overall regional health disparities. The Midlands region had the poorest health status in 2010 (8% below the national average); the Eastern region had the best (6% above average), followed closely by the Mid-West. The Mid-West has a better health status than the Midlands despite having lower income and a larger elderly population share. The health status of the Eastern region is just 2% higher than the Mid-West even though its income is 6% higher and the percentage of its population aged over 65 is 1.8 percentage points lower. Simple economic and demographic variables - mean income and the elderly population share – correlate well with health status. **CONCLUSIONS:** Our index maps significant regional disparities and paves the way for complementary epidemiological studies to trace their underlying lifestyle and medical causes and inform regional health policy.

HEALTH CARE USE & POLICY STUDIES – Prescribing Behavior & Treatment Guidelines

PHP192

FEASIBILITY OF MEDICINES REVIEW TO REDUCE POTENTIALLY INAPPROPRIATE MEDICINES IN THE ELDERLY: THE OPTI-SCRIPT CLUSTER RANDOMIZED CONTROLLED TRIAL

Clyne B[1], Hughes C[2], Smith SM[1], Fahey T[1]
[1]*Royal College of Surgeons in Ireland, Dublin, Ireland,* [2]*Queens University Belfast, Belfast, UK*

OBJECTIVES: Potentially inappropriate medicines (PIMs) can result in increased morbidity, adverse drug events and hospitalizations. Polypharmacy is the strongest predictor of PIMs,the prevalence of which was 36% in 2007 in those aged ≥ 70 years , with an associated expenditure of over €45 million. Medicines review may have the potential to improve patient outcomes and reduce prescribing costs. This study aims to assess the feasibility of introducing medicines review to reduce PIMs in older patients. **METHODS:** OPTI-SCRIPT is a cluster randomized controlled trial (RCT), that aims to assess the effectiveness of a complex intervention incorporating academic detailing, a medicines review with web-based pharmaceutical treatment algorithms that provide recommended alternative treatments, and tailored patient information leaflets in reducing PIMs. A qualitative evaluation is being conducted to determine the feasibility and acceptability of the intervention. **RESULTS:** Twenty-one GP practices (response rate 32.3%) participated. Identifying patients with a PIM required considerable time and expertise. Practices screened all patients aged ≥ 70 years to identify those suitable to participate. A pharmacist reviewed their repeat medications, identifying patients with a PIM who were then invited to participate. Despite being offered a once off review of their current prescriptions with their GP, only 37.4% (196) agreed to participate. Preliminary qualitative findings indicate that intervention group GPs valued the review process as an opportunity to reflect on their prescribing practice. Some GPs highlighted that conducting routine structured reviews with older patients wouldn't be feasible due to the time, resources and funding available to them currently in primary care. Participating patients placed a high value on their medicines review. **CONCLUSIONS:** Preliminary findings illustrate that implementing a system of structured reivews for older patients with a PIM is challenging. However, participating GPs and older patients saw the value of conducting medicines reviews, but formal resourcing of such services would need to be considered.

PHP193

USE OF CLINICAL PRACTICE GUIDELINES BY PHYSICIANS IN JAPAN

Shimbo T[1], Suzuki T[1], Takahashi O[2], Tanaka Y[1]
[1]*National Center for Global Health and Medicine, Shinjuku-ku, Japan,* [2]*St.Lule Life Science Institute, Chuo-ku, Japan*

OBJECTIVES: The present study aimed to determine the proportion of physicians in Japan who use clinical practice guidelines, as well as factors influencing this choice. **METHODS:** We conducted an on-line cross-sectional survey throughout Japan on general internists, gastroenterologists, cardiologists, endocrinologists and general surgeons, including gastrointestinal or breast surgeons, who registered for marketing research. Questions addressed their usage of CPGs in practice, education, and research, as well as their attitudes toward CPGs. We then investigated associations between usage and characteristics of the respondents. **RESULTS:** We received responses from 1342 physicians, 1222 (91.1%) of whom were male (mean age (SD), 46.5 (9.6) years). The proportion of respondents who always or often use CPGs in several practice settings, such as when providing explanations to patients based on CPGs, ranged from 27.7% to 54.6%. Among them, 822 respondents (61.3%) applied 1 to 4 CPGs, and 381 (28.4%) applied 5 to 9. Usage differed according to age group, subspecialty, and workplace. After multivariate adjustment, the mean probability (95% confidence interval) of a high usage of CPGs when providing explanations to patients was 65% (60% - 71%) and 40% (30% - 50%) for those aged < 40 y and ≥ 60 y, respectively, 44% (38% - 50%) for general internists, 65% (59% - 71%) for surgeons, and 51% (46% - 57%) and 65% (58% - 72%) for those working in clinics and university hospitals, respectively. Attitudes towards the trustworthiness and convenience of CPGs were associated with usage, although this was unable to explain all differences in usage among subgroups. **CONCLUSIONS:** A substantial proportion of Japanese physicians use CPGs in clinical practice. Age, subspecialty, and workplace were independently associated with CPG usage. This should be considered during the process of CPG implementation.

PHP194

SYSTEMATIC REVIEW ON USE OF ECONOMIC EVIDENCE BY CLINICAL GUIDELINES

Aggarwal S, McGrane M, Topaloglu H
Novel Health Strategies, Bethesda, MD, USA

OBJECTIVES: The recent reforms and policy changes have increased the cost pressures on all health care stakeholders, including clinical experts. In the past, clini-

cal guidelines were developed independent of cost or economic considerations. However, increasingly, more clinical guidelines are mentioning cost concerns and referring to economic data in new recommendations. The objective of this study was to analyze trends in the use of health economic information for developing clinical guidelines. **METHODS:** To understand trends in use of health economic information we conducted targeted search for clinical guidelines, expert recommendations, and consensus statements with specific mention of "cost" or "economic" or related terms. A systematic literature search was undertaken for the databases Pubmed, Google Scholar and Cochrane. The guidelines published between 2003-2012 were included. For guidelines which met the search criteria, data was collected for the name of the authors, indication, year of publication, country/region, and context of use of cost/economic evidence. **RESULTS:** Sixteen clinical guidelines published between 2003-2012 met the inclusion criteria for specific mention of cost/economic evidence. More than 50% of these guidelines were published between 2006-2012. For indication, 3 out of 16 guidelines were for diabetes, while the rest were for different indications. In these 16 guidelines "cost effectiveness" was mentioned 14 times, either referencing cost-effectiveness data or to mention the importance of such data for selecting treatment options. The guidelines commonly cite high cost of disease or high economic burden as one of the considerations for developing new recommendations (11 out of 16). Another term that was commonly used by these guidelines was "cost-benefit," which was mentioned 5 times in these guidelines. Notably, QALY was rarely mentioned (1 out of 16 times) in these guidelines. **CONCLUSIONS:** This analysis suggests that some clinical experts groups are increasingly showing willingness to use and incorporate health economic information for developing new recommendations.

PHP195

REASONS GIVEN BY THE EUROPEAN MEDICINES AGENCY FOR REVISING DISEASE-SPECIFIC SCIENTIFIC GUIDELINES

Caron M, Acquadro C
Mapi Research Trust, Lyon, France

OBJECTIVES: To review all the reasons provided by the European Medicines Agency (EMA) to substantiate the need for revisions to or updates of disease-specific scientific guidelines developed by the Committee for Medicinal Products for Human Use (CHMP). **METHODS:** All the scientific guidelines issued by the CHMP were reviewed on the EMA's website. The guidelines not focusing on disease-specific issues were not selected, i.e., guidelines listed in the following sections: Clinical Pharmacology and pharmacokinetics, General, Herbal Medicinal products, Information on medicinal products, and Radiopharmaceutical and diagnostic agents. **RESULTS:** A total of 182 disease-specific scientific guidelines were reviewed. The review identified 21 concept papers developed with the intent of revision (11.5% of specific guidelines). The analysis of the concept papers revealed that four main reasons were claimed: 1) Clarifications needed for pediatric development [10 concept papers: acute heart failure, asthma, Crohn's disease, hepatitis C, hypertension, glucocorticoid-induced osteoporosis, irritable bowel syndrome (IBS), multiple sclerosis, pain, and ulcerative colitis); 2) Evolution in the field and treatments (n=9); 3) Clarifications on endpoints identification and measurement (n=7); and 4) Safety aspects (n=6). For instance, in asthma, one of the critical aspects to be discussed regarding endpoints was "*the need to reinforce the use of clinical measurements (symptoms) and patient-reported outcome measures to complement lung-function parameters*." In IBS, regulators asked that "An evaluation whether more clear recommendations as regards the use of certain scales or newly developed PROs can be made is also desirable." **CONCLUSIONS:** The main reason for the EMA to revise disease-specific guidelines is the need for providing guidance in pediatric issues. This is in line with the introduction of Pediatric Investigation Plans (PIPs) by the European Commission in January 2007 to help ensure that medicines for children are included in the mainstream drug development process in Europe.

REDUCTION IN FIXATION TIME AND RELATED SURGICAL STRESS WITH THE USE OF ETHICON SECURESTRAP™ OPEN ABSORBABLE STRAP FIXATION DEVICE IN THE DEPLOYMENT OF INTRA-PERITONEAL ONLAY MESH (IPOM) FOR OPEN VENTRAL HERNIA REPAIR

Roy S[1], Shnoda P[2], Savidge S[2], Hammond J[2], Panish J[1], Wilson M[3]
[1]*Johnson & Johnson Global Surgery Group, Somerville, NJ, USA,* [2]*Ethicon, Somerville, NJ, USA,* [3]*University of Exeter, Exeter, UK*

OBJECTIVES: This study compared fixation time using ETHICON SECURESTRAP™ Open device to suture fixation of IPOM mesh in ventral/ incisional hernia repair. It also assesses surgeon-reported levels of task load experienced during the two fixation approaches. **METHODS:** Nine surgeons inserted skirted mesh using IPOM technique on created incisional defects in live swine models. Each surgeon performed two suture (using their standard technique) and two ETHICON SECURESTRAP™ Open fixation procedures. The duration of fixation procedure starting from mesh preparation through the last firing or suture knot was recorded. Surgical workload was measured using the validated Surgery Task Load Index (SURG-TLX) questionnaire. Time savings and task load reduction were determined by the lower limit of the two-sided 95% confidence interval for the difference between suture fixation and ETHICON SECURESTRAP™ Open groups. **RESULTS:** A total of 38 IPOM fixation procedures were performed with equal numbers using suture and ETHICON SECURESTRAP™ Open. 89% reduction in mean fixation time was observed from suture to mechanical fixation with ETHICON SECURESTRAP™ Open [mean reduction: 34.9 minutes (SD: 17.9 minutes); p<0.0001]. Similarly, 55% reduction in perceived overall workload was observed with SECURESTRAP™ Open compared to suture fixation [mean reduction: 22.17 (SD: 15.12); p=0.0003]. ETHICON SECURESTRAP™ Open demonstrated significantly lower ratings in five of the six elements of surgical task load, namely – Mental Demand, Physical Demand, Situational Stress, Task Complexity, and Temporal Demand [p<0.05 for all] compared to suture fixation. **CONCLUSIONS:** Time for fixation and related surgical task load can be significantly reduced by using the ETHICON SECURESTRAP™ Open fixation device compared with suture fixation of IPOM mesh. This shows promise of reducing open IPOM procedure time which may realize related patient benefits of reduced anesthesia time, infection risks, costs etc. Also, reduction in surgical stress could potentially offer improvement in surgical performance – benefiting the surgeon, the patient and the health care system.

COST SAVINGS IN THE HUNGARIAN CARE MANAGING PROGRAMME

Ágoston I, Vajda R, Jankó-Király A, Lampek K, Boncz I
University of Pécs, Pécs, Hungary

OBJECTIVES: A pilot care managing programme was introduced in Hungary in 1999. The conceptual foundations of the Hungarian implementation of managed care is closer to what was called the GP fundholding in the UK than HMOs in the USA. The purpose of the study is to analyse the cost savings realized within the Hungarian care managing programme. **METHODS:** The data derive from the financial database of the Hungarian National Health Insurance Fund Administration (NHIFA) covering the period 1999-2007. We identified the annual cost savings realized by the Care Managing Organizations. The Hungarian CMOs was financed through a risk adjusted capitation fee and the health services covered by CMOs were defined in legal regulations. Cost saving was defined as the difference between the annual revenues (capitation fee) and expenditures (real utilization) of care managing organizations. **RESULTS:** During the study period the total number of persons covered by the care managing programme increased from 1.5 % of the Hungarian population to its peak of 19.4 % in 2005. The cost saving of the care managing programme was 63138000 Hungarian Forint (HUF) or 249756 Euro (EUR) in 1999; 457662600 HUF (1759945 EUR) in 2000, 1109442300 HUF (4322246 EUR) in 2001; 2710926900 HUF (11157503 EUR) in 2002; 1452041100 HUF (5727683 EUR) in 2003, 3799000306 HUF (15094804 EUR) in 2004; 3709400000 HUF (14954510 EUR) in 2005; 4964600000 HUF (18786048 EUR) in 2006 and 3669000000 HUF (14599437 EUR) in 2007. These amounts resulted in the following annual savings rate: 1999: 3.6%; 2000: 10.4%; 2001: 6.5%; 2002: 8.7%; 2003: 3.4%; 2004: 4.0%; 2005: 2.1%; 2006: 2.9% and 2007: 2.9%. **CONCLUSIONS:** With the development of the Hungarian care managing system, the average number of enrolees increased. Cost savings of Care Managing Organizations varied between 2.1-4.0 % during the mature period of this programme.

PHP199

SYSTEMATIC REVIEW ON THE IMPACTS OF STRICT PHARMACEUTICAL PRICE CONTROLS

Relakis J[1], Maniadakis N[1], Kourlaba G[2], Shen J[3], Holtorf AP[4]
[1]*National School of Public Health, Athens, Greece,* [2]*National and Kapodistrian University of Athens School of Medicine, Athens, Greece,* [3]*Abbott, Basel, Switzerland,* [4]*Health Outcomes Strategies LLC, Basel, Switzerland*

OBJECTIVES: To systematically review and synthesize published evidence on the impact of pharmaceutical price controls, such as price cuts, price caps, price freezes or international price referencing. **METHODS:** A literature search was conducted in Medline, Scopus, Econlit, Web of Science and ABI/INFORM to identify relevant studies published in English to March 2013. **RESULTS:** Forty-seven out of 3787 initial studies were included. Price caps and price reductions were most commonly studied in the literature, followed by reference pricing and price freezes. The evidence indicates that price controls reduce company profits and have a detrimental effect on pharmaceutical research and development, pipeline productivity and investment. They may also inhibit, reduce or delay new product launches, increase parallel exports and diminish availability of generics due to disincentives and, hence, may reduce product availability, increase withdrawals and shortages. In terms of public expenditure about half of the studies indicate realized savings, but the other half indicate no effect or even increases in expenditure. In terms of effects on patients, studies indicate in the short term welfare gains due to lower cost and better access, but also losses due to drug shortages and availability issues. Long-term effects appear to be welfare losses due to reductions of discoveries, resulting from the disinvestment associated with the lower revenues. **CONCLUSIONS:** Effects of price controls are ambiguous in the case of pharmaceuticals. Price controls reduce drug acquisition cost and increase access in the short run. On the other hand, they may decrease patient welfare and access as they can cause product shortages, withdrawals and launch delays. Moreover, they may reduce the likelihood for new product discoveries. Contrary to common beliefs, price controls not always reduce expenditure. Thus careful consideration is needed in designing drug price policies. Value based pricing approaches may be more effective alternatives compared to price cutting.

PHP200

GUIDANCE FOR PARTNERSHIP WORKING BETWEEN CATSALUT AND THE PHARMACEUTICAL INDUSTRY

Gilabert A, Espinosa C, Mora R, Santos J
Catalan Autonomous Region Health Service, Barcelona, Spain

OBJECTIVES: Relationships between National/Regional Health care Systems (NHS) and pharmaceutical companies can and should be based on a cooperative venture, built on the expertise of each side, that best meets clearly defined public needs through the appropiate allocation of resources, risks and rewards, while preserving transparency and its independence. However, joint working can be difficult to initiate due to the number of parties involved and the lack of clear shared objectives. Guidelines can be very useful to support the NHS/Pharmaceutical Partner's commitment. To our knowledge, there are no such published guidelines in Spain. This first guidance in Spain was designed with the main aim of identifying and simplifying the initiation, the start-up phase and the remainder of joint working projects between the Catalan Heath System (CatSalut) and pharmaceutical companies. **METHODS:** A flowchart was designed to describe the standard steps and timelines suggested to start, implement, monitor and evaluate a Joint Working pro-

ject, applicable to both single and multi-company projects. Any obligatory internal processes should be completed in tandem. **RESULTS:** Health outcomes studies, pharmacoeconomic evaluations, and risk sharing agreements for the access of new pharmaceuticals were identified as projects of high priority to implement in the following years. **CONCLUSIONS:** The steps outlined in this guidance, although not compulsory, will provide useful practical tips for how to go about setting up a Joint Working project in Catalonia (Spain), and to assist through the remainder of it. This guide is not a substitute for suitable regulatory or legal advice.

PHP201

MAPPING AND ANALYSING PHARMACEUTICAL POLICY SETTINGS WORLDWIDE

Maniadakis N[1], Kourlaba G[2], Shen J[3], Holtorf AP[4], Kalo Z[5]

[1]*National School of Public Health, Athens, Greece,* [2]*National and Kapodistrian University of Athens School of Medicine, Athens, Greece,* [3]*Abbott, Basel, Switzerland,* [4]*Health Outcomes Strategies LLC, Basel, Switzerland,* [5]*Syreon Research Institute, Budapest, Hungary*

OBJECTIVES: In the context of increasing demand and expenditure for health services it is important to elaborate policies which maximise efficiency. Pharmaceuticals account for about a fifth of total health care expenditure and are often target of health care efficiency policies. The aim of this study is to classify and grade pharmaceutical supply and demand control policies across the globe and cluster systems by regulatory rigidity. **METHODS:** Pharmaceutical policies and market data across 65 countries were researched in the literature with emphasis on pricing, reimbursement, dispensing, expenditure and demand control domains. Policies were classified by domains and graded through a multi-country expert survey for the degree of regulation. Cluster analysis helped to group countries by policy types. **RESULTS:** Pricing policies for on-patent products (with increasing degree of regulation) include: free pricing, direct negotiations, value-based-pricing, cost-plus-pricing, conditional-pricing, reference-pricing, state dictates and tenders. Cost control policies include: discounts, rebates, risk-sharing agreements, price-volume agreements, profit controls, pay-backs, claw-backs, margin cuts, price cuts, freezes, and tenders. Reimbursement policies include: variants of ATC5-based internal referencing, variants of statutory copayments, and variants of ATC4-based internal referencing. Dispensing policies were: no restrictions, indicative substitution, mandated or compulsory substitution. Demand controls include: educational campaigns, prescription aids, indicative prescription guidelines, indicative INN prescription, prescription monitoring, quotas, targets, predefined budgets, compulsory INN prescription, mandatory electronic prescription, compulsory prescription guidelines, prior/posterior approvals, sanctions and incentives for target/guidelines adherence. Cluster analysis identified a set of countries using an intermediate regulation policy approach and another with a more rigid approach. These did not differ significantly (p: 0.20) concerning pharmaceutical expenditure as % of GDP. **CONCLUSIONS:** A variety of policies were used in recent years for controlling pharmaceutical expenditures. Countries fall into two subsets based on the intensity of the regulation. More regulated systems do not appear to be associated with lower pharmaceutical expenditure.

PHP202

THE COST-EFFECTIVENESS OF PERIODIC SAFETY UPDATE REPORTS (PSURS) FOR BIOLOGICALS IN EUROPE

Bouvy J[1], Ebbers H[2], Schellekens H[2], Koopmanschap MA[3]

[1]*Erasmus University Rotterdam, Rotterdam, The Netherlands,* [2]*Utrecht University, Utrecht, The Netherlands,* [3]*Erasmus University, Rotterdam, The Netherlands*

OBJECTIVES: The safety profile of new drugs is usually not fully established upon market entry, giving cause for Europe's comprehensive pharmacovigilance system. A key regulatory vehicle to communicate the outcomes of pharmacovigilance activities is the Periodic Safety Update Report (PSUR), which summarizes a product's worldwide safety data and facilitates periodic assessment of its benefit-risk profile. We assessed the cost-effectiveness of all PSURs submitted in Europe during 1995-2009 for biologicals, using a societal perspective. **METHODS:** We evaluated two regulatory scenarios: Full Regulation (pharmacovigilance including PSURs) and Limited Regulation (pharmacovigilance without PSURs). We assessed the source of regulatory action for all urgent safety issues that were identified for biologicals during 1995-2009. In two out of 24 urgent safety issues (systemic spread of botulinum toxin and edema after use of dibotermin-alfa), PSURs were the regulatory instrument that identified the safety issue and we assumed these issues would have been discovered five years later under limited regulation. Estimates from the literature and Markov-chain life tables were used to calculate costs and effects of PSURs for biologicals. **RESULTS:** The incremental cost-effectiveness ratio (ICER) of Full Regulation versus Limited Regulation was €342,110 per quality-adjusted life year gained. Extensive sensitivity analyses indicated a low probability of the Full Regulation scenario being cost-effective. Only two parameters resulted in a more favorable ICER: a 100% risk reduction after identification of the urgent safety issues (base-case assumption was 25%) and a high risk (1 in 1,000 patients) of severe systemic spread after therapeutic use of botulinum toxin (base-case assumption 1 in 10,000 patients). **CONCLUSIONS:** Regulatory cost-effectiveness analysis is a feasible instrument for assessing the (added) value of parts of the drug regulatory framework. In light of high costs of regulatory compliance, cost-effectiveness should be a consideration in deciding whether or not safety-related regulatory actions are required.

PHP203

UTILIZATION OF THE HUNGARIAN PUBLICLY FINANCED HEALTH CARE SYSTEM BY THIRD (NON EU) COUNTRY CITIZENS

Kovács G[1], Boncz I[2], Gyeney L[3]

[1]*Széchenyi István University, Győr, Hungary,* [2]*University of Pécs, Pécs, Hungary,* [3]*Pázmány Péter Catholic University, Budapest, Hungary*

OBJECTIVES: The number of citizens from third countries (outside of European Union or stateless) permanently living in Hungary is 205 000, and annually ca. 23000 people get permit to settle. Current study aims at exploring what group of foreigners, when and for what type of service use publicly financed health care. **METHODS:** Data was retrieved from National Health Insurance Fund Administration of Hungary (*NHIFA*) and Central Statistical Office. Current study's base was processing the last five years' statistical data (2007-2012), concerning health care of third country citizens permanently living in Hungary. We analyzed the volume, place and medical specialty of these services. **RESULTS:** In the last 5 years third country citizens required inpatient care 9414 times (61% in Budapest), emergency care 11776 times (63% in Budapest), out-patient care 72306 times (57% in Budapest). Patient accessed health care providers due to medical problems in the following medical fields: obstetrics (19%), surgery (18%), laboratory (18%), pediatrics (7%), and ophthalmology (6%). Most of the patients are from Ukraine (42 %), China (22 %), Vietnam (11 %), ex-Yugoslavia (6 %) and Russia (6 %). Analysis by nationalities shows that Chinese population requires health care relatively few times (for instance, 2011: 5%, in 2012: 6%) and even these are almost exclusively done in Budapest. In contrast USA citizens see doctors relatively often (2011: 8%, 2012: 8%), mainly in relation to diagnostics and curative surgery. From the neighboring non-EU states (23095 people, 31%) Ukrainian and (5709 people, 7%) ex-Yugoslavian citizens needed health care in the investigated period. Despite previous expectations, need for health care is not the characteristics of border regions but the capital city. **CONCLUSIONS:** Utilization of the Hungarian publicly financed health care system is significant by third country citizens. When planning health care capacity, this crucial fact must be taken into consideration.

PHP204

PHARMACEUTICAL REGULATION IN EUROPE AND ITS IMPACT ON CORPORATE R&D

Mahlich J[1], Eger S[2]

[1]*University of Vienna, Vienna, Austria,* [2]*Medical University of Vienna, Vienna, Austria*

OBJECTIVES: Many European countries regulate drug prices in order to cope with rising health expenditures. On the other hand, price regulation distorts incentives to invest in pharmaceutical R&D. This study aims at empirically assessing the impact of price regulation on pharmaceutical R&D expenditures. **METHODS:** We analyze a sample of 20 leading pharmaceutical companies between 2000 and 2008. The share of sales in Europe serves as a proxy for the degree of price regulation. We control for other determinants of R&D such as cash flow, company size, leverage ratio, growth rate, and Tobin's q. **RESULTS:** Our results suggest a nonlinear relationship between European sales ratio and R&D intensity. Beyond a threshold of 33% of sales generated in Europe, a higher presence in Europe is associated with lower R&D investments. **CONCLUSIONS:** Price regulation has a negative impact on pharmaceutical R&D investments. Policy makers must take long term effects of regulation into account.

PHP205

ELICITING THE RELATIVE IMPORTANCE OF KEY ELEMENTS FOR BENEFIT-RISK ASSESSMENT: A COMPARISON AMONG GENERAL POPULATION, HEALTH AUTHORITY AND MEDICAL DOCTORS

Ha JH[1], Na HS[1], Chung MW[1], Byun JH[2], Kwon SH[2], Park EJ[3], Lee EK[2]

[1]*Ministry of Food and Drug Safety, Chungcheongbuk-do, South Korea,* [2]*Sungkyunkwan University, Suwon, South Korea,* [3]*Korea Institute for Health and Social Affairs, Seoul, South Korea*

OBJECTIVES: This research was designed to find out the key attribute for benefit-risk assessment using swing weight method in general population, health authority and hospital doctors. **METHODS:** We selected six important elements for each benefit and risk assessment based on previous study. The elements of benefit assessment consisted of disease severity, size of population affected by disease, clinical guidelines recommendation, comparative interventions limitation, improvement of efficacy/effectiveness, improvement of quality of life. The attributes of risk assessment contained overall incidence of adverse events, overall incidence of serious adverse events, discontinuation rate due to adverse events, drug or food interactions, drugs of potential misuse, risk management. 583 subjects constituted 3 groups (general population, health authority and hospital doctors) were selected across the country by quota sampling method and performed survey to evaluate preference of each elements with the swing methods repeatedly. The trained interviewers assisted participant successfully completed survey. **RESULTS:** Improvement of efficacy/effectiveness and overall incidence of serious adverse events were revealed as the most important attributes than others for benefit- risk assessment in all three groups. Health authority group outweighed the improvement of efficacy/effectiveness [Mean (±SD): 0.208(±0.04)] and overall incidence of serious adverse events [Mean (±SD): 0.220(±0.05)], while 0.204(±0.03), 0.216(±0.04) in doctor group and 0.197(±0.04), 0.185(±0.04) in general population respectively. In six benefit attributes, the lowest preference score was clinical guidelines recommendation [0.114(±0.04)] in health authority group and [0.144(±0.04)] in general population while size of population affected by disease [0.126(±0.04)] in hospital doctor group. Among six risk elements, the lowest preference was drugs of potential misuse showed in health authority [0.117(±0.04)] and in hospital doctors [0.121(±0.04)] while risk management [0.121(±0.04)] in general population. **CONCLUSIONS:** This shows that improvement of efficacy/effectiveness among benefit attributes and overall incidence of serious adverse events among risk attributes are key elements for benefit-risk assessment.

PHP206

COVERAGE WITH EVIDENCE DEVELOPMENT IN SWEDEN – FORMALITY OR EFFECTIVE WAY TO REDUCE UNCERTAINTY?

Kornfeld A[1], Schroeder M[2], Toumi M[3]

[1]*Creativ-Ceutical, Paris, France,* [2]*Creativ-Ceutical, Copenhagen, Denmark,* [3]*University Claude Bernard Lyon 1, Lyon, France*

OBJECTIVES: TLV (formerly LFN) is responsible for reimbursement decisions in Sweden. They regularly give temporary reimbursement with request for additional

data: Coverage with Evidence Development (CED). The objective of this study was to review the outcomes of the CEDs granted by TLV during the years 2005 to 2012, and to appreciate if it is an effective way to manage uncertainty. **METHODS:** All decisions published from January 2005 to December 2012 on the TLV website were screened. All decisions that included a CED were reviewed and the information on the initial decision for a CED and the final decision based on the evidence developed were extracted in a standardized way. The information was then analyzed. **RESULTS:** During the period TLV issued 38 decisions with a CED, 4 in 2012, 5 in 2011, 11 in 2010, 3 in 2009, 2in 2008, 8 in 2007, 5 in 2006 and none in 2005. For 10 CEDs issued 2010 to 2012 the time for evaluation had to yet been reached. For 12 CED decision taken from 2006 to 2010 the time for evaluation was reached but no decision had been taken and the products continue to be reimbursed according to the conditions in the temporary reimbursement decision. 7 products were granted general reimbursement and 9 limited reimbursement based on the evaluation of the evidence. No product was rejected reimbursement. **CONCLUSIONS:** Although it is early to draw any final conclusions, a significant number of CED decisions were not followed up with a final decision, which leads to continued reimbursement. The risk of de-reimbursement based on a CED seems minimal in Sweden. Therefore it is unclear if CED will actually contribute to manage uncertainty in Sweden.

PHP207

VARIANCES IN INDIVIDUALS' PRESCRIPTION DRUG COSTS IN IRELAND

Walshe V[1], Kenneally M[2], Buckley G[2]
[1]*Health Service Executive, Cork, Ireland,* [2]*University College Cork, Cork, Ireland*

OBJECTIVES: To assess the average individual's drug costs prescribed under the main community drug scheme in Ireland over time, by age cohort and by geographical region. It also examined regional costs having standardized for age and sex. **METHODS:** The 2002 to 2012 average pharmacy payment per eligible person, number of items prescribed per person and the average cost per item prescribed were calculated. The most recent average individual cost of medicines was examined for each of the 4 health regions and 32 sub-regions by 22 age and sex cohorts. Regional age and sex adjustments were made by applying the scheme's national age and sex weights to each region's costs. This produced regional cost estimates independent of age and sex variations. **RESULTS:** Community drug expenditure has undergone substantial growth in the past 10 years with costs more than doubling and the number of persons covered by the main scheme increasing by nearly 60%. Nationally an individual's average cost of medicines was €713 in 2011, varying from €670 (-6%) in HSE-West to €762 (+7%) in HSE-South. Sub-regional LHO (local health office) cost variances were significantly greater ranging from €200 to €1,200. Average cost increases with age and for persons over 75 was nearly 4 times those aged 35 to 44 (€1,689 versus €446). Removing the impact of age and sex increases cost variances marginally overall, restraining some regions costs and promoting others. **CONCLUSIONS:** Individuals' prescription drug costs vary significantly by age and sex however regional cost differences are not explained by variances in age and sex and may be a result of other factors such as prevalence of chronic health conditions and GP prescribing patterns.

PHP208

ANALYSIS AND CLASSIFICATION OF RISK-SHARING SCHEMES PROPOSED IN REIMBURSEMENT APPLICATION RECEIVED BY AHTAPOL IN 2012

Zawodnik S[1], Iwanczuk T[1], Hermanowski T[2], Matusewicz W[3]
[1]*Agency for Health Technology Assessment in Poland, Warsaw, Poland,* [2]*Department of Pharmacoeconomics, Medical University of Warsaw, Warsaw, Poland,* [3]*Agency for Health Technology Assessment in Poland (AOTM), Warsaw, Poland*

OBJECTIVES: To analyze and classify the Risk-Sharing Schemes (RSSs) proposed in reimbursement applications received by Agency for Health Technology Assessment in Poland (AHTAPol) in 2012. **METHODS:** Risk-Sharing Schemes proposed in reimbursement applications received by AHTAPol in 2012 were quantitatively and qualitatively analyzed. The classification of the RSSs was also conducted based on both Carlson's approach and the Polish Act on Reimbursement of medicinal products. **RESULTS:** In the studied period, 52 reimbursement applications with 26 proposed RSSs were received by AHTAPol. They were classified into 5 categories according to the Act on Reimbursement. The most common category was making the official sales price dependent on the applicant providing supplies at a reduced price, as specified in the negotiations on the price of the medicine (34.61%). Further categories were: making the official sales price dependent ona pay-back of a part of the reimbursement obtained to the entity which is obliged to finance benefits with public funds (23.08%), making the official sales price dependent on the level of turnover of the medicine (11.54%) and making the level of the applicant's revenues dependent on the health effects achieved (3.85%). RSSs classified as others constituted 26.92% of all. Among 26 proposed RSSs only 8 of them could be classified according to the Carlson's approach (1 proposition included more than one category). As a results, 4 Price Volume Agreements, 4 Manufacturer Funded Treatment Initiation and 1 Conditional Treatment Continuationwere identified. **CONCLUSIONS:** Most of the propositions should not be considered as RSS according to the Carlson's approach. The most common propositions were related to medicinal product's price reduction and did not include any risk sharing. There is a strong need for further research.

PHP209

RISK SHARING FOR INNOVATIVE PHARMACEUTICALS WITHIN SOCIAL HEALTH INSURANCE: EXPERIENCES FROM CHINA

Chen W[1], Zhang L[1], Fan W[2]
[1]*Fudan University, Shanghai, China,* [2]*School of Public Health, Fudan University, Shanghai, China*

OBJECTIVES: To understand current risk sharing scheme landscape for innovative pharmaceuticals in some typical provinces and cities of China. **METHODS:** Risk sharing schemes for pharmaceuticals in four provinces (Guangdong, Zhejiang, Jiangsu and Sichuan) and three cities (Guangzhou, Hangzhou and Chengdu) were systematically collected through visiting social health insurance bureau websites, literature review and key informant interview. Case study and comparison analysis were conducted among these schemes. **RESULTS:** Two kinds of risk sharing schemes, performance based scheme and financial based scheme, were employed in sampling provinces and cities, with the latter model more often implemented. Performance based scheme has only been developed in one city (Guangzhou) for a non-small-cell lung cancer drug. Patients eligible for inclusion criteria and treated in one of three designated hospitals could be qualified to reimburse for more than one year treatment if they were responsive to the drug. Other provinces and cities has adopted the financial based scheme, mainly focusing on increasing patients access to expensive drugs, usually for breast cancer, leukemia and non-small-cell lung cancer and not covered by health insurance schemes. For instance, local health insurance fund of Zhejiang and Jiangsu province would only reimburse patients' five to six months treatment and pharmaceutical company should sponsor patients' treatment for the next six months. Besides, cities like Qingdao and Chengdu implemented the price volume scheme for special drugs and medical materials in order to control fund expenditure. **CONCLUSIONS:** By risk sharing scheme, some innovative drugs, previously not covered by social health insurance, can be reimbursed, which will increase patients' access, reduce patients economic burden, and help expending pharmaceutical companies' market share. However, as risk sharing scheme in China has only been adopted for only one or two years, long-term impact still needs to be observed and evaluated.

PHP210

SQUARING THE CIRCLE: INNOVATIVE CONTRACTING TO ACHIEVE MARKET ACCESS FOR INNOVATIVE PRODUCTS

Street-Docherty LM, Morrison S
GfK Bridgehead, Melton Mowbray, UK

In an increasingly resource-constrained environment, a variety of innovative contracting arrangements exist, representing an alternative to conventional pricing and reimbursement agreements between payer and manufacturer. There are various tools and resources that may influence funding with which payers and prescribers would welcome support from manufacturers. **OBJECTIVES:** To gain an overview of contractual agreements currently used within the pharmaceutical sector and to uncover how innovative contracting has, and continues to, evolve. **METHODS:** Secondary research was conducted to identify examples of innovative contracting, highlighting elements that work and associated hurdles, in order to understand issues relating to transparency and implementation. **RESULTS:** Sixteen markets worldwide embrace innovative schemes with a further 5 markets beginning to show uptake. In the past, agreements were predominantly performance-based. However, companies are increasingly moving towards financial schemes such as product bundling, confidential discounts and fixed price treatments. The most common elements of risk-sharing agreements are price volume agreements (39%), requirement for data collection (29.5%), and access limited only to eligible patients (13.1%). Innovative contracts are predominantly used for drugs that relate to high cost or high performance with oncology being the therapeutic area that dominates these agreements. **CONCLUSIONS:** Innovative contracting schemes can aid manufacturers with market access, help to maintain price and increase usage. However, the current design of many agreements is suboptimal, and there are hurdles which need to be overcome. It is important that there is a balance between risk and incentive for all stakeholders, and this balance between the benefits and cost implications must be carefully considered.

HEALTH CARE USE & POLICY STUDIES – Conceptual Papers

THE HEALTH OF HEALTH TECHNOLOGY ASSESSMENT IN IRELAND: FIVE POINTS FOR IMPROVEMENT

O'Mahony J[1], O'Neill C[2]
[1]*Trinity College Dublin, Dublin, Ireland,* [2]*National University of Ireland Galway, Galway City, Ireland*

This study critically appraises the contribution of cost-effectiveness analysis (CEA) in improving the rational allocation of health care resources in Ireland. While Ireland has successfully established some of the institutional infrastructure for CEA, there remain key areas for improvement: 1) Ireland has an explicit cost-effectiveness threshold of €45,000/QALY. It resulted from negotiations between the pharmaceutical industry and the public health service and only applies to pharmaceutical interventions. If Ireland is to use a threshold, it would be better served by an empirically determined threshold that applies to all interventions. 2) The threshold has recently been exceeded by a number of expensive drugs, in some cases by a very large margin. Conversely, despite being highly cost-effective, colorectal screening remains unimplemented due to a failure to allocate resources. In the absence of clarity around these decisions, the allocations appear to indicate that considerations of budget impact are dominating rather than complementing those of cost-effectiveness. 3) Recent CEAs by Ireland's statutory health technology assessment authority, the Health Information and Quality Authority (HIQA), appear to confuse average cost-effectiveness ratios with incremental cost-effectiveness ratios (ICERs). Clarity around the interpretation of cost-effectiveness evidence is required to instil confidence in the process. 4) Ireland has an established CEA process to appraise new drugs. However, this process has been bypassed in recent cases, as some costly cancer drugs have been approved before being subject to CEA, despite recommendations that these drugs be assessed. Consistency in approach is required to instil confidence in the process. (5) Greater transparency around reimbursement decisions would be desirable, whereby the relevant bodies issue documentation explaining their decisions and deliberations. In conclusion, CEA could make a greater contribution to rational resource allocation in Ireland if more rigorous and consistent decision rules were applied. Greater accountability of the decision making process should further that goal.

[1]*IMIM (Hospital del Mar Medical Research Institute; Red de Investigación en Servicios de Salud en Enfermedades Crónicas (REDISSEC), Barcelona, Spain,* [2]*IMIM (Hospital del Mar Medical Research Institute), Barcelona, Spain,* [3]*Institut d'Investigacions Biomèdiques August Pi i Sunyer (IDIBAPS), Hospital Clínic, Barcelona, Spain,* [4]*Institut Català d'Oncologia (ICO), Institut d'Investigació Biomèdica de Bellvitge (IDIBELL), L'Hospitalet de Llobregat, Spain,* [5]*Biomedical Research Institute of Lleida (IRBLLEIDA), University of Lleida. Red de Investigación en Servicios de Salud en Enfermedades Crónicas (REDISSEC), Lleida, Spain*

BACKGROUND: Colorectal cancer (CRC) screening in Spain uses a fecal-occult blood test (FOBT) for screening and colonoscopy as diagnostic tool. Adenomas constitute the most frequent findings of this colonoscopy, and the removal of these premalignant lesions is considered the main contributor to the reduction of mortality and incidence of CRC. There is no clear agreement regarding the risk classification of adenomas as well as the optimal surveillance strategy for each degree of risk. Genomics may contribute to further delineate individual risk, and its characterization is crucial for improving the effectiveness of surveillance strategies by targeting individuals who would benefit the most. **OBJECTIVE:** To optimize, within a CRC screening program, surveillance of premalignant lesions using individual risk-based strategies, based on genetic analysis, that take into account benefits, harms and costs. **METHODS:** A discrete-event simulation model that reproduces the process of screening and takes into account the costs at every stage, from invitation to screening to surveillance of findings will be upgraded. The natural history of the disease will be included, with special emphasis on the events after adenoma detection at screening colonoscopy. Based on the results of a study aimed at identifying common genetic variants associated with an increased susceptibility to develop colorectal adenomas, the risk of developing cancer or recurrent adenomas according to the clinical characteristics of the patients will be included in the model. The interval between surveillance colonoscopies will be optimized with the objective of minimizing the number of colonoscopies while keeping the same level of effectiveness, defined as the impact on incidence of advanced adenomas and cancer over time. IMPLICATIONS: Simulation models can help in the design of personalized screening strategies. Personalizing CRC screening through surveillance strategies may improve allocation of resources under cost constraints, minimize harms and maximize benefits of population-based programs, affecting millions of people.

PHP213

FIXED REFERENCE PRICING OR BENEFIT ASSESSMENT OF ESTABLISHED PRODUCTS – FROM THE FRYING PAN INTO THE FIRE?

Vosgerau S[1], Eheberg D[2], Plantör S[1], Lebioda A[1]

[1]*IMS Health GmbH & Co. OHG, Munich, Germany,* [2]*IMS Health, Munich, Germany*

For nearly 25 years, the most effective tool for containing public spending on pharmaceutical drugs in Germany is the formation of fixed reference price groups (FRPG) - the annual savings have continuously risen from 0.31 billion Euros in 1990 to 4.32 billion Euros in 2009. Hereunder, the so-called "jumbo groups" (patent-free and patented substances) that were introduced with the SHI Modernization Act of 2004 have been of high importance. With the recently published, first-time call for benefit assessments of substances in the established market (April 2013), the Federal Joint Committee (FJC) has yet launched another potent mean of reducing costs. Unlike the early benefit assessment of new active ingredients where several substances have undergone scrutiny since January 2011, it is unclear what the outlook is for the substances in the established market. Therefore, the objective of the presentation is to assess whether a FRPG or a benefit assessment is to be preferred by pharmaceutical companies for established substances. Fixed reference price scenarios are calculated for therapeutically comparable substance classes within the call for benefit assessment of substances in the established German drug market. For the established substances, a risk assessment and benchmark is performed based on the criteria in the code of procedure of the FJC and the assessment of new active ingredients, respectively. The results of the ongoing FRPG scenario evaluation will be displayed as bar charts by savings in €. The risk assessment is displayed in a tabular format. Apart from discussing the results of the FRPG calculations compared to the benefit assessment of established substances, the presentation discusses implications for international reference pricing, since the German market has been regarded as the last bastion of free pharmaceutical pricing for a long time.

HTA NATIONAL PUBLIC POLICY AND THEIR SOCIO-ECONOMIC ENVIRONMENT: A EUROPEAN PERSPECTIVE

Benoit C[1], Gorry P[2]

[1]*Sciences Po Bordeaux, Pessac, France,* [2]*Université Montesquieu - Bordeaux IV, Pessac, France*

OBJECTIVES: Socioeconomic factors are important components of Health Technology Assessment's (HTA) institutionalization. If most of the countries have established HTA agencies, they required scientific expertise to emerge and become institutionalized. In a previous scientometric work, we did an analysis of scientific conditions of HTA emergence in the scientific literature. Our observation allowed us to link HTA research capacity and HTA institutionalization in a given country. **METHODS:** In order to explore endogenous as well exogenous factors sustaining HTA expertise, we undertake a principal component analysis as multivariate analysis technique in order to establish which variable are more appropriate for the assessment of scientific expertise in the context of HTA public policy. **RESULTS:** HTA national public policy could be ranked according to their academic expertise. Country HTA publications productivity matched in comparison with health expenses & gross product in several countries. Nevertheless this ranking doesn't tell us why some country like UK perform well while others like France don't. **CONCLUSIONS:** Our results underline the country difference of arbitration between public policies such as public health, and industrial or innovation policy. Among tested variables, it appears that the regulation of drug pricing and market access, or the macroeconomic impact of pharmaceutical industry in a country contribute to determine the scope of HTA policies.

PHP215

CLINICAL, EPIDEMIOLOGICAL AND ECONOMIC METRICS DIFFERENCE BETWEEN HPV-RELATED AND TRADITIONAL HEAD AND NECK CANCERS

Coughlan D

NUI Galway, Galway, Ireland

Excessive smoking and alcohol consumption were the traditional causal factors in many head and neck cancers in the United States and Western Europe. However, the Human papilloma Virsus (HPV) is now responsible for up to 80% of cancers of the oropharynx. HPV-related oropharyngeal cancers are a distinct clinical, epidemiological and molecular entity. This poster will show that the metrics used to describe the burden of a cancer to policy makers are very nuanced. As the patients with HPV-associated oropharyngeal cancers are younger and healthier individuals, they have been shown to have a better prognosis than traditional head and neck cancers. The goal of treatment has shifted from mortality to morbidity in these cancers. Measures of morbidity (functional status) are now important considerations in treatment options. This poster will compare and contrast various epidemiological measures - Incidence /100,000, Prevalence, Years of Life Lost, Mortality to Incidence Ratio with respect to HPV-related and unrelated head and neck cancers. Finally, we will discuss the economic metrics (e.g. Disability adjusted life years, Years of working age lost) used to portray a cancer and make a link with research funding in various countries. The question posed is whether mortality or morbidity should predominate in resource/research allocation decisions?

PHP216

COMPARING THE VALUE OF DIFFERENT HTA DECISION MAKING PROCESS: EVALUATING THE EVALUATORS

Johannesen KM[1], Claxton K[1], Sculpher MJ[1], Wailoo AJ[2]

[1]*University of York, York, UK,* [2]*University of Sheffield, Sheffield, UK*

OBJECTIVES: How health care decision makers arrange their appraisal process of new health care technologies have direct impact on population health. However, no consensus exists on how the appraisal process should be designed to maximise population health or societal welfare. The purpose of this work is to develop a simple analytic framework that enables analysis of the different stakeholders' (decision makers and manufacturers) payoffs from alternative appraisal processes. **METHODS:** The analytic framework outlined in the paper is based on viewing the appraisal processes as a diagnostic test aimed at identifying cost-effective (true positives) and cost-ineffective (true negative) technologies. Based on this characterisation pay-off functions are formalised to analyse how design and operation of the appraisal process impacts population health and manufacturers' earnings. **RESULTS:** The framework identifies those factors that have the greatest influence on population health and manufactures payoffs and illustrates how this leads to conflicting interests towards how the appraisal process should be set up and operated. It is demonstrated that there is no uniquely optimal way to design and operate the appraisal of new health care technologies, since optimal design and operation depends on the price of technologies that undergo appraisal. The analysis also shows that operating a given reimbursement system implies a trade-off between incentivising cost-effective pricing (pricing below the threshold/willingness to pay) and rejecting more cost-effective technologies (increasing the proportion of false negatives). It is further demonstrated how the framework can be used to gain insight into current policy questions including who should bear the burden of proof and how rigorous the process should be. **CONCLUSIONS:** There is no unique way to design and operate the appraisal of health care technologies in order to maximise population health or societal welfare. Improving health or societal welfare through the appraisal process requires careful consideration of payoffs and incentives of all stakeholders.

PHP217

THE FRAMEWORK FOR HEALTH ECONOMIC MODELING AND MULTI-CRITERIA DECISION ANALYSIS (MCDA) ON THE EXAMPLE OF THE MOBILE STROKE UNIT (MSU)

Wahlster P, Niederländer CS, Kriza C, Kolominsky-Rabas PL

Centre for Health Technology Assessment (HTA) and Public Health (IZPH), University of Erlangen-Nuremberg, Erlangen, Germany

OBJECTIVES: The generation of evidence in the early development of a technology is a bottle neck for uncertainty in decision making. Health economic modeling can support the assessment of early innovation, but complex modeling approaches are criticized for being "black boxes" which in turn reduce their acceptance in health policy. **METHODS:** MCDA can address the gap about what matters to health care decision makers and data collection by explicitly structuring decision criteria. The combination of MCDA modeling and health economic modeling implies a potential for gaining efficiency. The simulation model of the intervention for stroke, the MSU, is analyzed regarding application of MCDA. **RESULTS:** Experts and stakeholders can support the: 1) Definition of model factors e.g. outcome parameter, which is generally accepted (Barthel-Index for Stroke outcome); 2) Evidence collection e.g. is the data valid? (outcome of thrombolysis); 3) Model structure e.g. interrelation between input parameters (stroke incidence, risk factors and population); 4) Validation of a model e.g. reassessment of step 1-3; and 5) Final analysis by using MCDA e.g. importance of economic vs. medical benefit. **CONCLUSIONS:** The methodological combination is advantageous because simulation modeling as well as MCDA have a similar sequence of events. The simulation output, which is commonly validated by technical and medical experts, can gain validity by the heterogeneous perspectives of participating stakeholders in the validation process. For example, this raises

questions about priority and importance of certain outcome parameters like the thrombolysis rates vs. the independence of patients after 3 months. Finally, the combination of MCDA and simulation modeling contributes to a transparent analytic process and results in a more complex understanding of the technology.

PHP218

MECHANISM OF COORDINATED ACCESS TO ORPHAN DRUGS

DeRidder H, Arickx F, Adriaens C, Quanten A, Mortier M, Kleinermans D
NIHDI, Brussels, Belgium

Although the EU Council stated that *"All health systems in the EU aim to make provision, which is patient-centered and responsive to individual need"*, unacceptable differences in access to orphan medicinal products (OMP) in the Member States of the European Union are identified. In the context of the 2010 Belgian EU presidency initiative on 'Innovation and Solidarity' and within the framework of the process on corporate responsibility in the field of pharmaceuticals, EU Commissioner Tajani therefore launched the project Mechanism of Coordinated Access to OMP.**OBJECTIVES:** Designing a operational mechanism of coordinated access to OMP for patients, stakeholders and Member States to provide, irrespective of the local conditions, access for patients with unmet medical needs and for whom these solutions would otherwise be out of reach – in an affordable and sustainable way ("real life access"). **METHODS:** The project is managed by Belgium (NIHDI), supported by the European Commission and Eminet. Thirteen Member States participated, with the stakeholders (AIM, EPF, ESIP, Eurordis, CPME, EFPIA, EGA, EuropaBio, GIRP). Three Workpackages cover the different aspects of granting effective access to medicines: Identifying and assessing a relevant orphan drug (assessment/evaluation) - Selection of target population and mechanisms of funding (structural access) - Treatment (individual access). Feasibility at present and opportunities for near future development of desirable activities were studied, and no-go solutions were documented and rejected in order to develop implementable scenarios for pilot projects and policy recommendations. Discussion: Although coordinated access at an European level will be organized on a voluntary basis, some sort of commitment from the participating partners is required. Moreover, it is crucial that the subsidiarity principle is not jeopardized or compromised. Duplication of efforts will be avoided and previously made investments – in terms of financial and human resources, expertise and experience - (ex. by EUnet HTA, EMA COMP, EUCERD, CAVOD,…) will be valorized.

PHP219

THE FUNDING OF ORPHAN MEDICINES IN EUROPE: PAYERS ACHILLES' HEEL?

Rietveld A, Brown C, Johnson N, Spoors J
RJW & Partners, Royston, UK

OBJECTIVES: To look at the affordability of orphan medications across Europe and whether payer attitudes to high-price medications are changing in the face of rising health care expenditure and tighter budgets. **METHODS:** A detailed review of 7 EU markets (France, Germany, Italy, The Netherlands, Poland, Spain, UK) looking at payer attitudes and funding decisions for key orphan drugs and the political, economic and societal impact of these. A key focus of the research was insight into payer attitudes towards the evidence base for the purpose of pricing negotiations and how anecdotal evidence, such as Patient Reported Outcomes (PROs) and patient case studies, have an impact on decision-making. Detailed research was also undertaken to ascertain the pricing levels achieved for a number of orphan drugs across Europe looking at payer thresholds and the implications of these for the purpose of reimbursement. **RESULTS:** The research demonstrates that there is considerable variation in pricing levels across the European markets and difference in payer attitudes towards the way orphan drugs are funded. Overcoming evidence challenges in orphan diseases remains a headache for payers and scepticism remains around dosing, innovation and whether approaches such as "coverage with evidence development" are adequate and/or sustainable in the long-term following initial approval. **CONCLUSIONS:** The environment for orphan medicines in Europe is changing; and as the financial performance of European countries begins to diverge, so do attitudes towards the funding of orphan medicines. Orphan medicine prices are rarely justified on the basis of traditional cost-effectiveness thresholds and most markets still differentiate them from other pharmaceuticals. However, payers are afraid of uncertainty and, given the increasing number of orphan drugs and the often tentative evidence base at launch, may be forced by overwhelming financial necessity to make tougher decisions on funding.

PHP220

BUDGET IMPACT AND THRESHOLDS: HOW ARE REAL DECISIONS MADE? - EXPECTED UTILITY OR PROSPECT THEORY?

Adams R[1], Gray E[1], McCullagh L[1], Schmitz S[2], Barry M[1], Walsh C[2]
[1]*National Centre for Pharmacoeconomics, Dublin, Ireland,* [2]*Trinity College Dublin, Dublin, Ireland*

Decision making rules in health technology assessments are often based on a fixed willingness to pay threshold for the incremental cost effectiveness. This may be thought of as consistent with expected utility – with utility here defined in terms of Incremental Net Benefit (INB) – a combination of QALY gain and the threshold value. Alternative methods such as multi criteria decision analysis allow incorporation of other dimensions into the decision space. These seek to explore whether utility may be driven by factors other than simple QALY gain. Prospect theory suggests that decision makers are concerned in practice with the 'size' of a given decision. Also, they handle investment and disinvestment differently. In the Irish State, every new drug is examined. In order to look at actual decisions, lifetime QALY gains were extracted from completed economic evaluations submitted to the Irish health care payer. Total spend on these was calculated using a combination of the payer reimbursement database and predicted budget impact. Real choices indicate that where the budget impact is relatively small the drug is more likely to be reimbursed even with a comparatively small QALY gain. Technologies in areas of cancer and orphan diseases often lie outside of the threshold where a technology would be accepted. Decision makers are faced with choices with varying degrees of risk. Choices associated with a low budget impact are deemed to be less risky. This is pragmatic; it reflects a preference on behalf of the decision maker. Reality does not always match the ideal of a fixed threshold.

PHP221

DOES HTA PROCESS HELP TO ACHIEVE THE HEALTH OBJECTIVES OF THE MILLENNIUM? A SOUTH AMERICAN ANALYSIS

Sansone D[1], Decimoni TC[1], Etto H[1], Santos AM[1], Araújo G[2], Fonseca E[3], Fonseca M[2]
[1]*Axia.Bio Consulting, São Paulo, Brazil,* [2]*Federal University of São Paulo / Axia.Bio Consulting, São Paulo, Brazil,* [3]*Federal University of São Paulo, São Paulo, Brazil*

OBJECTIVES: South America (SA) is a continent with 400 million people and occupies 12% of the world's territory. It is composed by 12 countries and 6.75% of its population is below the poverty line, as defined by UN. The proper distribution of financial health resources, through an HTA process in public systems is potentially essential to improve the quality of health care expenditure. The objective of this study is to understand the incorporation process of new health technologies and compare the general health status in each country, regarding the Objectives of the Millennium (OM). **METHODS:** A public data collection was performed in official sources linked to UN, to governments of SA and the Unión de las Naciones Suramericana (UNASUR). **RESULTS:** The public health financing in SA countries was between 2.43% and 6.20% of the GDP. An HTA process in an institutionalized and specialized form is in place in only 3 countries (Argentina, Brazil and Peru). Bolivia, Chile, Colombia, Paraguay and Venezuela do not have a specialized HTA process and the other four countries have no HTA process at all. Regarding the OM the decrease in child mortality, increase in vaccination, increase in malaria and tuberculosis treatments are among the closest to be achieved in all countries. There is a linear positive correlation of OM with the Human Development Index and with the percentage of GDP invested in public health but not with having a HTA process in place. **CONCLUSION:** At this moment, there is no evidence that an HTA process in place helps SA countries to achieve the OM.

PHP222

THE NEW ITALIAN HEALTH CARE REFORM: INTRODUCING NEW MEASURES TO SPEED UP MARKET ACCESS

Palombi M[1], Urbinati D[2], Lo Muto R[1], D'Ausilio A[1]
[1]*Creativ-Ceutical, Milan, Italy,* [2]*Creativ-Ceutical, Luxembourg, Luxembourg*

OBJECTIVE: The Balduzzi law (189/2012) introduced several changes aimed at promoting the country's development through a higher level of health protection and at bridging the gap left by the rationing of health care resource from the Spending Review (135/2012). Reducing the time to drug market access is one of the main purposes. The aim of the research is a critical analysis of this law to understand its actual and future impact on the health care scenario. **METHODS:** An evaluation of the laws issued in the last three years that aimed at regulating the drug market was carried out. To build a future scenario analysis, we focused our attention on the Balduzzi law and two of its articles (11 and 12) and on the new drugs approved by AIFA and commercialized under the new regulation. **RESULTS:** The changes that will have a major impact on the drug market are: the allocation of the medicines approved under centralized procedure in the non-negotiated C Class within 60 days from the publication in the Official Gazzette of the European Union and the direct placement of generics and biosimilars in the reimbursement class of the originator without any price negotiation. As of now, a total number of 49 drugs have been included in the non-negotiated C Class, within this new group there are 15 first drug authorizations. **CONCLUSION:** The new reform can be potentially an interesting innovation to speed up market access, though the impact of including new drugs in the C class (at patient charge) before the price negotiation is still under debate. The increased competitiveness coming from having a faster introduction in the market of generics/biosimilars could lead to important savings for the National Healthcare System over the next years.

PHP223

INVESTING IN EUROPEAN HEALTH R&D – A PATHWAY TO SUSTAINED INNOVATION AND STRONGER ECONOMIES

Pasmans R[1], Saka Ö[1], Urbina-Valdespino E[1], Delwart V[2], Gijssels S[2]
[1]*Deloitte, Diegem, Belgium,* [2]*Janssen Pharmaceutica NV, Bersee, Belgium*

A large number of factors point to an unavoidable rise in health care expenditure to 13%-18% of Europe's GDP by 2030, even with policy interventions or budget caps that aim to counterbalance these pressures. This growth in health care costs need not be undesirable especially so when higher spending on health care leads to improved health care quality and life expectancy. Therefore, the challenge is not "how do we reverse the growth of health care costs?" but "how can we best deploy the increasing resources spent on health care to create optimal benefits for the European population?" Health R&D is the key to being able to respond to this dilemma. Increased investment in R&D leads to improved health outcomes, long term efficiency gains, better productivity and high economic yields. However, the outlook for Europe is not as positive as it could be. Recently, there has been a stagnation or even decline in European private and public investment in R&D, which is in sharp contrast with the much higher investments in the US. Private biopharmaceutical investments in health R&D, which are double the size of public health R&D, in 2011 actually decreased in absolute terms. Public R&D investments declined or stagnated in most European countries and will be further under pressure in the near future due to public budget deficits. Janssen commissioned the Deloitte European Center on Health Economics and Outcomes Research to set out the arguments in support of increased investment in health R&D in Europe. The paper demonstrates that, even in times of austerity, policymakers need to prioritise approaches that will enhance public R&D investments and adopt strategies that produce incentives for private enterprises so that the current decline in private sector investment is halted.

PHP224

HOW DO ONCOLOGY DRUG PRICES VARY ACROSS EU5, THE UNITED STATES, AND BRIC MARKETS?

Patel P, Donze B, Zaganelli D
Alliance Life Sciences Consulting Group, Somerset, NJ, USA

OBJECTIVE: Pharmaceutical pricing is characterized by a consistent variability across markets. Social and economic differences represent only the easiest-to-predict reason for such variability. Stricter regulatory hurdles, market landscape, challenging negotiation processes, varying business strategies, and sometimes unplanned outcomes of pharma launch decisions concur in the final price for a specific drug. A better understanding of price trends and out-patterns is a useful insight to help improving pricing strategies by targeting realistic pricing expectations, and studying competitors' pricing mistakes and successes. This paper shows the price variability of ten different pharmaceuticals in ten key markets (France, Germany, UK, Italy, Spain, US, Brazil, Russia, India, and China). Common trends, similarities and particularities are discussed. **METHODS:** Using PRICENTRIC™ data, we collected ex-factory prices for various oncology products, and we defined whether a country fell into a HTA system or free pricing group. We also compared the product prices to GDP per capita (International Monetary Fund 2012) to investigate trends between the two parameters. The analysis investigates two key areas: 1. Difference in price depends on social, economic considerations but also by the nature and complexity of market access process 2. The relationship between prices and GDP per capita across countries. **RESULTS:** The US and Germany have the highest prices of all studied countries. They are also the only two countries where prices are freely set by manufacturers. Prices are slightly higher in countries having a high GDP per capita. However, countries like France and UK having strong HTA authorities and pricing regulations do have a small correlation to this trend line. **CONCLUSION:** Our analysis shows that pricing and pharma strategies can be based on countries' economic situation. Nevertheless, formal established HTA bodies with clear pricing rules help controlling pricing.

PHP225

A SYSTEMS-THINKING APPROACH FOR THE HEALTH CARE INDUSTRY: STRATEGIES AND INSIGHTS FOR BIOPHARMA, PAYERS AND PROVIDERS

Hoschander S[1], Doyle JJ[2], Istas A[3]
[1]*Quintiles Global Consulting, Hawthorne, NY, USA,* [2]*Quintiles, Hawthorne, NY, USA,* [3]*Quintiles, Durham, NC, USA*

Collaboration with health care stakeholders is a fundamental component of a systems-based health care economy, and it will become the dominate business model going forward. Yet most health care industry stakeholders are failing to accept this inevitable transition. While many acknowledge the need to move toward a more integrated "systems thinking" approach – one that maps influence patterns, amplifies interdependencies, and drives collective outcomes, they struggle with actual implementation. A viable and sustainable information network provides the structure, aligned incentives and competitive collaboration the bricks and mortar, and trust the cornerstone. Until they can build that and foster a culture of transparency, they won't achieve the cost and innovation benefits inherent in these cross-industry partnerships. Although health care stakeholders know they need to partner with others to be successful in this new systems-thinking economy, they need actionable strategies to demonstrate how the benefits of ongoing collaborations far outweigh the risks. This podium presentation will present original research aimed to qualify stakeholder perceptions on alignment and collaboration around the delivery of health care, in addition to critical hurdles they must overcome. A recent survey of close to 300 Biopharma executives, EU and US Payers, and US providers provides insight into their needs, their disparate perceptions, and their levels of confidence in the ability to shift to a systems-thinking collaborative culture. Approximately 25% of respondents stated they were not aligned with other stakeholders, though agree they need better alignment and foresee closer collaboration in the future. Over 70% of stakeholders believe data transparency and information-sharing is critically important to a successful and interoperable health care system, yet very few from each group were willing to demonstrate such transparency. Further detail will be given on insights and challenges gleaned from interviewing large and small stakeholders as well as practical strategies to guide the transformation to a systems-thinking industry.

PHP226

INTRODUCING THE ENCEPP WORKING GROUP (WG) ON HEALTH TECHNOLOGY ASSESSMENT (HTA): ENHANCING THE GENERATION OF ADDITIONAL EVIDENCE FOR HTA PROCESSES

Sinclair M[1], Lis Y[2], Van Engen A[3], Van Ganse E[4], Autier P[5], Daumer M[6], Ehrenstein V[7], Qizilbash N[8], Méndez I[9], Engel P[10], Bergman U[11], Fusco D[12], Pasterk M[5], Postma MJ[13], Smulders M[14], van Staa T[15], Pariente A[16], Ruether E[17], Toussi M[18], Moore N[19], Meyer F[20], Prieto L[21]
[1]*University of Ulster, Newtownabbey, United Kingdom,* [2]*PAREXEL International, Uxbridge, United Kingdom,* [3]*Quintiles, Hoofddorp, The Netherlands,* [4]*Université Lyon 1, Lyon, France,* [5]*International Prevention Research Institute, Lyon, France,* [6]*Sylvia Lawry Centre for Multiple Sclerosis Research, Munich, Germany,* [7]*Aarhus University Hospital, Aarhus N, Denmark,* [8]*OXON Epidemiology Limited and Department of Primary Care and Public Health, Imperial College, London, United Kingdom,* [9]*Oxon Epidemiology Limited, Madrid, Madrid, Spain,* [10]*Quintiles, Levallois-Perred Cedex, France,* [11]*Karolinska Institutet, Stockholm, Sweden,* [12]*Department of Epidemiology Lazio Region, Rome, Italy,* [13]*University of Groningen, Groningen, The Netherlands,* [14]*IMS Health, London, United Kingdom,* [15]*GPRD, London, United Kingdom,* [16]*Universite de Bordeaux, Bordeaux, France,* [17]*University of Munich, Munich, Germany,* [18]*IMS Health, Paris La Défense, France,* [19]*University of Bordeaux, Bordeaux, France,* [20]*Haute Autorité de Santé, Saint-Denis La Plaine Cedex, France,* [21]*European Medicines Agency, London, United Kingdom*

The European Network of Centres for Pharmacoepidemiology and Pharmacovigilance (ENCePP) is a project led by the European Medicines Agency aimed at further strengthening the post-authorisation monitoring of medicinal products in Europe by facilitating the conduct of multi-centre, independent post-authorisation studies focusing on safety and benefit/risk assessment. ENCePP has recently established a WG on HTA to develop methodological guidance to supplement the efficacy and safety aspects of medicines known at the time of marketing authorisation (MA) and to bridge the needs of HTA and post-marketing benefit-risk assessments. Decision makers are often faced with the challenge that long-term, real-world data on safety and effectiveness is lacking at the time of MA. This creates uncertainty around the medicines' risk-benefit profile while manufacturers, health care providers, and patient groups exert pressure by demanding early decisions and rapid access. Decision makers may unduly delay potential benefits to patients by waiting for stronger evidence, or may endorse medicines that later turn out to have a less robust benefit-risk ratio, to be ineffective, cost-ineffective, or even harmful. Hence, many countries have developed mechanisms that allow temporary access to promising medicines while concurrently requesting the generation of additional evidence to reduce uncertainty. Their objective is an optimal trade-off between different stakeholder needs, flexibility, responsiveness, and rigor as well as the flexibility to revise decisions on access when new evidence becomes available. The ENCePP WG on HTA has the potential to become a capacity building tool for regulatory and HTA agencies to develop research structures aimed at complementing the evidence generation for MA and market access. Post-authorisation studies developed under the auspices of ENCePP could provide new safety and clinical effectiveness information of marketed medicines. ENCePP expertise, research experience and health care databases may also contribute to the coordination, methodological guidance and data sourcing for the enhancement of HTA processes.

HEALTH TECHNOLOGY ASSESSMENT OF HIGH-VALUE THERAPIES

Hegyi R[1], Tóth E[1], Érsek K[1], Nagy B[2]
[1]*Healthware Consulting Ltd., Budapest, Hungary,* [2]*Healthware Ltd., Budapest, Hungary*

OBJECTIVES: Main function of a health system is to prevent diseases, restore health status and reduce health impairment. Health systems are mainly organized on efficacy based decisions, but sometimes their social functions modulate this principle. In case of small patient groups, end-stage status and unmet health needs, usually decision are made on the basis of equity, instead of efficacy. These demands create special development conditions; eventuate in high prices on the supply side, therefore cost-effectiveness cannot be guaranteed, not even with substantial health benefits. Numerous expensive drug therapies are available in Hungary with reimbursement, but due to fiscal restrictions, new therapies are not able to access reimbursement. These tendencies create a paradox situation, since equity is implemented occasionally in absence of objective criteria. Due to the huge differences among these therapies, a standardized decision-making principle does not exist, but a general framework can be developed. In our study, methods and techniques are introduced, which can help to assess these therapies and organize a transparent system. **METHODS:** For the general assessment of therapies, many methods are available. In our research, we reviewed these tools and investigated their combinability in the special situation of "high-value" therapies. **RESULTS:** A wide range of evidences (clinical trials, meta-analysis, health-economy analysis, HTAs) provide a robust background to compare high-value therapies between different therapeutic areas. Outputs (LYG, OS, QALY, costs etc.) show a significant variation following different clarification process. A standardized process needed to earn comparable outputs from evidences. **CONCLUSIONS:** As we found, these tools could help decision making on prioritizing therapies, allocate resources with a higher control and reduce the risk of reimbursement.

ORPHAN DRUG LEGISLATIONS: HEYDAY OR HAD THEIR DAY?

Palmer M, Hughes DA
Bangor University, Bangor, UK

Orphan Drug Legislation incentivises the development of treatments for rare diseases that would otherwise not be profitable investment opportunities. However, with budgets squeezed and diseases increasingly stratified, we question whether this legislation is fit for purpose. Segmenting diseases into genetically-defined subgroups, most notably among some cancers, has enabled increased pharmacological targeting. Common diseases are thus being reconsidered as multiple rare conditions, each eligible for orphan designation, entitling the treatments to the economic benefits afforded by legislation. Stratification also occurs in diseases which are already rare (e.g. cystic fibrosis), and new treatments, such as ivacaftor, are being developed to target specific mutations. Orphan status for a drug is maintained regardless of whether the overall population size, for which the drug is licensed, exceeds prevalence thresholds enabling companies to take a strategic approach to development. The high prices of orphan drugs impact on access. However, typical cost-effectiveness thresholds are often waived suggesting that greater value is placed on treatments for rare conditions, compared with prevalent diseases that are equally severe and debilitating. Population surveys indicate that funding policies that take resources from elsewhere in health economy budgets to fund these treatments are not in the public interest. At the same time, research and development into certain common diseases such as stroke, where the burden is much higher, has been somewhat neglected. We believe it is time to revisit orphan drug legislation. Regulators should be able to limit the benefits of orphan designation should the cumulative eligible population exceed a certain threshold. More robust criteria need to be applied for defining a "medically plausible subset" and pricing should to be brought closer in line with drugs for non-rare diseases. Furthermore, the focus of incentives should move more towards areas of unmet need where disease burden is greatest.

PHP229

REVIEW OF ECONOMIC PRINCIPLES OF BRANDED "ME-TOO" DRUGS MARKET

Hren R
University of Ljubljana, Ljubljana, Slovenia

In this paper, we review a well-known phenomenon of »me-too« drugs in the pharmaceutical branded markets, which has gained wide attention during the recent years. A branded "me-too" drug is deemed having somewhat similar therapeutic effect as the "breakthrough" drug, although from an intellectual property right perspective, there is no difference between the two. Definition of "me-too" drugs has yet to reach consensus and it would likely be ferociously disputed by the branded firms. When the first branded »me-too« drug enters the market, we are dealing with oligopoly, or more precisely, duopoly, described by Cournot model. From an oligopoly model, we would expect at Nash equilibrium both price to decrease and total volume to increase compared to shared monopoly conditions. An oligopolistic structure of a »me-too« pharmaceutical market puts substantial emphasis on branding and promotion (to achieve

horizontal differentiation), which is often cited (beside R&D costs) as the second barrier to entry to the branded market. Here, we have discussed several examples of Cournot model within various ATC4 groups and jurisdictions. We have also critically examined preponderance of »me-too« entries, particularly in the light of an R&D investment of the branded firms. Historically, »me-too« drugs are more ubiquitous than often realized by regulatory agencies, payers, and also the pharmaceutical industry itself. This unfortunately presents an inefficient use of resources as the breakthough innovation is nowadays, in the time of austerity measures, a real necessity. The models that would give incentives to the industry to invest in R&D for breaktrough therapies are possible and would not only contribute to optimization of societal welfare but would also in the long run increase an R&D productivity of branded firms.

CELL THERAPIES: ASSESSING THE PATIENT ACCESS OPPORTUNITIES AND CHALLENGES THAT LIE AHEAD

Walker R[1], Mackenzie A[2]
[1]*PriceSpective, London, UK,* [2]*PriceSpective, Cambridge, MA, USA*

This poster seeks to highlight the key challenges and opportunities surrounding patient access to innovative cell therapies in the EU5 and US. The findings are based on secondary research of commercialised cell therapies as well as primary research with payers in EU5 and US. Cell therapies have a unique opportunity to improve patient outcomes but face their own set of challenges due to being cell based. As many of these therapies involve manipulation of the patients' own cells before being reintroduced (e.g., ChondroCelect), the associated side effects are likely to be minimal. Other therapies (e.g., gene therapy, Glybera) involve the introduction of foreign genetic material but provide a potential long-term cure. However, there are some important challenges that must be assessed when considering how to commercialise such therapies. In the case of therapies where a patient's cells are manipulated *ex vivo*, who bears the risk if the patient does not receive their individualised treatment? For those therapies that purport to cure disease, how much are health care systems willing to pay for them and what evidence would be required in order to justify a high price? Moreover, for all therapies, there is the uncertainty regarding access pathways: will cell therapies necessarily undergo an HTA evaluation to gain access in the EU? What are the criteria that will be used to determine whether such a therapy is deemed a product (and, hence, undergo an assessment like a regular biopharmaceutical) or a procedure (and likely bypass a national evaluation)? In conclusion, cell therapies face uncertainties in market access and funding due to unestablished pathways for the spectrum of interventions that fit under the cell therapy umbrella. Until frameworks have been put in place, each cell therapy should be assessed individually in order to determine likely pathway to patient access.

THE IMPACT OF RECENT GENERIC DRUG PRICE POLICIES ON PHARMACEUTICAL INNOVATION: A THEORETICAL RATIONALE AND PROPOSAL OF A METHOD SUPPORTING INNOVATION IN AREAS OF UNMET MEDICAL NEED

Dionne PA[1], Ali F[1], Grobler M[2]
[1]*Pfizer Canada, Kirkland, QC, Canada,* [2]*Pfizer Australia, West Ryde, NSW, Australia*

New discoveries are a critical priority for the pharmaceutical industry, for which the primary aim should be to address unmet medical needs. However, the use of fixed cost-effectiveness (ICER) thresholds for health technology assessment (HTA) may tend to decrease incentives to innovate and affect future treatment options. This presentation highlights, using a case study, the impact of recent generic drug price policies on pharmaceutical innovation in the context of fixed ICER thresholds and proposes a new consideration for the cost-effectiveness analysis (CEA). There is a direct causal relationship between HTA and the market price of a drug; in jurisdictions where HTA agencies apply fixed ICER thresholds as an important reimbursement listing criterion, the incremental cost of a new drug is expected to be proportional to its incremental benefit over the comparator. However, the comparator price is subject to market forces or sudden policies and may change markedly affecting the cost-effectiveness assessment (e.g. where the comparator patent has expired). Since recent generic price regulations (e.g. 18% or 25% of the innovative price in Canada) increased the price gap between drugs' generic and patented versions, it is harder to achieve a sufficient level of incremental benefits in order to offset incremental prices of new treatments. This analysis thus demonstrates that with recent changes in generic drug prices in Canada and other jurisdictions, even promising drugs will have challenges to show attractive ICERs. Traditional decision-making process should be adapted to reflect these changes and to promote innovation in therapeutic fields with unmet medical needs. A compromise would be to include the comparator's patented price in the CEA instead of the generic drug in certain areas of unmet needs. By identifying the relevant disease areas, decison makers and HTA authorities could convey the importance of investing in these therapeutic areas to manufacturers.

PHP232

THE EXPANDING SCOPE OF COMPARATIVE EFFECTIVENESS REVIEWS REQUIRES COLLABORATIVE INFORMATION SYSTEMS SOLUTIONS

van Valkenhoef G
University Medical Center Groningen, University of Groningen, Groningen, The Netherlands

BACKGROUND: The scope of systematic reviews and health technology assessments is rapidly expanding due to increasing demand for more complex models that account for patient, treatment, and trial characteristics, network meta-analyses that include more interventions, and the growing number of clinical trials. By the year 2000, the effort required to publish a typical systematic review had already reached the thousands of person-hours, which were predominantly spent on data acquisition tasks. Innovative solutions are required to prevent the costs of comparative effectiveness research from ballooning out of proportion. **PROBLEM:** Typically only the end product of systematic reviewing, a report summarizing the evidence, is made widely available. However, capturing the intermediate results of literature searching, publication screening, and data extraction has the potential to greatly enhance the efficiency of future reviews. In the face of the increasing scope of systematic reviews, this unnecessary duplication of effort must be eliminated. However, doing so is difficult due to the current culture of data protectionism and a lack of suitable software that enables convenient and useful sharing of the intermediate results. **APPROACH:** Building on our previously published reviews of software for systematic review and trial analytics, the talk identifies the technical and cultural challenges to be met. We propose that a web-based solution enabling the global research community to contribute their intermediate results in exchange for access to the data contributed by others could rapidly gain momentum. Such a system would challenge data protectionism by greatly reducing the level of investment required for data acquisition. **CONCLUSION:** A disruptive web-based system enabling a massively collaborative approach to systematic reviewing can make data protectionism obsolete and eliminate much of the effort required for future systematic reviews.

VALUE-BASED PRICING IN THE UK AND POTENTIAL PATIENT ACCESS HURDLES TO INNOVATIVE DRUGS

Papadopoulou K, Grosvenor A
PriceSpective, London, UK

The UK government plans to introduce value-based pricing (VBP) for medicines in England and Wales from January 2014, and one of the key tenets of the scheme is to improve patient access to new innovative drugs. This poster aims to explore the extent to which VBP is likely to achieve this goal. To meet this objective, an in-depth review of available literature (including white papers from key stakeholders and scientific publications) was conducted. Targeted interviews with five leading thought-leaders in the implementation of VBP were also conducted to support analysis. Research identified a number of areas of uncertainty in VBP implementation that could detrimentally impact patient access to new drugs. First, the timeline for the VBP negotiation process remains unclear. Currently, it takes NICE on average 48 weeks to issue guidance on a single technology appraisal, which could be extended if a technology is not considered cost-effective. Under VBP, manufacturers will still be required to negotiate their price with the Department of Health if the calculated VBP price by NICE is unfavorable, and the VBP HTA methodology itself could be more complex than the current cost-per-QALY approach. Protracted negotiations could also delay access in Scotland and Northern Ireland. Equally, manufacturers may postpone launch in the UK if they consider VBP a threat in their price corridor in other markets. Finally, it is not clear if additional regional or local level negotiations will take place, which could further delay access. In conclusion, although there is potential for the new adjustable QALY threshold (which remains to be confirmed) to foster innovation, the ability of the new VBP process to expedite patient access remains uncertain.

A CHOICE OF BUSINESS FOR THE PHARMACEUTICAL INDUSTRY "SEGURO POPULAR" IN MEXICO

Vilchis S
Sistema de Proteccion Social en Salud Mexico, Mexico, Mexico

A choice of business for the pharmaceutical industry "Seguro Popular" in Mexico. Abstract Mexico has various providers of health services each one determined to a sector of the population where we can find the Mexican Social Security Institute (IMSS) that is specifically for workers in the private sector employees and their families, the Institute for security and services social of the State workers (ISSSTE) for workers in the service of the State or public sector and their families starting 2003 ushered to the Seguro Popular that extends to the population without social security or in State of helplessness in these three mentioned health are emerging as institutions providing health services larger Mexico insomuch that by 2013 the Seguro Popular has approximately 54 million affiliates number of successful membership in less than 10 years in a country where there is little more than 110 million of people Seguro Popular is placed, on par with the historic and hegemonic IMSS, as the largest buyer of drugs, aware of this are his consumption figures that since 2008 has been made public, in such data can find that from 2008 to 2012 they have bought 1,241,637,748.68 US Dlls only in drugs consumption regularly since the Seguro Popular has several portfolios of services where separate regular conditions of sufferings of low frequency and high cost and conditions of very low frequency and high cost for children under 5 years who in turn have specific budgets.

UNDERSTANDING THE EFFECT OF CLOSTRIDIUM DIFFICILE INFECTION ON HOSPITAL MORTALITY IN ENGLAND, THE NETHERLANDS, AND SPAIN

Wasserman M, Jones C, Roberts G, Latif F
Double Helix Consulting, London, UK

OBJECTIVES: Increasing rates of *Clostridium Difficile* Infection (CDI), a hospital-acquired infection, has stimulated a number of financial incentives and government sponsored initiatives to quell the spread of the disease. Previous research has shown the impact of CDI on hospital length of stay to attempt to quantify the resource implications. The purpose of this study is to evaluate the impact of CDI on in-hospital mortality. **METHODS:** Data were obtained from national hospital episode databases in England, The Netherlands, and Spain. Only patients over the age of 50 and those diagnosed with diabetes, chronic kidney disease, heart failure, and chronic obstructive pulmonary disease (COPD) were included in the analysis. Cases of CDI were stratified between hospital-onset and community-onset cases. Only those that were assumed to be hospital-onset were included in the analysis. A logistical regression was used to predict the relative effect hospital-onset CDI had on in-hospital mortality. A number of covariates were controlled for including: age, sex, comorbidities, and length of stay but varied between countries depending on the availability of data. **RESULTS:** Patients with hospital-onset CDI had an overall higher mortality rate compared to those who

did not have the disease, demonstrated by a crude relative risk of 6.06 in England (37.6% vs. 6.2%), 2.68 in The Netherlands (19.0% vs. 7.1%), and 1.97 in Spain (14.9% vs. 7.5%). When controlling for covariates, predictive models found a considerable impact of hospital-onset CDI on mortality with odds ratios of 2.57 for England (p<0.001), 1.88 for The Netherlands (p<0.001) and 1.33 for Spain (p<0.001). **CONCLUSIONS:** This research demonstrates the significant impact of CDI on hospital mortality and the need for more preventative measures within the hospital setting. Further research using death certificate data could improve the predictive results of models by ensuring that causal effects of CDI are accurately accounted for.

PGI2

RULING OUT IBD IN THE UNITED KINGDOM AND SPAIN: IS THE USAGE OF F-CALPROTECTIN IN PRIMARY CARE COST-EFFECTIVE?

Mascialino B[1], Hermansson LL[1], Larsson A[2]
[1]*Thermo Fisher Scientific, Phadia, Uppsala, Sweden,* [2]*Uppsala University, Uppsala, Sweden*

OBJECTIVES: The inflammatory bowel diseases (IBD) are characterized by chronic inflammation of the gastrointestinal tract; the irritable bowel syndrome (IBS) is a functional disorder (prevalence 10%-20%). They present overlapping symptoms, making diagnosis difficult in primary care. Endoscopy is the gold standard for IBD, but it often turns negative due to IBD's low prevalence, it is expensive, uncomfortable and risky for the patient. F-Calprotectin is a marker of intestine inflammation: as IBD patients exhibit levels higher than the general population and IBS patients, F-Calprotectin can be used to rule out IBD. The only CE evaluation on F-Calprotectin has been published by NHS (CEP09041, 2010); based on new evidence, we propose a refined model to evaluate the CE of F-Calprotectin compared to the standard pre-endoscopic serologic test (CRP+ESR) to distinguish IBD from IBS in the UK and Spain. **METHODS:** F-Calprotectin sensitivity (0.96) and specificity (0.96) were evaluated from a meta-analysis performed in March 2013; CRP+ESR sensitivity (0.35) and specificity (0.73), and the costs come from CEP09041. Published HRQoL values for IBD and IBS were transformed in QALYs with transfer-to-utility techniques. The outcomes included cost savings, cost per QALY. Uncertainty was addressed with a probabilistic sensitivity analysis. **RESULTS:** Results for UK show that F-Calprotectin is CE with respect to CRP+ESR: a) it results in more corrected IBD diagnoses at a lower price (it costs 113£ and 85€ less per patient); b) it reduces the number of unnecessary endoscopies, increasing the number of correctly diagnosed IBD (N=59) and IBS (N=195) patients; c) it brings about a QALY gain per patient equal to 0.0034QALYs; in the UK, the ICER of the CRP+ESR diagnostic strategy is 47,783£ (25,941€ for Spain), falling well outside the cost-effectiveness bounds (20,000–30,000£ per additional QALY). **CONCLUSIONS:** F-Calprotectin is CE to rule out IBD in primary care in UK and Spain.

DIAGNOSIS OF PANCREATIC EXOCRINE INSUFFICIENCY IN CHRONIC PANCREATITIS, PANCREATIC CANCER AND GASTROINTESTINAL OR PANCREATIC SURGERY PATIENTS: A SYSTEMATIC LITERATURE REVIEW AND EXPERT CONSENSUS ON THE ACCURACY OF DIAGNOSTIC TEST USED IN SPAIN

De Madaria E[1], Gonzalez-Carro P[2], Boadas J[3], Puig de la Bellacasa J[4], Carr E[5], Labrador E[4], Paz S[6], Lizán L[6], Schwander B[7], Dominguez Muñoz E[8]
[1]*Hospital General Universitario de Alicante, Alicante, Spain,* [2]*Complejo Hospitalario La Mancha Centro, Alcazar de San Juan, Spain,* [3]*Consorci Sanitari de Terrasa, Terrasa, Spain,* [4]*Abbott Laboratories, Madrid, Spain,* [5]*Abbott Laboratories, Allschwil, Switzerland,* [6]*Outcomes 10, Castellon, Spain,* [7]*AHEAD GmbH, Loerrach, Germany,* [8]*Hospital Universitario de Santiago de Compostela, Santiago de Compostela, Spain*

OBJECTIVES: To systematically appraise the literature on the accuracy of four widely used tests to diagnose Pancreatic Exocrine Insufficiency (PEI) secondary to chronic pancreatitis (CP), gastrointestinal/pancreatic surgery or pancreatic cancer in Spain, namely: coefficient of fat absorption (CFA); mixed 13C-triglyceride breath test (MTG); fecal elastase-I (FE-I); and serum nutritional markers (SNM). **METHODS:** A systematic review of the literature (March, 2013) was performed (*MedLine/PubMed*, Cochrane Library, CRD, MEDION, ARIF, MEDES, IBECS, ISI WOK, SCOPUS), based on the Cochrane and NHS Centre for Reviews and Dissemination recommendations for reviewing diagnostic test accuracy studies. Expert validation of the review strategy and results were achieved by two consensus meetings. **RESULTS:** Out of 13.379 publications, 16 from the systematic search and 3 from hand-search were reviewed: 11 in CP and 8 in cancer/surgery patients. Fourteen of these used the secretin/cerulein test as the reference standard. According to experts, CFA is the gold standard for PEI diagnosis (assumed accuracy 100%). 4 publications using CFA as the reference standard were selected: FE-I sensitivity and specificity in 58 CP (cutoff <218μg/g) and 40 cancer/surgery patients (cutoff 200μg/g) were 68% and 98%, and 91% and 35%, respectively. MTG was ≥90% sensitive and specific in all populations (63 patients), experts considered this a good reference standard. Sensitivity and specificity for SNM vs. MTG were 80% and 81%, respectively and considered by experts as similarly accurate in the cancer/surgery population. **CONCLUSIONS:** This is the first systematic review to confirm the accuracy of four diagnostic tests for PEI in CP and cancer/surgery patients, with the final selection of results being based on expert consensus to ensure that the data are representative of Spanish clinical practice. These data, together with resource use and cost information from clinical practice will feed an economic tool to assess the cost of PEI diagnosis in Spain.

NETWORK META-ANALYSIS OF APPROVED BIOLOGIC INTERVENTIONS FOR THE INDUCTION OF RESPONSE IN ULCERATIVE COLITIS

Chen M[1], Black CM[2], Gurunath S[1], Jansen JP[3], Chaudhary MA[4], Fan T[5]
[1]*Mapi Group, Boston, NJ, USA,* [2]*Merck Sharp & Dohme Corp., a subsidiary of Merck & Co., Inc., Whitehouse Station, NJ, USA,* [3]*Mapi / Tufts University School of Medicine, Boston, MA, USA,* [4]*Merck Research Laboratories, North Wales, PA, USA,* [5]*Merck & Co. Inc., Whitehouse Station, NJ, USA*

OBJECTIVES: To evaluate the comparative efficacy of approved biologic treatments for ulcerative colitis (UC), with a focus on golimumab(GOL), adalimumab(ADA), and infliximab(IFX) in the induction periods of clinical trials. **METHODS:** A systematic literature review was performed to identify relevant randomized controlled trials (RCTs). Data were extracted on study design and patient characteristics. Endpoints concerning efficacy were evaluated using network meta-analyses. Clinical response was defined as a decrease in Mayo score of ≥30% and ≥3 points, accompanied by a decrease in rectal bleeding score of ≥1 point or rectal bleeding score of 0 or 1. Clinical remission was defined as a total Mayo score of 2 points or lower, with no individual subscore exceeding 1 point. Mucosal healing was defined as absolute subscore for endoscopy of 0 or 1. Bayesian network meta-analyses (NMA) were conducted to evaluate each efficacy endpoint for TNF-naïve patients at the end of induction. All analyses were conducted using the OpenBUGS software package. **RESULTS:** Six RCTs were identified from the literature. Similar clinical response was observed between the IFX and GOL treatment regimens (IFX 5mg: OR=2.74, 95%CrI [1.48-5.1], IFX 10mg: 2.54 [1.37-4.73], GOL 200/100mg: OR=1.7 [0.93-3.14], GOL 400/200mg: 1.95 [1.05-3.58]) when compared to ADA 160/80mg. These similarities were also seen for mucosal healing (IFX 5mg: 2.66 [1.43-4.94], IFX 10mg: 2.57 [1.38-4.77], GOL 200/100mg: 1.54 [0.83-2.85], GOL 400/200mg: 1.68 [0.91-3.10]). IFX demonstrated slightly greater clinical remission than GOL (IFX 5mg: 1.96 [0.80-4.65], IFX 10mg: 1.51 [0.61-3.62], GOL 200/100mg: 1.55, 0.59-4.06], GOL 400/200mg: 1.47 [0.56-3.84]) when compared to ADA 160/80mg. **CONCLUSIONS:** The NMA allowed the estimation and comparisons of clinical response, remission, and mucosal healing of interventions for UC evaluated in different RCTs. The findings suggest that the greatest induction of response in moderate to severe UC patients is most likely achieved with IFX and GOL compared to ADA.

PGI5

NETWORK META-ANALYSIS OF APPROVED BIOLOGIC INTERVENTIONS FOR THE MAINTENANCE OF RESPONSE IN ULCERATIVE COLITIS

Chen M[1], Black CM[2], Gurunath S[1], Jansen JP[3], Chaudhary MA[4], Fan T[5]
[1]*Mapi Group, Boston, NJ, USA,* [2]*Merck Sharp & Dohme Corp., a subsidiary of Merck & Co., Inc., Whitehouse Station, NJ, USA,* [3]*Mapi / Tufts University School of Medicine, Boston, MA, USA,* [4]*Merck Research Laboratories, North Wales, PA, USA,* [5]*Merck & Co. Inc., Whitehouse Station, NJ, USA*

OBJECTIVES: To evaluate the comparative long-term efficacy of approved biologic treatments for ulcerative colitis (UC), with a focus on golimumab(GOL), adalimumab(ADA), and infliximab(IFX). **METHODS:** A systematic literature review identified 4 randomized controlled trials (RCTs) assessing the efficacy of IFX (5mg, 10mg), ADA (160/80/40mg) and GOL (100mg, 50mg) as maintenance treatment for moderate to severe UC. Data were extracted on study design and patient characteristics. Endpoints concerning efficacy were evaluated using network meta-analyses (NMA) within a Bayesian framework. Analyses were conducted to evaluate sustained response to therapy at both the mid-point (week 30/36) and completion (week 52/54/60) of each trial. An additional sub-analysis was conducted because the PURSUIT trial design included a re-randomization of induction responders to placebo, GOL 50mg or GOL 100mg. This sub-analysis was limited to patients who received an induction regimen of GOL 200/100mg followed by 100mg during the maintenance period and induction non-responders who received 100mg as per protocol. All analyses were conducted using the OpenBUGS software package. **RESULTS:** 4 RCTs were identified from the literature. Overall, IFX and GOL showed greater sustained response, remission and mucosal healing when compared to ADA 160/80/40mg. Between IFX and GOL, IFX doses showed greater remission at trial's completion (IFX5mg OR=2.04, 95%CrI 0.6-7.03; IFX10mg 1.96, 0.6-6.8; GOL50mg 1.24, 0.4-3.9; GOL100mg 1.79, 0.6-5.4), response (IFX5mg 1.88,0.8-4.4; IFX10mg 1.73, 0.7-4.1; GOL50mg, 1.38, 0.6-3.1; GOL100mg 1.45, 0.6-3.3) and mucosal healing (IFX5mg 1.51,0.7-3.4; IFX10mg 1.53, 0.7-3.5; GOL50mg, 1.38, 0.6-3.3; GOL100mg 1.38, 0.6-3.2. During the sub-analyses, GOL100mg and both IFX doses demonstrated greater sustained response and sustained remission when compared to ADA 160/80/40mg. Sustained mucosal response increased for IFX 5mg and IFX10mg but decreased for GOL100mg. **CONCLUSIONS:** Based on indirect comparison of RCT evidence, IFX and GOL are more efficacious to induce and maintain long term response than ADA among moderate to severe UC patients.

PGI6

A SYSTEMATIC REVIEW OF ANTIDEPRESSANTS IN IRRITABLE BOWEL SYNDROME: A QUALITATIVE ANALYSIS

Lindner L[1], O'Neill ID[2], McManus A[2], Rance M[3]
[1]*Almirall S.A., Barcelona, Spain,* [2]*Edge Communications, Dorking, UK,* [3]*Almirall UK, Uxbridge, UK*

OBJECTIVES: To systematically identify and review published evidence on the efficacy of antidepressants (tricyclic antidepressants (TCA) and selective serotonin inhibitors (SSRI)) for irritable bowel syndrome (IBS). **METHODS:** A systematic search of the medical literature was conducted using PubMed, Embase, and Cochrane databases. Search terms included 'irritable bowel syndrome', 'spastic colon', 'irritable colon', 'functional diseases, colon' and a mixture of agent terms – including antidepressants, tricyclic, and SSRIs. Randomised placebo-controlled trials evaluating the efficacy of antidepressants (SSRIs and TCAs) in adult patients with IBS were eligible for inclusion. Exclusion criteria included absence of placebo arm, patients<18 years of age, and dual publication. **RESULTS:** A total of 628 unique titles and abstracts were retrieved; 579 records were excluded upon title (or abstract) review and 31 upon full-text review. The final review included 17 studies, 10 reporting on TCAs, 6 on SSRIs, and 1 comparing both an SSRI and a TCA vs. placebo, and assessed the methodological compliance of each included study with that used in regulatory submissions. In these studies, the majority of patients had diarrhea, and only one study, (on SSRIs) reported specifically on IBS-C. Treatment duration ranged from 4-12 weeks. A range of outcomes were reported, most commonly global symptom relief, and improvements in abdominal pain/discomfort. Three studies reported on quality of life, while no studies reported specifically on treatment satisfaction. Most outcomes did not align well with those now required for FDA and EMA regulatory approval. Across all studies, patient dropouts were common, and reporting on per-protocol and intention-to-treat (ITT) populations varied and in many cases was not explicitly reported. **CONCLUSIONS:** The evidence base was of low quality, making estimates of effect very uncertain. Data for the efficacy of antidepressants in IBS subtypes is especially limited. Further studies are required to support the off-label use of antidepressants in IBS-C.

PGI7
CHARACTERISTICS OF CHILDREN AND ADOLESCENTS USING PROTON PUMP INHIBITORS OR HISTAMINE-2-RECEPTOR ANTAGONISTS: ANALYSIS OF THIN AND PHARMO DATABASES
Ruigómez A[1], Houweling LMA[2], García-Rodríguez LA[1], Penning-van Beest FJA[2], Herings RMC[2]
[1]Spanish Centre for Pharmacoepidemiologic Research (CEIFE), Madrid, Spain, [2]PHARMO Institute for Drug Outcomes Research, Utrecht, The Netherlands
OBJECTIVES: To describe demographics and co-morbidities of children starting PPI or H2RA use. **METHODS:** Data were obtained from The Health Improvement Network (THIN, a UK primary care database) and the Dutch PHARMO Database Network (including outpatient pharmacy and hospital databases). Children (<19 years) starting a PPI or H2RA between 2009–2012 (THIN) and 2008–2010 (PHARMO) were selected. Demographics, medical history, co-morbidities and co-medication were assessed. **RESULTS:** The study included 15782 PPI starters (THIN, n=5957; PHARMO, n=9825) and 8980 H2RA starters (THIN, n=5696; PHARMO, n=3284). The proportion of males was similar between PPI and H2RA starters in each database (THIN, 41% vs 48%; PHARMO, 44% vs 48%). H2RA starters more often were <12 years of age (THIN, 73% vs 26%; PHARMO, 58% vs 36%) and PPI starters more often had received other prior acid-suppressing treatment (THIN, 9% vs 2%; PHARMO, 10% vs 7%). In THIN, a history of infectious or respiratory disease was more common in PPI starters: infectious disease, 89% vs 65% (odds ratio (OR) 1.20; 95% confidence interval (CI) 1.05–1.37); respiratory disease, 77% vs 49% (OR 1.20; 95%CI 1.08–1.34). In PHARMO, PPI starters were also more likely to suffer from asthma/chronic obstructive pulmonary disease (8% vs 6% (OR 1.35; 95%CI 1.14–1.60)) and more often used antibiotics (20% vs 13% (OR 1.53; 95%CI 1.37–1.72)) and non-steroidal anti-inflammatory drugs (25% vs 5% (OR 4.48; 95%CI 3.80–5.29)). PPI starters in PHARMO were also more likely to have a history of diabetes or epilepsy (diabetes, 1% vs <0.5% (OR 5.00; 95%CI 2.33–10.73); epilepsy, 2% vs 1% (OR 1.69; 95%CI 1.16–2.45)). **CONCLUSIONS:** Results from both databases indicated that H2RA starters were younger than PPI starters. PPI starters were more likely to have received other prior acid-suppressing treatment and had more co-morbidities than H2RA starters.

PGI8
HEPATOCELLULAR CARCINOMA: AN EPIDEMIOLOGICAL AND MANAGEMENT SURVEY-BASED ANALYSIS IN ITALY
Cicchetti A[1], Gasbarrini A[2], Ruggeri M[1], Sacchini D[2]
[1]Università Cattolica del Sacro Cuore, Rome, Italy, [2]Università Cattolica del Sacro Cuore, Rome, Italy, Italy
OBJECTIVES: To verify how Hepatocellular Carcinoma (HCC) management is carried out in Italy and to point out the organizational key variables useful for an economic assessment, considering that Italy is among the European States with the highest incidence of HCC according to recent published data and that HCC is the final and highest cost health state along the natural history of liver diseases. **METHODS:** A questionnaire was set up jointly by clinicians (hepatologists and infectivologists), pharmacoeconomists and HTA experts, and submitted to 9 centers in order to collect epidemiology and management data. The survey consisted of a series of questions regarding HCC patients: gender and age, HCC etiology, BCLC (Barcelona Clinic Liver Cancer) staging at diagnosis, current treatments, hospitalization regimens, number and description of diagnostic/outpatient procedures, other relevant concurrent pathologies. The survey was administered to patients in four Italian centers of excellence for liver diseases with well-established experience in treating HCC patients. **RESULTS:** A total of 596 questionnaires were collected, the majority of which regarding male patients (79%), with a mean age of 67. Etiology proved to be mainly HCV-related (56%) and most patients underwent full hospitalization (81%) with a mean duration of 16.5 days, with a wide variability among centers, concerning both diagnostic procedures (CT, MRI, ecography…) and treatments (surgery, liver transplantation, drugs…). **CONCLUSIONS:** The collected data show a major heterogeneity, linked to the different etiology and epidemiology of the disease along the peninsula, well characterized by a number of published studies, but prove to be very helpful in describing the current situation regarding HCC in Italy. This descriptive analysis will be useful to set up a prospective study with the aim to implement an economic model able to compare different treatments and diagnostic procedures, and including organizational aspects in accordance to a cluster-randomized logic.

PGI9
INCIDENCE OF ANASTOMOTIC LEAKS AFTER COLORECTAL SURGERIES USING HOSPITAL EPISODE STATISTICS IN THE UNITED KINGDOM
Riebman J[1], Lim S[1], Gao X[2], Delatore P[1], Wan Y[2]
[1]Ethicon, Inc, Somerville, NJ, USA, [2]Pharmerit International, Bethesda, MD, USA
OBJECTIVES: Reported incidence of gastrointestinal anastomotic leaks after colorectal surgeries varies across regions, mainly due to different definitions of anastomotic leaks. A recent study using Premier Perspective administrative database reported 6.18% incidence of post-operative anastomotic leaks in US. The objective of this study is to apply a similar definition of anastomotic leaks from the US study and estimate incidence of anastomotic leaks after colorectal surgeries in UK. **METHODS:** Hospital Episode Statistics database was used to identify patients receiving colorectal surgeries from January 2007 to December 2011. The index colorectal surgeries included colectomy, hemicolectomy, sigmoid colectomy, and low anterior resection identified by OPCS-4 codes. The anastomotic leak event was defined by re-intervention (OPCS-4 codes) or diagnosis (ICD-10 codes) within 30-day window following index colorectal surgeries. The re-intervention included re-operation, re-anastomosis, stent, colostomy, image guided drainage, abscess, and washout. The diagnosis was generalized acute peritonitis. Chi-square and t tests were used to compare demographic characteristics between patients who had leaks and those who did not. **RESULTS:** A total of 132,045 patients (mean age: 65 years, 50% male) received colorectal surgeries during 2007-2011. Of these, 8,434 (6.38%) had anastomotic leaks within 30 days of the colorectal surgeries. 2.63% leak cases were defined by reoperation, 1.82% by diagnosis of generalized acute peritonitis, 1.24% by colostomy, 0.9% by image guided drainage, 0.7% by washout, 0.62% by abscess, 0.42% by re-anastomsis, and 0.01% by stent. Patients with leaks tended to be slightly younger and male, had higher Charlson Co-morbidity Index, and more likely admitted through emergency vs. elective surgery (p<0.05). **CONCLUSIONS:** Our study indicated an incidence rate of 6.38% for post-operative anastomotic leaks among patients undergoing colorectal surgeries in UK, compared to 6.18% leak rate seen in the US study. The results highlight the importance of future study in evaluating the impact of anastomotic leaks on patient's clinical and economic outcomes in UK.

PGI10
RESOURCE USE AND DISEASE PROGRESSION AMONG HCV-POSITIVE PATIENTS
Degli Esposti L[1], Sangiorgi D[1], Rizzardini G[2], Perno CF[3], Buda S[1]
[1]CliCon Srl, Ravenna, Italy, [2]"L. Sacco" Hospital Authority, Milano, Milano, Italy, [3]University Hospital Tor Vergata, Rome, Italy
OBJECTIVES: Hepatitis C is an infectious disease affecting the liver; chronic infection can lead to cirrhosis. The actual standard of care in Italy is Peginterferon+ribavirin. Our aim was to describe treatment patterns, disease progression and resource use in HCV. **METHODS:** An observational retrospective cohort analysis based on 4 Local Health Units administrative and laboratory databases was conducted. HCV-positive patients between January 1, 2009- December 31, 2010 were included and followed-up for one year. To explore which covariates were associated to disease progression (cirrhosis, hepatocellular carcinoma -HCC-, death for any cause), Cox proportional hazards models were performed. **RESULTS:** A total of 9514 patients were analyzed, 55.6% male, age 58.1±16.1; 5.8% had HIV, 3.0% HBV, 1.6% HCV+HBV+HIV, 26.1% cirrhosis, 4.3% HCC. Genotypes frequencies were 1a (17%), 1b (34%), 2 (24%), 3 (19%), 4 (5%). Antiviral treatment was not administered to the majority of patients (79%); the main factors affecting this decision were: age >65 years (44%), females (46% VS 40% of treated), cirrhosis (30%), normal liver enzymes (28%), ongoing substance/alcohol abuse (7%), HCC (5%). Disease progression in the observed timeframe was less frequent among treated patients (incidence rate per 100 patients/year: cirrhosis 2.1±0.7 VS 13.0±1.0, HCC 0.5±0.3 VS 3.6±0.5, death for any cause 0.5±0.3 VS 6.4±0.7); at multivariable Cox regression models, hazard ratios were, respectively, 0.30 (0.21-0.43), 0.41 (0.19-0.92) and 0.24 (0.12-0.48) (all p<0.05). For genotype1 subgroup, results were not statistically different between Peginterferon+ribavirin treated and untreated (cirrhosis: HR=0.82 (0.32-2.11), p=0.682). The annual expenditure for HCV management (drugs, hospitalizations, outpatient services) was €4,700 per patient. **CONCLUSIONS:** Actual standard of care was not widely used, especially for sensitive subgroups such as women and the elderly; in this context, there is an urgent need for treatment, but current therapies do not appear to be adequate for all patients, especially those with genotype1, which represents 60% of the Italian HCV population.

GASTROINTESTINAL DISORDERS – Cost Studies

PERITONITIS FLUID TREATMENT IN RUSSIAN FEDERATION: EVALUATION OF ECONOMICAL BURDEN IN REAL CLINICAL PRACTICE
Yagudina R, Kulikov A, Murashko M
I.M. Sechenov First Moscow State Medical University, Moscow, Russia
OBJECTIVES: Peritonitis is an inflammation of the parietal and visceral peritoneum which is accompanied by severe general condition of the body. Peritonitis as a complication of acute inflammatory diseases of the abdominal cavity is found in 15-20% of clinical observation and about 6% of all surgical procedures on the abdominal cavity. The research is conducted in regard to 4 technologies of fluid treatment, including: Reamberin, Ringer's solution, Plasma-Lyte and Sterofundin. **METHODS:** Retrospective researches analysis is considered as a source of data on real effectiveness. The decree of the RF Ministry of Health No 669 of October 15, 2007 is considered as a source of data on commonly used drugs and medical services. The price-list of the Clinical Center of the First MSMU charges for medical services is incorporated as the source of data on the price of medical services. **RESULTS:** The calculation is made for the hypothetical group of 100 patients with the peritonitis disease. During the cost of illness analysis of peritonitis the direct costs are estimated. They include: medical services and pharmacotherapy in the period of the residence in the in-patient department(euro per patient: 9 241 for Reamberin, 10 554,8 for Ringer's solution, 9 755,7 for Plasma-Lyte and 9 756,4 for Sterofundin). The cost-effectiveness analysis(CEA) results are the following: 10 241 euro for Reamberin, 12 639 euro for Ringer's solution, 12 302 for Plasma-Lyte and 11 683 euro for Sterofundin. The budget impact analysis(BIA) show that the 100% switching patients from Ringer's solution, Plasma-Lyte and Sterofundin to Reamberin saves respectively: 131 377 euro, 51 465 euro and 51 538 euro. **CONCLUSIONS:** Cost of illness analysis, CEA and BIA of peritonitis indicate that the scheme of therapy including Reamberin is the dominant one. Total costs are 9 241 euro per patient, CER is 10 241 euro per saved live.

PGI12
ORGANIZATIONAL AND ECONOMIC ISSUES RELATED TO THE INTRODUCTION OF BOCEPREVIR IN THE TREATMENT OF PATIENTS WITH GENOTYPE 1 CHRONIC HEPATITIS C IN ITALY
La Torre G[1], Miele L[2], Mannocci A[3], Saulle R[3], Giraldi G[3], Unim B[3], Ursillo P[3], Semyonov L[3], Colamesta V[3], Melcarne R[3], Biolato M[2], Cecchi R[1], Villari P[3], De Giusti M[3]
[1]Sapienza University of Rome, Rome, Italy, [2]Catholic University of Sacred heart, Rome, Italy, [3]Sapienza University of Roma, Roma, Italy
OBJECTIVES: To present the critical points concerning organizational and economic issues of the introduction of boceprevir in the treatment of patients with genotype 1 chronic hepatitis C in Italy. **METHODS:** A budget impact analysis was conducted adapting the NICE (UK) scheme for this drug, using the Italian epidemiological context and the perspective of the National Health Service. The cost-utility analysis (CUA) was carried out using a Markov model comparing the triple therapy (TT) with peginterferon alfa, ribavirin and boceprevir to the double therapy (DT) with peginterferon alfa and ribavirin. Available Italian published scientific literature provided data source. The main outcome of the CUA was the incremental cost-effectiveness ratio (ICER). The organizational aspects

considered were: clinical management of patient with HCV chronic infection, access modalities, outpatient visit, planned and unplanned visits, hospital admission, role of the general practitioner (GP). **RESULTS:** The budget impact analysis shows that, considering both naïve and previously treated patients, the treatment with boceprevir has an impact on the National Health Service of almost €66 million for the first year. Compared to treatment with DT, the cost-utility analysis shows for the boceprevir-based treatment strategy an ICER of €8.622,00. The management of TT for its intrinsic complexity requires monthly outpatients visits, at least at the beginning of treatment, for monitoring the compliance to treatment, efficacy and side effects. A critical organizational point is potentially the request for boceprevir for each single patient by the medical prescriptor, who needs to fill in detailed form from the Italian Agency of Drug (AIFA). **CONCLUSIONS:** The impact of the introduction of boceprevir on the budget is high, even if the ICER is favourable. Patients' management is particularly complex and there is the need for an alliance between the patients, their relatives, GPs and specialized centers.

PGI13

ENTERAL DIETS (ED): A COST-COMPARISON ANALYSIS FOR IN-HOSPITAL PREPARATIONS BASED ON REAL WORLD OBSERVATION

Clark OAC[1], Paladini L[1], Nishikawa AM[1], Borges L[1], Arraiz A[2]
[1]*Evidencias, Campinas, Brazil,* [2]*Danone Medical Nutrition, São Paulo, Brazil*

OBJECTIVES: ED can be administered based on three different systems – powder based (Po), open, liquid (Op), and a completely closed (Cl). There are differences in the preparation, installation and delivery and in the diarrhea rates among them. Our aim was to measure the total costs for each system, considering the resources needed to prepare, delivery administer and discard of each system (hidden costs). **METHODS:** We measured the human (nurse, nutritionist, auxiliary personnel) resources involved in ED preparations in three hospitals of Brazil. Then, we calculated the costs of the process, based on the minimum official wage for each professional category. After, we added the costs of the diets and materials needed to the infusion. We used as base case a daily need of 1 000Kcal / patient. Additional analyses were performed to include the side effects of ED system. **RESULTS:** There were differences among the human resources needed for each system. Hidden costs were 63% of the total for Op, 58% for Po and 53% for Cl. Particularly, the nurse time varied from 18 minutes for Po and Op and 5 min for Cl for each infusion. Considering that and average patient would require daily 4 infusions of Po or Op, that represents a total of 72min of nurse time to these systems, against 5 min to Cl. Total daily costs, were Op US$ 62.05; Po US$ 50.75 and Cl US$48.03. If we consider the costs of side effects, such as diarrhea, the costs are: Op US$ 73.42; Po US$ 62.15 and Cl 56.35. This increase in the difference amog the costs is due to a lower incidence of diarrhea in Cl systems. **CONCLUSIONS:** There are many hidden costs on the ED systems. If we consider them Cl systems are less costly than Op and Po.

PGI14

COST ANALYSIS OF PROTON PUMP INHIBITORS IN THE TREATMENT OF ULCER DUODENUM IN UKRAINE

Iakovlieva L, Gerasymovà O, Mishchenko O, Kuznetsov I, Kyrychenko O, Tkachova O
National University of Pharmacy, Kharkiv, Ukraine

OBJECTIVES: Proton pump inhibitors (PPIs) are essential components schemes of antyhelicobacter therapy (AT) of peptic ulcer disease. The aim of research - to determine the costs of the use of PPIs in the traditional triple schemes AT (first and second line) of the working age patients with a duodenal ulcer in Ukraine. The objects of research - preparations of omeprazole, pantoprazole, rabeprazole, lansoprozol, ezomeprazol, which are present in Ukraine. **METHODS:** Cost analysis on the use of PPIs in the schemes of AT was performed per one patient for 14 days with the daily doses of drugs: omeprazole - 40 mg, pantoprazole - 80 mg, rabeprazole - 40 mg, lansoprozol - 60 mg, ezomeprazol - 40 mg (according to the recommendations of the "Maastricht IV", 2010). For determining the costs only the costs of the PPIs were taken into account. The prices of drugs were taken from the information system "Drugs" of Company "Morion" (December, 2012). The currency ratio of UAH to dollar (USA) on 10.12.12 was 7.99:1. To determine the range of costs for use of PPIs determined their trade names with the minimum and maximum costs for the AT. **RESULTS:** The range of costs for use of PPIs in the traditional triple schemes AT in Ukraine is wide enough, respectively: omeprazole - 1.15 - 19.15 $, pantoprazole - 5.11 - 49.28 $, lansoprozol - 5.14 - 10.66 $, rabeprazole - 4.27 - 63.40$, ezomeprazol 1.81 - 36.42$. **CONCLUSIONS:** Costs only for the use of PPIs in the schemes of AT of duodenal ulcer can be quite high in Ukraine. In this regard, the choice of PPIs for inclusion in the schemes of AT is advisable to use the results of pharmacoeconomic studies that will optimize the costs of the payer.

PGI15

ECONOMIC ANALYSIS OF USE OF HARMONIC DEVICES IN INPATIENT LAPAROSCOPIC CHOLECYSTECTOMY IN THE UNITED STATES

Cheng H[1], Hinoul P[1], Clymer J[1], Vaughn B[2]
[1]*Johnson & Johnson(Ethicon Endo Surgery, Inc), Cincinnati, OH, USA,* [2]*Johnson and Johnson(Ethicon, Inc), Somerville, NJ, USA*

OBJECTIVES: Harmonic® ultrasonic energy devices have been developed as a safer and more efficient alternative to traditional electrosurgery (monopolar and bipolar) in laparoscopic cholecystectomy. However, the economic impact on hospital cost has not yet been assessed in the United States. The aim of the study is to evaluate the total cost of laparoscopic cholecystectomy performed with an ultrasonic device versus electrosurgery from a hospital perspective. **METHODS:** A literature review was performed to identify publications via EMBASE and MEDLINE database. Nine randomized controlled studies were included in this analysis based on inclusion criteria. The clinical results were weighted based on No. of patients to calculate averages for both energy devices. The total departmental cost data for electrosurgery group were obtained from a large US payor (PREMIER database) to apply the clinical findings to calculate the cost for the Harmonic group. The total cost in laparoscopic cholecystectomy with two energy devices was compared to determine which modality is more cost effective. **RESULTS:** The total case cost using an ultrasonic device in an inpatient laparoscopic cholecystectomy is $7701 v.s. electrosurgery is $8637. The use of an ultrasonic device provides a hospital savings of $936 per patient treated. The savings mainly resulted from shorter operating time (13 Minutes) and decreased hospital stay (0.7 days). **CONCLUSIONS:** Although the instrument cost is higher for the ultrasonic device, the total procedural cost is lower compared to electrosurgery. Utilization of the Harmonic® ultrasonic device in laparoscopic cholecystectomy can lead to substantial cost savings for US hospitals.

PGI16

MORTALITY AND MEDICAL COSTS ASSOCIATED WITH LIVER-RELATED DISEASES AMONG PATIENTS WITH HEPATITIS C VIRUS(HCV) INFECTION IN TAIWAN

Tang CH, Huang KC, Huang SY, Wu YT, Lin KD
Taipei Medical University, Taipei, Taiwan

OBJECTIVES: To examine the mortality and medical costs during the first and the 2nd year following the onset of the five liver-related diseases, i.e. HCV infection, compensated cirrhosis (CC), decompensated cirrhosis (DCC), hepatocellular carcinoma (HCC), or liver transplantation. **METHODS:** Patients with HCV infection and patients who transitioned to the health state of liver-related disease were identified from the National Health Insurance Research Database (NHIRD) during 2008-2010 if any outpatient/inpatient service with primary diagnosis code of 070.54 for HCV infection or 571.5 for CC occurred, or if patients registered in the Registry of Catastrophic Illness with diagnosis code of 571.5 for DCC, 155 for HCC or V42.7 for post liver transplantation. Dual infection patients with diagnosis code of 070.30 for HBV or 042-044 for HIV were excluded. The date that the outpatient visit/admission with the diagnosis code associated with each health state of liver-related disease firstly occurred was defined as the index date. Regression-adjusted medical costs associated with each health state of liver-related disease within 1st year and 2ndyear after the index date were estimated by generalized linear regression model. Excess risks of death for patients with DCC, HCC, or liver transplantation were assessed by Cox proportional hazard model. **RESULTS:** First year total medical costs associated with HCV infection, CC, DCC, HCC and liver transplantation were NT$25,345, NT$49,793, NT$187,428, NT$197,835, NT$487,816, respectively. The 2nd year total medical costs associated with DCC, HCC and liver transplant were NT$194,016, NT$176,167 and NT$270,009, respectively. Patients in the health states of DCC, HCC and liver transplantation posed higher risk of death with hazard ratio of 14.5when compared with their matched control counterparts. **CONCLUSIONS:** Liver-related diseases followed by HCV infection impose substantial economic burdens to the National Health Insurance in Taiwan. Effective treatment for HCV infection may imply potential savings to the society.

PGI17

RESOURCE UTILIZATION AND COSTS FOR PATIENTS WITH INFLAMMATORY BOWEL DISEASES IN ITALY: A POPULATION-BASED ASSESSMENT

Madotto F[1], Fornari C[1], Fiorino G[2], Ardizzone S[2], Bortoli A[2], Caprioli F[2], Cestari R[2], Conti S[1], Cortelezzi C[2], Mantovani LG[3], Massari A[2], Meucci G[2], Ravelli P[2], Vecchi M[2], Danese S[2], Cesana G[1]
[1]*University of Milano - Bicocca, Monza, Italy,* [2]*EPICO MICI LOMBARDIA Project, Milano, Italy,* [3]*Federico II University of Naples, Naples, Italy*

OBJECTIVES: To describe health care resource utilization in treating patients affected by inflammatory bowel diseases (IBD) and to assess the related direct costs to the Italian health care system (HS) in its most populated region. **METHODS:** A retrospective observational study was conducted using data from DENALI, a data warehouse that organizes and integrates the health care administrative databases of the national HS in Lombardy (northern Italy) with a probabilistic approach. The Italian HS provides universal coverage and records the accesses to health care services at regional level. We enrolled adult patients with Ulcerative Colitis (UC) or Crohn's Disease (CD) diagnosed during the period 2003-2009. Patients were classified in two cohorts in relation to the type of IBD and were followed until December 31st, 2009 to assess the mean annual consumption of resources (hospitalizations, pharmaceutical prescriptions, outpatient services) and the related costs incurred by HS. **RESULTS:** We identified 5,523 patients with UC and 3,321 with CD and the mean annual cost per-capita was €2,386 (95%CI: 2,241-2,516) and €2,699 (95%CI: 2,538-2,914) respectively. The breakdown of expense was similar in the cohorts: pharmacological treatments accounted for 37% , hospitalizations for 47% and outpatient services for 16%. Use of mesalamine was high in patients with UC and CD:94% and 88% of subjects was respectively prescribed at least one package during follow-up. High adherence (≥70%) to oral mesalamine was observed in 39% of patients with UC and in 24% of CD cohort. Less than 6% of patients used biologics, which were used only from 2008. **CONCLUSIONS:** This study confirms that patients with IBD represent a considerable economic burden for the Italian HS: prescribed drugs, especially mesalamine, account for a substantial proportion of health care costs. The results underline the importance of administrative databases and the need for further research, since the recent widespread use of biologics for treating IBD.

PGI18

UTILISATION AND COSTS OF INPATIENT AND OUTPATIENT SERVICES AMONG PATIENTS WITH IRRITABLE BOWEL SYNDROME- A STUDY USING THE CLINICAL PRACTICE RESEARCH DATALINK (CPRD)

Murray-Thomas T[1], Dedman D[1], Canavan C[2], West J[2], Card T[2]
[1]*Medicines and Healthcare Products Regulatory Agency, London, UK,* [2]*University of Nottingham, Nottingham, UK*

OBJECTIVES: Irritable bowel syndrome (IBS) is a common functional gastrointestinal disorder. We assessed utilisation of secondary care services and associated costs among patients with IBS. **METHODS:** IBS was identified by medical diagnosis and/or prescribing in the UK primary care setting. Patients had ≥12 months of medical history prior to diagnosis. Absolute resource use and expenditure were assessed post IBS and over four years (01/04/2008-31/03/2012) using Hospital Episode Statistic data. Inpatient admission, outpatient attendance and length of stay for any cause including IBS related conditions were assessed. Inpatient costs for the period were estimated using allocated Health Resource Group coded data. Outpatient costs

were estimated using national average reference costs based on treatment speciality. Costs of medications prescribed in secondary care were not included. Total, mean and annual visits and costs were estimated and stratified by gender, age and treatment speciality. Prices were adjusted to 2011/2012. **RESULTS:** We identified 79,303 patients with IBS with an average follow-up of 3.38 years. Of these patients, 46,814(59%) had ≥1 contact with secondary care for any cause; 22,685(48.5%) patients attended outpatient services only. Patients using secondary care had about 2 hospitalizations on average and 3-4 outpatient visits annually. Mean inpatient stay declined from 4 days in 2008/2009 to 3 days in 2011/2012. The total cost of hospitalisation during the period was over £114 million, including about £35(30%) million for emergency inpatient admissions and £33.8 million for outpatient attendance. Digestive disorders accounted for around 30% of inpatient admissions and 21% of expenditure incurred. Mean cost of inpatient admissions for digestive conditions was £1,993, average costs per patient was £4,871 and £2,779 for elective and emergency visits respectively. **CONCLUSIONS:** Utilisation and costs of secondary care among IBS patients is substantial, not only for the management of IBS and related conditions, but also for other co-morbid medical conditions.

PGI19

INTERIM RESULTS FROM THE BURDEN OF BOWEL DYSFUNCTION IN SPINAL CORD INJURY STUDY

Mittmann N[1], Bannon G[1], Hassan S[1], Seung SJ[1], Kee P[1], Cartolano NS[1], Pinto PM[1], Smith K[2], Craven C[3], Wolfe D[4]
[1]*Sunnybrook Health Sciences Centre, Toronto, ON, Canada,* [2]*Providence Care, Kingston, ON, Canada,* [3]*Toronto Rehabilitation Institute, Toronto, ON, Canada,* [4]*Parkwood Hospital, St. Joseph's Health Care, London, ON, Canada*

OBJECTIVES: There are approximately 40,000 Canadians living with spinal cord injury (SCI). Most individuals with SCI experience some type of bowel dysfunction (BD), which can contribute to a high burden in individuals and caregivers, and a decrease in quality of life. This study aims to identify and measure resources, costs, health preference and quality of life associated with BD and its management in a cohort of SCI individuals living in a community setting in Ontario over a 6-month period. **METHODS:** This study is a prospective, observational study with 80 adult participants being recruited at three SCI clinics in Ontario, Canada. Questionnaires are completed by participants over a 6-month period (baseline, three weekly and five monthly). Information related to demographics, BD (e.g., neurogenic bowel dysfunction score), health preference (e.g., Health Utility Index (HUI) Mark 3) and resource utilization (e.g., physician, medication, caregiver burden, etc.) attributed to BD is being collected. **RESULTS:** Results from three clinics are being evaluated. 45 participants have completed the questionnaires to-date. The majority of participants are male (60.00%). Mean time since SCI was 20.2±13.7 (2 – 42) years. Twenty (44.4%) participants were employed. At baseline, the mean neurogenic BD score was 14.37±6.05 (0 – 31). At 6 months, the score was 12.9±6.6 (2 – 28). The mean HUI-3 score at baseline was 0.17±0.31 (-0.37 – 0.95). At 6 months the score was 0.19±0.33 (-0.37 – 1). The mean number of visits to primary care physicians by participants was 8.3 ± 8.6 (0 – 33) times over 6 months. 52.21% of participants required caregiver assistance. 12.50% of participants required a mean 1.21±0.67 (0.3 – 2) hours daily assistance with their bowel routines. **CONCLUSIONS:** Results from the 45 SCI individuals with BD indicate a variety of health resources are being utilized over a 6-month period. Future results will have resources associated with BD quantified.

PGI20

A COST-OF-ILLNESS ANALYSIS OF HEPATITIS C IN GREECE

Athanasakis K[1], Arzoumanidou D[1], Petrakis I[1], Karampli E[1], Theodoropoulou T[2], Retsa MP[2], Kyriopoulos J[1]
[1]*National School of Public Health, Athens, Greece,* [2]*MSD Hellas, Athens, Greece*

OBJECTIVES: Hepatitis C virus infection is accompanied by significant disease and economic burden internationally. In absence of data, the objective of this study was to estimate the annual cost of hepatitis C treatment and follow-up, in Greece, according to disease severity. **METHODS:** Resource utilization for "typical patient" scenarios, according to disease stage, was elicited via an expert panel (gastroenterologists and hepatologists from major hospital units of the Greek NHS). Patients were stratified based on disease stages; (a) fibrosis stage F0 to F3, (METAVIR score) (b) compensated cirrhosis (c) decompensated cirrhosis – first year (d) decompensated cirrhosis – subsequent years (e) hepatocellular carcinoma (HCC) (f) liver transplant (LT) – first year (g) LT – subsequent years. Direct cost categories included yearly costs of consultations, laboratory and PCR tests, medications and hospitalization. Cost calculations were based on 2012 fixed fees and prices, from a Social Security perspective. **RESULTS:** The average direct annual cost per patient for F0-F3 patients was estimated at 642.7€, excluding the cost of medications or 12,685.1€, including the cost of standard of care with PegIFN/ribavirin regimen. Respective annual costs for states (b) to (g) were: 636.7€ (compensated cirrhosis), 2,250.1€ and 5,934.5€ (decompensated first and subsequent years), 21,890.1€ (HCC), 35,051.1€ and 4,001.5€ (LT first and subsequent years). Main cost variables were hospitalizations [48.9%, 53.3% and 88.2% of the total cost for states (c) (d) and (g)], medications [93.2% and 50.1% of the total cost for states (e) and (g)] and laboratory tests [89.1% and 83.0% of the total cost for states (a) and (b)]. **CONCLUSIONS:** This cost analysis of chronic hepatitis C in the Greek health care system has shown that there is a substantial economic burden, significantly increasing in advanced liver disease. Standard and new interventions that slow disease progression or achieve virus eradication are deemed necessary from a clinical and economic perspective.

PGI21

SYSTEMATIC REVIEW: THE ECONOMIC BURDEN OF CROHN'S DISEASE IN EUROPE IN ADULTS AND CHILDREN

Floyd D[1], Langham S[1], Chevrou-Severac H[2]
[1]*PHMR Associates, London, UK,* [2]*Nestlé Health Science, Vevey, Switzerland*

OBJECTIVES: Crohn's Disease (CD) is an immune-mediated disorder characterised by recurrent chronic uncontrolled inflammation on the intestinal mucosa affecting any part of the gastrointestinal tract. Although most people with CD lead active lives, five years after onset 15% to 20% of patients are disabled by their disease to some degree. The purpose of the current review was to evaluate recent data from the literature on the economic burden of CD in European countries in adults and in children, using US data as a benchmark. **METHODS:** A systematic review of the data on economic and humanistic burden for adults and children in Germany, France, UK, Italy, Spain and the US was performed covering the period 2000 to 2012. The methods followed recommendations and guidance published by the Centre for Reviews & Dissemination, York, UK. **RESULTS:** Of the 425 publications identified on the economic burden of CD, 92 were suitable for further evaluation, and 39 were selected. Among these studies, five presented total costs of CD management in adults, ranging from €1,425 to €15,521 per patient depending on the country. Most of the direct costs were due to hospitalisations, surgeries or use of biologic drugs. Patients with severe disease and those requiring hospitalisation had disproportionately higher costs (5.6 times higher) compared to those with milder disease. Direct costs were more important for relapsing disease than quiescent disease. Only one European study focused on children using biologic drugs as maintenance treatment. **CONCLUSIONS:** Research on the economic burden of CD management has been mainly published on adults in the US and UK, with limited data from Germany, Spain and Italy. Similar data for paediatric CD is almost non-existent. More research is needed to better understand the economic and humanistic burden faced by paediatric CD patients in Europe.

PGI22

ECONOMIC CONSEQUENCES OF NONALCOHOLIC STEATOHEPATITIS IN THE UNITED STATES

Lin F[1], Thomas S[2], Gruenberger JB[3], Calado F[3]
[1]*Novartis, East Hanover, NJ, USA,* [2]*Novartis Pharmaceuticals Corporation, East Hanover, NJ, USA,* [3]*Novartis Pharma AG, Basel, Switzerland*

OBJECTIVES: Non-alcoholic steatohepatitis (NASH) is a progressive form of non-alcoholic fatty liver disease that becomes increasingly prevalent with the growing epidemic of obesity and diabetes in the United States. An estimated 3% of adults in the US have NASH and are at high risk of severe liver complications, including cirrhosis, liver failure, and hepatocellular carcinoma (HCC). Despite the rising prevalence, data on its economic and clinical consequences are limited. The objective of this study was to predict the long-term clinical and economic consequences associated with the adult NASH patients in the US over the next 20 years, including NASH-related complications, morbidity, mortality and health care costs. **METHODS:** We developed a Markov cohort model to estimate the consequences of NASH, which included six Markov states: NASH, compensated cirrhosis, decompensated cirrhosis, HCC, liver transplantation, and death. We estimated the number of liver complications, their associated health care costs, and NASH-related mortality. **RESULTS:** By 2033, 53.1% and 32.8% of NASH patients would progress to compensated and decompensated cirrhosis, respectively. An estimated 13.7% of patients developed HCC, and 13.3% eventually underwent liver transplantation. Among NASH patients, 16% had Type II diabetes and 44.8% and 23.8% would develop decompensated cirrhosis and HCC. The model predicted hepatic-related mortality of 24.2% and 12.6% for patients with and without diabetes, while the cardiovascular-related mortality was estimated to be 12.1% and 8.8% for NASH patients with and without diabetes. The direct health care cost was estimated at $72,170 and $120,165 for patients with and without diabetes, resulting in a total of $574 billion health care cost over the next 20 years. **CONCLUSIONS:** NASH patients were expected to have substantial risks for chronic liver failure and result in an increasing financial burden on the US health care system.

PGI23

ECONOMIC EVALUATION OF TIPS COMPARED TO LARGE VOLUME PARACENTESIS IN PATIENTS WITH REFRACTORY ASCITES

Burke M[1], Hacking N[2], Wright M[2], Iqbal K[3], Craig J[4]
[1]*NICE, Manchester, UK,* [2]*Southampton General Hospital, Southampton, UK,* [3]*WL Gore & Associates Ltd., Livingstone, UK,* [4]*York Health Economics Consortium Limited, York, UK*

OBJECTIVES: Undertake an economic evaluation of transjugular intrahepatic portosystemic shunts (TIPS) compared to large volume paracentesis (LVP) in patients with refractory ascites. Paracentesis, although the standard treatment for refractory ascites, does not treat the underlying portal hypertension. According to a meta-analysis of individual patient data, using TIPS with bare metal stents (BMS) rather than LVP showed improved survival and lower recurrence of ascites although with a higher number of hepatic encephalopathy episodes (Salerno 2007). **METHODS:** A Markov economic model was developed to measure the incremental resources and costs associated with TIPS, using costs for ePTFE covered stent-grafts configured for TIPS (SG), compared to LVP over two years. Clinical data came mainly from the meta-analysis, whilst health care costs were from UK national databases. **RESULTS:** Use of TIPS rather than LVP to manage refractory ascites was estimated to save almost £1,600 per patient over 2 years. Total costs for the treatment pathway were £8,310 with TIPS and £9,907 with LVP treatments. The TIPS implantation, together with the associated costs of re-intervention & complications cost £6,760 but there were estimated savings of £8,360 from avoided LVP procedures. Using TIPS to manage refractory ascites, rather than LVP, was cost saving under all the sensitivity analyses undertaken. **CONCLUSIONS:** The economic model demonstrated a total cost reduction of £1,600 per patient from TIPS with SG compared to LVP. Actual cost reduction may be greater as clinical data used from the meta-analysis was for BMS. Compared to BMS, SG have improved patency resulting in fewer reinterventions (Bureau 2007) which may reduce overall costs.

PGI24

AN ECONOMIC EVALUATION COMPARING EPTFE COVERED STENT-GRAFTS CONFIGURED FOR TIPS WITH BARE METAL STENTS IN PROCEDURES FOR THE TREATMENT OF PORTAL HYPERTENSION COMPLICATIONS

Burke M[1], Hacking N[2], Wright M[2], Iqbal K[3], Craig J[4]
[1]*NICE, Manchester, UK,* [2]*Southampton General Hospital, Southampton, UK,* [3]*WL Gore & Associates Ltd., Livingstone, UK,* [4]*York Health Economics Consortium Limited, York, UK*

OBJECTIVES: Establish the potential resource and cost savings from using ePTFE covered stent-grafts configured for TIPS (SG) compared to bare metal stents (BMS). Most centres have adopted SGs to treat portal hypertension because of their reduced re-intervention rates, elimination of regular monitoring of patency and improved survival. However there is no published economic analysis identifying the related cost consequences. Understanding the improved efficiencies is essential in the current financial environment. **METHODS:** A Markov economic model was developed to measure the incremental costs of the initial procedure and re-interventions with SG compared to BMS. Re-intervention procedures included angioplasty (67%), introducing a balloon expandable stent (22%) or a second stent (10%). The adverse events were hepatic encephalopathy and clinical relapse. Clinical data came mainly from a published RCT (Bureau 2007), whilst health care costs were from UK national databases. **RESULTS:** Compared to BMS, using SG in TIPS resulted in a cost saving of over £1,150 per patient over 2 years. Modelling 100 patients, compared to BMS, the SG cohort had 25 fewer re-interventions including angioplasties, saving 41 hours staff time in theatre and 16 inpatient days; with fewer cases of encephalopathy (16), recurrent ascites (8), variceal bleeds (5) and a markedly reduced mortality (13). **CONCLUSIONS:** The model showed that ePTFE covered stent-grafts configured for TIPS reduced mortality and re-interventions, saved theatre time and bed-days, and reduced overall costs despite the higher initial device cost.

PGI25

AN ECONOMIC EVALUATION OF THE TRIPLE HCV TREATMENT REGIMEN FOR G1 NAÏVE PATIENTS IN THE GREEK HEALTH CARE SYSTEM

Athanasiadis A[1], Konstantopoulou T[2], Koulouris S[3]
[1]*Foundation for Economic & Industrial Research (IOBE), Athens, Greece,* [2]*Roche (Hellas), Greece, Athens, Greece,* [3]*Roche (Hellas), Athens, Greece*

OBJECTIVES: In 2011 EMA approved Boceprevir and Telaprevir with PegIFN and Ribavirin for the treatment of Genotype 1 Chronic Hepatitis C patients. In 2013 the Greek and other European HCV Guidelines recommend treatment allocation in G1 naïve patients according to the IL28B genotype or the RVR profile. Local studies indicate that the IL28B-CC and the RVR (+) rates are approximately 30%. The objective of this study was to implement this guidance and examine whether triple therapy with PegIFNa-2a+RBV and the two protease inhibitors, Boceprevir or Telaprevir, constitutes a cost-saving option for the treatment of naïve G1 patients in the Greek health care setting. **METHODS:** For the needs of this analysis, a cost-consequence model was utilized, to compare the costs incurred when: i) patients with IL28B CC aplotype (30%) were treated with SoC (PegIFN alfa-2a + RBV) and patients with IL28B non-CC aplotypes (70%) were treated with triple therapy and ii) all patients are treated with triple therapy. The economic inputs are based on official and publically available sources while the clinical inputs are taken from published clinical trial results. The number of patients treated per year was provided by local bibliography. **RESULTS:** The total cost to treat 509 naïve patients with triple therapy was €13,8 million compared to €10.9 million to treat based on IL28B allocation, maintaining the same SVR rate of 70% for either of the treatment strategies. **CONCLUSIONS:** This personalized approach based on a baseline predictor of response such as the IL28B profile was proven to be a cost-saving resource allocation choice compared to the option of treating all treatment naive patients with triple therapy, providing SVR rates of 70% and a constrain of cost for the Greek health care system of €2,9 million/year (aprox.25%).

PGI26

COST-EFFECTIVENESS OF EARLY VERSUS DELAYED HEPATITIS C VIRUS (HCV) TREATMENT WITH TELAPREVIR/PEGYLATED INTERFERON ALPHA/RIBAVIRIN TRIPLE THERAPY IN ADULTS AGED 40+ IN FRANCE

Lee A[1], Granados D[2], Hulbert E[3], McGarry L[4], Fleischmann J[5]
[1]*OptumInsight, Burlington, ON, Canada,* [2]*Janssen France, Issy les Moulineaux, France,* [3]*OptumInsight, Eden Prairie, MN, USA,* [4]*OptumInsight, Cambridge, MA, USA,* [5]*Janssen EMEA HEMAR, Neuss, Germany*

OBJECTIVES: To assess the cost-effectiveness of treating HCV infection (genotype 1) with telaprevir/pegylated interferon alpha/ribavirin (TPR) at METAVIR fibrosis stage F2 ("early") versus delaying treatment until progression to F3 ("delayed") from the French health care perspective. **METHODS:** A Markov model tracked the HCV+ French population aged 40+ over a lifetime horizon to compare outcomes of early versus delayed treatment. Model health states are defined by fibrosis stage (F0-F4) and complications of advanced HCV including decompensated cirrhosis, hepatocellular carcinoma, liver transplant, and death. During each 1-year cycle, individuals may remain in the current health state, respond to treatment or progress, at probabilities determined by disease status, age at infection, current age, gender, and treatment received. Transition probabilities, treatment efficacy, health-state utilities, resource utilization and costs were derived from published literature and standard French sources. Costs and outcomes were discounted at 4.0% for 30 years and 2% thereafter. Cost-effectiveness was assessed as incremental cost per life year gained (LYG) and QALY gained. **RESULTS:** An estimated 203,644 French residents aged 40+ years are diagnosed with HCV in 2013. Treating with TPR at F2 versus F3 is projected to result in 135,240 versus 113,728 individuals treated, at an incremental lifetime cost of €654.65M from the French health care perspective. Early treatment avoided 2,205 HCV-related deaths and saved 11,384 life-years, and 17,599 QALYs, at a cost of €57,506/LYG and €37,197/QALY gained. Results are most sensitive to efficacy parameters, time horizon, and discount rates and least sensitive to diagnosis and treatment parameters. **CONCLUSIONS:** Treating HCV-infected individuals at F2 is expected to results in better clinical outcomes but at higher cost compared to delaying treatment until the individual progresses to F3. Earlier treatment with TPR should be considered as an efficient choice by the French health care system based on its estimated incremental cost-effectiveness ratio of €37,197/QALY gained.

PGI27

COST-EFFECTIVENESS OF LINACLOTIDE COMPARED TO ANTIDEPRESSANTS IN THE TREATMENT OF IRRITABLE BOWEL SYNDROME WITH CONSTIPATION IN SCOTLAND

Fisher M[1], Falqués M[2], Rance M[3], Taylor DCA[4], Lindner L[2]
[1]*WG Consulting Healthcare Limited, High Wycombe, UK,* [2]*Almirall S.A., Barcelona, Spain,* [3]*Almirall UK, Uxbridge, UK,* [4]*Ironwood Pharmaceuticals, Cambridge, MA, USA*

OBJECTIVES: Presently, linaclotide is the only EMA approved therapy indicated for the treatment of irritable bowel syndrome with constipation (IBS-C). This study sought to determine the cost-effectiveness of linaclotide compared to antidepressants for the treatment of adults with moderate to severe IBS-C who have previously received antispasmodics and/or laxatives from the perspective of the Scottish National Health System (NHS). **METHODS:** A Markov model was created to estimate costs and QALYs over a 5-year time horizon from the perspective of NHS Scotland. Health states were based on treatment satisfaction (satisfied, moderately satisfied, not satisfied) and death. Transitions between states were based on satisfaction data from the linaclotide pivotal studies (MCP-103-302 and LIN-MD-31) and Scottish general all-cause mortality statistics. Treatment costs were calculated from the British National Formulary. NHS resource use and disease-related costs for each health state were estimated from Scottish clinician interviews in combination with NHS Reference costs. Quality of life was based on EQ-5D data collected from the pivotal studies. Costs and QALYs were discounted at 3.5% per annum. Uncertainty was explored through extensive deterministic and probabilistic sensitivity analyses. **RESULTS:** Over a 5-year time horizon, the additional costs and QALYs with linaclotide were £659 and 0.089, resulting in an incremental cost-effectiveness ratio of £7,370 per QALY versus antidepressants. Results were most sensitive to health state transitions probabilities, NHS resource use assumptions and health state utilities. Threshold analyses showed that the effectiveness of linaclotide would have to be at least 11% lower than the base case to exceed a willingness-to-pay threshold (WTP) of £20,000 per QALY. Based on the probabilistic sensitivity analysis, the likelihood that linaclotide was cost-effective at a WTP of £20,000 per QALY was 74%. **CONCLUSIONS:** Linaclotide is a cost-effective treatment for adults with moderate to severe IBS-C who have previously received antispasmodics and/or laxatives.

PGI28

COST-EFFECTIVENESS OF HEPATITIS C VIRUS (HCV) TREATMENT WITH TELAPREVIR/PEGYLATED INTERFERON ALPHA/RIBAVIRIN TRIPLE THERAPY VERSUS WAITING FOR NEW REGIMENS IN FRANCE

Lee A[1], Granados D[2], Hulbert E[3], McGarry L[4], Fleischmann J[5]
[1]*OptumInsight, Burlington, ON, Canada,* [2]*Janssen France, Issy les Moulineaux, France,* [3]*OptumInsight, Eden Prairie, MN, USA,* [4]*OptumInsight, Cambridge, MA, USA,* [5]*Janssen EMEA HEMAR, Neuss, Germany*

OBJECTIVES: To assess the cost-effectiveness of treating chronic HCV infection (genotype 1) with currently available telaprevir+pegylated interferon alpha/ribavirin (TPR) compared to waiting for new regimens with improved efficacy (hypothetical treatment assumed) currently in development from the French health care perspective. **METHODS:** A Markov model tracked the adult naïve HCV+ French population over a lifetime horizon. Model health-states are defined by METAVIR fibrosis stage (F0-F4) and complications of advanced HCV (decompensated cirrhosis, hepatocellular carcinoma, liver transplant, and death). During each 1-year cycle, individuals may remain in the current health-state, respond to treatment or progress, at probabilities determined by disease status, age at infection, current age, gender, and treatment received. Individuals were eligible for treatment in F2-F4. Transition probabilities, treatment efficacy, health-state utilities, resource utilization and costs were derived from published literature and standard French sources. The efficacy of a new hypothetical treatment regimen was based on currently published results; cost for the new treatment was assumed at €50,000 for a full treatment (excluding PR backbone). **RESULTS:** A treatment lag of 1, 2, and 3 years resulted in 142,777 individuals, 140,417 individuals, and 137,930 individuals being treated by the new regimen, respectively, versus 145,010 with immediate TPR treatment. The new treatment option resulted in additional life years saved (range 11,230-27,536), QALYs gained (range 12,528-29,359), and prevented more HCV-related deaths (range 3,839-5,756). Total costs incurred were higher for the new regimen versus TPR, from the health care perspective. ICERs were €58,294.49/QALY, €73,295.59/QALY, and €107,403.02/QALY gained for a 1, 2, and 3 year treatment lag, respectively. **CONCLUSIONS:** These findings suggest waiting for new regimens currently in development should not be the most efficient choice to be considered by French Health care system. Waiting for new treatments should yield better clinical outcomes, but with higher costs and ICERS that may be challenging for the payer.

PGI29

CROHN'S DISEASE: AN ECONOMIC ASSESSMENT OF BIOLOGICAL DRUGS IN ITALY

Cicchetti A[1], Gasbarrini A[2], Ruggeri M[1]
[1]*Università Cattolica del Sacro Cuore, Rome, Italy,* [2]*Università Cattolica del Sacro Cuore, Rome, Italy, Italy*

OBJECTIVES: This study had a dual objective: verify the improvements in quality of life (QoL) due to biological drugs administration and evaluate their cost-effeffectiveness versus the standard steroid-based therapy in Crohn's Disease (CD). High-cost biological drugs' efficacy is well-established, but they still lack of cost-effectiveness studies. **METHODS:** A survey was prepared with clinicians and pharmacoeconomists and administered in 9 centers in Italy. The questionnaire was set up to detect QoL through a Visual Analogue Scale and EQ-5D and to assess patients' profile (age, gender, job) and clinical features (time-to-first diagnosis, current and at-diagnosis Montreal classification, current and at-diagnosis treatments, past surgical procedures, hospitalizations). Collected data were then used in a statistical regression model and an economic assessment complete of probabilistic sensitivity analysis was performed comparing costs and utilities of the considered treatments. **RESULTS:** A total of 348 questionnaires were collected, giving back a

population with a mean age of 42, 52% male, 58% actively working, 52% undergone surgical interventions, and 66% being already administered previous therapies. The mean number of outpatients visits was 4.15/year, with 0.23 hospitalizations/year. At diagnosis, the 55% of patients were treated with steroids, while only the 3% with biological drugs. At the time of survey administration, the 9% of patients were treated with steroids, and the 50% with biological drugs. The statistical model showed a significant QoL improvement due to biological drugs therapy of about 6%. The economic assessment showed biological drugs to be cost-effective only in more severe settings of patients (€ 26.000 – 38.000 /QALY), but not in mild and moderate CD (€ 58.000 to 328.000 /QALY). **CONCLUSIONS:** The results of the analysis, based on simulation models and real practice data, are consistent with evidences from other countries and thus biological drugs can be considered a good health care investment in severe cases of CD.

PGI31

IS THE USE OF ESOMEPRAZOLE IN GASTROESOPHAGEAL REFLUX DISEASE A COST-EFFECTIVE OPTION IN POLAND?

Petryszyn P, Staniak A

Wroclaw University of Medicine, Wroclaw, Poland

OBJECTIVES: To compare the cost-effectiveness of therapy of different forms of GERD with esomeprazole and other proton pump inhibitors (PPIs) in Poland. **METHODS:** Results of clinical trials with esomeprazole in comparison with equivalent doses of other PPIs in the treatment of erosive esophagitis (EE - 6 RCTs), non-erosive reflux disease (NERD – 1 RCT) and GERD maintenance therapy (2 RCTs) were systematically reviewed. Meta-analysis was conducted as appropriate, relative risk values were calculated. Cost data derived from Polish Ministry of Health and pharmacies in Wroclaw. Cost effectiveness ratios and incremental cost effectiveness ratios were assessed for 100 patients. **RESULTS:** In the treatment of EE esomeprazole was significantly more effective than other PPIs. For 4 weeks therapy ICER values (esomeprazole 40 mg vs. omeprazole 20 mg and pantoprazole 40 mg) were 614 PLN and 906.33 PLN respectively if original and generic esomeprazole products were taken into account and 118.22 PLN and 162.67 for generics. For 8 weeks therapy ICER values (esomeprazole 40 mg vs. omeprazole 20 mg, lansoprazole 30 mg and pantoprazole 40 mg) were: 430.45 PLN, 329.47 PLN and 325.33 PLN (for generics and original esomeprazole) and 1869.58 PLN, 2677.89 PLN and 1812.67, respectively for generics. Differences in effectiveness of NERD therapy with esomeprazole and other PPIs were not statistically significant. The replacement of pantoprazole 20 mg with more effective esomeprazole 20 mg in the 6-month maintenance therapy was associated with a marginal cost of 3078.01 PLN (only generics included) and 4590.91 PLN (for original esomeprazole and generics) respectively. **CONCLUSIONS:** 1) For 4 and 8 weeks therapy of EE esomeprazole has to be recognized as a cost-effective option. 2) In the NERD treatment the choice of PPI should be based on the price of medicament. 3) The use of esomeprazole in GERD maintenance therapy is associated with a very high ICER.

PGI32

COMPARATIVE ECONOMIC ANALYSIS OF RETREATMENT STRATEGIES FOR HCV GENOTYPE 1 PATIENTS IN RUSSIA

Ivakhnenko O[1], Omelyanovsky VV[2], Rebrova O[3], Khachatryan G[1]

[1]*Autonomous non-profit organization "National Centre for Health Technology Assessment", Moscow, Russia,* [2]*The Russian Presidential Academy of National Economy and Public Administration, Moscow, Russia,* [3]*Pirogov Russian National Research Medical University, Moscow, Russia*

OBJECTIVES: To assess the cost-effectiveness of retreatment with pegylated interferon and ribavirin in combination with boceprevir of HCV genotype 1 patients, who failed to respond to previous treatment, in comparison with absence of retreatment and retreatment with pegylated interferon and ribavirin. **METHODS:** We performed cost-effectiveness analysis. Based on the published data we modeled the number of long-term unfavorable outcomes of HCV (liver cirrhosis, hepatocellular carcinoma and death) in the hypothetic cohort of HCV genotype 1 patients following one of three retreatment strategies: "no treatment" (NT), "peginterferon+ribavirin" (PR) and "peginterferon + ribavirin + boceprevir" (PRB). We have evaluated direct medical costs for a short-term (only cost of HCV retreament) and for a long-term (costs of medical care for adverse outcomes) periods for all strategies. Costs were estimated on the basis of average price for the drugs and reimbursement rates for medical services in the compulsory medical insurance system. Incremental cost-effectiveness ratio (ICER) for PR and PRB strategies vs NT were calculated as additional cost per unfavorable outcome avoided. **RESULTS:** It is expected that in hypothetic cohort of 10000 HCV genotype 1 patients 58,1% would fail to respond to the treatment. The estimated costs of retreatment for this group were EURO 69,07 mln in case of PR strategy and EURO 235,58 mln for PRB. The cumulative number of unfavorable outcomes of HCV during 25-year period would be 5075 cases for NT strategy, 4262 for PR and 2012 for PRB. The long-term costs of NT strategy were EURO 205,35 mln, EURO 168,37 mln in case of PR strategy and EURO 81,4 mln for PRB. ICER for PR strategy was EURO 44532 and for PRB - EURO 36379 per unfavorable outcome avoided. **CONCLUSIONS:** The use of PRB strategy is efficient as it allows reducing the number of unfavorable outcomes of HCV at a lesser cost.

PGI33

COST-UTILITY ANALYSIS OF LINACLOTIDE IN THE TREATMENT OF IRRITABLE BOWEL SYNDROME WITH CONSTIPATION IN BELGIUM

Gerlier L[1], Caekelbergh K[1], Lamotte M[1], Kinoo D[2], Meurgey F[3], Berdeaux G[1]

[1]*IMS Health HEOR, Vilvoorde, Belgium,* [2]*Almirall, Vilvoorde, Belgium,* [3]*Oukelos sprl, Brussels, Belgium*

OBJECTIVES: Linaclotide is the first drug that received EMA approval in the management of irritable bowel syndrome in its constipation form (IBS-C). We aimed at estimating the cost-utility of linaclotide, compared to standard of care (SoC) in Belgium. **METHODS:** The analysis was conducted using data from a 6-month randomized trial of linaclotide 290µg once daily (N=401) versus placebo (N=403), which provided monthly EQ-5D measures, treatment duration, adverse events (diarrhoea) and responder status (abdominal pain/discomfort improvement ≥ 30% from baseline). Belgian EQ-5D tariffs were used to estimate utilities and trapezoidal rule to estimate QALYs. A Delphi panel including 6 general practitioners and 5 gastroenterologists provided the resource use for IBS-C patients in different treatment phases: controlled with 2nd line or new drug else non-responders. Patient-level costs were applied using first-order Monte-Carlo simulation (gamma distribution function; per treatment arm and responder status; health care payer perspective). A stopping rule was implemented at 4 weeks for linaclotide non-responders. A non-parametric bootstrap with 1000 replications was performed. The 2012 Belgian GDP per capita (€34,000) was used as willingness-to-pay threshold. **RESULTS:** The responder rate at 4 weeks was 54.6% with linaclotide vs. 35.5% with SoC. There was on average 0.0129 QALYs gained per linaclotide patient vs SoC at 6 months (0.385 vs. 0.372), with an incremental cost of €95 (€1,376 vs. €1,280). The incremental cost-effectiveness ratio of was €7,364/QALY. The diarrhoea costs were higher with linaclotide (+€19.4) while savings were observed in clinical management (-€132.2) compared to SoC. Using a willingness-to-pay threshold of €34,000/QALY, 66% of the simulations were cost-effective. **CONCLUSIONS:** Due to improvements in abdominal pain/discomfort complaints in patients receiving linaclotide, savings were generated in the clinical management of IBS-C compared to SoC. Using the GDP per capita as willingness-to-pay threshold, linaclotide seems a cost-effective alternative to today SoC of IBS-C in Belgium.

PGI34

COST-EFFECTIVENESS OF CAPSULE ENDOSCOPY (PILLCAM®) IN THE DIAGNOSIS OF SMALL BOWEL CROHN'S DISEASE

Makino K[1], Arora N[1], Tilden D[1], Bingham W[2]

[1]*THEMA Consulting Pty. Ltd., Pyrmont, Australia,* [2]*Given Imaging ANZ, North Ryde, Australia*

OBJECTIVES: Capsule endoscopy (CE) is a minimally invasive endoscopic technology that uses a disposable capsule containing a small camera to monitor and diagnose disorders of the gastrointestinal tract such as Crohn's disease and obscure gastrointestinal bleeding. This study examines cost-effectiveness of CE (PillCam®, Given Imaging) for the diagnosis of small bowel Crohn's disease in Australia. **METHODS:** A modelled cost-utility analysis of CE vs. no CE followed by empiric treatment is performed. The population under consideration consists of patients with a clinical suspicion of Crohn's disease despite non-confirmatory results with prior endoscopic/radiologic tests. Due to a lack of alternative diagnostic options, many of these patients currently receive empiric treatment, whereby a diagnosis is achieved based on long-term response to therapy for Crohn's disease. CE increases the proportion of patients who receive a confirmed diagnosis for Crohn's disease or for other bowel conditions (represented by irritable bowel syndrome in the model), thereby allowing more patients to promptly receive a correct treatment and thus improving the down-stream treatment effectiveness. The administration of correct and effective treatment, as aided by CE, thus produces additional QALYs and potential cost savings, which are captured by the current model. The model has a 12-month time horizon and takes the perspective of Australian health care system. **RESULTS:** CE is estimated to produce 0.057 additional QALYs over the 12-month period. The additional cost of CE is in part offset by cost savings arising from the improved treatment selection. The incremental cost-effectiveness ratio (ICER) is estimated to be $23,672 per additional QALY. **CONCLUSIONS:** The current model suggests CE is highly cost-effective. Importantly, the target patient population currently experience a unique and special unmet clinical need because the currently funded endoscopic/radiologic technologies are unable to provide a confirmed diagnosis. The evidence for cost-effectiveness clearly supports that CE represents good value for money.

PGI35

THE COST-UTILITY OF FIDAXOMICIN AS COMPARED TO CURRENT STANDARD TREATMENT IN THE MANAGEMENT OF CLOSTRIDIUM DIFFICILE INFECTIONS IN BELGIUM

Lamotte M[1], Vellopoulou K[2], Richir K[3], Smets J[3], Grabe K[4], Coppens K[3]

[1]*IMS Health HEOR, Vilvoorde, Belgium,* [2]*IMS Health, Vilvoorde, Belgium,* [3]*Astellas, Brussels, Belgium,* [4]*Astellas Pharma Europe Ltd., Chertsey, UK*

OBJECTIVES: Clostridium difficile infection (CDI) is one of the most common hospital acquired infections in industrialised countries. CDI is responsible for severe morbidity, partly driven by the high proportion of patients experiencing a recurrence after an initial successful response to treatment. In Belgium, CDI incidence and mortality has more than doubled between 1998 and 2007. The aim of this study was to assess the cost-utility of fidaxomicin as compared to current standard treatment for managing CDI in Belgium. **METHODS:** A Markov model with a 1-year time horizon and 10-day cycles was developed to compare fidaxomicin, metronidazole and vancomycin in patients with all CDI and two subpopulations (severe CDI and first recurrence of CDI). Clinical data from two pooled published phase-3 trials (fidaxomicin vs. vancomycin) were used along a mixed treatment comparison of fidaxomicin vs. metronidazole. Treatment paths and data input were approved during an advisory board. Costs of first episode and recurrent CDI hospitalizations were taken from the IMS Hospital Disease Database. Cost per quality-adjusted life-year (QALY) gained was calculated from the health care payer perspective. **RESULTS:** The model showed cost savings and QALY gained versus vancomycin and metronidazole. Fidaxomicin versus an average of these comparators delivered benefits for all CDI patients (-1,100€; 0.008 QALY), for severe CDI (-1,300€; 0.009 QALY) and for first recurrence CDI (-1,500€; 0.009 QALY). One-way sensitivity analyses revealed that time horizon and the odds ratio of recurrence with fidaxomicin had most affect on the results. Applying a cost-effectiveness threshold of €30,000 per QALY gained, probabilistic sensitivity analysis showed acceptable cost-effectiveness in 80% of all CDI cases. **CONCLUSIONS:** Based on the available clinical data the model showed that fidaxomicin dominates vancomycin and metronidazole generating additional QALYs with cost-savings not only in patients with all CDI, but also in subpopulations with severe CDI or a first recurrence.

PGI36

THE COST EFFECTIVENESS OF PEGINTERFERON ALFA AND RIBAVIRIN FOR THE TREATMENT OF HEPATITIS C IN CHILDREN AND YOUNG PEOPLE

Cooper K[1], Baxter L[2], Loveman E[1], Hartwell D[1], Frampton G[1]
[1]*University of Southampton, Southampton, UK,* [2]*London School of Hygiene, London, UK*

OBJECTIVES: To assess the cost-effectiveness of peginterferon α-2a and peginterferon α-2b in combination with ribavirin compared to best supportive care (BSC), for the treatment of chronic hepatitis C virus (HCV) in children and young people aged 3 to 17 years. **METHODS:** A Markov state-transition economic model of chronic HCV in children and young people was developed that extrapolated the impact of sustained virological response (SVR) on life expectancy, quality-adjusted life expectancy and lifetime costs. The model was adapted from one previously developed for adults. A systematic review was conducted of the clinical effectiveness of the treatments, and the health related quality of life for patients with hepatitis C. Uncertainty was explored through probabilistic and deterministic sensitivity analyses. **RESULTS:** Seven studies were identified that were relatively small and of generally poor quality. Estimates of SVR were similar for peginterferon α-2a (60%) and peginterferon α-2b (58%), whilst the SVR for no treatment was assumed to be zero. From this model, peginterferon alfa (α-2a or α-2b) in combination with ribavirin was more effective and cheaper than BSC. Sensitivity analyses suggest that the results were generally robust to all changes to the structural assumptions and input parameters. The model results were most sensitive to changes to the discount rate, time horizon, SVR and baseline fibrosis of the cohort. **CONCLUSIONS:** Treatment of children and young people with peginterferon alfa (α-2a or α-2b) and ribavirin may be an effective therapy. Peginterferon alfa (α-2a or α-2b) in combination with ribavirin is cost-effective compared with BSC. However, the available evidence is of poor quality. The views expressed in this paper are those of the authors and do not necessarily represent the views or policies of the UK HTA programme or Department of Health.

PGI37

COST-UTILITY ANALYSIS OF TELAPREVIR IN COMBINATION WITH PEGINTERFERON ALPHA AND RIBAVIRIN IN PREVIOUSLY UNTREATED PATIENTS WITH CHRONIC HEPATITIS IN A ROMANIAN SETTING

Paveliu MS[1], Comsa R[2], Mircea R[2]
[1]*Titu Maiorescu University, Bucharest, Romania,* [2]*Mind Research&Rating s.r.l., Bucharest, Romania*

OBJECTIVES: To estimate the cost-effectiveness in Romanian setting of triple therapy with Telaprevir and Peginterferon/Ribavirin (TVR+PR) compared with PR alone in previously untreated patients with hepatitis C virus (HCV) infection from the third payer - National Health Insurance Agency (NHIA). **METHODS:** We used the published data of efficacy from large international trials and published Markov models to estimate the cost-effectiveness of this new HCV serine protease inhibitor (telaprevir) using the specific local cost and epidemiological data. The superior results shown by Jacobson IM et all in ADVANCE trial - (Telaprevir for previously untreated chronic hepatitis C virus infection) for telaprevir - 75% sustained virologic response compared with 44% for PR alone. The discount rate was 3% for both cost and efficacy. Cost were extracted from NIHA tarrifs, Minister of Health drugs price catalog and from previous published data. The reference patient was a 45-year-old male with chronic liver disease due to chronic HCV infection. Time horizon was set patient life time. The clinical outcomes and Utilities for all health states were taken from ADVANCE phase-3 trial. The comparator was Peginterferon 2alfa with ribavirin. The effectiveness was measured in quality-adjusted life years (QALY). The cost of secondary drug reactions were not included in the model. **RESULTS:** Incremental cost effectiveness ratio (ICER) for telaprevir in combination with PR compared to PR alone was 23291 €/1 gained QALY. **CONCLUSIONS:** As in Romania HTA is only at the beginning, health authorities has to evaluate the most cost-effective strategy to follow for treatment of patients with chronic hepatitis as ICER of telaprevir in combination with PR compared with PR alone is reaching or is above the level recommended by Word Health Organisation as upper threshold (3 GDP/capita – Romania's GDP/capita is 6200Euro). Further CUA should be performed, including for guided therapy and treatment designated to previous treated patients.

PGI38

THE CURRENT MANAGEMENT AND COSTS OF IRRITABLE BOWEL SYNDROME WITH CONSTIPATION IN BELGIUM: A 2-ROUND EXPERT SURVEY

Caekelbergh K[1], Gerlier L[1], Lamotte M[1], Kinoo D[2], Meurgey F[3], Berdeaux G[1]
[1]*IMS Health HEOR, Vilvoorde, Belgium,* [2]*Almirall, Vilvoorde, Belgium,* [3]*Oukelos sprl, Brussels, Belgium*

OBJECTIVES: Patients suffering from irritable bowel syndrome (IBS) with constipation (IBS-C) receive laxatives as first line therapy. In spite of these laxatives most of them experience failure. We aimed at describing the current management and its costs of Belgian IBS-C patients who failed first line treatment. **METHODS:** A 2-round Delphi panel was conducted including general practitioners (GP) and gastroenterologists. The type and frequency of medical resources used per year as second-line IBS-C therapy (consultations, exams/tests, drugs, hospitalizations) were collected, reflecting the expert's own practice in the first round and finding a Belgian consensus in the second round. Two patients' profiles were defined: second line current management and third line management in case of second line failure. Unit costs (2012 INAMI/RIZIV tariffs) were assigned to the resources used to calculate a cost per patient-year and a range based on the distribution of experts' answers. **RESULTS:** Eleven experts participated (6 GPs/5 gastroenterologists). The drugs prescribed in second line were laxatives (71.4%, mainly osmotics), spasmolytics (72.2%), pain killers (11.5%) and antidepressants (6.0%). There were 7.7 consultations per patient-year on average (GP: 5.3; specialists: 2.4). Emergency room visits occurred in 10.4% and diagnostic tests included thyroid function (79.1%), rectosigmoidoscopy (39.8%) and abdominal echography (36.8%). There were 0.97 IBS-related admissions to hospital per patient-year. After a second line failure, resource use increased with more laxatives (75.5%), antidepressants (24.6%) and pain killers (17.3%), 11.6 consultations (GP: 7.5; specialist: 4.1), 14.5% emergency room visits and 1.25 hospitalizations. Diagnostic tests were also more frequent (rectosigmoidoscopy: 49.3%; abdominal echography: 43.6%) except thyroid function (70.0%). The annual cost of second line was €2,114 [1,509;2,819] versus €2,920 [2,072;3,917] after second line failure. Hospitalizations accounted for about 75% of the costs. **CONCLUSIONS:** IBS with constipation leads to significant resource use and high costs certainly in case of second line treatment failure.

AGREEMENT BETWEEN CHILD AND PARENT SYMPTOM DIARY RESPONSES IN CHRONIC CONSTIPATION (CC) AND IRRITABLE BOWEL SYNDROME WITH CONSTIPATION (IBS-C): IMPLICATIONS FOR THE MEASUREMENT OF SYMPTOMS IN YOUNG CHILDREN

Holloway L[1], Arbuckle R[1], Carson RT[2], Dennee-Sommers B[3], Abetz-Webb L[1]
[1]*Adelphi Values, Bollington, UK,* [2]*Forest Research Institute, Jersey City, NJ, USA,* [3]*Endpoint Outcomes, Boston, MA, USA*

OBJECTIVES: Using patient-reported and observer-reported outcome measures to assess symptoms in children is challenging. While the child is arguably the most 'valid' reporter, parents may provide more reliable responses. Our aim was to assess the agreement in child and parent ratings of CC/IBS-C symptoms collected through an electronic daily diary (eDiary). **METHODS:** Separate child and parent eDiaries were developed to assess CC/IBS-C symptoms based on concept elicitation interviews with 64 children and 75 parents. The eDiaries were completed by 36 children (aged 6-11) and 30 parents for 5-9 days prior to cognitive debriefing interviews. eDiary data were compared for five symptoms: abdominal pain, bowel movement (BM) frequency, stool form/consistency, straining and rectal pain during defecation. **RESULTS:** There were moderate to high levels of agreement (children/parents selecting the same level of response on a given day) for all items, including 66.9% agreement for BM frequency; 70.2% for stool form and 72.5% for rectal pain. Children's reports of their 'tummy hurting' were consistent with parents seeing their child holding his/her tummy (68.5% agreement) and parents being told by the child that his/her tummy hurt (76.4% agreement). Children's reports of straining were consistent with parents observing their child making a face (60.4% agreement) and hearing their child grunt (52.3% agreement) during defecation. Across all symptoms, agreement was higher for 6-8 year old children and their parents (mean 76.9% agreement) compared to 9-11 year old children and their parents (mean 58.4%). **CONCLUSIONS:** The results present evidence of moderate to strong agreement between children's and parents' reports of core CC/IBS-C symptoms. Lower levels of agreement in ratings amongst 9-11 year old children and their parents may be due to parents being less aware of their child's symptoms.

PGI40

VALIDATING THE UNIDIMENSIONAL FATIGUE IMPACT SCALE (U-FIS) FOR USE IN CROHN'S DISEASE

Wilburn J[1], McKenna S[1], Twiss J[1], Kemp K[2], Campbell S[2]
[1]*Galen Research Ltd., Manchester, UK,* [2]*Manchester Royal Infirmary, Manchester, UK*

OBJECTIVES: Fatigue is usually defined as a feeling of exhaustion, lack of energy or tiredness and affects many aspects of daily living. Crohn's Disease (CD) is often associated with severe fatigue. The Fatigue Impact Scale (FIS) was developed to determine the mental and physical impacts of fatigue. It has been simplified and shortened to 22 items and shown by Rasch analysis to be unidimensional. This version is called the U-FIS. The study was designed to determine the validity of the U-FIS when used with CD patients. **METHODS:** CD patients were asked to complete the U-FIS and a subset of respondents completed it again two weeks later to assess test-retest reliability. Rasch analysis was applied to U-FIS data to determine unidimensionality. Construct validity was further assessed by relating scores on the U-FIS to those on the Crohn's Life Impact Scale (CLIQ) and the Nottingham Health Profile (NHP). **RESULTS:** A total of 158 CD patients (36.1% female; aged 16-79 years (mean: 42.4; SD 15.0)) completed the U-FIS, with 103 completing it a second time. Overall fit to the Rasch model was confirmed ($p = 0.61$) and no items misfit. Internal consistency (0.98) and reproducibility (test-retest reliability = 0.88) for the U-FIS were good. U-FIS scores correlated 0.79 with those on the CLIQ indicating the importance of fatigue to quality of life. U-FIS scores were also related as expected with NHP section scores. **CONCLUSIONS:** The U-FIS is a reliable and valid instrument for measuring fatigue in Crohn's Disease. These findings replicate those found with the use of the measure with patients who have Multiple Sclerosis. The U-FIS is valuable as it provides a holistic index of the impact of fatigue from the patient's perspective. The measure may prove valuable for use with patients who have a wide variety of chronic conditions.

PGI41

VALIDATION OF THE CROHN'S LIFE IMPACT QUESTIONNAIRE (CLIQ), THE FIRST PATIENT-REPORTED OUTCOME MEASURE SPECIFIC TO ADULTS WITH CROHN'S DISEASE

Wilburn J[1], McKenna S[1], Twiss J[1], Kemp K[2], Campbell S[2]
[1]*Galen Research Ltd., Manchester, UK,* [2]*Manchester Royal Infirmary, Manchester, UK*

OBJECTIVES: The study was designed to identify the final CLIQ – the first patient-reported outcome measure specific to adults with Crohn's Disease (CD) and determine its unidimensionality, reproducibility and construct validity. The measure has two scales; Activity limitations and needs-based Quality of Life (QoL). **METHODS:** CD patients were sent a package consisting of the CLIQ, the Nottingham Health Profile (NHP), the Unidimensional Fatigue Impact Scale (U-FIS) and a demographic questionnaire. A subset of respondents received a second questionnaire package 2 weeks later. Rasch analysis was applied to responses for item reduction and assessment of unidimensionality. Assessments of internal consistency, test-retest reliability and construct validity were also undertaken. **RESULTS:** The CLIQ was completed by 273 CD patients (65.6% female; aged 16-79 years (mean: 43.9; SD 15.1).

101 patients completed and returned the second package. Both scales had good overall fit to Rasch model (Chi^2 p = 0.35; Chi^2 p = 0.13 for activity limitations and QoL respectively) and unidimensionality of the scales was confirmed. No evidence of DIF by age or gender was found and the scales had good coverage of the measurement constructs. Internal consistency was 0.91 for the QoL scale and 0.93 for Activity limitations. Good reproducibility was observed (QoL 0.91, Activity limitations 0.89) and both scales were able to distinguish between self-perceived disease severity and general health status groups (p<.01). **CONCLUSIONS:** The CLIQ is the first CD-specific PRO and is truly patient-based as its content was generated directly from CD patients. It is well accepted, completed by patients and is easy to score. Both scales measure a clear unidimensional construct and generate valid total scores. The scales have good consistency, reproducibility and promising construct validity. Studies are planned to assess responsiveness. The CLIQ will prove to be an important tool for assessing Activity limitations and QoL in clinical audit, practice and trials.

PGI42

THE RELATIONSHIP BETWEEN IRRITABLE BOWEL SYNDROME WITH CONSTIPATION SYMPTOMS AND HEALTH-RELATED QUALITY OF LIFE

Buono JL[1], Taylor DCA[2], Spalding WM[2], Carson RT[1]
[1]*Forest Research Institute, Jersey City, NJ, USA,* [2]*Ironwood Pharmaceuticals, Inc., Cambridge, MA, USA*

OBJECTIVES: To identify symptoms significantly impacting health-related quality of life (HRQOL) and how changes in symptoms explain variability in HRQOL among adult patients with irritable bowel syndrome with constipation (IBS-C). **METHODS:** IBS-C symptom and HRQOL data were pooled from two Phase 3 trials (n=1602) assessing efficacy and safety of linaclotide, a guanylate cyclase-C agonist approved for adult treatment of IBS-C in the US and moderate to severe IBS-C in Europe. IBS-C symptoms measured included abdominal (bloating, cramping, discomfort, fullness, pain) and bowel (spontaneous bowel movement [SBM] and complete SBM [CSBM] frequency, stool consistency, and straining) symptoms. HRQOL measures included: a disease-specific Irritable Bowel Syndrome-Quality of Life questionnaire (IBS-QOL), and generic HRQOL measures, the EuroQol-5D (EQ-5D) and Short Form-12 (SF-12). Analysis of variance evaluated relationships between Week 12 change from baseline in IBS-C symptoms and HRQOL, controlling for demographics and baseline HRQOL. **RESULTS:** Changes in IBS-QOL overall score were most significantly impacted by changes in abdominal fullness, cramping, and straining (beta coefficients: -1.1, -1.3, -1.7, respectively). The full model explained nearly half of the changes in IBS-QOL (R-Square: 0.42). Changes in EQ-5D were primarily driven by changes in abdominal bloating, cramping, and straining (beta coefficients: -0.009, -0.009, -0.011, respectively, R-Square: 0.49). Changes in SF-12 physical and mental component summaries (PCS and MCS) were best explained by changes in bloating, cramping, and straining (beta coefficients: -0.41, -0.34, -0.53, respectively; R-square: 0.42), and abdominal fullness and CSBM frequency (beta coefficients: -0.59 and 0.26, respectively; R-square: 0.35), respectively. **CONCLUSIONS:** Improvements in abdominal cramping and straining at Week 12 compared to baseline were associated with improvements in HRQOL as measured by the IBS-QOL, EQ-5D and SF-12 PCS. Improvements in abdominal bloating and fullness, and increases in CSBMs were also associated with HRQOL improvements. Targeting improvement in specific IBS-C symptoms may result in increased patient HRQOL.

PGI43

THE IMPACT OF TYPE OF LIVER CONDITIONS ON THE PATIENTS' HEALTH RELATED QUALITY OF LIFE

Cortesi PA[1], Scalone L[1], Ciampichini R[2], Cozzolino P[2], Cesana G[1], Mantovani LG[3], Okolicsanyi S[1], Ciaccio A[1], Rota M[1], Valsecchi MG[1], Gentiluomo M[4], Gemma M[1], Grisola A[5], Scripo R[1], Pecere S[5], Pontisso P[6], Burra P[6], Mondelli M[7], Fabris L[6], Colledan M[5], Fagiuoli S[5], Belli LS[4], Strazzabosco M[1]
[1]*University of Milano - Bicocca, Monza, Italy,* [2]*Charta Foundation, Milan, Italy,* [3]*Federico II University of Naples, Naples, Italy,* [4]*Niguarda Hospital, Milan, Italy,* [5]*Azienda Ospedaliera Papa Giovanni XXIII, Bergamo, Italy,* [6]*University of Padua, Padua, Italy,* [7]*Fondazione IRCCS Policlinico San Matteo, Pavia, Italy*

OBJECTIVES: Liver diseases (LDs) have a high impact on morbidity, mortality and health-related quality of life (HRQoL). LDs may have different impact on patients' HRQoL. The aim of our study was to evaluate HRQoL in the major liver conditions: hepatitis B(HBV), hepatitis C(HCV), cirrhosis(compensated and decompensated), hepatocellular carcinoma(HCC), autoimmune hepatitis(AIH), primary biliary cirrhosis(PBC), primary sclerosing cholangitis(PSC), NAFLD/NASH, patients in the liver transplant list and post-transplant. **METHODS:** A naturalistic, prospective, multicenter study has been conducted to generate and validate a set of health care outcomes indicators for the major liver conditions. LDs patients (age>18 years) were enrolled in 3 major Italian medical centers and are still being followed up (median f-up:13 months). Within this study, socio-demographic, clinical and HRQoL were collected using the EQ-5D-3L. The HRQoL data was analyzed dividing the patients in sub-groups according to the most recently diagnosed and most severe condition. **RESULTS:** We enrolled 3,217 patients, 64.8% male, aged 19-91 (median=61) years; 95.0% of them filled in the EQ-5D at baseline visit. Patients in the HCC group were 22.6%; while in the AIH group were 1.6%. The highest percentage of problems in Mobility dimension (39.2%) was reported by decompensated cirrhosis sub-group, the highest percentage in Self-care (22.6%) and Usual Activities (47.1%) by patients in liver transplant list, in Pain/Discomfort (59.2%) by AIH and in Anxiety/Depression (57.8%) by PBC. The HBV sub-group reported the best HRQoL with a mean EQ-5D VAS of 77.8; while AIH and listed for liver transplant patients reported the worst HRQoL levels (mean EQ-5D VAS=67.7 and 63.5, respectively). **CONCLUSIONS:** our study shows how HRQoL is different between LDs and how it is negatively related with the clinical severity. Understanding the different impact of LDs on the patients' HRQoL could help physicians and decision makers to better estimate the burden of these conditions and to improve the quality of care.

PGI44

ECONOMIC AND QUALITY-OF-LIFE BURDEN OF MODERATE TO SEVERE IRRITABLE BOWEL SYNDROME WITH CONSTIPATION (IBS-C) IN SPAIN: INTERIM ANALYSIS OF THE IBIS-C STUDY

Mearin F[1], Fortea J[2], Valveny N[3], Cortes X[2], Lindner L[2], Prior M[2]
[1]*Centro médico Teknon, Barcelona, Spain,* [2]*Laboratorios Almirall S.A., Barcelona, Spain,* [3]*TFS, Barcelona, Spain*

OBJECTIVES: The IBIS-C study, currently ongoing, is the first to assess the burden of IBS-C in 6 European countries (France, Germany, Italy, Spain, Sweden, UK) . We present an interim analysis of the retrospective data from Spain. **METHODS:** This is an observational, retrospective-prospective (±6-months(m)) study in patients diagnosed in the last five years of IBS-C (Rome-III criteria) of moderate-to-severe degree (IBS-Symptom Severity Score(IBS-SSS)≥175). Quality-of-life(QoL) was assessed with the EuroQoL-5D(EQ-5D) and IBS-QoL. **RESULTS:** We included 46 patients (62% severe, mean(±SD) 44.6±12.2 years, 83% women, time since diagnosis 2.8±3.6 years). According to IBS-SSS, 94% had abdominal pain in the last month (62% of time) and 85% abdominal distention. Other prevalent symptoms were: constipation (96%), abdominal discomfort (72%) and bloating (59%). Mean IBS-QoL was 46±23, on a scale 0-100 (worst QoL), and the most affected domains were "food avoidance" (mean:64) and "health worry" (60). Mean EQ-5D was 51±20, on a scale 0-100 (best QoL), and 93% and 70% of patients, respectively, reported problems in pain/discomfort and anxiety/depression. In the previous 6m, 83% of patients consulted a primary care physician, and 89% a specialist (mostly a gastroenterologist)(mean(95%CI):2.8(1.4-4.3) and 2.0(0.9-3.1) visits, respectively). 20% of patients required emergency department visits or hospitalization (mean stay:1.3(0.6-1.9) days). 76% of patients underwent a diagnostic test (mean:2.1(1.3-2.9) tests). 89% of patients took medication (63% prescription drugs and 54% OTC medications), 26% received complementary therapies. The mean direct costs per patient for the National Health System(NHS) were €1,025/6m(549-1627) and the mean costs for the patient were €200/6m. 17% of patients had sick leave(mean:3.5 leaves; mean duration:58 days) and 46% had productivity losses(mean:49 hours). Mean indirect costs were €991/6m. Total costs amounted to €2216/6m. **CONCLUSIONS:** Moderate-to-severe IBS-C has a great impact on health care resource utilization and productivity of patients, and the results suggest significant costs to the NHS and society. QoL can be severely affected.

PGI45

HEALTH-RELATED QUALITY OF LIFE (HRQL) IN CHRONIC HEPATITIS C (CH-C) PATIENTS TREATED WITH SOFOSBUVIR CONTAINING INTERFERON-FREE REGIMENS

Younossi ZM[1], Stepanova M[1], Nelson D[2], Lawitz E[3], Nader F[1], Hunt S[4]
[1]*Inova Fairfax Hospital, Falls Church, VA, USA,* [2]*University of Florida, Gainesvillle, FL, USA,* [3]*Texas Liver Institute, San Antonio, TX, USA,* [4]*Inova Health System, Falls Church, VA, USA*

OBJECTIVES: Interferon-containing regimens for treatment of CH-C are associated with substantial side effects and significant impairment in HRQL. The aim of this study is to evaluate the effect of Interferon-free regimens on HRQL. **METHODS:** Three validated HRQL instruments, namely, Medical Outcomes Study-Short Form 36 (SF-36), CLDQ-HCV (Chronic Liver Disease Questionnaire-HCV) and FACIT-F (Functional Assessment of Chronic Illness Therapy-Fatigue) were administered to previously untreated CH-C patients (N=201) treated with interferon-free regimen (Sofosbuvir+Ribavirin) at baseline, during, and after treatment. Patients were randomized to receive 16 weeks of active treatment or 12 weeks of active treatment followed by 4 weeks of blinded placebo. Historical data for interferon containing regimens were available for all these questionnaires. **RESULTS:** Small decrements in most of the domains of all HRQL metrics were noted at weeks 4, 12, and 16 of active treatment regardless of the study arm (maximum observed decrements in HRQL summary scores between 3.3% and 8.8% compared to baseline, p<0.05). There were no differences between the study arms at all time points (p>0.05). These decrements were substantially better than historical data available for interferon-containing regimens (between 10.4% and 15.2% for the same scores, p<0.0001). By week 4 of follow-up after treatment, some of the social and emotional well-being-related domains of FACIT-F improved significantly compared to their own baseline (by 4.9-6.0%, p<0.05). At the end of 12-week follow-up, all those domains as well as domains of CLDQ-HCV (activity, emotional, worry, systemic domains) further improved (by 3.8-11.2%, p<0.05), while physical and functional well-being-related domains of FACIT-F and SF-36 returned to their baseline levels or improved moderately (by 3.1-8.3%, p<0.05). **CONCLUSIONS:** The impairment in HRQL in CH-C patients treated with an interferon-free regimen is minimal and diminishes soon after the end of treatment. This interferon-free regimen is associated with substantially better HRQL as compared to interferon-containing regimens.

SYSTEMATIC LITERATURE REVIEW IN MODERATE TO SEVERE ULCERATIVE COLITIS

Huisman E, Medic G, Eijgelshoven I, Weijers L, Karabis A
Mapi - HEOR & Strategic Market Access, Houten, The Netherlands

OBJECTIVES: Ulcerative colitis (UC) is a chronic inflammatory bowel disease. The objective of this systematic literature review (SLR) was to examine the evidence on the efficacy and safety of all available pharmacological interventions for moderate to severe UC. **METHODS:** A systematic literature search using a predefined strategy was performed in Medline®, EMBASE®, Medline-In-Process, Cochrane Library and BIOSIS from 1966 to 2013, to identify randomized controlled trials (RCTs) concerning the efficacy and safety of available treatments in adult patients with moderate to severe UC. Studies reporting on mild-moderate UC patients were included if they reported results for the moderate subgroup separately. No language restrictions were applied to the search. **RESULTS:** A total of 4344 abstracts were screened based on the predefined selection criteria, of which 4279 were excluded. In total, 65 publications, reporting results from 65 RCTs were included (49 double blind),

examining aminosalicylates (n=23), corticosteroids (n=10), immunosuppressants (n=15), biologics (n=16) and kinase inhibitors (n=1). Baseline patient characteristics, study design and outcomes were extracted, including: adverse events (AE) (reported in n=24 studies), serious AE (n=25), deaths (n=23), clinical remission (n=49), clinical response (n=33) and mucosal healing (n=11). Eleven different disease activity scales and four different endoscopic scales were used. The mean age of included patients ranged from 27 to 51, and the percentage of males from 28.6% to 87.5%. Due to large differences and different scales used for reporting efficacy it is not feasible to report the range across different scales. Safety endpoints were also reported inconsistently. The results per outcome are presented in a narrative way per treatment class. **CONCLUSIONS:** A comprehensive SLR performed which identified 65 RCT reporting on the efficacy and safety of pharmacological treatments in moderate to severe UC patients. Differences in patient population, disease severity, disease activity scales and trial duration are explored and presented.

PGI47

HOW THE PRICING STRATEGY OF 2ND GENERATION HCV DIRECT ANTIVIRAL AGENTS CAN AFFECT THE NUMBER OF TREATED PATIENTS IN ITALY AND THE NATIONAL DRUG BUDGET

Lanati EP[1], Lidonnici D[1], Cammà C[2]
[1]*MA Provider Srl, Milan, Italy,* [2]*University of Palermo, Palermo, Italy*

OBJECTIVES: To assess the impact of new HCV drugs pricing strategy on the number of potential treated/cured patients and on the Italian Healthcare Service budget, using a simplistic model to design different scenarios for second generation direct antiviral agents (DAAs). **METHODS:** We calculated the HCV drugs budget and the number of patients for setting a base case by summing a) AIFA values for HCV dual therapy drugs to assess the number of patients currently treated; b) triple therapy number of patients estimated from AIFA budget (210.000.000€ in total). We performed budget scenarios on two variables: 1) pricing strategy of more effective DAAs; 2) total HCV drugs budget. We calculated the number of treated and responder patients, considering only genotype 1 HCV to maintain a comparability between base case and future scenarios with new DAAs. **RESULTS:** The number of patients to be cured with stable budget vs base case are: 1) 9.000 (+56% vs. base case) with parity price vs. triple therapy; 2) 7.500 (+30% vs. base case) in case of a 20% premium price that would allow 8.300 patients to be treated. Assuming to double the allocated budget from payers (420.000.000€) and to reduce the new DAAs price by a 20%, 25.000 patients will be treated and 22.500 (+291% vs. base case) will be cured. **CONCLUSIONS:** This simplified analysis shows that more effective drugs can significantly increase the number of patients who could be treated and cured. In order to support these results, efforts from both payers (higher budget) and pharma companies (lower prices) are needed.

PGI48

EXPLAINING THE INCREASED HEALTH CARE EXPENDITURES AMONG INDIVIDUALS WITH CO-OCCURRING CHRONIC OBSTRUCTIVE PULMONARY DISEASE AND GASTROESOPHAGEAL REFLUX DISEASE: A COST-DECOMPOSITION ANALYSIS

Ajmera MR[1], Raval AD[1], Shen C[2], Sambamoorthi U[3]
[1]*West Virginia University, Morgantown, WV, USA,* [2]*The University of Texas MD Anderson Cancer Center, Houston, TX, USA,* [3]*West Virginia University School of Pharmacy, Morgantown, WV, USA*

OBJECTIVES: The objective of this study is to examine health care expenditures associated with Gastro-esophageal Reflux Disease (GERD) among elderly with Chronic Obstructive Pulmonary Disease (COPD) and understand the explanatory factors associated with incremental expenditures associated with (GERD). **METHODS:** The study utilized retrospective cross-sectional design. Data were extracted from multiple years (2006-2009) of the Medicare Current Beneficiaries Survey (MCBS). The analytical sample consisted of community dwelling elderly individuals with COPD (n = 3,821) identified using appropriate International Classification of Diseases, Ninth Revision, Clinical Modification (ICD-9-CM) codes. The key independent variable was defined as presence or absence of GERD. T-tests and ordinary least squares regressions (OLS) on log-transformed total health care expenditures were performed to analyze the association between health care expenditures with GERD among individuals with COPD. Blinder-Oaxaca decomposition analysis was performed to estimate contribution of factors towards explaining the excess health care expenditures. **RESULTS:** Among elderly individuals with COPD, the annual average health care expenditures were higher for those with GERD ($36,793 ± $1,387) as compared to those without GERD ($24,722 ± $800). Individuals with GERD had poorer health status, low physical activity profile, and higher rates of obesity. Furthermore, the rates of depression and anxiety were significantly higher among individuals with GERD compared to those without GERD. A decomposition technique revealed that nearly 30.9% of the incremental health care spending associated with GERD was due to the differences in characteristics such as Charlson's comorbitity score (17.5%), perceived health status (7.13%) and depression (5.85%). **CONCLUSIONS:** Our findings highlight the burden of comorbid conditions among those with COPD and GERD. This study reinforces the need to modify the care-delivery model from single-disease care approach to integrated/ multiple diseases care approach to manage the complex comorbid diseases, which may ultimately reduce the excess health care expenditures.

PGI49

DISPENSATION CHANNELS OF ANTI-TNFS IN INFLAMMATORY BOWEL DISEASE

Thivolet M[1], Rémuzat C[2], Kornfeld A[1], Toumi M[3]
[1]*Creativ-Ceutical, Paris, France,* [2]*Creativ-Ceutical France, Paris, France,* [3]*University Claude Bernard Lyon 1, Lyon, France*

OBJECTIVES: In The Netherlands, the funding for some high cost drugs and particularly biologics was transferred in 2012 to hospital pharmacy dispensation channel. A European study forecast (2012-2016) shown hospital dispensation as a very effective policy to reduce budget impact of branded biologics and increase savings related to biosimilars. Two biologics (anti-TNFs) are indicated for Inflammatory Bowel Disease (IBD) in EU with different mode of administration: infliximab (Intravenous) and adalimumab (Subcutaneous). The objective of this study was to compare the dispensation channel of anti-TNFs used in IBD across European (EU) top 5 countries. **METHODS:** We analyzed dispensation conditions using IMS data from 2011 and official local official websites, France (Haute Autorité de Santé and Health insurance drugs database), Italy (Agenzia Italiana del Farmaco), Spain (Ministerio de Sanidad Servicios Sociales e Igualdad), Germany (Gemeinsamer Bundesausschuss), United Kingdom (Department of Health). **RESULTS:** In UK, Spain, Italy, both infliximab and adalimumab dispensation were restricted to hospital channel. In Germany, both infliximab and adalimumab can either be dispensed through retail and hospital channels. In France, adalimumab was available either in hospital and retail channels under exceptional status, and infliximab was dispensed through hospital channels only. The differences across countries could not be related to products labels as they are all approved under European Medicines Agency (EMA) centralized procedure. **CONCLUSIONS:** It is unlikely that the gaps observed are only related to differences in health care services organization but rather budget constraint like in UK, Italy and Spain. In Germany and France, the two leading EU pharmaceuticals markets this is not yet the case. Hospital dispensation channel of biologics and biosimilars is a new way to generate savings mainly through tenders.

PGI50

PAEDIATRIC GASTROENTERITIS: DISEASE BURDEN, COST AND LOSS OF PRODUCTIVITY OF MALAYSIAN AND VIETNAMESE PARENTS

Azmi S[1], Reginald P[2]
[1]*Veras Research, Petaling Jaya, Malaysia,* [2]*Azmi Burhani Consulting, Petaling Jaya, Malaysia*

OBJECTIVES: The cost of paediatric gastroenteritis is poorly documented in Asia. This analysis reports findings of a survey on disease burden, cost and productivity loss caused by paediatric gastroenteritis in Malaysia and Viet Nam. **METHODS:** A survey was conducted between August 2012 and April 2013 targeting respondents in public spaces in Hanoi and Bac Giang, Viet Nam and Klang Valley, Malaysia. The surveys were self-administered and collected information on demographics, disease burden, cost and productivity loss. Descriptive analysis was conducted to report the overall findings using STATA SE 11.2. **RESULTS:** Survey questionnaires were completed by 245 and 307 respondents from Malaysia and Viet Nam, respectively. Over 90% of the respondents were parents of children below 10. Overall, 69% reported that their children experienced gastroenteritis requiring physician visits and 28% reported episodes requiring hospital admissions. Differences were noted in the treatment seeking patterns between the two countries. These differences influenced cost and productivity loss to the families of affected children. In Malaysia, a large proportion of parents (41.2%) reported hospitalisation cost to be more than USD 350 whereas in Viet Nam, a majority (74.6%) reported hospitalisation cost less than USD 34. Among these, 52.9% and 30.5% of Malaysian and Vietnamese parents paid out-of-pocket for hospital admission, respectively. The majority reported days off work of 2 to 5 days, however more parents in Viet Nam (23.7%) required greater than 6 days off work to care for their affected child compared to Malaysia (3.9%). **CONCLUSIONS:** Gastroenteritis has an impact on cost and productivity loss to parents of affected children in Malaysia and Viet Nam. However, there were several differences noted likely due to differences in GDP, health system and cultural factors.

PGI51

INFLAMMATORY BOWEL DISEASES IN ITALY: INCIDENCE TRENDS AND PATIENTS' CHARACTERISTICS

Fornari C[1], Madotto F[1], Fiorino G[2], Ardizzone S[2], Bortoli A[2], Caprioli F[2], Cestari R[2], Conti S[1], Cortelezzi C[2], Mantovani LG[3], Massari A[2], Meucci G[2], Ravelli P[2], Vecchi M[2], Danese S[2], Cesana G[1]
[1]*University of Milano - Bicocca, Monza, Italy,* [2]*EPICO MICI LOMBARDIA Project, Milano, Italy,* [3]*Federico II University of Naples, Naples, Italy*

OBJECTIVES: To assess the impact of inflammatory bowel diseases (IBD) in the Italian general population: incidence and time trends from 2003 to 2009, as well as population characteristics. **METHODS:** A retrospective observational study was conducted in Lombardy, an Italian region with about 10 million of inhabitants, using health care administrative databases of the national health care system (HS) which provides universal coverage. The main administrative databases were integrated in a data warehouse called DENALI using probabilistic record linkage. New cases of Crohn's Disease (CD) and Ulcerative Colitis (UC) were identified in the adult population between January 1, 2003 and December 31, 2009. Annual age-standardized incidence rates were computed separately for CD and UC using the population living in Lombardy at 2001 census. Moreover we evaluated patients' baseline main characteristics, coexisting chronic conditions and survival at December 31, 2009. **RESULTS:** The annual incidence rate per 100,000 person-years of IBD was 15.6 (95%CI 15.2-15.9); UC and CD incidences were 9.7 (9.4-10.0) and 5.9 (5.7-6.1) respectively. Incidence rates of both diseases were higher in men than in women. CD incidence was highest in subjects aged 20-24 (9.2, 95%CI 8.1-10.2) and decreased with age, while UC incidence was stable in the 20-65 year-old population. No time trends in UC and CD incidences were observed from 2003 to 2009, both in the whole study population and in gender and age-specific subgroups. The mean age at CD diagnosis was 44 years (±16.6 sd), which was lower than that at UC diagnosis (46 ± 16.6, $p<0.0001$). During a mean follow-up time of 3.4 years (± 2.0) 2.2% of IBD patients died. **CONCLUSIONS:** Our study provides updated estimates on current epidemiology of IBD in Italy. IBD incidence in Lombardy is lower than in northern Europe and the data confirm that UC incidence is higher than that of CD.

SENSORY SYSTEMS DISORDERS – Clinical Outcomes Studies

PSS1

INDIRECT COMPARISON OF THE EFFECT OF BIOLOGICS IN PATIENTS WITH PSORIASIS; A META-ANALYSIS OF RANDOMIZED, DOUBLE BLIND CLINICAL TRIALS IN BAYESIAN FRAMEWORK

Brodszky V, Mo M, Gulacsi L, Baji P, Balogh O, Péntek M
Corvinus University of Budapest, Budapest, Hungary

OBJECTIVES: The main aims of this systematic review were to identify all relevant literature on clinical efficacy for biological medications in patients with psoriasis and to conduct an up-to-date meta-analysis. **METHODS:** The following comparators were considered for this analysis: adalimumab, etanercept, infliximab, and ustekinumab. A MEDLINE search was conducted until March 2013. The Cochrane Highly Sensitive Search Strategy was applied to identify randomized controlled publications and was combined with 'psoriasis' MeSH terms and drug names. Randomized, controlled, clinical trials with adults with moderate-to-severe psoriasis where the full paper can be obtained were included. Evidences were combined in a mixed treatment comparisons in a Bayesian framework. Efficacy was measured by the 75% and 90% improvement of Psoriasis Area Severity Index (PASI) at three months were analysed. **RESULTS:** Nineteen trials were included in this indirect comparison; treatment arms with off-label dosages were excluded. Each biologic showed significantly more favourable effect than placebo with respect to any level of PASI response. Significantly more patients on infliximab treatment met PASI75 endpoint than on etanercept, adalimumab or ustekinumab, combined odds ratios (95% confidence intervals) were 5.34 (2.29-12.50), 7.49 (3.31-16.92) and 3.64 (1.62-8.20) respectively. Similarly, significantly more patients on infliximab treatment met PASI90 endpoint than on adalimumab or etanercept, odds ratios were 6.12 (1.07-34.86) and 7.78 (1.02-59.01). No significant differences in terms of PASI75 and PASI90 improvements were observed between adalimumab, etanercept or ustekinumab. **CONCLUSIONS:** All biologics demonstrated statistically significant improvements compared to placebo. This review also showed that infliximab was significantly more efficacious than other biologics.

PSS2

COMPARATIVE EFFECTIVENESS OF PEAK AND TROUGH EFFECTS OF BIMATOPROST 0.03%/TIMOLOL 0.5% PRESERVATIVE-FREE FIXED COMBINATION FOR THE TREATMENT OF OPEN-ANGLE GLAUCOMA AND OCULAR HYPERTENSION

Harvey B[1], Stradwick S[1], Brereton NJ[1], Shergill S[2], Wong W[3]
[1]*BresMed, Sheffield, UK,* [2]*Allergan Ltd., Marlow, UK,* [3]*Allergan Inc., Irvine, CA, USA*

OBJECTIVES: To evaluate the comparative effectiveness of bimatoprost 0.03%/timolol (BTFC) 0.5% preservative-free (PF) fixed combination solution in single dose vials (BTFC PF) for the treatment of glaucoma/ocular hypertension (OHT) compared to alternative combination therapies accounting for fluctuations in intraocular pressure (IOP). **METHODS:** A systematic review was conducted to identify randomised controlled trials investigating efficacy of combination therapies for the treatment of glaucoma/OHT; where efficacy is defined as IOP change from baseline. Maximum and minimum changes in IOP were used as a representation of peak and trough effects of medication. Prostaglandin/prostamide analog and timolol monotherapy trials were also included as key connectors. A Bayesian mixed treatment comparison (MTC) analysis was used to synthesise the resulting evidence base. Supportive probability of best and rankogram summary analysis were used to position treatments within the network based on efficacy. **RESULTS:** A total of 136 studies met the pre-determined MTC inclusion criteria in total; representing 24 unique treatment arms. BTFC PF was numerically superior to all treatments (monotherapies and combination therapies; preserved and PF therapies) in lowering IOP efficacy in both peak and trough analyses. This superiority was statistically significant ($p<0.05$) for 18/23 comparisons in both analyses. Lack of evidence is the likely reason for non-significance in remaining comparisons. The probability of the BTFC formulations (preserved or PF) being the best treatments in the network was 0.94 (94% chance) in the peak analysis and 0.90 (90% chance) in the trough analysis; BTFC PF specifically had a 57% chance in the peak analysis and 62% chance in the trough analysis. No other treatments had >6% chance. Overall ranking of BTFC PF and BTFC preserved in terms of IOP-lowering efficacy was 1st and 2nd respectively. **CONCLUSIONS:** BTFC PF showed the greatest clinical efficacy of any combination- or mono-therapy in reducing IOP from baseline in patients with glaucoma and/or OHT.

PSS3

BASELINE CHARACTERISTICS AND VITREORETINAL INTERFACE FEATURES IN PATIENTS WITH VITREOMACULAR TRACTION AND MACULAR HOLE FROM THE MIVI-TRUST CLINICAL PROGRAM

Lescrauwaet B[1], Koshy Z[2], Labourette A[3], Duchateau L[4]
[1]*Xintera Consulting, Leuven, Belgium,* [2]*University Hospital Ayr, Ayr, UK,* [3]*4Clinics, Paris, France,* [4]*Ghent University, Ghent, Belgium*

OBJECTIVES: There is limited published evidence on demographic and vitreoretinal interface (VRI) characteristics of patients with vitreomacular traction (VMT), including when associated with macular hole (VMT+MH). Establishing insights into the characteristics of untreated VMT patients may contribute to a better understanding of the burden of VMT disease. The objective of our analysis is to describe baseline patient characteristics and VRI features in patients with persistent VMT included in the phase 3 ocriplasmin studies. This analysis reports on VMT patients without MH (VMT) and VMT patients with MH (VMT+MH). **METHODS:** Two randomized, double-masked, placebo-controlled trials designed to determine efficacy and safety of ocriplasmin for the treatment of VMT comprising of 652 patients (VMT n=499; VMT+MH n=153). Baseline characteristics included patient demographics (age, gender); eye-disorder characteristics (time since diagnosis, visual acuity (VA) in study eye (SE); VA in non-study eye (NSE), presence of pseudophakia and/or ERM; VRI features (focal adhesion ≤1500 microns; min-max MH width), VFQ-25 composite score. **RESULTS:** Baseline characteristics for VMT vs. VMT+MH patients were respectively: 72.6 versus 68.7 years; 62.7% versus 75.8% female. Time since diagnosis: 268 days versus 62 days; VA: SE 66.8 versus 55.9, NSE 73.5 versus 77.8. Pseudophakes: 38.7% versus 20.9%, concomitant ERM: 46.3 % versus 15.8%. The majority of VMT patients presented with focal adhesion ≤1500 microns (69%) while VMT+MH patients presented with a min-max hole width of 272.7 microns. VFQ-25 composite score: 78.0 vs. 80.3. **CONCLUSIONS:** Baseline characteristics of the MIVI-TRUST ocriplasmin patient population show differentiations between patients with persistent VMT versus those with associated MH. This analysis establishes the representativeness of the MIVI-TRUST patient population in the context of clinical practice.

PSS4

ATOPIC DERMATITIS: EVALUATION OF 2 DIFFERENT DRUG RELATED MANAGEMENTS

Taieb C
CREES PFSA, Paris, France

OBJECTIVES: Atopic Dermatitis (AD) is a chronic relapsing skin condition and one of the most common skin diseases worldwide. Nowadays, the prevalence of AD is estimated to be between 5%-and-30% in children. AD onset is commonly before 5years old in children. Therapeutic treatments include topical corticosteroids (CS) and long-term emollients as first-line therapy, followed by topical calcineurin inhibitors. Emollients represent one of the cornerstones of treatments for patients with AD. The aims of this study were to compare the drug related management and the drug related costs between children with AD treated by at least an emollient (composed-of-Glycerol [15 gr], Vaseline [8 gr] and liquid-paraffin [2gr] per 100 gr) and children not treated by emollient. **METHODS:** This was a retrospective analysis of data extracted from the "Disease Analyzer™" database, including anonymized data from medical files of the patients seen by a representative sample of FrenchGP. Children with AD diagnosed before 1 year old were tracked for 12-months after the date of diagnosis. Only children monitored at least 1 year after the diagnosis were included in the analysis. Costs of AD treatments were calculated from a societal perspective. **RESULTS:** 49 children with AD were treated by the emollient (group 1) and 59 were not (group 2). 59.2% of children of group 1 were treated by CS *vs* 72.9% in group 2; the same trend was found for the prescription of antiseptic (24.5%-*vs*-27.1%) and antibiotic (10.2%-*vs*-13.6%). On the contrary, healing was more prescribed in the emollient group (32.7%-*vs*-25.4%). Average annual cost of prescribed dermatological drugs was estimated to be 139.8 € in the emollient group and 146.4 € in the other group. **CONCLUSIONS:** These preliminary results suggest that CS, which may have negative effects (skin fragility, infection, addiction and impact on growth), are less prescribed in the emollient group. Studies considering larger samples are warranted to confirm this trend.

PSS5

BASELINE PATIENT, OCULAR FEATURES AND MANAGEMENT OF A PATIENT POPULATION DIAGNOSED WITH VITREOMACULAR TRACTION: AN OBSERVATIONAL STUDY IN FLANDERS

Lescrauwaet B[1], Spaepen E[2], Vriens I[3], Stalmans P[3]
[1]*Xintera Consulting, Leuven, Belgium,* [2]*SBD Analytics BVBA/SPRL, Bekkevoort, Belgium,* [3]*Universitaire Ziekenhuizen Leuven, Leuven, Belgium*

OBJECTIVES: Limited data is published on baseline characteristics of patients diagnosed with vitreomacular traction (VMT) or different macular hole (MH) stages. Aim of our study was to describe the baseline patient and ocular characteristics, and the management of patients diagnosed with diseases of the vitreomacular interface. **METHODS:** This was an observational study with retrospective design. The study sample included patients from a large tertiary care ophthalmology center in Flanders, who had at least 1 outpatient visit at the study center between July 2009 and May 2013. Patients presented with or without visual symptoms and were examined using optical coherence tomography (OCT) in both eyes. Patients diagnosed with other retinal diseases were excluded from this study. This analysis reports on the VMT cohort only. **RESULTS:** The study sample included a total of 509 patients of which 156 patients (191 eyes) presented with VMT. Mean (SD) age was 72.8 (9.8); 59% were female. Majority (73%) was referred by an ophthalmologist for symptoms of general vision loss (60%) and/or metamorphopsia (23%). Mean follow-up was 1.64 years. Eyes in which a vitrectomy was performed (n=41) presented with worse visual acuity (VA) compared with eyes managed through observation (0.43 versus 0.55; p=0.029). However, VA in fellow eye was significantly better in eyes managed with vitrectomy (0.7 versus 0.56, p=0.039). Metamorphopsia (61% versus 37%, p=0.005) and concomitant ERM (20% versus 9%, p=0.049) were significantly more prevalent in eyes managed through vitrectomy compared with observation. **CONCLUSIONS:** In a real-life population, visiting the outpatient clinic of a large tertiary care ophthalmology center, 31% of patients presented with VMT. Patients were predominantly managed though observation. Worse visual acuity of fellow eye, and presence of metamorphopsia or ERM were significantly associated with occurrence of vitrectomy.

PSS6

CHILDREN WITH ATOPIC DERMATITIS: MONITORING A FRENCH COHORT OVER A NINE-YEAR PERIOD

Taieb C
CREES PFSA, Paris, France

OBJECTIVES: To assess the diseases associated with AD or that take over during the years following the diagnosis of the infant and to calculate the annual cost of treating these children. **METHODS:** The cohort includes infants with AD who have undergone consultation with their general practitioners between the beginning of 2000 to the end of 2003. The data gathered through the IMS database was entered by general practitioners, enabling tracking of patients. The tracking period was started after diagnosis. Only infants who were monitored for a minimum of one-year were included. A control group comprising infants without AD and who were monitored for at least a year was created. **RESULTS:** A total of 723 infants who met the criteria outlined were identified. In the first year following their birth, infants with AD had significantly more concomitant disorders, particularly respiratory disorders (85% vs. 76%), and asthma (8.9% vs 4.6%) or other types of dermatosis (46.9% vs. 28.2%) among others. During the nine-years of monitoring, the children of the AD cohort consumed more dermatological products than the children of the control-group did in terms of emollients or topical corticosteroids. As well, the AD group consumed more antiseptic products than the control group did in the first year (27.6% vs 14%). Children with AD were observed to consume more anti-asthma drugs, with a peak occurring at age 4. **CONCLUSIONS:** From an epidemiological perspective, this study

was in line with current data. Pulmonary symptoms call for vigilance in monitoring children. Chronic ocular inflammation sometimes is the cause of long-term cataracts in patients with atopic disorders. Early ocular symptoms found in this cohort must be specified and suggest that an opthamological follow-up may be required in some cases. In addition, the abnormally high consumption of antiseptics - and also often the source of irritation - raises concerns about children's treatment.

PSS7

BURDEN OF ACTINIC KERATOSIS IN GERMANY-RESULTS OF A LITERATURE RESEARCH

Pfiffner C[1], Macheleidt O[2], Batscheider A[1], Ehlken B[1], Greiner RA[1], Schroeder C[1], Hutt HJ[2]
[1]*IMS Health, Munich, Germany,* [2]*LEO Pharma GmbH, Neu-Isenburg, Germany*

OBJECTIVES: Actinic keratoses (AK) are dermatological conditions with the risk-potential becoming squamous cell carcinoma (SCC). Descriptions of AK-epidemiology and cost-of-illness are currently necessary when submitting an AMNOG dossier for an AK-product in Germany. **METHODS:** To describe AK-epidemiology a targeted literature research was conducted in PubMed in 2012, using the search terms (epidemiology OR incidence OR prevalence). To find relevant cost-of-illness information the following search terms were used (cost OR costs OR burden OR econom* OR pharmacoeconom* OR financ* OR budget OR reimburs* OR (resource NEAR (use OR utilization))). Both searches were combined with AND ((actinic OR solar OR senil*) AND (keratos* OR cheilitis)) AND Germany. PubMed research was supplemented by additional searches in guidelines and the World Wide Web for publications in German/English. **RESULTS:** The screening of the epidemiology results (36 in PubMed) identified two relevant publications of four studies investigating AK-prevalence in Germany (Schäfer epub ahead of print 2012, Lichte 2010). An additional search for the German phrase "nicht melanozytäre Hautkarzinome" identified a publication on the cost-benefit of skin-cancer-screening, including data on prevalence of AK (Guther 2011). The study results demonstrate a prevalence range between 2.0% and 7.4% with increasing prevalence by age. So far no cost-of-illness data of AK were identified for Germany (5 hits in pubmed). In an expert survey from Augustin and Kornek (2012) one important cost-factor was seen in the progression of AK into SCC and its prevention might reduce treatment cost and burden of disease for patients. Citation tracking of this expert-survey identified an additional prevalence-study in Germany (prevalence 2%, Augustin 2011). **CONCLUSIONS:** No data of AK-incidence in Germany are available. Prevalence data of AK in Germany have a broad range from 2.0% - 7.4%. Cost-of-illness data are needed for Germany to demonstrate the cost saving aspect of AK-prevention as seen in cost-of-illness studies of other countries.

PSS8

PREVALENCE AND RISK FACTORS OF ACTINIC KERATOSES

Schaefer I[1], Kornek T[1], Spehr C[1], Reusch M[2], Augustin M[1]
[1]*University Medical Center Hamburg-Eppendorf, Hamburg, Germany,* [2]*Dermatology Center Tibarg, Hamburg, Hamburg, Germany*

OBJECTIVES: In Europe only few and inconsistent data on the prevalence and treatment of Actinic Keratoses (AK) are available. Objective of this study was to determine the prevalence of AK in Germany, to identify potential predictors and to estimate the number of AK cases treated in dermatologic practices. **METHODS:** In a multiple-source-approach, prevalence was assessed from whole-body-examinations in a cohort of 90.800 employees and from nationwide statutory health insurance (SHI) data of 2008. c) The number of cases documented in dermatological offices was estimated from statistics of a SHI Physicians Association. **RESULTS:** Standardized prevalence of AK from dermatological examinations was 2.7%; the rate increased with age (11.5% in the group 60-70 years) and was higher for men (3.9%) than for women (1.5%). Significant associations were also identified for skin phototype I, sunburns in childhood and solar lentigines. Vitiligo and a history of melanoma were also but not significantly associated with AK. In the SHI data analysis standardized AK prevalence was 1.8%. Age-specific rates were below 1.5% up to 60 years and rose to 8.2% (13.2% in men) in the group 80-89 years. The prevalence from these large data sets - which is at the lower limit of studies from other countries – suggests about 1.7 Mio. estimated AK cases in Germany. In 2011 AK accounted for 8.3% of the hundred most frequently treated dermatological outpatient diagnoses. The proportion of AK cases has risen almost continuously over the last 10 years. Estimated annual number of AK cases documented by dermatologists in Germany is about 1.7 Mio. **CONCLUSIONS:** AK is a frequent condition in higher age groups and more prevalent in men; a relevant need for health care evident. Predictors and risk factors for AK are easy to identify in the population, which could also help to detect groups with special need for preventive measures.

SENSORY SYSTEMS DISORDERS – Cost Studies

PSS9

THE BUDGET IMPACT OF INTRODUCING RANIBIZUMAB IN ENGLAND AND WALES FOR THE TREATMENT OF VISUAL IMPAIRMENT DUE TO CHOROIDAL NEOVASCULARIZATION SECONDARY TO PATHOLOGIC MYOPIA

Malcolm WA[1], Leteneux C[2], Claxton L[3], Taylor M[3], Rathi H[4]
[1]*Novartis UK, Frimley, UK,* [2]*Novartis Pharma AG, Basel, Switzerland,* [3]*York Health Economics Consortium, York, UK,* [4]*Novartis Healthcare Pvt.Ltd., Hyderabad, India*

OBJECTIVES: To evaluate the budget impact of introducing ranibizumab. **METHODS:** Cumulative costs were assessed using an open cohort model with a 5-year time horizon and NHS perspective. The number of eligible patients was based on: the estimated prevalence of pathologic myopia (PM) in the population >40 years old (1.2%); the incidence of choroidal neovascularization (CNV) in patients with PM (0.98%); the proportion of patients eligible for pharmacotherapy (81%) and bilateral disease prevalence (5.5%). Treatment and diagnosis rates were estimated at 80% and 83–86% respectively. Treatment frequency was based on RADIANCE trial data. The model compared two scenarios. In the 'with ranibizumab' scenario, the proportion of eligible patients treated with ranibizumab was estimated as 7% at year 1, increasing to 32% at year 5; the proportion receiving verteporfin photodynamic therapy (vPDT) fell from 93% to 68%. In the 'without ranibizumab' scenario, only vPDT was administered. Costs of treatment, administration, monitoring, bilateral disease and management of recurrences were included. **RESULTS:** An estimated 2045 patients were eligible for treatment at year 1 and 2119 at year 5. In the 'with ranibizumab' scenario, 143 patients received ranibizumab at year 1, increasing to 678 at year 5; 1902 patients received vPDT at year 1 and 1441 at year 5. 'With ranibizumab' annual costs were higher in years 1–2 than 'without ranibizumab' costs. During years 3, 4 and 5, cost savings occurred with ranibizumab (£3867, £121 584 and £232 467, respectively), owing to lower total costs of treatment and monitoring than with vPDT. The total 5-year saving 'with ranibizumab' over 'without ranibizumab' was £227 086. **CONCLUSIONS:** Treating visual impairment due to CNV secondary to PM with ranibizumab rather than vPDT is estimated to provide significant cost savings in England and Wales over 5 years.

PSS10

PHARMACOECONOMIC ASSESSMENT OF RANIBIZUMAB IN THE TREATMENT OF THE DIABETIC RETINOPATHY IN THE RUSSIAN FEDERATION

Serpik VG, Yagudina R, Kulikov A
I.M. Sechenov First Moscow State Medical University, Moscow, Russia

Diabetic retinopathy (DR) is one of the main reasons of vision loss. Traditional treatment provides insufficient control of disease and adverse events. New drug ranibizumab usage in treatment of DR opens new opportunities in treatment of DR. **OBJECTIVES:** To provide pharmacoeconomic assessment of ranibizumab in DR treatment in the Russian Federation. **METHODS:** Comparative modeling cost-effectiveness (CEA) and budget impact (BIA) analyses based on clinical trials results were conducted. CEA with 1 year time horizon for basic group patients and BIA with 5 year time horizon for high risk vision loss patient group. CEA considered only direct costs (DC), while BIA dealt with both DC and indirect costs (IC). 1 EURO = 40 RUB. **RESULTS:** Annual total costs (TC) per patient (PP) for ranibizumab treatment (8 injections on the average) approached 9786 EURO. Annual TC for LC treatment were 440 EURO PP. Ranibizumab provides 6,1 letters vision improvement on the average, while LC – 0,8 letters. Cost-effectiveness ratio (CER) for ranibizumab was 1604 EURO per letter, for LC CER was 550 EURO per letter. ICER was 1764 EURO per additional letter. Second scenario included DR patients going blind in 5 years on LC treatment, while on ranibizumab treatment they could keep their eyesight. TC over 5 years for ranibizumab treatment (13 injections on the average) were 15225 EURO PP. TC over 5 years on LC were 27327 EURO PP, including IC due to vision loss – 25250 EURO. BIA results have shown that ranibizumab treatment for high-risk vision loss DR patients group provided 9 616 EURO (discounted at 3,5%) cost-saving PP in comparison with LC treatment. **CONCLUSIONS:** Ranibizumab is highly effective costly treatment that demands additional consideration for administration in common DR patient group, while it seems to be cost-saving in DR patient group of high-risk vision loss.

PSS11

EVALUATION OF THE HERPES ZOSTER IMPACT AS COMORBIDITY FACTOR IN 5 PATHOLOGIES FRENCH HOSPITAL CARE AMONG ADULTS AGED 50 AND OLDER

Blein C[1], Gavazzi G[2], Paccalin M[3], Baptiste C[4], Vainchtock A[5]
[1]*HEVA, Lyon, France,* [2]*Hopital de la TRONCHE, LA TRONCHE, France,* [3]*CHU la Milétrie, POITIERS, France,* [4]*SANOFI PASTEUR MSD, LYON, France,* [5]*HEVA, LYON, France*

OBJECTIVES: To evaluate the impact of Herpes Zoster (HZ) as associated diagnosis on hospitalizations for an other main health problem, using 3 evaluation criteria: length of stay, number of death and cost from the national health insurance perspective. **METHODS:** The hospitalizations of people aged 50 years and more were selected from the French national hospital database (PMSI) 2011 using ICD 10 diagnosis code: HZ (B02*) in associated diagnosis (DAS), and excluding codes of immunosuppressive conditions (D8* or B20*-B24*). The 5 main categories of diseases leading to hospitalization distribution allowed us to select, in decreasing order of importance: circulatory (I0*-I5* & I7*-I9*), respiratory (J0*-J9*), digestive (K0*-K9*), osteo-articular systems (M0*-M9*), and diabetes (E1*). For each of the 5 categories, a retrospective case-control has been realized. The cases are defined by hospitalizations with HZ in DAS and controls were hospitalizations without HZ in DAS matched on age and sex to the cases. Statistical non parametric analyses (Wilcoxon-Mann-Whitney) in each of the five categories have been realized to evaluate the difference in length of stay, death rate, and cost. **RESULTS:** In each of the five categories, cases presented a statistically significant length of stay compared to the controls. Median differences varying of 3 days for osteo-articular system (+50%) to 6 days for digestive system (+300%). None difference in the death rates has been observed. The study also demonstrated a statistically significant cost of cases compared to the controls median differences varying of 857€ for circulatory system (+25%), 922€ for osteo-articular system (+26%), 945€ for respiratory system (+26%), 987€ for diabetes (+39%), and 2011€ for digestive system (+126%). **CONCLUSIONS:** When present as an associated diagnosis in hospitalizations of people 50+ for other medical reasons, HZ significantly increases the length of stay at hospital and subsequent economic burden for the French health system.

PSS12

SPECTACLE INDEPENDENCE AND VISION-RELATED QUALITY OF LIFE IN CATARACT SURGERY PATIENTS FOLLOWING IMPLANTATION OF A MULTIFOCAL INTRAOCULAR LENS

Samiian A[1], Carones F[2]
[1]*Alcon Labs, Geneve, Switzerland,* [2]*Centro Oftalmo Chirurgico Carones, Milano, Italy*

OBJECTIVES: The aim of this study was to compare spectacle independence and vision-related quality of life following implantation of a multifocal intraocular lens (IOL: ReSTOR®) or monofocal IOLs. **METHODS:** This prospective observational study involved 206 cataract surgery patients (median age 71 years, range 51–90 years) receiving either the multifocal IOL or monofocal IOLs. The primary outcome measures were the proportion of patients with a postoperative improvement in uncorrected visual acuity of 0.1 logMAR or better, the proportion of patients achieving spectacle independence, and vision-related quality of life assessed using the

5-dimension National Eye Institute Refractive Error Quality of Life (NEI-RQL)-42 scale; expenditure on spectacles was also measured. **RESULTS:** The proportion of patients with a postoperative improvement in visual acuity of 0.1 logMAR or better was significantly higher with the multifocal IOL than with monofocal lenses (45.7% vs. 2.1%, respectively; P<0.0001), as was the proportion of patients achieving spectacle independence (73.3% vs. 25.3%, P<0.0001). At 6 months, the group difference in NEI-RQL-42 scores for dependence on correction significantly favoured the multifocal IOL (mean difference 37.3, 95% confidence interval 28.7–46.0, P<0.0001), but there were no significant differences between the groups in scores for the other four dimensions (near vision, appearance, limitation in activity, and satisfaction with correction). The mean costs of spectacles in patients with multifocal or monofocal IOLs were €154.42 and €267.21, respectively, for lenses and €66.59 and €74.35, respectively, for frames. **CONCLUSIONS:** Compared with monofocal IOLs, the multifocal IOL resulted in greater spectacle independence and lower expenditure on glasses. These findings are consistent with those of a previous economic modelling study, which showed that the use of this lens resulted in significant cost savings due to a reduced need for spectacles.

PSS13

COSTS COMPARISON OF CUTANEOUS DRUG REACTIONS TREATMENT DIVIDED BY DIAGNOSIS GROUPS

Wisniewska N[1], Szkultecka-Debek M[2], Owczarek W[1], Paluchowska EB[1], Jahnz-Rozyk KM[1]
[1]*Military Institute of Medicine, Warsaw, Poland,* [2]*Department of Dermatology, Military Institute of Medicine, Warsaw, Poland*

OBJECTIVES: The aim was to analyze the total direct costs of treatment of cutaneous drug reactions (CDR) from health care provider and public payer perspective divided by diagnosis groups. **METHODS:** We analyzed retrospectively data from 164 patients (57 men, 107 women) hospitalized in the Department of Dermatology, Military Medical Institute in Warsaw (from 2002 to 2012) due to CDR. Total direct costs from the public payer and health care provider were calculated for different diagnoses (based on ICD 10 codes). The analysis was based on data derived from the patients' medical charts, daily medication logs, and cost data provided by the hospital organization and accounting department. The services paid by National Health Fund (NHF) were grouped based on ICD-10 and DRG system. For the purpose of the analysis the hospitalization costs were calculated based on the prices for medical services established by the NHF on the basis of a contract with the selected health institution. **RESULTS:** In the study group 3 CDR groups were identified: J38-severe skin disease (generalized rash) J39-large dermatological diseases (erythema multiforme) J49-gentle dermatological diseases (urticaria). From NHF perspective the most expensive procedure is J 38 – 962 € per patient (1€ = 4.24 PLN), the lower cost is for J39 and J 49 (476€ and 331€ respectively). From health care provider's perspective the total direct costs equal: J38 – 630 €, J 39 – 552 €, J49 – 375€. Differences in costs could be due to high costs of the clinically severe diseases treatment incurred by the provider while according to the NHF, these units are classified as large dermatological diseases and thereby direct treatment costs are much lower than real provider's costs. **CONCLUSIONS:** The analysis results suggest taking into consideration reclassification of the services by NHF or better estimation of DRG groups by the public payer.

PSS14

COSTS OF PREVALENCE-BASED CENTRAL RETINAL VEIN OCCLUSION (CRVO) IN THE UNITED KINGDOM

Priaulx J[1], Wittrup-Jensen KU[2]
[1]*Bayer HealthCare, New Bury, UK,* [2]*Bayer Pharma AG, Berlin, Germany*

OBJECTIVES: The societal costs associated with CRVO are little known. Only a few studies report on the burden of retinal vein occlusion, the resource use and cost of CRVO. No specific burden of illness study is available that describes the situation in the UK. The purpose of this study was to create a model that enabled the calculation of the societal costs of CRVO in the UK. **METHODS:** The health care utilisation inputs for the model were derived from a survey conducted among UK ophthalmology experts. The model included parameters that contribute to the costs of illness of CRVO and is based on the prevalence of CRVO in the UK. These were direct and indirect costs including drug treatment, non-drug treatment (e.g. grid laser photocoagulation and pan retinal photocoagulation), monitoring of the disease, adverse events, lost productivity, transportation and the cost of blindness. **RESULTS:** In the UK, the average annual contribution from each patient to the overall cost of CRVO was calculated to £14,692. The annual cost for the UK society was estimated to be almost £700 million. The main part of the cost, 42%, was from monitoring of the disease. Also, 20% was from the cost of blindness, 16% from the drug treatment and 15% from treatment of adverse events. **CONCLUSIONS:** Despite CRVO being an uncommon disease, the annual costs to the UK society are substantial. The total burden of CRVO is most sensitive to changes in the cost associated with interventions, with the number of hospital visits, ophthalmoscopy examinations and the number of optical coherence tomography (OCT) procedures as the dominating factors. By reducing the cost and/or the number of interventions by 25%, the overall burden of CRVO decreases from £14,692 to £13,147 per patient, which corresponds to a societal saving of almost £73 million per year.

PSS15

SYSTEMATIC LITERATURE REVIEW OF ECONOMIC BURDEN OF CHRONIC PLAQUE PSORIASIS

Feldman SR[1], Burudpakdee C[2], Gala S[2], Mallya U[3]
[1]*Wake Forest University, Winston-Salem, NC, USA,* [2]*MKTXS, Raritan, NJ, USA,* [3]*Novartis Pharmaceuticals Corporation, East Hanover, NJ, USA*

OBJECTIVES: Psoriasis is a significant economic burden to both patients and payers in terms of direct and indirect costs. Previous systematic reviews have been limited with regards to geographical region of assessment and type of economic outcomes reported. Hence, the objective of this systematic review is to provide a global comprehensive understanding of the direct and indirect economic burden of psoriasis. **METHODS:** A systematic literature search was conducted and studies were identified from PubMed and conference proceedings. Studies published in English language between January 2001 and May 2013, and reporting direct and indirect economic burden of psoriasis were identified using search strategies. A total of 1,181 abstracts were screened by two researchers; any discrepancy was resolved by a third researcher. **RESULTS:** Forty studies (34 primary articles and 6 conference abstracts) from 12 countries including 19 from the US, 4 from Canada, 3 from Germany, 2 each from Italy, The Netherlands and the UK, 1 each from Australia, Brazil, Israel, Spain, Sweden and Switzerland, and 2 multinational studies met the inclusion criteria. Overall, 27 studies assessed direct costs, 3 studies assessed indirect costs, and 10 studies evaluated both. Major contributors of direct costs included medication costs, office visits, hospitalization costs and monitoring costs. Productivity loss, patient and caregiver work days lost, and restricted activity days were key drivers of indirect costs. Among the European countries, the most recent studies reported an annual total cost (direct and indirect cost) per patient of €11,928 in Sweden, €8,372 in Italy, and €2,866 - €6,707 in Germany based on treatment type. In US and Canada, the annual direct and indirect economic burden of psoriasis was $1.4 billion and CDN$1.7 billion respectively. **CONCLUSIONS:** Costs associated with chronic plaque psoriasis are high in many countries indicating a continued need for new treatments.

PSS16

CANADIAN BURDEN OF CHOROIDAL NEOVASCULARIZATION SECONDARY TO PATHOLOGIC MYOPIA: BASELINE CHARACTERISTICS OF PATIENTS

Zaour N[1], Heisel O[2], Barbeau M[1], Ma P[3]
[1]*Novartis Pharmaceuticals Canada Inc., Dorval, QC, Canada,* [2]*Syreon Corporation, Vancouver, BC, Canada,* [3]*University of British Columbia, Vancouver, BC, Canada*

OBJECTIVES: To identify the real world standard of care, treatment patterns, medical history, resource use and costs of patients with choroidal neovascularization (CNV) secondary to pathologic myopia (PM) in Canada. **METHODS:** With enrollment still ongoing, 85 patients with Myopic CNV were recruited by ophthalmologists and retina specialists from 16 centres across Canada to participate in this retrospective, multicenter study. Medical records covering at least one year of follow up data from the CNV diagnosis, and up to two years, were analyzed to gather all information related to Myopic CNV. **RESULTS:** Data from 67 study participants was analyzed. Patients had a mean age of 55.4 years (range: 27 – 80 years) at the time of their PM diagnosis (CNV affected eye), and 56.0 years (range: 29 - 82 years) at the time of their first lifetime CNV episode. The analysis showed that 71.6% of participants were female, 71.6% were Caucasian, 61.2% had subfoveal CNV in the affected eye and 31.3% had more than one lifetime CNV episode reported. Based on their visual acuity at the time of CNV diagnosis at the beginning of the chart review period, they were grouped by the Snellen score of the affected eye into 7 groups: 20/32-20/20 (n=5), 20/50-20/32 (n=5), 20/80-20/50 (n=15), 20/125-20/80 (n=12), 20/200-20/125 (n=2), 20/320-20/200 (n=7) and <=20/320 (n=21). The approximate mean Snellen score was 20/160 in the affected eye and 20/63 in the fellow eye. The proportion of patients that had both eyes affected with PM was 58.2%. **CONCLUSIONS:** Information on Myopic CNV is very limited in the literature. The baseline characteristics of Canadian patients presented here are aligned with other few data available in the public domain. This is the first study worldwide investigating the burden of Myopic CNV and the final results, will help us better understand this debilitating disease.

PSS17

COSTS OF INCIDENCE-BASED CENTRAL RETINAL VEIN OCCLUSION IN FRANCE

Girmens JF[1], Koerber C[2], Miadi-Fargier H[3], Wittrup-Jensen KU[4]
[1]*CHNO des Quinze-Vingts, Paris, France,* [2]*Bayer Santé S.A.S, Loos, France,* [3]*Bayer Santé S.A.S., Loos, Nord, France,* [4]*Bayer Pharma AG, Berlin, Germany*

OBJECTIVES: Retinal vein occlusion (RVO) is the most common retinal vascular disorder with the potential for significant vision-related morbidity. The societal costs associated with CRVO are little known. Only a few studies reports on the burden of retinal vein occlusion or the resource use and cost of Central Retinal Vein Occlusion (CRVO). No specific burden of illness study is available that describes the situation in France. The purpose of the current study was to create a model that enables study of the societal costs of CRVO in France. The perspective of the model was prepared from a societal perspective. **METHODS:** The input for health care utilisation input, were derived from a client survey conducted among French clinical experts in ophthalmology. An incidence-based model was constructed, which included the following parameters: direct and indirect costs, including treatment with drugs, non-drug treatments (e.g., grid laser photocoagulation and pan retinal photocoagulation), monitoring of the disease, adverse events, lost productivity, transportation and the cost of blindness. **RESULTS:** In France the incidence of people suffering from CRVO was estimated to 10,471 (2011). The average annual contribution from each patient to the overall cost of CRVO was calculated to 11,434€. The yearly direct and indirect costs were estimated to app. 120mill Euros. The contributing factors driving the cost of CRVO, in France, are, cost of blindness 29%, drug treatment cost 26%, cost of adverse events 25% and cost from monitoring 14%. **CONCLUSIONS:** Despite CRVO being a uncommon disease, the annual costs to the French society, based on the incidence of CRVO, are substantial. The cost of blindness account for 26% of the total annual costs indicating that there is a potential for reducing those costs with improved treatment options in CRVO.

PSS18

COSTS OF BEST SUPPORTIVE CARE IN THE TREATMENT OF MODERATE-TO-SEVERE PSORIASIS IN THE UNITED STATES

Tencer T, Li S, Zhang F
Celgene Corporation, Summit, NJ, USA

OBJECTIVES: To describe the best supportive care costs of psoriasis patients following discontinuation of conventional systemic or biologic therapy. **METHODS:** Adult patients with ≥ 2 psoriasis diagnoses (from office visits) with continuous insurance

coverage ≥ 6 months before (baseline period) and ≥ 12 months post-index date were selected from the MarketScan Commercial and Medicare Claims database (2005-2009). The index date was defined as the last day of conventional systemic or biologic drug coverage. Discontinuation was defined as no systemic or no biologic treatment for ≥ 12 consecutive months from the last day of systemic or biologic prescription coverage. Patients were classified as having discontinued from a biologic if there was evidence of biologic drug use during the baseline period; otherwise they were defined as having discontinued from non-biologic systemic therapy. Twelve-month average costs following discontinuation were reported. **RESULTS:** A total of 4,720 psoriasis patients met the selection criteria; 67.4% discontinued from non-biologic systemic therapy and 32.6% from biologic therapy. Over the 12-month period following discontinuation, total costs were $10,577 (SD: 19,910) and $9,001 (SD: 16,401) for biologic and non-biologic discontinuers, respectively (p=0.004). Outpatient and medication costs were significantly higher for the biologic discontinuers compared to the non-biologic discontinuers ($5,283 vs. $4,449, p= 0.003, and $2,738 vs. $2,470, p= 0.022, respectively). There was no statistically significant difference in hospital/ER costs ($2,556 vs. $2,083, p= 0.214, respectively). Outpatient costs accounted for approximately 50% of total costs for both cohorts. **CONCLUSIONS:** This study suggests that outpatient costs account for a substantial proportion of health care costs in psoriasis patients who discontinued from systemic or biologic therapy. Patients who had discontinued from biologic therapy incurred significantly higher outpatient and medication costs compared to patients who had discontinued from conventional systemic therapy.

PSS19

AN INNOVATIVE METHOD: APPLICATION OF NEGATIVE PRESSURE WOUND THERAPY IN THE TREATMENT OF CHRONIC LEG ULCERS – MEDICAL AND HEALTH ECONOMICS ASPECTS

Kovács LA[1], Kádár Z[1], Várszegi D[1], Sebestyén A[2]
[1]*University of Pécs, Pécs, Hungary,* [2]*National Health Insurance Fund Administration, Pécs, Hungary*

OBJECTIVES: Chronic leg ulcers without healing tendency present a serious public health and socio-economic issue. Rationally combinig causal and conservative treatments with innovative methods, it would be beneficial to improve the effectivity of wound treatment, thus reducing its financial impacts. The aim of study was to investigate the cost of conservative treatment and an innovative Negative Pressure Wound Therapy (NPWT). **METHODS:** The authors present cases of dermatological patients with severe, chronic leg ulcers of various etiologies resistant to conservative therapy (Patients-1: fasciitis necrotisans; Patients-2: ulcer associated with chronic venous insufficiency; Patients-3: pyoderma gangrenosum), thus comparing the costs of conservative treatment (social insurance subsidies on bandages) and NPWT (not financed by social insurance) in each patient. Furthermore, the authors compare costs of NPWT cases with other cases (Patient-4: fasciitis necrotisans; Patient-5: ulcer associated with chronic venous insufficiency; Patient-6: ulcer associated with rheumatoid arthritis), in which no NPWT was applied thus far due to financial reasons. (1USD$=225 HUF, Hungarian Forint). **RESULTS:** Social insurance subsidies on bandages/patient (USD) in treatment period: Patient-1.: $1324; Patient-2.: $15495; Patient-3.: $412; Patient-4.: $11376; Patient-5.: $10557; Patient-6.: $7306. Cost of NPWT/patient and proportion of social insurance subsidies on bandages/patient: Patient 1.: $1405 (106%); Patient 2.: $667 (4.3%), Patient 3.: $778 (188.9%). The cost of NPWT is relatively high, however, NWPT-treated leg ulcers have healed compared to cases receiving conservative treatment, which can be attributed to NPWT stimulating wound healing. **CONCLUSIONS:** Treatment of the disease resulting leg ulcer – causal therapy combined with NPWT – is beneficial in wound healing, reducing high costs of wound treament, shortening the time of wound healing, improving the patient's quality of life. Application of NPWT in specialized centers of wound treatment and financing by social insurance would be recommended for cases not responding to conservative treatment in Hungary.

PSS20

DIFFERENTIAL DIAGNOSIS OF LEG ULCERS – MEDICAL AND HEALTH ECONOMICS ASPECTS

Kovács LA[1], Várszegi D[1], Kálmán E[1], Sebestyén A[2]
[1]*University of Pécs, Pécs, Hungary,* [2]*National Health Insurance Fund Administration, Pécs, Hungary*

OBJECTIVES: Incidence of chronic leg ulcers without healing tendency exceeds 1% among adults and 3-5% among people over 65 years. The burden of diseases caused by wounds without healing tendencies can only be estimated. Complications of chronic wounds are severe, life-threatening. Total social insurance subsidies on bandages in Hungary is 22-26 million USD/year. Using case studies the authors emphasize the importance of (differential) diagnosis, mistakes of wound treatment affecting healing and increasing costs of treatment, in contrast to therapy costs. **METHODS:** The authors present leg ulcer cases of various etiologies referred to the dermatological clinic, seeking mistakes of wound treatment, examining social insurance subsidies on bandages, based on bandage prescriptions. Patients 1-4.: Ulcus cruris due to chronic venous insufficiency; Patient 5.: Leg ulcer caused by lymphoedema; Patients 6-8.: Ulcerous malignancies treated as leg ulcers; Patient 9.: Ulcus cruris+myeloproliferative disease; Patient 10.: Bilateral leg ulcers resulting from cardial decompensation and diabetes mellitus. (1USD$=225 HUF, Hungarian Forint). **RESULTS:** Social insurance subsidies (USD) on bandages per patients and mistakes in wound therapy: Patient 1.: $1857; Patient 2.: $1639; Patient 3.: $1787; Patient 4.: $53329, lack of compression therapy and lymphatic massage; Patient 5.: $12.567, lack of lymphatic massage; Patient 6.: $213; Patient 7.: $294; Patient 8.: $2143, lack of correct diagnosis; Patient 9.: $2993, no treatment of concomitant hematologic disease; Patient 10.: insufficient therapy of co-morbidities: diabetes, obesity, cardial decompensation. **CONCLUSIONS:** Modern treatment of leg ulcers mainly aims at determining primary causes, treating diseases causing wound healing disorders, namely causal therapy. Inefficient wound treatment is costly, application of modern bandages without principles, not treating co-morbidities and treating on inadequete levels cause financial problems to both the patient and the social insurance. Introducing professional guidelines for wound treatment, shortening "patient paths" and establishing centers of wound treatment would be recommended in Hungary.

PSS21

THE COST-EFFECTIVENESS OF INTRAVITREAL AFLIBERCEPT (IVT-AFL) IN TREATING NEOVASCULAR AGE-RELATED MACULAR DEGENERATION IN AN ITALIAN SETTING

D'Ausilio A[1], Midena E[2], Pilotto E[2], Calligari N[3], Bianchi C[3], Wittrup-Jensen KU[4]
[1]*Creativ Ceutical, Luxembourg, Luxembourg,* [2]*University of Padova, Padova, Italy,* [3]*Bayer Pharma, Milano, Italy,* [4]*Bayer Pharma AG, Berlin, Germany*

OBJECTIVES: In Italy, standard treatment care of patients with neovascular ("wet") age-related macular degeneration (wAMD) is currently performed with ranibizumab (RBZ) on as-needed basis (PRN). The objective of this study was to assess the cost-effectiveness of intravitreal aflibercept (IVT-AFL), administered every other month vs. RBZ PRN treatment, in the Italian treatment setting. **METHODS:** A Markov model was built to compare IVT-AFL compared to RBZ PRN in wAMD. Health states were based on visual acuity in the better-seeing eye. In the model, patients may remain in the same status (same visual acuity), progress to another status or die. A proportion of patients may also discontinue treatment monthly or upon becoming blind. Parameters were estimated from two randomized phase III studies VIEW 1/VIEW 2, published literature or expert opinions. Analyses were performed from the Italian Healthcare perspective, using a 20-year time horizon (starting age was 77 years). The simulation model calculated costs (drug, administration, monitoring, vision impairment and adverse events), quality-adjusted life-years (QALYs) and incremental cost-effectiveness ratios (ICERs), all discounted at 3% annually. Deterministic and probabilistic sensitivity analyses (SA) were performed to test the robustness of the results. **RESULTS:** IVT-AFL costs 30,852€ compared with 33,636€ for RBZ PRN; QALYs totaled 2.651 for IVT-AFL and 2.638 for RBZ-PRN respectively. IVT-AFL is associated with less cost and more QALYs gained than RBZ-PRN and hence dominates RBZ PRN. Deterministic SA showed that the results were most sensitive to changes in efficacy and time horizon, while probabilistic SA showed that 90% of the iterations fell within the cost-effectiveness threshold deemed acceptable for Italian Payers (for example €40,000). **CONCLUSIONS:** Results indicate that, within the Italian treatment setting, attainment of maximal visual gains via IVT-AFL is cost-saving that means less costly and more effective (more QALYs gained) compared to RBZ PRN.

PSS22

COST-EFFECTIVENESS OF RANIBIZUMAB FOR THE TREATMENT OF VISUAL IMPAIRMENT DUE TO CHOROIDAL NEOVASCULARIZATION SECONDARY TO PATHOLOGIC MYOPIA IN THE UNITED KINGDOM

Leteneux C[1], Claxton L[2], Malcolm WA[3], Taylor M[2], Rathi H[4]
[1]*Novartis Pharma AG, Basel, Switzerland,* [2]*York Health Economics Consortium, York, UK,* [3]*Novartis UK, Frimley, UK,* [4]*Novartis Healthcare Pvt.Ltd., Hyderabad, India*

OBJECTIVES: To evaluate the cost-effectiveness of ranibizumab compared with verteporfin photodynamic therapy (vPDT) for the treatment of patients with visual impairment due to choroidal neovascularization (CNV) secondary to pathologic myopia (PM). **METHODS:** A Markov model with a 3-month cycle length and health states defined by best-corrected visual acuity (BCVA) was developed from the UK health care provider perspective. A lifetime time horizon was applied, and future costs and outcomes were discounted at 3.5%/year. Baseline characteristics were derived from the phase 3 RADIANCE study; year 1 health state transitions and treatment frequency were based on the RADIANCE study and a vPDT study (VIP). Treatment was given beyond year 2 only in cases of mCNV recurrence (6%/year). Existing literature was used to estimate BCVA transitions beyond 12 months. Health states were based on the visual acuity of the study eye, which could be each patient's better-seeing eye (BSE) or worse-seeing eye (WSE). BSE utility values came from a published source. **RESULTS:** The mean lifetime cost of ranibizumab treatment was slightly lower than the cost of vPDT. Ranibizumab was associated with higher lifetime quality-adjusted life-years (QALYs) than vPDT (relative gain of 0.43), reflecting higher utility values and reduced mortality with ranibizumab. Ranibizumab therefore dominated vPDT. Ranibizumab had a 100% probability of being cost-effective compared with vPDT at a willingness-to-pay threshold of £20 000 per QALY. The model was sensitive to the number of ranibizumab injections in year 1. Ranibizumab remained cost-effective even when the mean number of ranibizumab injections increased from 3.5 (base case) to 12 and the mean number of vPDT treatments remained constant (3.4) in year 1. **CONCLUSIONS:** Ranibizumab is less costly and is associated with a gain in QALYs relative to vPDT for the treatment of patients with visual impairment due to CNV secondary to PM in the UK.

PSS23

COST-EFFECTIVENESS OF BIOLOGIC THERAPIES FOR THE TREATMENT OF MODERATE TO SEVERE PSORIASIS IN THE UNITED KINGDOM

Betts KA[1], Sundaram M[2], Mughal F[3], Yan SY[1], Signorovitch J[1], Wang K[2], Wu EQ[1]
[1]*Analysis Group, Inc., Boston, MA, USA,* [2]*AbbVie Inc., North Chicago, IL, USA,* [3]*AbbVie Ltd., Maidenhead, Berkshire, UK*

OBJECTIVES: To evaluate the cost-effectiveness of biologic treatments for moderate to severe psoriasis in the UK. **METHODS:** A decision model similar to those utilized in NICE appraisals TA103, TA134, TA146, and TA180 was constructed consisting of 2 distinct periods, the trial and treatment periods. Clinical efficacy was estimated during the trial period based on the relative probabilities of achieving Psoriasis Area and Severity Index (PASI) response (50/75/90) obtained via a network meta-analysis of 15 randomized controlled trials of adalimumab, etanercept, infliximab, and ustekinumab. Weight-based dosing was calculated for infliximab and ustekinumab to reflect licensed use. Only patients who achieved PASI 75 response in the trial period continued into the treatment period. Treatment benefits were determined by the relationship between predicted PASI response and the EQ-5D health utility measure. Costs (2011 British pounds) were assessed from a UK National Health Services perspective and included drug acquisition, administration, monitoring and hospitalization

costs. Drug acquisition cost for ustekinumab reflected the manufacturers' UK Patient Access Scheme. Incremental cost-effectiveness ratios (ICERs) were calculated and treatments were ranked relative to supportive care. One-way sensitivity analyses, using alternative plausible values for key parameters, explored uncertainty in the results. **RESULTS:** Infliximab provided the most additional quality-adjusted life-years (QALYs) vs. supportive care (0.186) followed by ustekinumab (0.174) and adalimumab (0.169). In the base case, adalimumab was the most cost-effective biologic (£19,082/QALY vs. supportive care), followed by ustekinumab (£20,964/QALY), etanercept 25 mg BIW (£26,580/QALY), etanercept 50 mg BIW during the trial period followed by 25mg BIW (£28,719 per QALY), and infliximab (£46,844 per QALY). ICERs for ustekinumab and infliximab compared with adalimumab were £87,625 and £332,015, respectively. Adalimumab remained the most cost-effective in the majority of the sensitivity analyses. **CONCLUSIONS:** In this decision-model analysis, adalimumab was the most cost-effective biologic treatment for moderate to severe psoriasis in the UK.

PSS24

A COST-EFFECTIVENESS ANALYSIS OF INGENOL MEBUTATE GEL FOR THE TREATMENT OF ACTINIC KERATOSIS: A SCOTTISH PERSPECTIVE

Tolley K[1], Kemmett D[2], Thybo S[3], Nasr R[4], Gillingham H[5]
[1]*Tolley Health Economics, Buxton, UK,* [2]*Royal Informary of Edinburgh, Edinburgh, UK,* [3]*Leo Pharma A/S, Ballerup, Denmark,* [4]*LEO Laboratories Limited, Princes Risborough, UK,* [5]*Abacus International, Bicester, UK*

OBJECTIVES: Ingenol mebutate gel is a recently developed, topical, 2 or 3 days patient-administered AK therapy. The objective was to compare the cost-effectiveness of ingenol mebutate gel with diclofenac gel and other available therapies for the first-line treatment of AK in adult patients, from the perspective of the National Health Service (NHS) in Scotland. **METHODS:** A cost-utility analysis was conducted using a decision tree approach to calculate the costs and benefits of different treatment strategies for AK over a 12-month time horizon. Data on the relative efficacy of treatment was derived from a systematic review of RCTs and a subsequent mixed-treatment comparison (MTC). Utility scores and resource use data were obtained from published sources. Due to the uncertainty surrounding the impact of AEs on HRQoL and costs, AEs were modelled in a scenario analysis. **RESULTS:** In the primary comparison, ingenol mebutate 150 mcg/g gel and 500 mcg/g gel were associated with ICERs of £44 and £114 per QALY gained, respectively compared with diclofenac (3%) for 8 weeks and £36 and £74, respectively compared with diclofenac (3%) for 12 weeks. In the secondary comparisons, ingenol mebutate 150 mcg/g gel and 500 mcg/g gel were associated with ICERs of £47 and £134, respectively compared with 5-FU/salicylic acid (0.5%/10%) cutaneous solution and dominated cryotherapy (i.e. were cheaper and more effective). Ingenol mebutate 150 mcg/g gel and 500 mcg/g gel were cheaper and less effective than 5-FU (5%) cream. Ingenol mebutate 150 mcg/g gel, but not ingenol mebutate 500 mcg/g gel, was cost-effective assuming a decision making willingness-to-pay threshold of £20,000/QALY (for one additional QALY gained, there would be an incremental cost of £26,525 incurred for 5-FU (5%) cream vs ingenol mebutate gel). **CONCLUSIONS:** Ingenol mebutate gel is a fast-acting, convenient and, relative to most comparators, cost-effective therapy for the first-line treatment of AK.

PSS25

COST EFFECTIVENESS OF ANTI-OXIDANT VITAMIN + ZINC TREATMENT TO PREVENT THE PROGRESSION OF INTERMEDIATE AGE RELATED MACULAR DEGENERATION TO ITS WET FORM. A SINGAPORE PERSPECTIVE

Saxena N[1], George PP[1], Heng BH[1], Lim TH[2], Yong SO[2]
[1]*National Healthcare Group, Singapore, Singapore,* [2]*Tan Tock Seng Hospital, Sinapore, Singapore*

OBJECTIVES: To determine if providing high dose anti-oxidant vitamins + Zinc treatment to intermediate Age Related Macular Degeneration (AMD) patients aged 40-79 years from Singapore is cost effective in preventing progression to Wet AMD. **METHODS:** We estimated the number of AMD patients aged 40 to 79 years (Category 3 and 4) in the Singaporean resident population. This hypothetical cohort was followed for 5 calendar years to determine the number of patients who would progress to wet AMD given the following four treatment scenarios: a) Vitamins +Zn followed by Ranibizumab (as needed) for wet AMD; b) Placebo followed by Ranibizumab (as needed) for wet AMD; c) Vitamins + Zn followed by Bevacizumab (monthly) for wet AMD; and d) Placebo followed by Bevacizumab (monthly) for wet AMD. Costs were estimated for the above scenarios from the providers' perspective and cost effectiveness was measured by cost per disability adjusted life year (DALY) averted with a disability weight of 0.22 for wet AMD. Crude annual mortality rate was incorporated into the model. **RESULTS:** Over 5400 patients could be prevented from progressing to Wet AMD cumulatively over five years if preventive anti-oxidant vitamins +Zn treatment were prescribed. Vitamins + Zn followed by ranibizumab (as needed) or bevacizumab (monthly) was cost effective compared to placebo followed by either drug (cost per DALY averted: $1885.8 - well within the threshold suggesting it is cost effective). However, bevacizumab (monthly 1 injection) alone was cost effective. Cost savings as a result of prescribing anti-oxidant vitamins +Zn were $ 46.7M for ranibizumab arm over 5 years. **CONCLUSIONS:** Prophylactic treatment with high dose anti-oxidant vitamins + Zn for intermediate AMD patients, followed by ranibizumab for patients who progressed to wet AMD was found to be cost-effective. These findings have implications for intermediate AMD screening, treatment and health care planning in Singapore.

PSS26

COST-EFFECTIVENESS ANALYSIS OF LINEZOLID AND VANCOMYCIN IN PATIENTS WITH COMPLICATED SKIN AND SOFT-TISSUE INFECTIONS CAUSED BY METHICILIN-RESISTANT STAPHYLOCOCCUS IN PORTUGAL

Inês M[1], Saramago P[2], Pinto A[3]
[1]*Pfizer Portugal, Porto Salvo, Oeiras, Portugal,* [2]*University of York, York, UK,* [3]*Pfizer Portugal, Porto Salvo, Portugal*

OBJECTIVES: Methicillin-resistant Staphylococcus aureus (MRSA) complicated skin and soft-tissue infection (cSSTI) is an infection associated with high health expenditure for the Portuguese National Health Service (NHS). A decision analytic model was adapted to the Portuguese setting to evaluate the cost-effectiveness (CEA) of linezolid *vs.*vancomycin in MRSA cSSTI. **METHODS:** Published Bayesian evidence synthesis results were used to populate efficacy parameters of the model. Resource utilization and MRSA prevalence rates were obtained through an expert panel of Portuguese clinicians and costs from published sources were applied to resource units. Analyses were done from the Portuguese NHS perspective. Both univariate and probabilistic sensitivity analyses were performed to test the robustness of model results. **RESULTS:** Average cost per patient for linezolid and vancomycin treatments were 15,195€ and 17,345€ respectively. Average effectiveness gained with linezolid treatment was 0.002QALYs. Average saving obtained with linezolid treatment was 2150€ per patient. **CONCLUSIONS:** Linezolid is a dominant strategy compared to vancomycin: less costly and more effective. Compared to vancomycin, linezolid is expected to result in lower total costs that offset its higher acquisition cost in cSSTI in Portugal.

PSS27

ECONOMIC EVALUATION OF RANIBUZUMAB FOR THE TREATMENT OF MYOPIC CHOROIDAL NEOVASCULARIZATION IN CANADA

Lee A[1], Zaour N[2], Becker DL[1], Leteneux C[3], Barbeau M[2]
[1]*OptumInsight, Burlington, ON, Canada,* [2]*Novartis Pharmaceuticals Canada Inc., Dorval, QC, Canada,* [3]*Novartis Pharma AG, Basel, Switzerland*

OBJECTIVES: To assess the cost-effectiveness of ranibizumab compared to verteporfin in photodynamic therapy (vPDT) for the treatment of myopic choroidal neovascularization (mCNV) from the Canadian health care and societal perspectives. **METHODS:** A Markov model was used to follow a cohort of 55-year old patients with mCNV over a lifetime horizon. The model included 8 health states based on best corrected visual acuity (BCVA) and an absorbing death state. Patients were allowed to remain in their current health state, or transition to other health states or death every 3 months. Results from the RADIANCE trial were used to inform the first year transitions for patients receiving ranibizumab, and the first 3 months for those on vPDT. The VIP trial was used to estimate month 4-12 transitions for vPDT. Patients transitioned according to natural progression from year 2 onwards. Health state utilities were derived from a Canadian utility study and published sources. Resource use and costs were collected from clinical trials, published literature, expert opinion, and standard Canadian sources. **RESULTS:** From the health care perspective, patients receiving ranibizumab for mCNV incurred less health care costs compared to those on vPDT (cost savings of $3,939). This was achieved while accruing an additional 0.07 life years (LYs) and 0.37 quality-adjusted life years (QALYs). Thus ranibizumab dominated vPDT. Similar findings were observed from the societal perspective (cost saving of $14,217). The average BCVA score remained consistently higher with ranibizumab compared to vPDT over the entire time horizon. **CONCLUSIONS:** From a cost-effectiveness standpoint, ranibizumab dominated vPDT in the treatment of mCNV, from both Canadian health care and societal perspectives. Patients on ranibizumab realized more QALYs and LYs at a lower cost compared to vPDT.

PSS28

COST-EFFECTIVENESS OF INTRAVITREAL AFLIBERCEPT IN TREATING NEOVASCULAR AGE-RELATED MACULAR DEGENERATION IN SWEDEN

Clements KM[1], Hulbert EM[2], Panchmatia HR[1], Eriksson M[3], Wittrup-Jensen KU[4], Nilsson J[5], Weinstein MC[6]
[1]*OptumInsight, Cambridge, MA, USA,* [2]*OptumInsight, Eden Prairie, MN, USA,* [3]*Bayer AB, Solna, Sweden,* [4]*Bayer Pharma AG, Berlin, Germany,* [5]*OptumInsight, Stockholm, Sweden,* [6]*Harvard School of Public Health, Boston, MA, USA*

OBJECTIVES: Monthly dosing with ranibizumab (RBZ) is needed to achieve maximal sustained visual gains in patients with neovascular ("wet") age-related macular degeneration (wAMD). In Sweden dosing is on an as-needed (PRN) basis, resulting in suboptimal efficacy. Intravitreal aflibercept dosed every 2 months (IVT-AFL) demonstrated clinically equivalent efficacy compared to RBZ monthly dosing (RBZ Q4) in a randomized clinical trial setting. We assessed the cost-effectiveness of IVT-AFL vs. RBZ Q4 and RBZ PRN real-life data, in a Swedish setting. **METHODS:** A Markov model compared wAMD treatment over two years with either IVT-AFL, RBZ Q4 or real-life RBZ PRN. Health states were based on visual acuity in the better-seeing eye; a proportion discontinued treatment monthly or upon visual acuity <20/400. Parameters were estimated from trial data, published literature, or expert opinion. Analyses were performed from a societal perspective with a lifetime horizon (starting age 77 years). The model calculated costs (drug, administration, monitoring, vision impairment, adverse events, caregiver), quality-adjusted life-years (QALYs), and incremental cost-effectiveness ratios (ICERs), all discounted 3% annually. Deterministic and probabilistic sensitivity analyses were performed. **RESULTS:** IVT-AFL cost 578,400 SEK, compared with 686,600 SEK for RBZ Q4 and 565,700 SEK for real-life RBZ PRN; QALYs totaled 4.58 for IVT-AFL, 4.59 for RBZ Q4, and 4.43 for real-life RBZ PRN. Compared with real-life RBZ PRN, IVT-AFL cost 80,000 SEK/QALY gained. RBZ Q4 cost over 20 million SEK/QALY gained, compared with IVT-AFL Q8. The model was most sensitive to IVT-AFL efficacy and patient age. IVT-AFL had a 42% probability of dominating RBZ Q4 and a 100% probability of being cost-effective vs. RBZ PRN, at an assumed willingness-to-pay threshold of 500,000 SEK. **CONCLUSIONS:** Results suggest that, in Sweden, attainment of maximal visual gains via IVT-AFL is cost-effective compared with real-life RBZ PRN dosing. RBZ Q4 is not cost-effective relative to IVT-AFL.

PSS29

THE COST-EFFECTIVENESS OF BIMATOPROST 0.03%/TIMOLOL 0.05% PRESERVATIVE-FREE FIXED COMBINATION COMPARED WITH DORZOLAMIDE/TIMOLOL PRESERVATIVE-FREE FIXED COMBINATION AND 2-BOTTLE UNFIXED COMBINATIONS FOR THE TREATMENT OF PRIMARY OPEN-ANGLE GLAUCOMA IN THE UNITED KINGDOM

Hirst A[1], Almond C[1], Brereton NJ[1], Shergill S[2], Wong W[3]
[1]*BresMed, Sheffield, UK,* [2]*Allergan Ltd., Marlow, UK,* [3]*Allergan Inc., Irvine, CA, USA*

OBJECTIVES: To evaluate the cost-effectiveness of bimatoprost 0.03%/timolol 0.05% (BTFC) preservative-free (PF) fixed combination compared with dorzolamide/timolol

PF fixed combination (DTFC PF), and tafluprost PF/timolol PF unfixed-combination (TTUF PF) for the treatment of primary open-angle glaucoma (POAG). **METHODS:** A cost-effectiveness and cost-utility model was developed to estimate lifetime costs and outcomes. The analysis was performed from a UK NHS perspective. No head-to-head evidence was available for BTFC PF and the comparators; therefore effectiveness estimates in terms of the mean lowering of intraocular pressure (IOP) at Week 12 were estimated using a mixed treatment comparison (MTC). Estimates of visual field progression were taken from the literature and modelled by an irreversible decrease in patients' mean deviation (MD) score in each 12-week cycle. Resource use levels for each of the health states were obtained using a clinician survey. All costs and utilities were obtained from literature or NHS cost sources. Outcomes were reported in terms of cost per mmHg IOP gained and cost per quality-adjusted-life-year (QALY). Deterministic and probabilistic sensitivity analyses were performed. **RESULTS:** The cost-effectiveness results indicated that BTFC PF dominates DTFC PF and TTUF PF, with patients treated with BTFC PF having a greater IOP reduction (1.6 mmHg) and incurring lower lifetime costs (£2,294 vs. DTFC PF, £2,919 vs. TTUF PF). The cost-utility results indicate BTFC PF dominates DTFC PF and TTUF as well with an incremental gain of 0.03 QALYs. Deterministic sensitivity analyses indicate the results are most sensitive to the rate of visual field progression. Probabilistic sensitivity analysis indicates that BTFC PF has a 98.8% probability of being cost-effective at a threshold of £20,000/QALY. **CONCLUSIONS:** BTFC PF is considered a cost-effective treatment option for the treatment of POAG when compared with DTFC PF and TTUF PF from a UK NHS perspective.

COST-MINIMIZATION ANALYSIS OF INTRAVITREAL AFLIBERCEPT (IVT-AFL) FOR NEOVASCULAR AGE-RELATED MACULAR DEGENERATION IN SPAIN

Garcia-Layana A[1], Ortega A[2], Ruiz-Moreno JM[1], Figueroa MS[3], Farres J[4], Mendivil J[4], Altemark A[5], Wittrup-Jensen KU[5]

[1]*Clínica Universidad de Navarra, Pamplona, Spain,* [2]*Clínica Universitaria de Navarra, Pamplona, Spain,* [3]*Hospital Universitario Ramón y Cajal, Madrid, Spain,* [4]*Bayer Hispania, S.L., Barcelona, NE, Spain,* [5]*Bayer Pharma AG, Berlin, Germany*

OBJECTIVES: Anti-VEGF therapy improves visual acuity in patients with neovascular ("wet") age-related macular degeneration (wAMD). By comparing different treatment regimen scenarios, based on data from available randomized clinical studies, the objective was to compare costs for intravitreal aflibercept (IVT-AFL) treatment with Ranibizumab treatment when treating wAMD patients in a Spanish setting. **METHODS:** A Markov model, describing wAMD treatment was estimated, calculating the direct medical costs based on 2-year clinical trial data. Parameters were estimated from trial data, published literature, and expert opinion. Costs, discounted at 3% per year, were calculated over a five-year horizon. Alternative scenarios and deterministic sensitivity analyses were performed and reported. **RESULTS:** IVT-AFL, dosed every two months in Year 1 and modified quarterly dosing in year two, was least expensive, €13,519, followed by IVT-AFL every second month, for two years, €16,085. Cost of Ranibizumab monthly (RBZ Q4) regimens ranged from €17,284 (12.6 injections over two years) to €26,457 (monthly injections over two years). Results were driven by less frequent IVT-AFL dosing and monitoring. The model was most sensitive to RBZ Q4 Year 1 efficacy and Year 2 injection frequency. **CONCLUSIONS:** IVT-AFL is less expensive than Ranibizumab when treating wAMD in Spain, due to less frequent dosing with IVT-AFL and lower monitoring costs.

PSS31

COST-MINIMIZATION ANALYSIS OF MULTIFOCAL AND MONOFOCAL INTRAOCULAR LENSES IN CATARACT SURGERY IN THE CZECH REPUBLIC

Kruntoradova K, Klimes J, Dolezal T, Vocelka M

Institute of Health Economics and Technology Assessment, Prague, Czech Republic

OBJECTIVES: To model the lifetime cost attributed to intraocular lenses (multifocal vs. monofocal) implantation during cataract surgery from patient's perspective. **METHODS:** The Markov model was developed with 28-day cycle length projecting life-time costs of patients undergoing cataract surgery of both eyes at 65 years. Patients move among four health states which occur after cataract surgery. Patients become independent on the spectacles or need them after cataract surgery with probabilities derived from literature. In the model, we assume that new glasses are bought by patients, who wear glasses after surgery, every three years. Patient may die from each health state with probability derived from Czech life-tables there was no difference in mortality specific for particular intraocular lenses. Resource utilization was received by an expert panel and unit costs were derived from current pricing list. Costs of cataract surgery with multifocal and monofocal lenses implantation were 1,200EUR and 9.9EUR, respectively. Mean costs of spectacles were 48.9EUR and 82.5EUR after the intervention of implanting multifocal and monofocal lenses, respectively and monthly costs of ophthalmologist visit, maintenance and service of spectacles was 0.4EUR. Discount rate of 3% was applied. One-Way Sensitivity Analysis was performed. **RESULTS:** After cataract surgery with multifocal lenses implantation, patients purchase on average by 4.4 spectacles less compare to patients undergoing monofocal intraocular lenses implantation (i.e. 5.9). The initial patient's investment of 1,190EUR into multifocal IOLs is in the lifetime horizon partially offset by saving of 364EUR attributed to lower number of new spectacles purchased and their maintenance. Costs on spectacles after cataract surgery with monofocal lenses and level of reimbursement of multifocal lenses were the biggest driver of the results. **CONCLUSIONS:** Bilateral multifocal IOL implants decrease patient's dependence on spectacles. From patient's perspective, the initial investment into multifocal lenses is partially compensated by saving of spectacles costs and its maintenance.

PSS32

A QUEBEC ECONOMIC EVALUATION FOR 36 MONTHS OF RANIBIZUMAB FOR THE TREATMENT OF DIABETIC MACULAR EDEMA

Haig J[1], Barbeau M[2], Ferreira A[3], Pickering M[2]

[1]*Optum, Burlington, ON, Canada,* [2]*Novartis Pharmaceuticals Canada Inc., Dorval, QC, Canada,* [3]*Novartis Pharma AG, Basel, Switzerland*

OBJECTIVES: The value of ranibizumab monotherapy and laser combination therapy compared to laser photocoagulation was assessed within the framework of a cost-utility analysis from the Quebec health care and societal perspectives. **METHODS:** A Markov model followed a cohort of patients with diabetic macular edema over a lifetime time horizon. The model included 8 heath states as defined by best-corrected visual acuity and one absorbing state for death. All transition probabilities in Year 1 were based on the RESTORE trial. For Years 2 and 3 data from the RESTORE Extension trial was used to inform ranibizumab monotherapy and combination therapy transition probabilities. For laser photocoagulation, Years 2 and 3 transition probabilities were based on data from DRCR.net trials. From Year 4 onwards, all transition probabilities were based on the natural history of disease. Health state utilities were derived from the literature (for the best-seeing eye) and a Canadian utility study in RVO patients (for the worse-seeing eye). Resource use and costs were collected from published literature and standard Quebec sources. Costs and outcomes were discounted at 5% as recommended by Canadian guidelines. **RESULTS:** From the health care perspective, patients receiving ranibizumab monotherapy accrued an additional 0.40 quality-adjusted life years (QALYs) and an incremental cost of CAD$9,790, resulting in $24,345 per QALY gained. Patients receiving combination therapy accrued an additional 0.32 QALYS and an incremental cost of $11,387, resulting in $36,148 per QALY gained. At a willingness-to-pay threshold of $50,000, ranibizumab monotherapy and combination therapy had a 75.2% and 59.3% probability of being cost-effective (CE), respectively. From the societal perspective, considering costs from productivity losses, ranibizumab monotherapy and combination therapy dominated laser photocoagulation and had an 88.2% and 78.8% probability of being CE, respectively. **CONCLUSIONS:** Compared to laser photocoagulation, ranibizumab monotherapy and combination therapy for 3 years show cost-effectiveness from health care and societal perspectives.

PSS33

A COST-UTILITY ANALYSIS OF RANIBIZUMAB IN AGE-RELATED MACULAR DEGENERATION BASED ON REAL-LIFE OBSERVATIONAL DATA IN FRANCE

de Pouvourville G[1], Lafuma A[2], Moeremans K[3], Nivelle E[3], Umuhire D[4], Gerlier L[3], Maurel F[5], Ponthieux A[6]

[1]*ESSEC Chair of Health Systems, Cergy, France,* [2]*Cemka Eval, Bourg La Reine, France,* [3]*IMS Health HEOR, Vilvoorde, Belgium,* [4]*IMS Health, La Défense Cedex, France,* [5]*IMS Health, La Défense, France,* [6]*Novartis Pharma S.A.S., Rueil-Malmaison Cedex, France*

OBJECTIVES: To calculate the cost-effectiveness of ranibizumab versus licensed comparators in wet age-related macular degeneration (AMD) from a French societal perspective based on real-life observational data. **METHODS:** A Markov model was developed containing 5 health states defined by visual acuity (VA) of the treated eye and a death state. The model time horizon covered 2 years of treatment followed by 8 years of best supportive care (BSC). Medical and non-medical resource use and efficacy during treatment were based on observational patient-level data with ranibizumab (LUEUR and LUMIERE studies) or verteporfin (OPV study). No observational data were available for pegaptanib. Efficacy was obtained per VA level to control for population differences in baseline VA. The base-case analysis reflects 1st line therapy. Mutual to both comparators, BSC was modelled with clinical trial placebo data and resource use estimates. Annual discount rates were 4% for costs (€ 2011) and outcomes. Utilities reflected general population preference (UK) using time-trade-off methods. **RESULTS:** Compared to verteporfin, 1st line ranibizumab provided a gain of 0.20 QALYs and avoided 0.63 years of vision impairment (Y_{VI}). The total incremental cost was €3,843. The cost-utility was €19,088/QALY, the cost per Y_{VI} avoided was €6,114. Similar outcomes were obtained when including pre-treated patients. Ranibizumab was cost-effective with a probability of 62.8% and 78.2% at willingness to pay thresholds of €20,000/QALY and €30,000/QALY respectively. **CONCLUSIONS:** Based on real-life observational studies, 2-year treatment with ranibizumab was associated with improved vision-related health outcomes and a cost-utility ratio below commonly applied willingness to pay thresholds.

PSS34

COST-EFFECTIVENESS OF SEQUENCES OF BIOLOGIC TREATMENTS FOR MODERATE-TO-SEVERE PSORIASIS IN FINLAND

Asseburg C[1], Valgardsson S[2], Soini EJ[1]

[1]*ESiOR Oy, Kuopio, Finland,* [2]*Janssen-Cilag, Lysaker, Norway*

BACKGROUND: Little is known about the health-economic properties of sequences of biologics agents for the treatment of moderate-to-severe psoriasis. These are available to patients who have failed to achieve therapeutic goals on the traditional systemics such as methotrexate and ciclosporin. **OBJECTIVES:** To predict the five-year costs and health outcomes associated with different sequences of biologic psoriasis treatments (adalimumab, etanercept, infliximab, and ustekinumab), and to evaluate their cost-effectiveness from a Finnish societal perspective. **METHODS:** The Psoriasis Area Severity Index (PASI) was chosen as the main efficacy measure and results of a published meta-analysis were re-run to provide relative efficacy of the biologics in the short term. A fully stochastic Markov cohort model was developed that represents patient health in terms of PASI, Dermatology Life Quality Index (DLQI), and quality-adjusted life-years (QALY). Failure to achieve efficacy targets, serious adverse events and other reasons of withdrawal led to switch to the next treatment in the sequence, and eventually methotrexate maintenance. Costs included direct medical and related direct costs as well as productivity losses. Costs and QALYs were discounted at 3% per annum. **RESULTS:** At a willingness-to-pay threshold of EUR 50,000 per QALY gained, only four of the 60 potential sequences had non-zero probability of being cost-effective. The sequence most likely to be cost-effective was first-line ustekinumab followed by adalimumab followed by maintenance. Its incremental cost-effectiveness ratio (ICER) per QALY gained relative to the cheapest sequence (etanercept followed by adalimumab) was estimated at EUR 8,253. Some modelling assumptions tested in the sensitivity analyses may be influential in driving the results, but others, for example inclusion of an anti-TNF class effect, made

little difference. **CONCLUSIONS:** Using a sequence model of biologic therapies in psoriasis, first-line ustekinumab was found to be cost-effective in the treatment of moderate-to-severe psoriasis in Finland.

PSS35
COST-UTILITY OF PEDIATRIC COCHLEAR IMPLANTATION IN HUNGARY
Hashim MS, Dozsa C
Corvinus University, Budapest, Hungary
OBJECTIVES: To calculate the Cost-Utility of unilateral pediatric Cochlear Implantation in Hungary. Parallel to that, we aim to provide an assessment of currently served cases and epidemiological demand. **METHODS:** Cost accounting of direct medical costs, from public purchaser perspective, covering medical resources sacrificed for unilateral implant in 1 year children, with a 60 year life expectancy. Cost-utility is calculated based on direct costs and QALY gain retrieved from literature, both to be discounted at 3% annually. Prevalence of eligible newborns to undergo Cochlear Implantation versus served cases is reported. **RESULTS:** Draft estimation of total direct costs is 12.26 million HUF (25,288 EUR) and when discounted it would be 7.3 million HUF (24,219 EUR). This is divided into 2.1% preoperative, 53.8% operative (including cost of implant) and 44% post operative. Based on health utility reported by Cheng, discounted QALY gain ranges from 6.1 to 10.8 life years. Therefore, Cost-utility of unilateral CI would range from 679,433 HUF (2,343 EUR) to 1,204,449 HUF (4,153 EUR) per discounted QALY gain. Currently in Hungary, about 90 cases are operated per year (0.1 % of crude birth rate). From 220 to 250 new cases, 2.5 to 3 times currently served, every year (0.24 – 0.37 % of crude birth rate), would be necessary for providing equal access to care. **CONCLUSIONS:** This study provides an overview to Hungarian policy makers and other stakeholders about cost-utility, direct costs and estimated effect, and also of the possible full capacity of such costly intervention. Unilateral Cochlear Implantation appears to be reasonable if direct costs per QALY are compared to GDP in Hungary. Hungarian values are compared with international values.

SENSORY SYSTEMS DISORDERS – Patient-Reported Outcomes & Patient Preference Studies

PSS36
UTILITY AND RESOURCE USE OF AN AUSTRALIAN POPULATION OF PSORIASIS PATIENTS
Wilson JL, Porter A, Price N, Dowling H
AbbVie Pty Ltd., Sydney, Australia
OBJECTIVES: Psoriasis is a chronic, systemic immune-mediated disorder characterised by skin and often joint involvement affecting 2.3% of the Australian population. While psoriasis has traditionally been viewed as a non-serious skin condition, it is now recognised as a systemic inflammatory disease with a growing body of evidence linking the condition with a number of serious co-morbidities. The objective of this study was to determine the burden, in terms of disutility and resource use, that co-morbidities have on patients with psoriasis. **METHODS:** A large-scale, multi-centre, cross-sectional study of Australian adults with psoriasis was conducted during 2011. The survey contained 43 questions and focused primarily on comorbidity, health care resource use and the impact of psoriasis on disutility as assessed by EQ-5D. **RESULTS:** A total of 330 patients responded to the survey. Three-quarters of respondents reported having at least two or more concomitant medical conditions, with only 8% reporting no comorbidities. Combined, joint-related conditions such as joint pain (46%) and psoriatic arthritis (28%) represented the largest proportion of medical comorbidities reported. The mean EQ-5D score for the cohort was 0.73. Utility decreased as the number of co-morbidities increased, ranging from 0.88 for patients with no co-morbidities to 0.36 for patients with 9 co-morbidities. Resource use and out of pocket expenses also increased with increasing number of co-morbidities. **CONCLUSIONS:** This study highlights the co-morbid nature of psoriasis with most respondents reporting having two or more concomitant conditions. Furthermore, based on the mean EQ-5D health status score, psoriasis has a considerable impact on patient quality of life comparable with other chronic diseases.

PSS37
PATIENT PREFERENCES REGARDING MONITORING AND TREATMENT FOR THE MANAGEMENT OF NEOVASCULAR AGE-RELATED MACULAR DEGENERATION
Ferreira A[1], Lall A[2], Squire A[1], Gregg L[3], Graham A[3]
[1]*Novartis Pharma AG, Basel, Switzerland,* [2]*Novartis Healthcare Pvt. Ltd., Hyderabad, India,* [3]*Adelphi, Bollington, Macclesfield, UK*
OBJECTIVES: To investigate qualitatively patient preferences for monitoring and treatment in the management of neovascular (wet) age-related macular degeneration (wAMD) in different countries. **METHODS:** The study involved 39 patients with wAMD from the UK (n=9), Canada (n=10), Germany (n=10) and Japan (n=10). Subjects participated in a 30-minute semi-structured telephone interview. Data were analysed to identify key themes and opinions. **RESULTS:** Most (74%, n=29) patients were aged ≥ 70 years, 28% (n=11) required a caregiver to attend clinic visits, and 90% (n=35) had comorbidities. Only 13% (n=5) of patients were treatment-naïve, 41% (n=16) had received ≤ 1 year of therapy and 46% (n=18) had received > 1 year of therapy. Most (92%, n=36) were currently or had previously been receiving ranibizumab; 8% (n=3) were receiving or about to initiate therapy with aflibercept. Most patients (62%, n=24) preferred monthly monitoring with treatment given as needed based on disease progression, 26% (n=10) preferred bimonthly monitoring and fixed bimonthly dosing and 13% (n=5) had no preference. Patients reported being very anxious about their sight and tended implicitly to trust their treating physician to decide on the most appropriate treatment; as a result, patients reported being highly adherent to therapy. Many patients reported appreciating the reassurance provided by frequent monitoring and were very satisfied with their current dosing regimen as chosen by their treating physician. **CONCLUSIONS:** The results of this pilot, qualitative study suggest that most patients prefer frequent monitoring with dosing based on disease progression to treat their wAMD. Understanding patient preferences will help physicians to manage their patients' disease most effectively and potentially ensure greater adherence to therapy. Further research is warranted to understand patient preferences quantitatively.

PSS38
PSORIASIS PATIENTS' TOLERANCE FOR THERAPEUTIC RISKS IN RETURN FOR SYMPTOM IMPROVEMENT IN THE UNITED KINGDOM
González JM[1], Johnson FR[1], Mughal F[2]
[1]*RTI Health Solutions, Research Triangle Park, NC, USA,* [2]*AbbVie Ltd., Maidenhead, Berkshire, UK*
OBJECTIVES: To quantify UK psoriasis patients' tolerance for serious side-effect risks associated with biologic treatments relative to the value of symptom improvements. **METHODS:** Members of a UK psoriasis patient organization were invited to complete an on-line conjoint-analysis survey which evaluated efficacy and safety features of biologic treatments for psoriasis. Patients' trade-off preferences for improvements in the severity and coverage of psoriatic lesions were elicited, as well as treatment-related risks of tuberculosis (TB), serious infections, and lymphoma. The choice pattern observed in the data was used to estimate preference weights which indicated patients' relative trade-off preferences among treatment outcomes. Preference weights were used to derive maximum levels of side-effect risks that patients would accept for various improvements in psoriasis symptoms. The DLQI was used to assess the impact of psoriasis on patients' quality of life. **RESULTS:** A total of 159 people with a self-reported physician diagnosis of psoriasis completed the survey. Mean age was 39 years and most respondents reported having psoriasis for at least 5 years. Also, the mean DLQI score was 11. Respondents would accept up to 0.39% of treatment-related risks of lymphoma for reducing the area covered by a severe lesion from 25% to 10% of their torso, and up to 0.60% if lesions were on their arms or legs.For the same improvement in symptoms, respondents would accept up to a 2.3% risk of TB or 3.3% risk of serious infections if the lesions were on their torso, and a 3.6% risk of TB or 5.2% risk of serious infections if the lesions were on their arms and legs. **CONCLUSIONS:** Psoriasis patients' tolerance for side-effect risks varies with side-effect severity and location of lesions. Estimates of patients' risk tolerance for serious side-effects indicate that patients value psoriasis symptom control further confirming that psoriasis has a significant effect on patients' quality of life.

PSS39
ATOPIC DERMATITIS IN ADULTS: DESIGN AND VALIDATION OF A SPECIFIC BURDEN QUESTIONNAIRE
Taieb C
CREES PFSA, Paris, France
OBJECTIVES: Atopic Dermatitis (AD) is a common skin condition, even in adults. On the contrary of quality of life questionnaires, the notion of individual burden associated with a disease has been introduced to determine the "disability" in the broadest sense. The aim of the current study was to develop and validate the Atopic dermatitis Burden Scale questionnaire for Adults (ABS-A) following Classical Test Theory method (CTT). **METHODS:** The questionnaire was developed by a working group composed of individuals with expertise in PRO development, dermatologists, and patients from patients' association. Subsequently, this questionnaire was sent to 900 people with AD. ABS-A was refined via exploratory factor analysis (EFA). Internal consistency was determined by calculating the Cronbach's alpha, concurrent validity by calculating the Spearman's rank coefficient correlation between ABS-A, SF-12 and Dermatology Life Quality Index (DLQI) questionnaires. Discriminant validity was analysed according to the severity degrees of AD assessed by the Patient Oriented SCORing index of AD questionnaire. **RESULTS:** A total of 128 individuals filled out the ABS-A entirely and were then evaluated. 68.8% of them were men and almost 50% of them were aged between 35 and 64 years old. Based on the results of the EFA, 1 item was removed due to cross-loading on factors. Consequently, the questionnaire consisted of 18 items grouped into 4 domains. ABS-A showed good internal coherence (Cronbach's á: 0.89). ABS was significantly correlated to both components of the SF-12 ($r(PCS)=-0.36$, $p<0.0001$; $r(MCS)=-0.52$, $p<0.0001$). A higher coefficient correlation has been found between ABS-A and DLQI ($r=0.78$; $p<0.0001$). Significant differences between severity degrees of AD have been shown. **CONCLUSIONS:** These preliminary results suggest the validity of the ABS-A questionnaire. However, since recruitment of patients is not achieved, performing analyses of the other stages of CTT, and Confirmatory Factor analysis or Rash analysis are warranted. Comparison between both methods may be valuable.

PSS40
THE BURDEN IMPOSED BY ATOPIC DERMATITIS ON FAMILIES: CREATION OF A SPECIFIC QUESTIONNAIRE
Taieb C[1], Branchoux S[2]
[1]*CREES PFSA, Paris, France,* [2]*Pierre Fabre, Boulogne Billancourt, France*
OBJECTIVES: The notion of individual burden, associated with the disease, has been introduced recently to determine the "disability" caused by the pathology in the broadest sense of the word (psychological-social-economic-physical). **METHODS:** The ABS questionnaire (Atopy Burden Score Q) consists of 19 items, structured around 5 components. It was distributed to a random sample of families consulting at the Necker Hospital, staying at the Avène Hydrotherapy Center, and members of the patient-association. The ABS was accompanied by SF12 and PGWBI, to confirm internal and external validation, and by the PO-SCORAD to assess the level of severity. **RESULTS:** A total of 58 Q were considered evaluable. 51% of the AD children were girls. The PO-SCORAD established the level of severity of the AD: 14%, 50% and 36% of children had mild, moderate or severe AD respectively. Internal-validity was measured by Cronbach's alpha, which is equal to 0.81, reflecting a good homogeneity of the 19 items. The mean PGWBI score is 51.82±14.28. The score reflecting the most important deterioration is found among parents of children with severe atopy. In contrast, the scores associated with moderate and mild atopy are not correlated with severity. Families' QoL, measured using the SF12, revealed no deterioration in the physical component. The ABS score is correlated with the scores of the Q

used, thus confirming external validity. The mean score calculated from the ABS is 48.17±18.36. The score increases with the severity of the AD. A statistically significant difference is observed between the 3 severity-groups, i.e. mild, moderate and severe, with scores of 30.63, 42.55 and 62.62 respectively. **CONCLUSIONS:** The internal and external validity of our Q were confirmed. ABS is correlated with the severity of AD. Hence, we have a short, easy-to-use, validated tool for assessing the burden imposed by atopy on families. Following cultural and linguistic validation, the ABS is now available in US English, Spanish, German and Italian.

PSS41

HEMANGIOMA FAMILY BURDEN: CREATION OF A SPECIFIC QUESTIONNAIRE

Taieb C[1], Boccara O[2]
[1]*CREES PFSA, Paris, France,* [2]*Necker Hospital, Paris, France*

OBJECTIVES: The notion of individual burden, associated with the disease, has been introduced recently to determine the "disability" caused by the pathology in the broadest sense of the word (psychological-social-economic-physical). The aim of our study is to develop a specific questionnaire for assessing the burden on families of children with HI. **METHODS:** A "Hemangioma Family Burden" questionnaire (HFB) consisting of 22 items, The score increases with the heaviness of the burden. It was distributed accompanied by 2 validated QoL questionnaires (SF12 and PGWBI) to obtain internal and external validation **RESULTS:** A total of 58 evaluable Q were returned. One parent from each family described how they perceived the effects of the disease, which led to the creation of 6 severity groups, paired together for size reasons: "not-very-far-reaching" and "somew-hat-far-reaching"; "quite-far-reaching" and "far-reaching"; "very far-reaching" and "extremely far-reaching". Internal validity was measured by Cronbach's alpha, which is equal to 0.95, reflecting a good homogeneity of the 22 Q items. The mean scores of the physical and mental components are 54.93±5.12 and 40.49±11.28 respectively. Hence, the HFB score is correlated with these 2 components, thus confirming external validity. The mean score calculated from the HFB is 23.42±19.93. The score increases with the "severity score" of the parents. In fact, a statistically significant difference is observed between the 3 severity groups: 5.28±6.8 for those reporting the smallest extent to 41.0±18.71 for those reporting the greatest extent, and 27.7±16.96 for a moderate extent. This confirms the sensitivity of the HFB **CONCLUSIONS:** During the evaluation, internal and external validity were confirmed. The HFB is correlated with the extent felt by parents, a feeling deemed relevant because it is often the cause of consultation and demand for treatment. We now have an easy-to-use, validated IH tool for assessing the disability caused. Following cultural and linguistic validation, the HFB is now available in US English, Spanish, German and Italian.

PSS42

A SYSTEMATIC REVIEW OF PATIENT REPORTED OUTCOMES IN GLAUCOMA

Aggarwal S, Segal J, Topaloglu H
Novel Health Strategies, Bethesda, MD, USA

OBJECTIVES: Patient reported outcomes (PRO) are becoming useful tools for collecting and generating evidence for new medical products to show improvements in health-related quality of life (HRQoL). Glaucoma is a chronic disease with high importance for patient HRQoL. The objective of this study was to review, analyze, and understand trends in the PRO instruments used in patients with Glaucoma. **METHODS:** A systematic literature search for Glaucoma trials with PROs endpoints was undertaken for the databases Pubmed, Embase, Biosis, Google Scholar and Cochrane. Data was collected for the study size, interventions, year, PRO instrument and results for PROs. Analysis for conducted to identify trends in commonly used PRO instruments and categorize results as positive, neutral or negative. **RESULTS:** A total of 31 studies with a total of 9819 patients were identified. In these studies there were eleven different PROs instruments were identified that were Glaucoma health perception index, Glaucoma quality of life questionnaire (Glau-QoL), Glaucoma utility index, Impact of vision impairment, Low vision quality of life questionnaire, National eye institute visual function index-19 items, National eye institute visual function index-51 items, Nursing home vision quality of life questionnaire, Quality of life and visual function questionnaire, Vision core module 1, and Vision quality of life index. The most commonly used instruments were Impact of vision impairment (used in 7 studies) and Low vision quality of life questionnaire (used in 4 studies). **CONCLUSIONS:** Patients with glaucoma have significant impairment in their QoL, hence collection of such data is important for new medical products. PRO instruments such as Impact of vision impairment and Low vision quality of life questionnaire have been commonly used to generate evidence to show which therapies improve patient QoL.

PSS43

CORRELATIONS BETWEEN CHANGES IN THE URTICARIA ACTIVITY SCORE (UAS7) AND THE DERMATOLOGY LIFE QUALITY INDEX (DLQI) FROM BASELINE TO 28 OR 40 WEEKS: COMPARISONS OF TRAJECTORIES OF CHANGE IN PATIENTS WITH CHRONIC SPONTANEOUS/IDIOPATHIC URTICARIA (CSU/CIU)

Stull DE[1], McBride D[2], Balp MM[3], Gnanasakthy A[4]
[1]*RTI Health Solutions, Didsbury, Manchester, UK,* [2]*RTI Health Solutions, Manchester, UK,* [3]*Novartis Pharma AG, Basel, Switzerland,* [4]*Novartis Pharmaceuticals, East Hanover, NJ, USA*

OBJECTIVES: The UAS7 is a patient-reported measure of urticaria symptoms. Daily pruritus scores and number of hives are summed over 7 days for a weekly score. The DLQI was developed as a brief (10-item) patient-reported measure with one-week recall for routine clinical use to assess the psychosocial effects of skin disease. The objective of this analysis was to examine changes in the UAS7 with those of the DLQI to see if the DLQI could be used in a clinic visit in lieu of collecting one week of UAS7 diary data. **METHODS:** Data come from three pivotal, phase 3 clinical trials investigating the effects of omalizumab for patients with refractory CSU/CIU (publication available elsewhere). DLQI data were collected at baseline and weeks 4, 12, 24, and 40 (ASTERIA I and GLACIAL), and baseline and weeks 4, 12, and 28 (ASTERIA II). UAS7 score was reported at baseline and every four weeks but data from the same weeks as the DLQI were used for these analyses. Pooled data from all 3 studies were analysed using latent growth models to generate intercepts and slopes of change across trials for each patient, irrespective of treatment. Slopes of change were correlated to examine how closely DLQI changes mirrored UAS7 changes. **RESULTS:** Results indicated that both measures showed large improvements over the course of the trials: UAS7 and DLQI scores were high at the start of the study reflecting moderate-severe CSU/CIU (UAS7) and a very large effect on patient's life (DLQI). Correlations between changes in DLQI and changes in UAS7 by study end were 0.88, 0.85, and 0.88, indicating high correspondence between the two measures. **CONCLUSIONS:** These results suggest that collecting DLQI information in-clinic can provide an excellent indication of the weekly UAS7 score, and is more efficient for clinical practice routine in assessing CSU/CIU patients.

PSS44

ETANERCEPT PROVIDES IMPROVED QUALITY OF LIFE REGARDLESS OF THE PRESENCE OF PSORIATRIC ARTHRITIS IN MODERATE/SEVERE PSORIASIS SUBJECTS FROM CENTRAL AND EASTERN EUROPE, LATIN AMERICA AND ASIA

Kemeny L[1], Amaya M[2], Cetkovska P[3], Lee WR[4], Galimberti LR[5], Mahgoub E[6], Rahman M[6], Marshall L[6], Pedersen R[6], Tang B[7]
[1]*University of Szeged, Szeged, Hungary,* [2]*Hospital San Lucas, Monterrey, Mexico,* [3]*University Hospital, Plzeò, Czech Republic,* [4]*Shuang Ho Hospital, New Taipei City, Taiwan,* [5]*Hospital Italiano, Buenos Aires, Argentina,* [6]*Pfizer Inc, Collegeville, PA, USA,* [7]*Pfizer, Inc., New York, NY, USA*

OBJECTIVES: Some psoriasis patients also have psoriatic arthritis (PsA), which increases disease burden and further reduces quality-of-life (QoL). Our objective was to compare QoL of subjects with both psoriasis and PsA to those with psoriasis alone, and to evaluate improvement on etanercept (ETN) therapy in specific countries of Central and Eastern Europe, Latin America, and Asia where data are limited. **METHODS:** Patients with moderate/severe psoriasis were randomized to 50mg ETN QW (once weekly) or 50mg ETN BIW (twice weekly, weeks 1-12), followed by 50mg QW (weeks 13-24). The following post-hoc assessments were included: EuroQoL-5D (EQ-5D); Dermatology Quality of Life Index (DLQI); Functional Assessment of Chronic Illness Therapy (FACIT)-Fatigue; Hospital Anxiety and Depression Scale (HADS); Medical Outcomes Study (MOS)-Sleep; and Work Productivity and Activity Impairment (WPAI). Subjects with and without PsA were pooled across ETN groups for comparisons of changes in scores from baseline to week 24, which were based on independent sample t-tests. **RESULTS:** Of 171 subjects analysed, 64 (37.4%) had PsA. Baseline demographic characteristics and QoL measures were similar in PsA and psoriasis-alone groups. EQ-5D scores improved significantly over time with ETN treatment in both subjects with and without PsA ($P<0.0001$) with similar adjusted mean improvement in both groups after 24 weeks (0.2 vs 0.2; $P=0.6202$). Improvement in EQ-5D greater than MID (change ≥ 0.05) at week 24 was observed in a greater proportion of PsA than psoriasis-alone subjects (74.6% vs 63.8%; $P=0.174$). Significant improvements from baseline in both PsA and psoriasis-alone groups were also observed after 24 weeks in DLQI (both $P<0.0001$), FACIT (both $P<0.01$) and HADS anxiety (both $P<0.0001$) scores. Improvements of other patient-reported outcomes were also observed at weeks 24 in both disease subgroups. **CONCLUSIONS:** ETN in both dose regimens provided significant improvement in QoL measures in subjects with moderate-to-severe psoriasis, regardless of the presence of PsA.

PSS45

QUALITY OF LIFE IMPROVEMENT WITH ETANERCEPT IN PATIENTS WITH MODERATE/SEVERE PSORIASIS FROM CENTRAL AND EASTERN EUROPE, LATIN AMERICA AND ASIA

Kemeny L[1], Amaya M[2], Cetkovska P[3], Lee WR[4], Galimberti LR[5], Mahgoub E[6], Rahman M[6], Marshall L[6], Tang B[7]
[1]*University of Szeged, Szeged, Hungary,* [2]*Hospital San Lucas, Monterrey, Mexico,* [3]*University Hospital, Plzeò, Czech Republic,* [4]*Shuang Ho Hospital, New Taipei City, Taiwan,* [5]*Hospital Italiano, Buenos Aires, Argentina,* [6]*Pfizer Inc, Collegeville, PA, USA,* [7]*Pfizer, Inc., New York, NY, USA*

OBJECTIVES: To assess the impact of etanercept (ETN) on quality-of-life (QoL) through 24 weeks in patients with moderate/severe psoriasis in specific countries of Central and Eastern Europe, Latin America, and Asia where data are limited. **METHODS:** Patients with moderate/severe psoriasis were randomized to 50mg ETN QW (once weekly) or 50mg ETN BIW (twice weekly, weeks 1-12), followed by 50mg QW (weeks 13-24). Patients completed the Dermatology Life Quality Index (DLQI) EuroQoL 5D (EQ-5D), FACT-Fatigue, HADS Anxiety Score, Psoriasis Subject Satisfaction Questionnaire, and Work Productivity Activity Impairment (WPAI) at baseline and subsequent visits. **RESULTS:** Of 171 patients analysed, 85 were randomised to ETN BIW and 86 to ETN 50 QW. Baseline DLQI scores were 14.8 in both treatment groups suggesting severe QoL impairment. Significant improvements in DLQI from baseline were observed at weeks 12 and 24 in both groups (all $p<0.0001$); mean improvement at week 12 for ETN BIW was greater than for ETN QW (10.8 vs 8.4, $p=0.001$), but was similar between groups at week 24 (11.0 vs 9.5, $p=0.063$). EQ-5D utility was significantly improved from baseline in both groups at weeks 12 and 24 (all $p<0.0001$), with mean improvement significantly greater for the higher dose at both time-points (week 12: 0.3 vs. 0.2, $p=0.029$; week 24: 0.3 vs. 0.2, $p=0.027$). Mean EQ-5D improvement at week 24 was greater than MID (change ≥ 0.05) in a significantly greater proportion of patients receiving BIW than QW (77.1% vs 58.8%; $p=0.013$). Improvements of other patient-reported outcomes from baseline were observed at weeks 12 and 24 in both treatment groups. **CONCLUSIONS:** At baseline, patients had severely impaired QoL, and improvement in QoL was achieved with both ETN regimens. Improvements observed with ETN BIW were significantly greater than with ETN QW for both DLQI and EQ-5D utility at week 12, but only for EQ-5D at week 24.

PSS46

QUALITY OF LIFE OF PATIENTS SUFFERING FROM EXUDATIVE AGE-RELATED MACULAR DEGENERATION AND TREATED BY INTRAVITREAL INJECTIONS AND ITS PREDICTORS: THE EQUADE STUDY

Leveziel N[1], Joubert M[2], Hermans M[3], Moser E[3], Le Picard S[3], Maurel F[4]
[1]*CHU de Poitiers, Poitiers, France,* [2]*Association DMLA, Saint-Cloud Cedex, France,* [3]*Retina France, Colomiers cedex, France,* [4]*IMS Health, La Défense, France*

OBJECTIVES: To assess the quality of life (QoL) of patients with an exudative Age-Related Macular Degeneration (AMD) treated by intravitreal Anti-VEGF (vascular endothelial growth factor) and determine its drivers in a real-life setting. **METHODS:** A self-reported survey was carried out among AMD patients belonging to 2 French associations. Only patients with exudative AMD and under active intravitreal anti-VEGF treatment over the last 6 months were included. Data on demographics, disease parameters, past and ongoing treatments were collected. One validated vision-specific QoL instrument was also considered: the NEI-VFQ-25. Patients were stratified into four groups of visual acuity (VA). A multivariate model was performed to identify the QoL drivers. **RESULTS:** Out of the 1,888 questionnaires mailed 32.4% were returned and 24.7% fulfilled the inclusions criteria and were fully completed for analyses. Patients' mean age was 78.0 years (SD 7.6). A total of 70.5% were women. A total of 60.4% had bilateral disease. The mean duration of symptomatic exudative AMD was respectively of 7.2 (SD 5) and 2.3 years (SD 3) for the first and the second eye. Most of anti-VEGF treated eyes (n=641) were treated for more than 1 year (77.4%). The mean annual number of anti-VEGF injections was 4.7 (SD 2.7). The mean NEI-VFQ-25 global score was 53.4 (SD 21.5). A decrease of this score was positively correlated to VA decrease (0.63;p<.0001). This correlation was observed for 11 subscales out of 12. The main risk factor associated to the lower Qol score was the worst VA category, with an odds ratio of 5.2 (CI95%[2.6-10.4];p<.0001). **CONCLUSIONS:** In a real-life survey of patients treated and followed for exudative AMD, VA decrease was the strongest factor linked to QoL worsening. Other factors such as the number of Anti-VEGF injections were not correlated to QoL in this study. Then, preservation of useful VA still remains a major concern to improve patients' QoL.

PSS47

ASSESSMENT AND CAUSAL LINK BETWEEN VISION-RELATED QUALITY OF LIFE AND GENERAL HEALTH RELATED QUALITY OF LIFE IN DRY EYE PATIENTS

Ernst F

Santen GmbH, Munich, Germany

OBJECTIVES: This abstract describes attempts to evaluate the burden of dry eye disease with regards to vision-related quality of life (QoL) and the causal link to general health related quality of life. Recent increased awareness of dry eye disease (DED) by both health care professional and patients has been accompanied by improved recognition that it is a chronic disorder often requiring long-term treatment and management. DED, frequently associated with symptoms of discomfort and visual disturbance, also impairs general health status and general quality of life, including aspects of physical, social, and psychological functioning. This abstract summarizes the available research on the burden of DED and the impact on QoL. **METHODS:** The research included systematic literature search on clinical relevant DED literature based on HTA relevant requirements, in order to identify potential differences within DED. Correlations with socio- demographic characteristics, clinical parameters, and psychological status were evaluated. **RESULTS:** A relative small amount of data supporting the effectiveness of DED treatments as assessed by QoL measures exists (such as DEQLQ, IDEEL etc.). Dry eye treatments have been associated with improvements in symptoms measured by OSDI (Ocular Surface Disease Index), and in ophthalmology-disease-specific measurement of QoL, and with enhancement of patients' ratings regarding their ability to perform activities of daily life. Significant correlations were found between symptoms score and QoL scores and patient anxiety, especially depression levels which correlates to general health. **CONCLUSIONS:** Vision-related QoL in dry eye patients was correlated with general health status, especially with anxiety and depression. DED has further implication on general public health and deserves an increased attention and resources.

PHYSICIAN EXPERIENCE WITH RITUXIMAB TO TREAT PEMPHIGUS VULGARIS IN CANADA: A QUESTIONNAIRE-BASED STUDY

Mittmann N, Knowles S, Heelan K, Bannon G, Seung SJ, Shear N

Sunnybrook Health Sciences Centre, Toronto, ON, Canada

OBJECTIVES: To examine the experience of physicians who treat patients with pemphigus vulgaris (PV) in Canada as well as the utilization and access of the drug rituximab (Rtx). **METHODS:** An online questionnaire was created in SurveyMonkey® to collect data from participants based on a convenience sample size of 10 English-speaking dermatologists. Consent was implied once the dermatologist completed the questionnaire. Non-identifying information for both dermatologists and PV patients was collected. **RESULTS:** The 10 participating dermatologists have been treating PV patients an average of 20.9 ± 10.7 (5 – 45) years in which 28.8 ± 58.3 (0 – 200) was the mean number in their practice. Experience with Rtx is based on an average of 4.1 ± 3.8 (0 – 10) years and 13.1 ± 29.2 (0 – 100) PV patients treated with Rtx. All participants answered that "failure of conventional therapy for at least six months" was the primary reason for using Rtx and that azathioprine, intravenous immunoglobulin and mycophenolate mofetil were the most popular treatments used to treat PV patients prior to Rtx. On average, it takes 3.2 ± 2.2 (0 – 6) months for a remission to be induced after Rtx treatment and 90% of the dermatologists were concerned that infections would be an adverse event. Lastly, 6.3 ± 12.3 (0 – 40) was the mean number of Rtx drug reimbursement letters that the dermatologists had written on behalf of PV patients in which 1.9 ± 2.5 (0 – 6) letters were successful in securing Rtx drug reimbursements. **CONCLUSIONS:** A recent survey of 10 Canadian dermatologists experienced with treating PV patients found that Rtx utilization is still new, disease remission is achieved within a short period of time, and the drug reimbursement process remains a barrier based on the low number of letters written by the dermatologists.

REAL-WORLD UTILIZATION DATA OVER 4 YEARS OF RANIBIZUMAB INJECTIONS FOR THE TREATMENT OF WET AGE-RELATED MACULAR DEGENERATION IN CANADA

Lebel K[1], Gonder J[2], Davies B[1], Zaour N[1]

[1]*Novartis Pharmaceuticals Canada Inc., Dorval, QC, Canada,* [2]*St. Joseph's Health Care, London, ON, Canada*

OBJECTIVES: To assess the yearly frequency of ranibizumab injections for the treatment of wet Age-Related Macular Degeneration (wAMD) in two large Canadian public drug plans: Ontario Public Drug Program (OPDP) and Régie de l'assurance-maladie du Québec (RAMQ). **METHODS:** Pharmastat database (IMS Health Canada Inc.) was used to assess the mean annual number of ranibizumab injections for wAMD patients covered by the OPDP or RAMQ drug plans (1 injection was defined as 1 claim). Only wAMD treatment-naïve patients were included and the index date was defined as the date of the first ranibizumab claim. The analysis looked at monthly data from March 2008 to November 2012 for OPDP patients and from January 2008 to May 2012 for RAMQ patients and tracked the mean number of claims during the patient's first, second, third and fourth year of ranibizumab therapy. **RESULTS:** For the OPDP, the mean number of ranibizumab injections was 6.0, 5.4, 5.5 and 5.6 for year 1 (N=26,606), year 2 (N=19,466), year 3 (N=12,708), and year 4 (N=6,681), respectively. For the RAMQ, the mean number of injections was 5.4, 4.7, 5.2 and 5.7 for year 1 (N=3,457), year 2 (N=2,185), year 3 (N=1,178), and year 4 (N=349), respectively. **CONCLUSIONS:** These results suggest that many Ontario and Quebec retina specialists and ophthalmologists do not treat monthly but rather adopt an individualized ranibizumab treatment regimen to manage their patients' wAMD. In addition, these results provide information on the real-world utilization of ranibizumab in wAMD for up to four years of treatment. The analyses, conclusions, opinions and statements expressed are those of Novartis Pharmaceuticals Canada Inc., and not those of IMS Health Canada Inc.

PSS50

DEFINING THE PATIENT JOURNEY VIA CLAIMS ANALYSIS IN AN ORPHAN OPHTHALMIC CONDITION: IS THERE A STANDARD OF CARE?

Gavaghan M[1], Abraham J[1], Pauer L[2]

[1]*GfK Bridgehead, Wayland, MA, USA,* [2]*Santen, Inc., Emeryville, CA, USA*

OBJECTIVES: To date, there has not been extensive study on the economics or established treatment guidelines in patients with non-infectious posterior uveitis (NIPU). Current treatment is mostly topical/systemic/injection corticosteroids, though treatment is associated with significant side effects. We undertook a secondary research analysis of MarketScan claims data to better understand the patient journey and the current treatment standard of care for NIPU patients. **METHODS:** We analyzed the MarketScan dataset to identify NIPU patients from a defined list of ICD-9 codes. We then identified patients with 30 months of continuous enrollment data, 6 months prior and 24 months post initial diagnosis. Patients were assessed for number of office visits/procedures, number of diagnostic tests, number of inpatient stays, and number and frequency of drug treatment (corticosteroids, corticosteroid injections, immunomodulators, and biologics). **RESULTS:** Of the 56 million lives in the claims dataset, 34,827 had an ICD-9 code consistent with NIPU. Of these unique patients, 33,386 were analyzed. 78.8% of patients came from the commercial dataset, 59% of patients were female, and the average age at diagnosis was 51.5 years. Prior to diagnosis, 5,775 patients were treated for NIPU at an average cost of $185.43 per patient (58.0% topical/systemic corticosteroids, 22.7% corticosteroid injections, 15.7% immunomodulators, 3.7% biologics). In the 24 months post-diagnosis, the number of treated patients increased to 11,570 patients at an average cost of $249.01 per patient (45.7% topical/systemic corticosteroids, 37.4% corticosteroid injections, 16.4% immunomodulators, 3.2% biologics). Examining each six-month period post-diagnosis, the number of treated patients decreased, but the share of treatments remained the same. **CONCLUSIONS:** Patients with NIPU are engaging the health care system and being treated for NIPU at least six months prior to an official diagnosis. Efforts should be made to better identify patients with NIPU to ensure proper diagnosis and treatment.

PSS51

WAITING TIMES AND SCHEDULING IN DERMATOLOGICAL PRACTICES IN GERMANY

Krensel M[1], Augustin M[1], Reusch M[2], Rosenbach T[3]

[1]*University Medical Center Hamburg-Eppendorf, Hamburg, Germany,* [2]*Dermatology Center Tibarg, Hamburg, Hamburg, Germany,* [3]*Dermatology Center Osnabrück, Osnabrück, Germany*

OBJECTIVES: Waiting time for medical consultation is an important quality indicator of health systems. International studies have shown that there is considerable variation of waiting time between countries. It may also vary within countries depending on the degree of emergency, indication, and way of reimbursement. Our objective was to assess practice organization and waiting times in German dermatological practices. **METHODS:** A one page questionnaire was sent to be returned anonymously by fax to 2,644 German office base dermatologists randomly selected. Included were items on organization of practice, region and specific average waiting times for selected diagnoses. The postal codes obtained from the practices were mapped to the 17 German regions of physicians association of statutory health insurance. **RESULTS:** Data sets were obtained from 681 practices. A total of 4.3% of practices rarely or never gave fixed appointments, 36.3% only gave fixed appointments. The percentage of treatment at fixed appointments varied by regions from 71.1% in Bremen and Brandenburg to 90.0% in Hessen. Moreover, private practices not being associated with the statutory health system showed a higher rate of timed appointments with 94.8% compared to 83.0%. Average waiting time in practices treating also patients with statutory health insurance is 5 weeks and thus 4 times higher compared to waiting time in practices treating private insured patients only (1.2 weeks). There was large variation in waiting time for the first appointment between different indications. Patients with acute eczema or pigmented lesions specific for melanoma were given appointments after 1.7 or 1.2 weeks, respectively; for skin cancer screening, patients had to wait for 5.7 weeks on average. There was only small geographic variation regarding this pattern. **CONCLUSIONS:** Patients with risky and acute indications are treated with low waiting times whereas patients with less threating skin diseases have to wait longer for appointments at dermatological offices.

SAFETY IN NATIONAL CARE - REAL WORLD DATA FROM THE GERMAN PSORIASIS-REGISTRY "PSOBEST"

Rustenbach SJ[1], Purwins S[1], Spehr C[1], Radtke MA[1], Reich K[2], Augustin M[1]
[1]*University Medical Center Hamburg-Eppendorf, Hamburg, Germany,* [2]*Dermatologikum Hamburg, Hamburg, Germany*

OBJECTIVES: The registry "PsoBest" observes systemic therapy of moderate and severe psoriasis/psoriasis-arthritis in Germany since 2008. The registry is supported by the German society for dermatologists, the association of dermatologists, pharmaceutical manufactures, dermatologists and patients. It is located at CVderm and documents safety, effectiveness and patient benefit in routine health care. One purpose of PsoBest is to monitor the safety of systemic antipsoriatics. **METHODS:** Patients receiving first time a conventional systemic or biologic treatment are observed for 5 years, regardless of therapy switches. Standardised questionnaires for physicians and patients are compiled. Adverse and serious adverse events (AE/SAE) are coded in MedDRA and analyzed twice a year. **RESULTS:** Pharmacovigilance after 42 months on 1984 patients with 800 expositions to biologics (1196 patient years) and 1430 to systemics (1548 patient years) resulted in 187 SAE codings in 121 patients (6.1%). A total of 105 SAE were observed under biologic and 95 under conventional systemic treatment (8.9 and 4.5%, respectively). Of these, 20 SAE in 14 patients were observed in combined treatment. By system-organ-classes, general disorders and administration site conditions were observed for 2.3% of biologic (1.51 events/100 patient years) and 1.3% systemic patients (1.32 events/100 patient years). The rates for cardiac disorders were 0.92 (1.4% of patients) and 0.84 (0.9% of systemic patients), respectively. For infections and infestations the rates were 0.84 (1.3%) and 0.52(0.8%) and for neoplasms benign, malignant and unspecified (incl. cysts and polyps) 0.67 (1.0%) and 0.71 (0.8%). **CONCLUSIONS:** PsoBest provides urgently needed long-term safety data in the systemic treatment of psoriasis and psoriatic-arthritis from routine care in Germany. To date, no safety concern emerged from the registry. To raise the power for signal detection, verification, analysis and assessment, PsoBest is proactively contributing to the European surveillance of effectiveness and safety of systemic psoriasis therapy (ENCEPP-network psonet).

PSS53

AFLIBERCEPT IN NEOVASCULAR (WET) AGE-RELATED MACULAR DEGENERATION: AN ANALYSIS OF THE PAYER DECISION LANDSCAPE

Brown A[1], Ferreira A[2], Lamle S[2], Milnes F[2]
[1]*Abacus International, Manchester, UK,* [2]*Novartis Pharma AG, Basel, Switzerland*

OBJECTIVES: To investigate and analyse decisions of Health Technology Assessment or national drug reimbursement agencies for aflibercept in neovascular (wet) aged-related macular degeneration, including decision outcomes, the rationale for these, the data package and any payer critique of the manufacturer approach. **METHODS:** A search of decision-making agency websites in key European markets, Canada and Australia was conducted to identify relevant decisions. Data were extracted and used to conduct a qualitative analysis of decisions. **RESULTS:** Five decisions were identified; from NICE (England & Wales), SMC (Scotland), HAS (France), G-BA (Germany) and PBAC (Australia). In all instances, the clinical and economic arguments, where applicable, were based on demonstration of non-inferiority of aflibercept to an existing therapy, ranibizumab. These arguments were supported by two key trials of aflibercept vs. ranibizumab: VIEW 1 and 2, and also indirect comparisons and network meta-analyses. In all decisions, aflibercept was either recommended for the full licensed indication or recommended with restrictions. All agencies commented that the key trials were well conducted and unbiased; however, they also state that the dosing schedule for ranibizumab did not reflect the license or clinical practice in respective markets, and it was unclear if there would be any difference in the frequency of injections between therapies in the clinical setting. Furthermore, for the economic models for NICE, SMC and PBAC, the respective agencies thought the frequency of injections and number of clinician visits for ranibizumab were overestimated. All agencies concluded that aflibercept demonstrated no additional clinical benefit over ranibizumab. For example, HAS in France granted an ASMR level V: no improvement in clinical benefit, while NICE recommended that aflibercept be used in accordance with their recommendations for ranibizumab. **CONCLUSIONS:** While aflibercept is an effective alternative therapy to ranibizumab, payers have concluded that it offers no demonstrable added clinical benefit compared with ranibizumab.

PSS54

HEALTH RELATED QUALITY OF LIFE-OUTCOME IN NATIONAL CARE - REAL WORLD DATA FROM THE GERMAN PSORIASIS-REGISTRY "PSOBEST"

Purwins S[1], Spehr C[1], Augustin M[1], Radtke MA[1], Reich K[2], Rustenbach SJ[1]
[1]*University Medical Center Hamburg-Eppendorf, Hamburg, Germany,* [2]*Dermatologikum Hamburg, Hamburg, Germany*

OBJECTIVES: The registry "PsoBest" observes systemic therapy of moderate and severe psoriasis/psoriasis-arthritis in Germany since 2008. The registry is supported by the German society for dermatologists, the association of dermatologists, pharmaceutical manufactures, dermatologists and patients. It is located at CVderm and records efficacy, safety, and patient benefit in routine health care. One purpose of PsoBest is to monitor health related quality of life (HrQoL) and severity of psoriasis in the process of care. **METHODS:** Patients receiving first time a conventional systemic or biologic therapeutic are observed for 5 years, independent of further treatment. Standardised questionnaires for physicians and patients are compiled. Main outcomes are severity (PASI), affected body surface area (BSA) and HrQoL (DLQI and EQ-5D). **RESULTS:** A total of 1,984 patients were enrolled up to July 2012 (60% male, mean age of 47 years); mean duration of illness was 19±14 years. Patients on biologics (n=686) tended to be male (63 v. 58%), older (48.1 v. 46.7 years) as patients on conventional systemics (n=1,298) and had a longer history of psoriasis (21.9 v. 16.8 years). The biologic cohort showed more nail involvement (64 v. 52%), signs of arthritis (47 v. 17%), higher severity (PASI: 15.6 v. 14.6; BSA: 22. v. 21.5) and lower HrQoL (DLQI: 11.7 v. 11.0; EQ-5D VAS: 50.6 v. 55.7). For the biologics cohort, mean PASI improved to 4.5 between 12 and 24 months (reduction of 70% from baseline). Moreover, HrQoL (DLQI) improved by 65% from inclusion. The conventional systemics cohort showed comparable reduction in PASI=3.1 (77%) but less improvement in DLQI= 3.1 (49%). **CONCLUSIONS:** PsoBest provides long-term real-world data on psoriasis care in Germany. The results show the high burden of psoriasis patients entering the registry and also the high quality of care and patient benefit after initiation of systemic treatment.

PSS55

RECRUTING PHYSICIANS FOR HEALTH OUTCOME AND POST-APPROVAL STUDIES: BENEFITS OF A MANAGED PHYSICIAN PANEL

Potthoff P[1], Güther B[1], Brown C[2], Eichmann F[1]
[1]*Kantar Health Germany, Munich, Germany,* [2]*All Global, London, UK*

OBJECTIVES: Access to multi-country physician panels is an alternative option to recruit medical sites for health outcome or post-approval studies, compared to the conventional approach of individually recruiting clinical expert sites. The objective of our study was to assess the potential of physician panels for site recruitment. **METHODS:** In 2012, a representative survey among members of a managed physician panel (All Global's managed panel of ophtalmologists in US, UK, GER, FR, IT and SP) was conducted. The survey assessed the willingness of the physicians to participate in post-approval studies. Information about former participation in those studies and commitment to special requests for post-approval studies (e.g. ethical committee involvement, advent reporting to sponsor, security of patient's informed consent) were also collected. **RESULTS:** A total of 200 opthalmologists participated in the survey. Since no special incentive was offered for participation the response rate of more than 25% was satisfactory. 79 (39,5%) of the physicians formerly participated in clinical trials and 95 (47,5%) in post-approval studies. 54,5% of the ophtalmologists were willing to participate in future studies. More than 80% of this group was ready to ask their hospital or other legal authorities for permission to participate in studies of this kind, to report serious adverse events to the sponsor of the study and to ask patients for written informed consent. **CONCLUSIONS:** Managed physician panels are a valuable alternative option to recruit medical sites for post-approval or health outcome studies. Every second ophtalmologist from panels is experienced in this kind of studies and most of them are willing fullfil all necessary legal and quality requirements. In addition to timing and cost factors, an adavantage of physician panels is the better representation of daily medical routine-practice, adding to the epidemiological validity of respective projects.

PSS56

LYMPHEDEMA – THE LONG WAY TO DIAGNOSIS AND THERAPY

Blome C[1], Herberger K[1], Sandner A[1], Augustin M[2]
[1]*University Medical Center Hamburg, Hamburg, Germany,* [2]*University Medical Center Hamburg-Eppendorf, Hamburg, Germany*

OBJECTIVES: Clinical experience indicates that edema often remain undiagnosed. The aim of this study was to examine how much time passes between important events in the 'patient journey' and what predicts late consultation and diagnosis. **METHODS:** Sixty-five patients with secondary arm lymphedema and 161 patients with primary or secondary leg lymphedema were interviewed. The following latency times were computed: time between 1) first symptoms and first visit to physician; 2) visit to physician and diagnosis; 3) diagnosis and lymph drainage therapy; and 4) diagnosis and compression therapy. Associations of latency times with patient and clinical characteristics were analysed using t tests and multivariate linear regression. **RESULTS:** All arm edema patients had consulted a physician in the year after first symptoms at the latest, and everyone except two received the diagnosis in the following year at the latest. For secondary leg edema, the average latency until physician consultation was also short with 0.5 ± 1.8 years, and latency until diagnosis was 1.7 ± 3.8 years. In contrast, latencies in primary leg edema were significantly longer: The average time between first symptoms and physician consultation was 5.2 ± 11.0 years, and edema diagnosis was made after further 6.7 ± 11.4 years. On average, it took 13.5 years from first symptoms to lymph drainage therapy in these patients and 13.7 years until compression therapy. Predictors of late consultation and late diagnosis in primary leg edema were age<40, positive family anamnesis, and female gender. **CONCLUSIONS:** Primary leg lymphedema are diagnosed late in many cases, especially in younger women.

PSS57

ADHERENCE BY SPANISH RETINOLOGISTS TO THE GUIDANCE FOR THE MANAGEMENT OF PATIENTS WITH WET AGE-RELATED MACULAR DEGENERATION

Colomé A[1], Balaña M[1], Ruiz Moreno JM[2], Roura M[1]
[1]*Novartis Farmacéutica, S.A., Barcelona, Spain,* [2]*Instituto Oftalmológico Alicante (VISSUM) y Universidad de Castilla la Mancha, Alicante, Spain*

OBJECTIVES: To assess the adherence by Spanish retinologists to the recommendations for the management of age-related macular degeneration (AMD) published by the Spanish Society of Retina and Vitreous (SERV). **METHODS:** Non-interventional, retrospective and multicenter study, involving 59 researchers from different Spanish Ophthalmology Services that collected medical records from 346 patients aged ≥50 years and diagnosed with exudative AMD. **RESULTS:** Adherence to SERV-guidelines by Spanish retinologists was high concerning diagnostic (96.8%) and control items (98.6%) of AMD patients, slightly lower for therapeutic issues (84.4%), and much lower on patient follow-up and retreatment criteria (46.9%). When focusing on diagnostic, first symptoms indicative of wet AMD were sharp and progressive loss of visual acuity (64.7%), followed by metamorphopsia (distorted vision) (33.8%) and central scotoma (23.1%). Main diagnostic confirmatory tests were visual acuity (97.1%), OCT (93.4%), biomicroscopy (92.2%) and fluorescein angiography (71.1%). For therapeutic issues, first choice treatment was based on anti-VEGF-drugs (99.1%), mainly ranibizumab (96.8%) as a loading dose of three injections (88.1%). Main patient follow-up tests were: visual acuity tests (98.0%), optical coherence tomography (96.0%), biomicroscopy (91.9%). Most common control schemes during the first year of treatment were every-two-months (35.8%) or monthly (30.4%) visits;

while after first year of treatment, controls tend to become less frequent, mostly every-three-months (39.9%). When recurrence occurs, main retreatment criteria were: presence of macular fluid (93.5%), loss of ETDRS letters (50.5%; 68.8% with ≥5 letters), macular hemorrhage (46.3%) and increase of central-retinal-thickness (45.4%). Single injection of anti-VEGF retreatments was applied in 48.6% of recurrences, while 23.6% were not treated with anti-VEGF. **CONCLUSIONS:** A relatively high adherence to SERV guidelines was followed by Spanish retinologists regarding diagnosis, treatment and control of AMD. However, limitations have been identified on patterns of follow-up and retreatment criteria that may compromise therapeutic and clinical outcomes.

PSS58

TREATMENT PATTERNS OF RANIBIZUMAB AND AFLIBERCEPT FOR THE MANAGEMENT OF WET AGE-RELATED MACULAR DEGENERATION IN ROUTINE CLINICAL PRACTICE IN THE UNITED STATES

Ferreira A[1], Sagkriotis A[1], Milnes F[1], Olson M[1], Hill J[2], Lu J[2], Makin C[2]
[1]*Novartis Pharma AG, Basel, Switzerland,* [2]*IMS Health, Plymouth Meeting, PA, USA*

OBJECTIVES: To compare the frequency of injections for ranibizumab and aflibercept for the treatment of wet age-related macular degeneration (wAMD) in a real-world setting. **METHODS:** Claims from the IMS Integrated Data Warehouse were used to identify treatment-naïve patients with wAMD receiving ≥1 prescription for ranibizumab or aflibercept between 1 November 2011 and 31 March 2012 and with a follow-up of 365 days. Patients were considered to be treatment-naïve if they had received no anti-VEGF treatment for >180 days prior to the index date. Mean number of injections received within 365 days of treatment initiation and the proportion of patients receiving 3 loading doses within 3 months were calculated and compared for patients starting therapy with ranibizumab or aflibercept. No adjustments for bilateral treatment were performed. **RESULTS:** Patient characteristics were similar for patients receiving ranibizumab (N=2,799) or aflibercept (N=117) at the index date (median age: 82 years; % male, 36%). The mean (±SD) number of anti-VEGF injections received by patients starting on ranibizumab or starting on aflibercept was similar: 5.6±3.5 and 5.4±2.8, respectively (p=0.6593). In patients continuously treated with the same agent for 12 months, the mean number of injections was also similar across ranibizumab and aflibercept: 4.9±3.4 (n=1,898) vs 5.2±2.6 (n=87), respectively (p=0.2705). Approximately two-thirds of patients with more than 3 injections received 3 loading doses within the first 3 months (ranibizumab, 65.6%; aflibercept, 64.3%). Results for patients who were treatment-naïve for 365 days were consistent with the above results. **CONCLUSIONS:** There are limited data regarding real-world treatment patterns with aflibercept for the management of wAMD. Our results suggest that in routine clinical practice patients receive a comparable number of injections in the first year of treatment with both ranibizumab and aflibercept. Analysis of data from larger patient populations and for longer follow-up is warranted when these data become available.

APPLICATION OF LOGISTIC REGRESSION FOR SIGNAL DETECTION AND RISK ASSESSMENT OF MACROLIDE-ASSOCIATED TORSADE DE POINTES

Ali AK
Eli Lilly and Company, Indianapolis, IN, USA

OBJECTIVES: Torsade de pointes (TdP) is an identified risk for antibacterial treatment with macrolides, but the risk might vary across individual macrolides. This study evaluates the association between macrolides and TdP from the FDA Adverse Event Reporting System (FAERS). **METHODS:** Disproportionality analysis of FAERS between 1997 and 2012 was conducted for azithromycin, clarithromycin, erythromycin and Telithromycin with TdP preferred term of the Medical Dictionary for Regulatory Activities using logistic regression. Logistic reporting odds ratio (LROR) and corresponding 95% confidence intervals (CIs; LR05-LR95) are estimated for individual macrolides. Estimates are compared with Multi-Item Gamma Poisson Shrinker data mining algorithm. Estimates ≥2 yield significant safety signals. Lack of overlap between estimate-specific CIs indicates efficient approach for signal detection. **RESULTS:** A total of 318 TdP events were reported for macrolides. The majority of reports were for erythromycin (n=122) and clarithromycin (n=114), followed by azithromycin (n=74) and telithromycin (n=8). Most of events were reported for females with median age of 62.8 years. 98% of TdP were serious events (10% of those were deaths). Death contributed to 18%, 10% and 5% of serious TdP events for azithromycin, erythromycin and clarithromycin, respectively. Telithromycin didn't have death TdP reports. Significant TdP signals were identified for macrolides. LROR (LR05-LR95) were: erythromycin 48.1 (40.4-55.9); clarithromycin 15.3 (12.1-19.1); azithromycin 13.9 (11.1-17.2); and telithromycin 6.79 (3.20-13.5). Except for telithromycin, no overlap was observed between estimate-specific CIs between analysis methods. **CONCLUSIONS:** Macrolides are associated with more than expected reporting of TdP compared to other drugs and events in the database; however, the risk was highest in erythromycin and lowest in telithromycin. Fatal TdP was highest in azithromycin, and telithromycin didn't have fatal TdP. The findings show differential risk of TdP across macrolide antibiotics, emphasizing the need for monitoring cardiac rhythms in patients treated with macrolides.

PCV2

DIRECT-TO-PATIENT CONTACT AND PROACTIVE PHARMACOVIGILANCE SYSTEM: A CASE STUDY

Wiederkehr S, Seux M, Michel J, Fournie X
Mapi, Lyon, France

Post-authorization non-interventional safety studies typically enroll patients at sites and safety events are reported and collected as appropriate by site personnel during standard-of-care visits. Although this is the traditional approach, it has several practical shortcomings: infrequent or irregular standard-of-care visits; patients switching health care providers; transient nature of some safety events; treatment at non-study sites, and the lack of care-seeking for the safety events. An alternative study design that overcomes several of these shortcomings includes direct-to-patient contact (DPC) and follow-up. **OBJECTIVES:** The purpose of this study is to describe patients' short and long term management patterns including the detection and verification of events of interest by contacting patients' event treating physician (ETP). **METHODS:** This is multinational multicenter observational prospective longitudinal cohort study involving 10,600 patients in Europe and South America. Patients were enrolled at hospital and followed up by telephone by a specialized DPC unit at 6 weeks then quarterly up to 2 years after hospital discharge. Data collected include clinical outcomes, safety events of interest, economic burden and quality of life. **RESULTS:** A total of 88,276 phone calls to patients were performed, achieving a reachable rate of 88.5% and an interview successful rate of 84.6%. 87.2% of the initial sample completed the 2-year follow-up period: 5.7% of the sample died, 6.0% voluntarily withdrew and 0.9% was withdrawn to participate to a clinical trial. Only 19 patients were never reached (0.2%). In total, 2144 events of interest were detected and a medical verification from ETPs was obtained in 72.3% of the case. **CONCLUSIONS:** This study demonstrates that DPC along with a proactive pharmacovigilance system achieved very high response rates from both patients and ETPs. It represents an effective alternative methodology to collect patients data, including safety data, in real life settings.

PCV3

ANTITHROMBOTIC STRATEGIES AND ADVERSE OUTCOMES IN ACUTE CORONARY SYNDROME AND ATRIAL FIBRILLATION: A COMMUNITY STUDY

Chamberlain AM[1], Gersh BJ[1], Klaskala W[2], Mills RM[2], Alonso A[3], Weston SA[1], Roger VL[1]
[1]*Mayo Clinic, Rochester, MN, USA,* [2]*Janssen Research & Development, LLC, Raritan, NJ, USA,* [3]*University of Minnesota School of Public Health, Minneapolis, MN, USA*

OBJECTIVES: Atrial fibrillation (AF) is frequent in acute coronary syndromes (ACS) and impacts the need for subsequent antithrombotic treatment. However, whether associations of antithrombotic treatment with strokes, bleeding, and death differ between ACS patients with and without AF remains uncertain. **METHODS:** Olmsted County, MN residents with incident myocardial infarction or unstable angina during 2005-2010 were classified according to AF status prior to or during the index ACS hospitalization. Antithrombotic strategy at discharge was categorized into double/triple vs. no/single and warfarin vs. no warfarin therapy. Cox regression was used to examine associations between treatment and strokes, bleeding, and mortality and to test whether AF differentially impacted these associations. Models were age- and sex-adjusted and weighted for the inverse probability of the propensity score for therapy. **RESULTS:** A total of 244 of 1140 incident ACS patients had AF (ACS+AF), and of these patients, 49% were discharged on double/triple antithrombotic therapy and 33% received warfarin. In 896 ACS patients without AF, 63% were discharged on double/triple therapy and 4% on warfarin. Over a median of 4.2 years, 95 strokes, 297 bleeds, and 255 deaths occurred. Antithrombotic strategy was not associated with the risk of stroke or bleeding. Among all ACS patients, mortality was similar between strategies; however, ACS+AF patients on double/triple therapy (vs. no/single therapy) showed a trend toward a lower risk of death [HR (95% CI): 0.64 (0.41-1.02) for ACS+AF, 1.25 (0.83-1.87) for those without AF; $p_{interaction}$=0.03]. For warfarin vs. no warfarin, those with AF exhibited a lower mortality risk with warfarin [HR (95% CI): 0.46 (0.29-0.73) for ACS+AF, 2.01 (0.94-4.32) for those without AF; $p_{interaction}$<0.01]. **CONCLUSIONS:** Altogether, in community ACS patients, antithrombotic strategy is not associated with the risk of stroke, bleeding, or death. However, in the subset of ACS patients with AF, a warfarin strategy is associated with a lower risk of death.

PCV4

COMORBIDITY INFLUENCE IN THE CONTROL OF ARTERIAL HYPERTENSION

Sicras-Mainar A[1], Fernandez JL[2]
[1]*Badalona Serveis Assistencials, Badalona, Spain,* [2]*Primary Care Center Doctor Vicenç Papaceit, La Roca del Valles, Spain*

OBJECTIVES: Determine the impact of co-morbidity in controlling arterial hypertension in clinical practice situation. **METHODS:** Cross-sectional study, conducted from retrospective review of patient records obtained from primary care. We included patients' ≥ 30 years who demanded attention during the year 2012. The main measures were: demographics, control (≤ 140/90 mmHg) blood pressure (BP), evolution time, co-morbidity (general and specific) protocol using cardiovascular events (CVE), visits and referrals to specialists. Statistical analysis and multiple linear regression for correction of the models, $p<0.05$. **RESULTS:** We recruited 900 patients (mean age 67.4 years, women: 51.1%). The 64.8% (CI: 61.7% -67.9%) of subjects had a proper control of the BP. The average duration of hypertension was 6.0 years and use 4.6 protocol entries / year. The average number of visits was 15.3 and 0.7 referrals. The years of evolution were associated with age ($r = 0.323$). The control patients showed a higher average BP of ischemic heart disease (11.1% vs. 6.9%) and CVE (19.4% vs. 14.8%), $p <0.05$. The BP control was associated with women (OR = 1.4) and the presence of CVE (OR = 1.8), $p <0.02$. The number of diagnoses (morbidity) was associated with age (ß = 0.14) and the number of referrals (ß = 0.08), $p <0.05$ (coefficient R^2= 40%). **CONCLUSIONS:** Optimal control of BP is high. The profile of these patients is women in a situation of secondary prevention.

PCV5

HIGH DOSAGES OF STATINS IN HIGH CARDIOVASCULAR RISK PATIENTS IN A REAL WORLD SETTING: TREATMENT PATTERNS AND OUTCOMES

Degli Esposti L, Sangiorgi D, Buda S
CliCon Srl, Ravenna, Italy

OBJECTIVES: International guidelines recommend the use of high dosages statins (in particular, Rosuvastatin and Atorvastatin) in high cardiovascular (CV) risk patients. The aim of this study was to assess the degree of implementation of the

recommended therapeutic strategies and clinical outcomes as a function of the therapeutic strategies in a real world setting. **METHODS:** An observational retrospective cohort analysis based on 4 Local Health Units administrative databases was conducted. High CV risk patients who filled at least one prescription for high dosages statins between January 1, 2007-December 31, 2007 (enrolment period) were included. Patients were followed-up for 24 months. Patients were defined as adherent if they had >80% of follow up period covered by drugs dispensation. To correct for potential confounders, a multivariable proportional hazards Cox regression model considering age, gender, type of statin, adherence to treatment and stay on treatment was assessed. Stay on treatment was defined as no switch or down titration during the follow up period. **RESULTS:** Among 36,327 (3% of the population) high CV risk patients, Rosuvastatin 40mg (R40) and Atorvastatin 80mg (A80) were not used (0.1% each treatment); 625 (2%) patients used R20 and 908 (2%) A40. Stay on treatment was similar across treatments: 61% for R20 and 60% for A40 (p=0.583). 2.6 (1.7-3.5) CV events per 100 patients/year for R20 and 4.4 (3.4-5.4) for A40 were observed (p=0.014). At the multivariable Cox regression analysis, risk of CV event was lower for R20, as compared to A40 (HR=0.60, 95%CI 0.39-0.91, p=0.017). Other statistically significant covariates were adherence (HR=0.50, 95%CI 0.29-0.87, p=0.015) and stay on treatment (HR=0.58, 95%CI 0.40-0.85, p=0.006). **CONCLUSIONS:** Despite guidelines recommendations, high dosages statins are poorly used in real practice. Stay on treatment was similar among those treated with R20 and A40, even though R20 showed a lower incidence of cardiovascular events.

PCV6

MODELING THE CARDIOVASCULAR EFFECTS OF SWITCHING PATIENTS FROM ROSUVASTATIN TO ATORVASTATIN

Folse H[1], Schuetz CA[1], Rengarajan B[1], Sternhufvud C[2], Gandhi SK[3]
[1]*Archimedes, Inc., San Francisco, CA, USA,* [2]*AstraZeneca R&D, Mölndal, Sweden,* [3]*AstraZeneca Pharmaceuticals LP, Wilmington, DE, USA*

OBJECTIVES: This analysis estimates the impact of switching from rosuvastatin to atorvastatin on cardiovascular (CV) events. **METHODS:** Using the Archimedes model, a discrete-event simulation, we evaluated a simulated population of 50,038 patients aged 45–70 years with dyslipidemia and adherent to rosuvastatin. The virtual population was created based on matched biomarker profiles of patients in the National Health and Nutrition Examination Survey (NHANES). Statin treatment models were based on data from published studies, including STELLAR, JUPITER, CARDS, ASCOT, and TNT. Patients were started on a rosuvastatin dose based on their LDL-C and ATP-III goal. Treatment prevalence was calibrated to match distributions of statin use observed in U.S. pharmacy claims data. In the experimental arm, patients switched to twice the mg atorvastatin dose as their rosuvastatin dose at their first follow-up visit (no switching occurred in the control arm). Patients were monitored for 5 years, during which time they received regular visits, with the opportunity to increase their dosage if they were above their LDL-C goal. Rate of first occurrence of MI, stroke, or CV death (MACE) for each arm was estimated. **RESULTS:** After 5 years, when all patients switched to atorvastatin, 4.8% fewer patients reached goal, and mean LDL-C increased by 7.1 mg/dL. The 5-year relative risk of MACE was 1.117 (95% CI 1.098–1.135), and the number needed to harm (NNH) to incur one additional MACE was 262, favoring rosuvastatin. For diabetics, the relative risk of MACE was 1.128 (95% CI 1.096–1.159), and the NNH to incur one additional MACE was 195, indicating greater risk for diabetics. The results were insensitive to assumptions of adherence rates and LDL-C goal values. **CONCLUSIONS:** In this simulation, switching from rosuvastatin to atorvastatin led to fewer patients attaining LDL-C goal, higher mean LDL-C values, and greater risk of MACE over 5 years.

PCV7

RIOCIGUAT FOR THE TREATMENT OF PATIENTS WITH PULMONARY ARTERIAL HYPERTENSION (PAH): RESPONDER ANALYSIS OF WHO FUNCTIONAL CLASS III PATIENTS FROM THE PATENT-1 STUDY

Grünig E[1], Sikirica M[2], Curram J[3], Davie N[4], Ghofrani HA[5]
[1]*Centre for Pulmonary Hypertension at the Thoraxclinic of University Hospital Heidelberg, Heidelberg, Germany,* [2]*Global HEOR, Bayer HealthCare Pharmaceuticals, Berlin, Germany,* [3]*Clinical Statistics EU, Bayer HealthCare Pharmaceuticals, Newbury, UK,* [4]*Global Clinical Development, Bayer HealthCare Pharmaceuticals, Wuppertal, Germany,* [5]*University of Giessen and Marburg Lung Center (UGMLC), member of the German Center for Lung Research (DZL), Giessen, Germany*

OBJECTIVES: Indications for PAH medications vary between countries, and products may have restricted reimbursement based on policies limiting treatment to WHO functional class (FC) III patients. In the PATENT-1 study, the novel soluble guanylate cyclase stimulator riociguat significantly improved 6-minute walking distance (6MWD) and a range of secondary endpoints in patients with PAH. This subgroup analysis of PATENT-1 investigated the proportion of FC III/IV patients achieving threshold criteria. **METHODS:** PATENT-1 was a double-blind, randomized Phase III study in which patients with PAH received 12 weeks' oral treatment with placebo, an individual titration of riociguat (up to 2.5 mg tid), or a capped titration of riociguat (up to 1.5 mg tid). Increase in 6MWD ≥40 m, 6MWD ≥380 m, cardiac index (CI) ≥2.5 L/min/m^2, pulmonary vascular resistance (PVR) <500 dyn·s·cm^{-5}, mixed venous oxygen saturation (SvO_2) ≥65%, FC I/II, absence of clinical worsening events, and NT-proBNP <1800 pg/mL were chosen as positive response criteria based on studies showing their prognostic relevance at baseline and after targeted therapy. **RESULTS:** At baseline, 241 patients were in FC III/IV (FC IV n=4) across the three treatment groups, and similar proportions met selected criteria in the riociguat individual titration (n=141) and placebo groups (n=61). At Week 12/last visit, the proportion of patients fulfilling these criteria was higher in the riociguat individual titration group than the placebo group for all parameters: increase in 6MWD ≥40m (44% vs 15%), 6MWD ≥380m (49% vs 36%), CI ≥2.5 L/min/m^2 (75% vs 43%), PVR <500 dyn·s·cm^{-5} (52% vs 27%), SvO_2 ≥65% (68% vs 35%), FC I/II (33% vs 23%), absence of clinical worsening events (99% vs 90%), and NT-proBNP <1800 pg/mL (84% vs 64%). **CONCLUSIONS:** In this population of predominantly FC III PAH patients, riociguat increased the proportion fulfilling criteria defining a positive response to therapy.

PCV8

PATIENT REPORTED OUTCOMES ASSSESMENT OF THAI CHRONIC STABLE ANGINA PECTORIS(CSAP)

Rojkajornnaphalai S
Chest Hospital, Nonthaburi, Thailand

OBJECTIVES: A pilot test to assess patient-centered outcomes in daily management of coronary artery disease at cardiology clinics in Thailand. **METHODS:** A Delphi method was used for development of PRO questionnaire assessing along with ivabradine treatment from randomly selected CSAP patients under the Health Authorities' pharmacovigilance monitoring program. A 15-items short-form health survey with 5 response choices adopted with permission from validity-tested PRO used in medical outcomes study in Thai patients, four health dimensions included general, physical, social function role limiting and mental health dimensions with 1, 6, 5 and 3 items each respectively. Standardized scoring was calculated with the lowest(0) to highest(100). Field tests among healthy volunteers performed.The reliability test employed inter-item and intra-item consistency using Cronbach's alpha coefficient. All 15 items of survey were evaluated at initiation and after four months clinical intervention. The treatment acceptability was further assessed from patient interviews. **RESULTS:** Of 162 patients randomly selected for PRO evaluation, 85(53%) was men, all patients mean(SD) age of 67.3(11.7) years whom 97(59.5%)was >65 years, 9(5.5%) was smokers and 81(49.7%) had a Body Mass Index ≥25 kg/m^2. Forty-three (26.4%) of patients had previous intervention and 63(39%) had heart failure(HF). The internal consistency of the score for all 15 items, for physical, social function role limiting and mental health dimensions, reflected Chronbach's alpha coefficient of 0.888, 0.771, 0.702 and 0.807 at baseline. After 4-month, Cronbach's alpha coefficient were of 0.735, 0.715, 0.661 and 0.519. All mean scores(SD) of these four health dimensions, were significantly improved from 47.59(11.50) to 54.91(9.45), from 50.33(12.11) to 54.91(10.42), from 39.53(10.35) to 52.68(10.32) and from 45.88(17.08) to 54.88(18.49) respectively (P<0.001). **CONCLUSIONS:** This pilot development confirms reliability of 15-items short-form health survey, score is consistent overtime. Thai CSAP patients who were prescribed ivabradine reported a highly significant improvement in quality of life including all health dimensions general, physical, social function role limiting and mental health. Patient-reported outcomes questionnaires could be recommended alongside clinical treatment.

PCV9

ATTAINMENT OF LOW-DENSITY LIPOPROTEIN CHOLESTEROL GOALS IN PATIENTS AT VERY HIGH CARDIOVASCULAR RISK IN THE UNITED KINGDOM: RESULTS FROM A GENERAL PRACTICE POPULATION STUDY

Ray KK[1], Foody J[2], Khan I[3], Lewis BE[4]
[1]*St George's University of London, London, UK,* [2]*Brigham and Women's Hospital, Boston, MA, USA,* [3]*Sanofi, Bridgewater, NJ, USA,* [4]*Regeneron Pharmaceuticals, Inc., Tarrytown, NY, USA*

OBJECTIVES: European guidelines support LDL-C goals based on an individual's absolute cardiovascular (CV) risk and have established a goal of <70 mg/dL in very high CV risk patients. The objective of this study was to estimate the proportion of individuals that attain these goals and assess the determinants of any observed variation. **METHODS:** Patients in The Health Improvement Network (THIN) UK general practice database with an LDL-C measurement during 2011 and at very high risk of CV risk events were identified and further categorized as recent acute coronary syndrome (ACS, within 6 months pre LDL-C measurement), prior coronary events, stroke, and peripheral vascular disease (PVD). Lipid-lowering therapy (LLT) was categorized as high-potency statin, standard-potency statin, non-statin LLT, and no LLT. **RESULTS:** In total, 25,535 patients met the inclusion criterion. Median (inter-quartile range [IQR]) age was 71 (62 to 79) years, 63.5% were male, and median (IQR) LDL-C was 108 (83 to 139) mg/dL. Across the total cohort, 6.3%, 61.3%, 17.8%, and 14.6% had evidence of recent ACS, prior coronary events, stroke, and PVD. Patients with LDL-C < 70 mg/dL within these categories were 18.9%, 13.5%, 14.5%, and 11.4%. Across the total cohort, 16.0%, 52.5%, 0.5%, and 31.0% were on high-potency statin, standard-potency statin, non-statin LLT, and no LLT. Patients with LDL-C < 70 mg/dL within these LLT categories were 18.3%, 15.4%, 11.6%, and 8.5%. **CONCLUSIONS:** In a large, contemporary cohort of very high CV risk patients, few achieved the optimal LDL-C goal of <70 mg/dL. One third were not on any LLT, <20% were on high-potency statin, and >80% of those receiving high-potency statins were not at LDL-C goal. These data suggest the need for ongoing efforts to improve prescribing of appropriate LLT as well as identifying new therapies to improve goal attainment among very high CV risk patients.

VENOUS THROMBOEMBOLISM IN GYNAE-ONCOLOGY PATIENTS POST SURGERY – IS TINZAPARIN PROPHYLAXIS AN EFFECTIVE ANTICOAGULANT?

Ibrahim N[1], Norris L[2], O'Toole S[3], Gleeson N[1]
[1]*Dept of Gynaecology-oncology, St. James's Hospital. Dept of Obstetrics and Gynaecology, Trinity Centre for Health Sciences, St. James's Hospital, Dublin, Ireland, DUBLIN4, Ireland,* [2]*Dept of GynaecologDept of Obstetrics and Gynaecology, Trinity Centre for Health Sciences, St. James's Hospital, Dublin, Ireland, DUBLIN8, Ireland,* [3]*Dept of Gynaecology-oncology, St. James's Hospital. Dept of Obstetrics and Gynaecology, Trinity Centre for Health Sciences, St. James's Hospital, Dublin, Ireland, DUBLIN5, Ireland*

OBJECTIVES: Venous thromboembolism (VTE) is a relatively common post-operative complication in cancer patients associated with high mortality rates. Gynae-oncology patients are predisposed to developing VTE due to the presence of a number of high risk factors. Current thromboprophylactic protocols for LMWH dosage and duration may be insufficient as a significant percentage of VTEs in gynae-oncology patients occur despite LMWH prophylaxis. The aim of this study is to investigate the anticoagulant (anti-Xa) activity of Tinzaparin prophylaxis in the immediate post-operative period in gynae-oncology patients. **METHODS:** All patients attending St. James's

Hospital with suspected gynaecological malignancy and who fulfilled the inclusion criteria were recruited for the study. All patients with BMI less than 35 received Tinzaparin (4500 IU) once daily injection while those with BMI more than 35 received a higher dose (7500 IU). Two days post surgery; venous blood samples were collected for anti-Xa analysis 4 hours post Tinzaparin injection. **RESULTS:** The majority of patients received Tinzaparin of 4500 IU. The mean anti-Xa level in the malignant group was 0.191 IU/ml while in the benign group the level was 0.1740 IU/ml. There was no difference between the two groups. In the malignant group, the number of cases with peak anti-Xa levels below 0.1IU/ml was slightly higher than in the benign group. One patient with malignant disease developed VTE, in the immediate postoperative period and showed a low peak anti-Xa level (0.06IU/ml). **CONCLUSIONS:** The results of this study show that Tinzaparin prophylaxis provides adequate peak anti-Xa levels in the majority of gynae-oncology patients post surgery and is unlikely to be responsible for the high rates of VTE in cancer patients in the immediate post operative period. Larger studies are required to confirm this.

IMPACT OF PILL-SPLITTING TRAINING ON DRUG PHYSIOCHEMICAL PROPERTIES, COMPLIANCE AND CLINICAL OUTCOMES IN ELDERLY POPULATION: A CROSS-OVER COHORT STUDY

Lee VWY[1], Yu Y[1], Tang L[1], Yan B[2]
[1]*The Chinese University of Hong Kong, Hong Kong, Hong Kong,* [2]*The Chinese University of Hong Kong, Shatin, Hong Kong*

OBJECTIVES: Pill splitting is a common problem in Hong Kong public hospitals for flexible dose adjustment and cost containment, especially for chronic diseases' treatments such as hypertension, diabetes mellitus. The current study aimed to determine the importance of education on the proper way of pill splitting for elderly in Hong Kong by exploring their habits of pill splitting, evaluating their knowledge on pill cutting and investigating the impact of improper pill cutting habit. **METHODS:** Survey was conducted on elderly taking selected drugs require splitting (Metformin, Atenolol and Amlodipine) in 5 elderly centers. The survey focuses on habits and knowledge regarding pill cutting. Elderly subjects were asked to cut 3 pills that they were currently taking in their own ways. After proper education, they were asked to cut another 3 pills with a pill cutter. The collected sample were then weighed and analyzed. The result was then compared with ideal value of half of the whole pill. **RESULTS:** From the survey, 72% of the elderly have never received any education on pill cutting. Above half consider pill cutting troublesome. About half thought that all kinds of pills can be cut without affecting the expected effect. 80% cut pills for more than one dose each time, including 44% cut pills for 7 days' doses each time. From the experiment, the results of Metformin and Atenolol show that the cut drug samples' weights deviate a lot from the ideal value (50% of the whole pill) before education. After education, the samples' weights get closer to the ideal value. However, the result of Amlodipine does not show significant difference. **CONCLUSIONS:** Education can improve the accuracy of dose in regimen require pill splitting. Elderly in Hong Kong do not receive enough education on the proper way of pill splitting from the health care giver.

PCV13

TOTAL AND LOW-DENSITY LIPOPROTEIN CHOLESTEROL LEVELS IN HIGH RISK PATIENTS TREATED WITH ATORVASTATIN MONOTHERAPY IN THE UNITED KINGDOM

Jameson K[1], D'Oca K[2], Zhao C[3], Ramey D[3], Tershakovec AM[3], Marrett E[3]
[1]*MSD Ltd., Hoddesdon, UK,* [2]*MSD, London, UK,* [3]*Merck Sharp & Dohme Corp., Whitehouse Station, NJ, USA*

OBJECTIVES: European guidelines recommend statins as first-line treatment for elevated cholesterol in patients at high cardiovascular (CV) risk; however, many patients do not attain guideline-recommended goals on statin monotherapy. As atorvastatin is now generically-available and its use is likely to increase, we examined recommended total cholesterol (TC) and low-density lipoprotein cholesterol (LDL-C) levels in high-risk patients treated with atorvastatin monotherapy in the UK. **METHODS:** In this retrospective UK general practice database study, included were patients with a prescription for atorvastatin monotherapy (IndexRx) between November 30, 2008-November 30, 30, 2011, who had evidence of coronary heart disease (CHD), atherosclerotic vascular disease (AVD), diabetes mellitus (DM), or familial hypercholesterolemia, ≥1 TC and LDL-C measurement 3-12 months post-IndexRx, and an atorvastatin prescription (to determine the daily dose) within 45 days of lipid measurements. Endpoints included proportions of patients (overall and by dose) below guideline-specific thresholds: TC<5.0, TC<4.0, and for patients with CHD/AVD+DM, TC<4.0 or LDL<2.0 mmol/L. **RESULTS:** Of 2999 high-risk patients (60.2% males, mean age 67.9 years [SD 10.6]) meeting selection criteria, 23.9, 28.2, 36.2, and 11.6% received prescriptions for 10-mg, 20-mg, 40-mg, and 80-mg atorvastatin, respectively. Further, 27.6% of patients were newly initiated with atorvastatin monotherapy at index date. Overall, mean follow-up TC was 4.08 (SD 0.80) and LDL-C was 2.08 (SD 0.65) mmol/L. The proportion of patients with TC<5.0 and <4.0 mmol/L was 88.8% and 45.8%, respectively. For those with CHD/AVD+DM, 63.7% had TC<4.0 or LDL-C<2.0 mmol/L. Generally, more patients were below lipid thresholds with higher atorvastatin doses. **CONCLUSIONS:** In UK patients at high CV risk, a substantial proportion did not achieve guideline-recommended lipid levels. Less than half of patients achieved TC<4.0 mmol/L, and only two-thirds of patients with CHD/AVD+DM were below recommended levels for either TC or LDL-C. More effective lipid-lowering strategies may be needed to achieve optimal TC and LDL-C levels in high-risk patients.

PCV14

INDIRECT TREATMENT COMPARISON AND ECONOMIC EVALUATION OF NOVEL ORAL ANTICOAGULANTS FOR THE PREVENTION OF STROKE IN PATIENTS WITH ATRIAL FIBRILLATION IN THE NETHERLANDS

Le HH[1], Pechlivanoglou P[2], Postma MJ[1]
[1]*University of Groningen, Groningen, The Netherlands,* [2]*University of Toronto, Toronto, ON, Canada*

OBJECTIVES: Management with vitamin K antagonists (VKAs) has been an effective and cost-effective strategy for stroke prevention in atrial fibrillation (AF) but is associated with shortcomings. Novel oral anticoagulants (NOACs) were developed with the aims of no monitoring requirement and improved effectiveness and safety profiles. Economic evaluations require the comparison of all relevant options. However, there are no randomized controlled trials (RCTs) directly comparing these agents. In such cases, indirect treatment comparison (ITC) can be used to synthesize indirect comparative evidence. Through ITC-based evidence synthesis, the cost-effectiveness of all available NOACs for stroke prevention in AF patients may be evaluated. **METHODS:** ITC models were based on RCTs data comparing dabigratran, rivaroxaban, or apixaban with VKA treatment. Relative effectiveness was estimated for stroke/systemic embolism, intracranial hemorrhage, myocardial infarction, extracranial hemorrhage, and minor bleeding. A Markov model was developed using ITC-synthesized evidence with VKA as the baseline. Health utilities were collected from international sources whereas costs and mortality data were extracted from Dutch sources. Univariate and probabilistic sensitivity analyses (PSA) were conducted on the base-case incremental cost-effectiveness ratio (ICER). **RESULTS:** The ICERs for dabigatran, apixaban, and rivaroxaban compared to VKA were €12,146/QALY, €12,488/QALY, and €24,124/QALY, respectively. Sensitivity analysis using the upper and lower limits of the 95% confidence interval for absolute stroke risk with VKA treatment resulted in ICERs that varied drastically from dominance for VKA to being dominated by all NOACs. This is likely due to the large uncertainty observed between the baseline risk profiles of the VKA arms in the three RCTs. The options with the highest probabilities of cost-effectiveness in PSA were VKA at thresholds under €13,000/QALY and dabigatran or apixaban at thresholds above this mark. **CONCLUSIONS:** Dabigatran and apixaban were shown to be cost-effective options for AF patients in The Netherlands. However, these results were strongly influenced by uncertainty around stroke risk with VKA treatment.

PCV15

ESTIMATING THE CARDIOVASCULAR BENEFITS OF DPP-4 INHIBITORS: A SIMULATED STUDY

Schuetz CA[1], Ong SH[2], Yeung T[1], Blüher M[3]
[1]*Archimedes, Inc., San Francisco, CA, USA,* [2]*Novartis Pharma AG, Basel, Switzerland,* [3]*University of Leipzig, Leipzig, Germany*

OBJECTIVES: Outcomes trials are currently underway to establish the effects of DPP-4 inhibitors on major adverse cardiovascular events (MACE), but to-date no major clinical trial has published results. Using simulations, we evaluated the effectiveness of DPP-4 inhibitors in preventing MACE in two populations with type 2 diabetes, relative to the standard of care. **METHODS:** We used the Archimedes ARCHeS platform to simulate two clinical trials of virtual individuals with diagnosed type 2 diabetes (N=11,000 each). The DPP-4 class was modeled with a meta-analysis of HbA1c and weight change, pooling results from published trials. The study treatments were added-on to standard care. The first simulated trial examined subjects with elevated cardiovascular (CV) risk, based on established CV disease or multiple risk factors. The second considered individuals on metformin monotherapy with HbA1c ≥ 7%. We tracked changes in biomarkers and outcomes for 20 years. **RESULTS:** The DPP-4 class was associated with HbA1c drops of 0.66% [0.71% , 0.62%] in the elevated CV risk population and 0.71% [0.75%,0.67%] in the metformin add-on population; and a weight drop of 0.14 [0.36,-0.07] kg in both cohorts. The biomarker benefits produced a relative risk (RR) for MACE at 5 years of 0.977 [0.968, 0.986] and 0.962 [0.949, 0.975] for the elevated CV risk population and metformin add-on population, respectively. The number needed to treat to prevent one occurrence of MACE at 5 years was 327 [233,550] in the elevated CV risk population. **CONCLUSIONS:** Our simulated study suggests that DPP-4 inhibitors do not increase the risk of MACE relative to the standard of care in a population with elevated CV risk, and a representative diabetic metformin monotherapy population. This study provides insights on the long term benefits of DPP-4 inhibitors, and will support interpretation of the CV safety trial results likely to be published soon.

PCV16

INDIRECT COMPARISONS OF NOVEL ORAL ANTICOAGULANTS FOR THE PREVENTION OF STROKE IN PATIENTS WITH NONVALVULAR ATRIAL FIBRILLATION: A SYSTEMATIC LITERATURE REVIEW

Claflin AB[1], Liu X[2], Phatak H[3]
[1]*Pfizer Inc, New York, NY, USA,* [2]*Pfizer, Inc., New York, NY, USA,* [3]*Bristol-Myers Squibb Company, Princeton, NJ, USA*

OBJECTIVES: Given the absence of head-to-head studies, this review summarized indirect treatment comparison studies of oral anticoagulants (OACs) for the prevention of stroke in patients with nonvalvular atrial fibrillation (NVAF). **METHODS:** Eligible English-language studies published up to May 31, 2013 were identified from electronic databases, Medline, EMBASE and Cochrane Library. Studies were included if the indirect comparison involved at least two OACs currently on the market with the common comparator warfarin. The search yielded ten published studies and one in press study was obtained. **RESULTS:** Eleven indirect comparison studies, based on data from three phase III (RE-LY, ROCKET-AF, and ARISTOTLE) and one phase II (PETRO) clinical trial, was reviewed. Six pairwise comparisons were reviewed across studies: any/all OACs vs. warfarin, apixaban vs. dabigatran 110mg, apixaban vs. dabigatran 150mg, apixaban vs. rivaroxaban, dabigatran 110mg vs. rivaroxaban, and dabigatran 110mg vs. rivaroxaban. OACs as a whole were found to have significantly better bleeding and efficacy endpoints when compared with warfarin. Apixaban and dabigatran 110mg were found to have significantly reduced risk of multiple bleeding endpoints when compared with rivaroxaban and dabigatran 150mg. Dabigatran 150mg was found to have significantly decreased risk of multiple efficacy endpoints when compared with rivaroxaban. Three studies compared discontinuation rates. Apixaban and rivaroxaban were found to have significantly lower discontinuation rates compared with both doses of dabigatran. Apixaban was also found to have a significantly lower discontinuation rate compared with rivaroxaban. **CONCLUSIONS:** Apixaban,

dabigatran and rivaroxaban appear to have better safety and efficacy profiles when compared with warfarin. Apixaban and dabigatran 110mg consistently demonstrated reduced risk of bleeding when compared with rivaroxaban and dabigatran 150mg. Dabigatran150mg demonstrated increased efficacy on multiple endpoints when compared with rivaroxaban, while discontinuation rates were increased. Head-to-head studies would help clarify any differences among these medicines for efficacy and bleeding.

PCV17

META-ANALYSIS OF SAFETY OF DABIGATRAN AND WARFARIN FOR TREATMENT OF ATRIAL FIBRILLATION

Aggarwal S, Segal J
Novel Health Strategies, Bethesda, MD, USA

OBJECTIVES: Atrial fibrillation (AF) is an irregular and often rapid heart rate that commonly causes poor blood flow to the body. Dabigatran and Warfarin have shown safety and efficacy for treatment of AF. The objective of this study was to conduct meta-analysis and present evidence for safety of Dabigatran versus Warfarin for treatment of AF. **METHODS:** For this meta-analysis we included randomized controlled trials (RCTs) evaluating Dabigatran for the treatment of AF. We included studies that were: (1) a RCT in humans; (2) an investigation of patients with nonvalvular atrial fibrillation; (3) an evaluation of dabigatran compared with warfarin or each other; and (4) a report of results of stroke or systemic emboli and major bleeding. A systematic literature search for dabigatran trials was undertaken for the databases Pubmed, Embase, Biosis, Google Scholar, and Cochrane. Data was collected for the study size, interventions, year and total bleeding events. For meta-analysis, random effects and fixed effects models were used to obtain cumulative statistics. **RESULTS:** Two RCTs with a total of 12,268 patients were identified. The pooled event rate for Dabigatran for total bleeding events was 31.9% (95% CI 31%-33%). The pooled response rate for Warfarin for total bleeding events was 35.1% (95% CI 34%-37%). The cumulative relative risk for total bleeding events with Dabigatran versus Warfarin was 0.91 (95% CI 0.89-0.93) **CONCLUSIONS:** Meta-analysis shows Dabigatran has a slightly lower rate of total bleeding events compared to Warfarin.

PCV18

EFFECT OF IVABRADINE ON THAI CHRONIC STABLE ANGINA PECTORIS PATIENTS

Rojkajornnaphalai S
Chest Hospital, Nonthaburi, Thailand

OBJECTIVES: To evaluate efficacy/safety of ivabradine in chronic stable angina pectoris(CSAP) Thai patients. **METHODS:** Ivabradine 5-7.5 mg bid was prescribed to CSAP patients. Hemodynamic parameters including systolic/diastolic blood pressure(SBP/DBP) in mmHg and heart rate(HR) in beats per minute(bpm) were recorded at entry and after 1,4 months follow-up. A standardized digital device was used to monitor BP and HR. Acceptability was evaluated in patient interviews. **RESULTS:** A total of 256 patients, men/women ratio of 1.04, mean(SD) age 67.1(12.4) years, 149(58%) were >65 years old, 64(25%) and 76(29.7%) of patients had previous intervention and heart failure(HF). 127(50%)&51(20%) received beta-blockers&nitrate as initial medication. Patients' assessment was made using Canadian Cardiology Society angina pectoris classification(CCS). At entry, 34.9%, 52.2% and 10.8% of patients were found with CCS grades 3, 2 and 1. Among 76 HF patients, 35.8%, 58.2% and 6.0% were found with stage 3, 2 and 1 of NYHA classification. In overall population, mean(SD) baseline HR was 86.9(11.2) bpm and SBP/DBP 137.8(24.6)/81.7(15.9) mmHg. After 4 months, mean(SD), HR significantly reduced to 69.96(7.13)bpm ($p<0.001$) and SBP/DBP lowered to 126.5(12.9)/73.9(8.9) mmHg, while mean arterial pressure(MAP)was optimally maintained at 100.4(17.6) mmHg. The highly significant drop in mean difference(SE) HR of 16.9(0.7) was observed with 95% CI between 15.5-18.3 bpm. No significant mean difference(SE),[95% CI] SBP drop, between patients with/without HF, and with/without previous intervention of 7.32(1.17),[4.99-9.64] and 8.15(2.07),[4.02-12.2764], or 8.14(1.27),[5.61-10.67] and 7.46(0.89),[5.69-9.22] ($p=0.502$, $p=0.691$) respectively. Improvement for CCS 3 and CCS 2 angina class, reduced to 1.9% and 36.1% whereas the NYHA classification for stage 3&2 reduced to 3.2%&56.4%($p<0.001$). Common AE reported were palpitation(2.5%) and nausea(1%). **CONCLUSIONS:** Ivabradine is a well-tolerated heart rate reducing agent, effective for both chronic stable angina pectoris and heart failure. It effectively reduces elevated heart rate without affecting other hemodynamic parameters. In this Thai setting, ivabradine significantly improves CCS and NYHA classifications with minimal side effects being reported.

PCV19

EVALUATION OF THE POTENTIAL EFFICACY OF IVABRADINE IN HEALTH CARE OF THE REPUBLIC OF BELARUS

Kozhanova I[1], Romanova I[1], Gavrilenko L[1], Sachek M[2]
[1]*Belarusian State Medical University, Minsk, Belarus,* [2]*The Belarusian Center for Medical Technologies, Computer Systems, Administration and Management of Health, Minsk, Belarus*

OBJECTIVES: To determine the potential population of patients with stable angina pectoris in Belarus who need prescription of ivabradine and setting the amount of the effect of the drug in this group of patients. **METHODS:** In the research pharmacoeconomic Markov model of ivabradine application in patients with stable angina, national surveillance data, analysis of literature have been used. Patients with stable angina after revascularization, patients with contraindications to beta-blocker use, not applying the dihydropyridines and having a contraindication to ivabradine use have been used to determine the target population. The number of prevented or postponed events – PPE - (nonfatal myocardial infarction and unstable angina, cardiovascular death, the number of surgical revascularization) has been calculated. For the potential efficacy of ivabradine use in patients with stable angina and heart rate $\geq$ 70 bpm calculating the data about efficacy in accordance with the results of the Beautiful study were used **RESULTS:** The total number of patients with stable angina pectoris in Belarus in 2011 was 242943. The total number of patients with stable angina who have indications for ivabradine was 17559 people. The number of prevented cases of non-fatal myocardial infarction and unstable angina was 244 cases per year. The number of prevented cases of cardiovascular death was 95 cases per year. The number of prevented cases of surgical revascularization was 260 cases per year. **CONCLUSIONS:** The analysis allowed to identify Belarusian patients in need of ivabradine use by estimating the size of the target group of patients with stable angina and elevated heart rate for whom antianginal therapy is inadequate or impossible and who need an ivabradine prescription and potentially could make the most effective reaction to the therapy.

PCV20

EVIDENCE THRESHOLDS IN THE ABSENCE OF EFFECTIVE ALTERNATIVES: THE CASE OF INTERMITTENT COMPRESSION IN CRITICAL LIMB ISCHEMIA

Moran P, Teljeur C, Harrington P, Ryan M
Health Information and Quality Authority, Dublin, Ireland

OBJECTIVES: Intermittent pneumatic compression (IPC) is proposed as an adjunct to medical care for people with critical limb ischemia (CLI) who are unsuitable for revascularisation. Given the lack of treatment options for these patients, a safe therapy that can be shown to provide even a modest clinical improvement may make a significant contribution to the management of this condition. This research aims to synthesise and critically appraise the evidence supporting the use of this technology in this cohort. **METHODS:** A systematic review of the clinical effectiveness of IPC in non-reconstructable CLI was performed. Medline, Embase and trial registries were searched for randomised controlled trials (RCTs), non-randomised controlled trials (nRCTs) and controlled before-and-after (CBA) studies comparing IPC plus medical care to medical care only. **RESULTS:** No RCTs or nRCTs were identified. Two CBA studies, both with a high risk of bias, found that IPC was associated with improved limb salvage and wound healing (OR 7, 95% CI 1.82 to 26.89, $p<0.05$ for both outcomes) as well as improved quality of life scores in bodily pain (mean difference [MD] 32.7, 95% CI 29.4 to 36.0, $p<0.05$) and physical functioning (MD 18.8, 95% CI 14.1 to 23.6, $p<0.05$). Improvements were also reported for initial and absolute claudication distances (MD 26.9m, 95% CI 21.7 to 32.1, $p<0.05$; MD 52.9m, 95% CI 42.2 to 63.6, $p<0.05$, respectively). No serious adverse events were reported. **CONCLUSIONS:** Despite some promising results there is a lack of high-quality evidence demonstrating the effectiveness of IPC in addition to medical management in non-reconstructable CLI. Where findings are equivocal a question arises as to the minimum level of evidence required to support the introduction of a technology when no effective alternatives exist. Competing interpretations of the balance of risks and benefits between different stakeholders in the decision-making process in these circumstances are discussed.

PCV21

EFFECTS OF EXCESS USE OF CORONARY ANGIOGRAPHY AND ITS ASSOCIATION WITH MORTALITY RATES, HEALTH CARE COSTS AND HOSPITAL QUALITY IN TURKEY

Baser O[1], Burkan A[2], Baser E[3], Koselerli R[2], Ertugay E[2], Altinbas A[4]
[1]*STATinMED Research/The University of Michigan, Ann Arbor, MI, USA,* [2]*Social Security Institution, Ankara, Turkey,* [3]*STATinMED Research, Ankara, Turkey,* [4]*Diskapi Yildirim Beyazi Education and Research Hospital, Gastroenterology Clinic, and STATinMED Research, Ankara, Turkey*

OBJECTIVES: To evaluate excess use of coronary angiography prior to coronary artery bypass graft (CABG) surgery and its association with mortality, health care costs and hospital quality in Turkey. **METHODS:** MEDULA, a nationwide integrated system shared between general health insurance and health care providers in Turkey was used to analyze coronary angiography utilization. Patients age 18–99 years who underwent CABG surgery between April 1, 2009 and October 1, 2010 were identified and assigned to "standard-therapy" or "excess-use" groups based on whether they had one or more coronary angiography, respectively, within 3 months of the first CABG diagnosis date (index date) during the identification period. Survival rates and annual health care costs of patients in the coronary angiography standard-therapy and excess-use groups were compared using propensity score matching. The empirical Bayes approach was used to combine mortality and hospital volume for quality index. Chi-squared tests were used to assess the relationship between hospital quality and excess use of coronary angiography excess use. **RESULTS:** From a total of 20,126 identified patients, 7.27% underwent excessive coronary angiography procedures, at average annual costs that were 9.7% higher than patients with a single angiography ($p<0.01$). Operational mortality associated with excessive use was significantly higher as well (7.4% vs. 5.4%, $p<0.02$). Use of coronary angiography across cities and hospitals varied. Patients who underwent cardiac surgery in high-quality hospitals were less likely to have excessive angiography use than those in low-quality hospitals (7.0% vs. 9.5%, $p<0.01$). **CONCLUSIONS:** In Turkey, excess use of coronary angiography prior to CABG surgery is associated with higher operational mortality, higher expenditures and lower hospital quality.

PCV22

ANTICOAGULANT USE IN HOSPITALIZED PATIENTS WITH ACUTE VENOUS THROMBOEMBOLISM IN THE UNITED STATES

Liu X[1], Xie L[2], Phatak H[3], Mardekian J[1], Tan W[1], Baser O[4], Schneider RF[1], Ramacciotti E[3]
[1]*Pfizer, Inc., New York, NY, USA,* [2]*STATinMED Research, Ann Arbor, MI, USA,* [3]*Bristol-Myers Squibb Company, Princeton, NJ, USA,* [4]*STATinMED Research/The University of Michigan, Ann Arbor, MI, USA*

OBJECTIVES: To examined anticoagulant use and associated factors in hospitalized patients with acute venous thromboembolism (VTE) in the US clinical practice setting. **METHODS:** Adult VTE patients were selected from the linked MarketScan and Hospital Drug database in an inpatient setting between 07/01/2006-12/31/2011. The first hospitalization with a diagnosis of VTE was designated index hospitalization (IH). Patients were required to have at least 6 months continuous enrollment and

have no VTE diagnosis in the 6 months prior to IH. Parenteral and oral anticoagulants used during IH were identified. Multivariate logistic regression was used to examine factors associated with anticoagulant use. **RESULTS:** A total of 957 VTE patients were eligible for the study. Mean age was 62.8 years, and 45.1% were male. Mean length of stay was 8.7 days. During index hospitalization, 45.4% patients were treated with parenteral anticoagulants (PA) and warfarin, 24.6% with warfarin only, and 13.6% with PA only. Among patients treated with PA, low molecular weight heparin accounted for 93.4%. Chemotherapy (OR=2.24), respiratory disease (OR=1.44), and pulmonary embolism (PE) vs deep vein thrombosis (DVT) (OR=1.42) were significantly associated with PA use, while prior stroke (OR=0.43) and renal disease (OR=0.58) were associated with less likelihood of PA use. DVT plus PE vs DVT (OR=3.87), obesity (OR=2.57), chemotherapy (OR=2.23), and PE vs DVT (OR=2.19) were significantly associated with warfarin use, while bleeding history (OR=0.41), diabetes (OR=0.64), and heart disease (OR=0.67) were associated with less likelihood of warfarin use. **CONCLUSIONS:** Less than half of VTE patients during hospitalization were prescribed PA and warfarin, 25% warfarin only, and 14% PA only. Clinical factors including VTE type, stroke and bleeding history, comorbid respiratory disease, diabetes, heart disease, obesity, and chemotherapy were associated with anticoagulant use. Further research needs to examine characteristics and health outcomes of patients who did not receive parenteral anticoagulants during hospitalization.

THE USE OF ORAL ANTICOAGULATION DRUGS FOR STROKE PREVENTION IN NONVALVULAR ATRIAL FIBRILATION IN FRANCE, ITALY, GERMANY, SPAIN AND THE UNITED KINGDOM: IS CURRENT PRACTICE CONSISTENT WITH THE 2012 ESC RECOMMENDATIONS?

Carrasco J[1], Cotté FE[2], Duprat Lomon I[3], Marchant N[4], Letierce A[5], Huguet M[6]
[1]*Bristol-Myers Squibb Company, Paço de Arcos, Portugal,* [2]*Bristol-Myers Squibb, Rueil-Malmaison, France,* [3]*Bristol-Myers Squibb, Rueil-Malmaison, France,* [4]*Pfizer Ltd., Surrey, UK,* [5]*Cegedim strategic Data, Boulogne-Billancourt, France,* [6]*Cegedim Strategic Data, Boulogne-Billancourt, France*

OBJECTIVES: The REACT AF study investigated the outcomes and management associated with stroke prevention treatments in patients with non-valvular atrial fibrillation (NVAF) in Europe. This analysis assessed 1) the use of oral anticoagulation drugs (OACs) and 2) whether current practice is consistent with the 2012 European Society of Cardiology (ESC) recommendations. **METHODS:** We conducted an observational retrospective cohort study of patients with NVAF in the *Longitudinal Patient Database (CEGEDIM)* in France, Italy, UK, Spain and Germany. The analysis included patients >=18 years old, with AF diagnosis, and without rheumatic valvular disease or prosthetic valves. Patients had to be in the database for ≥1 year before date of 1st visit (index date) during the inclusion period (May 2010-April 2012). We calculated patients' CHA_2DS_2-VASc score at index date for untreated patients and at the time of the current OAC initiation for treated patients. We evaluated patients' requirement for stroke prevention therapy based on the 2012 ESC recommendations and calculated the percentage of patients for whom treatment initiation and OAC use were consistent with recommendations. **RESULTS:** In France 53% of the OAC patients (total=16,329) were treated consistently with the 2012 ESC recommendations (treatment requirement and choice of OAC); 46% in Germany (total=13,468), 58% in Spain (total=12,357); 39% in Italy (total=22,447); and 36% in the UK (total=19,956). The percentage of patients (CHA_2DS_2-Vasc> 1, if not alone due to female gender) not receiving the required treatment (either not treated or treated with a non-recommended OAC) was 36% in France; 48% in Germany; 34% in Spain; 52% in Italy; and 48% in the UK. **CONCLUSIONS:** The study findings indicate there is a discrepancy between current practice regarding OAC prescribing and the 2012 ESC recommendations. Special attention must be given to time of treatment initiation and choice of OAC to correctly follow ESC recommendations.

PCV24

ADHERENCE TO TREATMENT AND PERSISTENCY IN PATIENTS TREATED WITH VKA IN FRANCE, ITALY, GERMANY, SPAIN AND THE UNITED KINGDOM

Carrasco J[1], Cotté FE[2], Duprat Lomon I[3], Letierce A[4], Huguet M[5], Marchant N[6]
[1]*Bristol-Myers Squibb Company, Paço de Arcos, Portugal,* [2]*Bristol-Myers Squibb, Paris, France,* [3]*Bristol-Myers Squibb, Rueil-Malmaison, France,* [4]*Cegedim strategic Data, Boulogne-Billancourt, France,* [5]*Cegedim Strategic Data, Boulogne-Billancourt, France,* [6]*Pfizer Ltd., Surrey, UK*

OBJECTIVES: This study investigated the outcomes and management associated with stroke prevention treatments in patients with non-valvular atrial fibrillation (NVAF) in Europe. This analysis estimated persistence and adherence to treatment with VKA. **METHODS:** We conducted an observational retrospective cohort study of patients with NVAF in the *Longitudinal Patient Database (CEGEDIM)* in France, Italy, the UK, Spain and Germany. The analysis included patients >=18 years old, with AF diagnosis, treated with VKA and without rheumatic valvular disease or prosthetic valves. Patients had to be in the database for >=1 year before date of 1st visit during inclusion period (May 2010/April 2012). We estimated persistence (time to VKA discontinuation) as the time from first prescription to last prescription before discontinuation, defining discontinuation as switch or absence of renewal within 3 months, using the Kaplan-Meier method. We measured adherence to treatment by the Medication Possession Ratio (MPR) during the inclusion period. **RESULTS:** Median time to treatment discontinuation was 0.78 year in Germany (n=6,386), 1.00 year in Italy (n=8,774), 1.34 years in France (n=9,184), 1.99 years in Spain (n=7,526), and 1.92 years in the UK (n=7,731). Persistence at 5 years was 12% in Germany, 20% in Italy, 24% in France, 26% in Spain, and 25% in the UK. Concerning adherence the mean MPR was 0.54 in Spain, 0.56 in Italy, 0.57 in France, and 0.59 in Germany. There was insufficient data to estimate adherence in the UK. **CONCLUSIONS:** MPR >=0.80 is used to define good adherence. The results show adherence to treatment with VKA is low in the countries studied. Results were consistent across countries, which suggest that low adherence is not country specific. Low adherence to treatment with VKA can affect the maintenance of patients within recommended range of INR, and therefore may increase the risk of stroke.

PCV25

ANTICOAGULATION TREATMENT WITH VKA IN FRANCE, ITALY, GERMANY, SPAIN AND UNITED KINGDOM. RESULTS FROM THE REACT AF STUDY

Carrasco J[1], Cotté FE[2], Duprat Lomon I[3], Letierce A[4], Huguet M[5], Marchant N[6]
[1]*Bristol-Myers Squibb Company, Paço de Arcos, Portugal,* [2]*Bristol-Myers Squibb, Paris, France,* [3]*Bristol-Myers Squibb, Rueil-Malmaison, France,* [4]*Cegedim strategic Data, Boulogne-Billancourt, France,* [5]*Cegedim Strategic Data, Boulogne-Billancourt, France,* [6]*Pfizer Ltd., Surrey, UK*

OBJECTIVES: This study investigated the outcomes and management associated with stroke prevention treatments in patients with non-valvular atrial fibrillation (NVAF) in Europe. The primary objective of this analysis was to assess the management of patients treated with vitamin K antagonists (VKA). **METHODS:** We conducted an observational retrospective cohort study of patients with NVAF in the *Longitudinal Patient Database (CEGEDIM)* in France, Italy, the UK, Spain and Germany. The analysis included patients >=18 years old with recorded AF diagnosis, treated with VKA, and without rheumatic valvular disease or prosthetic valves prior to the index date (date of 1st visit during inclusion period – May 2010 - April 2012 - , or date for first AF diagnosis, if this falls during this period. Only patients with >=1 year of data were included to ensure adequate data availability. Using recorded INR measures, we estimated the average time within therapeutic range (TTR), INR between 2 and 3 for patients eligible to apply the Rosendaal Method. **RESULTS:** In France 1,110 patients were assessed, in Germany 1,208, in Italy 1,230, & the UK 2,702. Insufficient data were retrieved in Spain (n=12). INR was measured 9.6 times/year in France, 9.5 times/year in Germany, 9.8times/year in Italy, and 13.1 times/year in the UK. In France, 48% of the patients had TTR >=70% of their time; in Germany, 44%; in Italy, 46%, and in the UK, 65%. **CONCLUSIONS:** Treatment outcomes with VKAs, in particular stroke and bleeding, depend on maintaining patients' INR values within recommended range. The results show that the majority of patients in France, Germany and Italy, & 1/3 of patients in UK did not achieve recommended TTR and therefore were at increased risk of stroke or major bleeding. Further research is needed to demonstrate the correlation between these estimates and stroke and major bleeding rates within countries.

PCV26

PHARMACOEPIDEMIOLOGICAL STUDY OF HMG COA REDUCTASE INHIBITOR PRESCRIBING: IMPACT OF GENERIC PRESCRIBING ON COST

Truter I
Nelson Mandela Metropolitan University, Port Elizabeth, South Africa

OBJECTIVES: To investigate the prescribing of hypolipidaemic agents with specific emphasis on the effect of generic prescribing on HMG-CoA reductase inhibitor (statin) costs. **METHODS:** A retrospective, cross-sectional pharmacoepidemiological study was conducted on 2011 medical insurance claims data in South Africa. **RESULTS:** A total of 4805 patients (56.88% males) were prescribed 38373 hypolipidaemic agents. The average age of patients was 56.07 (SD=13.32) years. Statins accounted for 93.85% of all prescriptions and 83.44% of cost, followed by fibrates (3.61% of prescribing frequency and 7.72% of cost). Simvastatin was the most frequently prescribed statin (accounting for 62.59% of all prescriptions), followed by atorvastatin (17.04%) and rosuvastatin (11.68%). Simvastatin was also the active ingredient with the lowest average cost per product of R46.43. Simvastatin was prescribed under 16, atorvastatin six and pravastatin four different trade names. Fluvastatin, lovastatin and rosuvastatin only had one trade name under which they were prescribed. Only one cholesterol absorption inhibitor drug was prescribed (ezetimibe) accounting for 1.64% of prescriptions. This product had the highest average cost per prescription of R416.37. Other hypolipidaemic agents prescribed accounted for only 0.89% and consisted of the combination of ezetimibe and simvastatin, and cholestyramine. The fibrates constituted 3.61% of prescribing, with most prescriptions for bezafibrate. Dosages for the statins were investigated and it was found that the average Prescribed Daily Doses (PDDs) were generally lower or in agreement with the Defined Daily Doses (DDDs). The average PDD of simvastatin was 23.70 (DDD=30 mg), pravastatin 25.35 mg (DDD=30 mg), lovastatin 26.31 mg (DDD=45 mg), atorvastatin 20.91 (DDD=20 mg) and fluvastatin 57.29 mg (DDD=60 mg). **CONCLUSIONS:** There are a variety of generic equivalents available for the statins on the South African market. It was clear that products with more generic equivalents had a lower average cost per prescription compared to the innovator products.

PCV27

USE OF CALCIUM CHANNEL BLOCKERS IN SERBIA IN THE PERIOD FROM 2007 TO 2011 YEAR

Milijasevic D, Milijasevic B, Tomic N, Sabo A, Raskovic A, Horvat O
Faculty of Medicine, University of Novi Sad, Serbia, Novi Sad, Serbia and Montenegro

OBJECTIVES: Calcium channel blockers are drugs of first choice in the treatment of hypertension. The aim of this study was to analyze the consumption of calcium channel blockers in Serbia in the period from 2007 to 2011 year. **METHODS:** The data about the use of drugs were taken from the Agency for Drugs and Medical Devices of the Serbia. **RESULTS:** The most frequently used drug from this group with mainly vascular effects was amlodipine. During this observed five years the consumption of amlodipine is in steadily increased. In 2007. it was 21.25DDD/1000 inh/day, at the end of 2011. year the consumption was 72.97DDD/1000 inh/day. On the second place in drug consumption in the same group of drugs was nifedipine. Contrary to amlodipine, nifedipine recorded a decline in consumption. From the calcium channel blockers with direct cardiac effects the most frequently used drugs were verapamil and diltiazem. The consumption of verapamil in the observed years was uneven. At the and of 2011. consumption of this drug was reduced by 50%. The consumption of diltiazem in observed five years is in constantly decreasing. **CONCLUSIONS:** In Serbia, in the observed period the consumption of calcium channel blockers been uneven. In 2010 and 2011 the consumption of calcium channel blockers marks a positive trend. This research was supported by Provincial Secretariat for Science and Technological Development, Autonomous Province of Vojvodina project No 114-451-2458/2011 and by Ministry of Science, Republic of Serbia, project no 41012.

PCV28

USE OF DIURETICS IN SERBIA IN THE PERIOD FROM 2007 TO 2011 YEAR

Tomic Z, Sabo A, Mikov M, Milijasevic D, Vukmirovic S, Milijasevic B
Faculty of Medicine, University of Novi Sad, Serbia, Novi Sad, Serbia and Montenegro

OBJECTIVES: Diuretics are drugs of first choice in the treatment of hypertension. The aim of this study was to analyze the consumption of diuretics in Serbia in the period from 2007 to 2011 year. **METHODS:** The data about the use of drugs were taken from the Agency for Drugs and Medical Devices of the Serbia. **RESULTS:** The use of diuretics during the observed period in Serbia is quite small and it ranged from 5 to 6% of the total consumption of all drugs from the C group. Furosemide was the most frequently used diuretic. In the five year period furosemide consumption ranged from 33-55% of the total consumption of all diuretics. The second largest consupmtion during first four years of the study is belonged to the indapamide. Indapamide consumption in the fifth year was at the fourth position. At the third position in drug consumption in the first four years was hydrochlorothiazide. Use of hydrochlorothiazide in 2011 took second place. Spironolactone has occupied the fourth position in the first four years. During the last years of the period spironolactone occupied the third position. Consumption of all other diuretics was small. **CONCLUSIONS:** In Serbia, in the observed period, consumption of diuterics is two to three times lower in comparison with the consumption of diuretics in Norway and Finland. This research was supported by Provincial Secretariat for Science and Technological Development, Autonomous Province of Vojvodina project No 114-451-2458/2011 and by Ministry of Science, Republic of Serbia, project no 41012.

PCV29

USE OF BETA BLOCKING AGENTS IN SERBIA IN THE PERIOD FROM 2007 TO 2011 YEAR

Milijasevic B, Tomic N, Milijasevic D, Sabo A, Stilinovic N, Mikov M
Faculty of Medicine, University of Novi Sad, Serbia, Novi Sad, Serbia and Montenegro

OBJECTIVES: Beta blocking agents are drugs of first choice in the treatment of hypertension. The aim of this study was to analyze the consumption of beta blocking agents in Serbia in the period from 2007 to 2011 year. **METHODS:** The data about the use of drugs were taken from the Agency for Drugs and Medical Devices of the Serbia. **RESULTS:** During the observed period in Serbia the consumption of selective beta blocking agents were dominant. The most frequently used drug from this group was metoprolol. During this five years the consumption of metoprolol is in steadily decreased. In 2007. it was 37.73 DDD/1000 inh/day, at the end of 2011. year the consumption was 22.13 DDD/1000 inh/day. On the second place in drug consumption in the same group of drugs was atenolol. Atenolol also recorded a decline in consumption. On the third place in drug consumption was bisoprolol. At the beginning of 2007. consumption of this drug was very small, gradually grew and reached its maximum in 2011. From the unselective beta blocking agents the most frequently used was propranolol and his consumption in the observed years was constant. **CONCLUSIONS:** In Serbia, in the observed period the consumption of beta blocking agents been mostly constant. From all drugs in C07 group the most frequently used group of drugs was C07AB. This research was supported by Provincial Secretariat for Science and Technological Development, Autonomous Province of Vojvodina project No 114-451-2458/2011 and by Ministry of Science, Republic of Serbia, project no 41012.

PCV30

THE HUMANISTIC AND ECONOMIC BURDEN OF VENOUS THROMBOEMBOLISM IN PREGNANT WOMEN: A SYSTEMATIC REVIEW

Kourlaba G[1], Milonas C[2], Kontodimas S[3], Holm MV[4], Maniadakis N[5]
[1]*National and Kapodistrian University of Athens School of Medicine, Athens, Greece,* [2]*National School of Public Health, Athens, Athens, Greece,* [3]*LEO Pharmaceutical Hellas S.A., Athens, Greece,* [4]*LEO PHARMA, Copenhagen Area, Denmark,* [5]*National School of Public Health, Athens, Greece*

OBJECTIVES: To systematically review the humanistic and economic burden of pregnancy-related venous thromboembolism (VTE). **METHODS:** Pubmed, Cochrane Central Register of Controlled Trials, Econlit, Science Direct, JSTOR, Oxford Journals and Cambridge Journals were searched using combinations of a considerable number of relevant words. Humanistic studies published from January 2000 to December 2012 were eligible for inclusion in the review. The reference lists of all relevant papers retrieved from the original search were manually screened to identify additional studies. The identified studies were independently reviewed by two reviewers against pre-determined criteria. A quality assessment of the selected studies was also conducted by using standard methods. The data of selected studies were extracted onto a data extraction form and consequently synthesized. **RESULTS:** Twenty studies were included in our review. The overall pregnancy-related VTE incidence rate per 1,000 deliveries ranged between 1 and 1.72. This rate was higher in the postpartum period compared to the antenatal period. Events were spread across the 3 trimesters, with the majority of events occurring in the third trimester of pregnancy. Limited data is available on mortality due to pregnancy-related VTE, with one study reporting an overall mortality rate of 1.1/100,000 deliveries due to pregnancy-related VTE. Recurrence rate was found to be higher in the postpartum period compared to the pregnancy period. Poorer quality of life (QoL) was identified in women with pregnancy-related VTE in comparison to their counterparts with no VTE. Data regarding the economic burden of VTE in this specific population was lacking. **CONCLUSIONS:** The present systematic review showed that women are under a substantially increased risk of VTE events during pregnancy and VTE strongly affect their QoL. Despite the expected economic burden imposed by the pregnancy-related VTEs, no relevant studies were found. Therefore, further research is required to evaluate the humanistic and economic burden of VTE in pregnant women.

PCV31

IN-HOSPITAL AND LONG-TERM MORTALITY AND MORBIDITY BURDENS IN PATIENTS WITH ACUTE CORONARY SYNDROMES

Zeymer U[1], Domenger C[2], Zakouri B[3]
[1]*Institut für Herzinfarktforschung, Ludwigshafen, Germany,* [2]*Sanofi, Paris, France,* [3]*Sanofi Research and Development, Chilly-Mazarin, France*

OBJECTIVES: To describe current real-world data on in-hospital/long-term mortality and morbidity outcomes in patients in the western world with acute coronary syndromes (ACS). **METHODS:** We conducted a review of publications from international registries: GRACE (Global Registry of Acute Coronary Events) and GRACE expanded (both worldwide); GRACE UK-Belgium; and EuroHeart survey II/III (Europe/Mediterranean basin). The most recent data on in-hospital/long-term outcomes were stratified by ACS type: ST-elevation myocardial infarction (STEMI) and non-ST elevation Acute Coronary Syndromes (NSTE ACS), which includes unstable angina (UA) and the non-ST elevation myocardial infarction (NSTEMI). **RESULTS:** In-hospital mortality rates were 4.6–7.8% in STEMI patients, 2.2–5.9% in NSTEMI patients, and 0.8–2.7% in UA patients. At 6 months post-discharge, mortality rates were 4.5–4.8% in STEMI patients, 6.2% in NSTEMI patients, and 3.6% in patients with UA. These rates increased to 19%, 22%, and 18% in STEMI, NSTEMI, and UA, respectively, at 5 years post-discharge. The most common morbidities were in-hospital congestive heart failure (STEMI, 11–15%; NSTEMI, 6.1–10%; and UA, 6%) and in-hospital myocardial (re)infarction (STEMI, 2–2.8%; and NSTE-ACS, 1.7–2.4%). Six months post-discharge myocardial (re)infarction rates were 2% in STEMI patients and 2.9% in NSTE-ACS patients, which are lower than previously reported in clinical trials. **CONCLUSIONS:** Despite current treatments, a substantial proportion of patients with ACS still suffer death and serious morbidities in the acute phase of the disease and longer term. Further research is needed to improve acute and long-term therapies.

PCV32

INTERRUPTION/BRIDGING OF VKA TREATMENT OF PATIENTS WITH ATRIAL FIBRILLATION: ANALYSIS OF INCIDENCE AND CLINICAL OUTCOMES BASED ON A GERMAN CLAIMS BASED DATA SET

Wilke T[1], Groth A[2], Müller S[2], Hastedt C[3], Fuchs A[4], Maywald U[4]
[1]*IPAM - Institut für Pharmakooekonomie und Arzneimittellogistik, Wismar, Germany,* [2]*IPAM Wismar, Wismar, Germany,* [3]*Boehringer Ingelheim Pharma GmbH & Co. KG, Ingelheim am Rhein, Germany,* [4]*AOK Plus, Dresden, Germany*

OBJECTIVES: For patients with atrial fibrillation (AF) undergoing a surgery, guidelines recommend the interruption of VKA-treatment combined with LMWH/UFH bridging. As a result, patients may be placed at higher risk for thromboembolic events during this time. This study investigates the incidence of such perioperative management situations and describes clinical event rates. **METHODS:** Claims data from a large German statutory health insurance (period 01/01/2007-31/12/2011) was analysed. AF-patients who started VKA-treatment within this period and continued ther-apy until 31/12/2011 were included. VKA-interruption/bridging was assumed when the patient was admitted to a hospital due to an inpatient surgical procedure (case 1) or the patient experienced an outpatient surgery, combined with an outpatient prescription of a LMWH/UFH within 10 days after surgery (case 2). Clinical events of interest were cardiovascular (strokes, TIA, embolism, myocardial infarctions) and bleedings leading to inpatient hospitalization. Daily event rates during regular VKA usage days were compared to those 5 days before/30 days after surgery ("interruption/bridging days"). **RESULTS:** 41,170 patients were included (mean age 74.8 years; 50.8% male; average CHA2DS2-VASc score 5.2). 11,695 (28.4%) VKA-patients experienced a hospital admission due to a surgery (case 1). 464 patients (1.1%) experienced an outpatient surgery with outpatient LMWH prescription (case 2). Overall (both cases) potential interruption/bridging occurred 0.24 times per person-year. The daily cardiovascular/bleeding event risk during potential VKA-interruption/bridging was about 10fold/25fold higher than during a regular VKA-usage day (0.08%/0.21% vs. 0.0078%/0.0083%, vs. ($p<0.0001$)). About half of the bleedings were coded by treating physicians as due to anticoagulation therapy. **CONCLUSIONS:** Periods in which VKA-interruption/bridging due to surgery was required frequently occur during the VKA-treatment of AF patients. The cardiovascular/bleeding event risk of VKA-patients is significantly higher during such periods compared to periods of regular VKA-treatment. Whether this is due to VKA-interruption/bridging or the surgical procedures themselves needs to be analysed in future.

PCV33

USING A CAUSE-OF-DEATH-BASED MORTALITY MODEL TO IDENTIFY THE INDIVIDUALS WHO WOULD BENEFIT MOST FROM PRIMARY PREVENTION WITH STATINS

Martin C[1], Pichardo-Almarza C[2]
[1]*Crystallise Limited, London, UK,* [2]*InScilico Ltd., London, UK*

OBJECTIVES: To explore the use of a cause-of-death-based mortality model to identify those individuals most likely to benefit from taking statins for primary prevention of cardiovascular disease (CVD). **METHODS:** A cause-of-death-based, deterministic Markov model of all-cause mortality was developed. The baseline population average mortality rates for CVD, COPD, other respiratory disease, and cancer were adjusted by referencing individual risk factor values to population averages. Risk factors that were used as model inputs included cigarette consumption per day (CPD), systolic blood pressure (SBP), body mass index (BMI), total cholesterol (TC), and high density lipoprotein (HDL). A total of 11,520 scenarios were modelled encompassing all combinations of high and low values for these risk factors, in men and women, and younger (35 years) and older (65 years) age categories. **RESULTS:** Using an arbitrary threshold for a meaningful clinical benefit of 6 months' increased life expectancy per 10 years of treatment, individuals who are on the cusp of benefiting from statin therapy include: men aged 35 with SBP of 150 mmHg, BMI of 20 kg/m^2, smoking 15 cigarettes per day, with a TC:HDL ratio of 3.5; men aged 70 with SBP of 140 mmHg, BMI of 20 kg/m^2, smoking 10 cigarettes per day, with a TC:HDL ratio of 2.8; women aged 35 with SBP of 135 mmHg, BMI of 20 kg/m^2, smoking 15 cigarettes per day, with a TC:HDL ratio of 4.2 or higher; and women aged 65 with SBP of 140 mmHg, BMI of 30 kg/m^2, who are non-smokers, with a TC:HDL ratio of 4.2. **CONCLUSIONS:** The model facilitates decision-making about when to start preventive treatment and highlights that this is a multi-dimensional problem that renders rules-of-thumb inadequate in determining who most benefits from therapy.

PCV34
THE EFFECTIVENESS OF STATINS IN THE TREATMENT OF CARDIOVASCULAR DISEASE: CROSS-SECTIONAL STUDY WITH PAIRED GROUPS FROM ELECTRONIC PATIENT RECORDS
Abrahão MT, Nobre MR, Gutierrez MA
INCOR - HCFMUSP, Sao Paulo, Brazil
OBJECTIVES: Electronic Patient Record has proven useful to assess the benefits, harms and costs in the real world. To describe the association between the use of statins and cardiovascular events in patients with myocardial ischemia by means an Electronic Patient Record (ePR) as the basis for a retrospective cohort study. **METHODS:** To evaluate the association between the use of statins and cardiovascular events, we conducted a cross-sectional study with patients in the ePR of the Heart Institute (InCor) - University of São Paulo Medical School. Patients were considered for the period between 2004 and 2012 and evaluated in terms of the association between the use of statins with prevalence of percutaneous coronary intervention (PCI), coronary artery bypass graft (CABG) and inpatient mortality. A total of 46,757 patients were randomly selected and matched for gender, age group (18-49/50-59/60-69/>70), and category of cardiovascular disease diagnosis, being from three ICD-10 groupings, I20-I25/I63-I69/G45/I70. The pairing resulted in two groups, each of them with 14,654 patients, a group with prescription of statin (SG) and a group for comparison (CG) without statin. **RESULTS:** A total of 67.4% of the patients registered in the ePR used statins. The presence of reverse causality, very common in cross-sectional studies, was observed in patients submitted to revascularization procedures. Revascularization was made present in 14% of CG versus 42% of SG, which is justified by the drug administration for care of patients undergoing those procedures. Mortality was 5.8% in CG and 4.7% in SG, with prevalence rates of 80%. The absolute reduction in the prevalence of death between groups was 1.1% ($^{95\%}$CI:0,6-1,6%) in favor of the use of statins. **CONCLUSIONS:** Statins were not prescribed to approximately one third of the patients, the use of statins was higher in patients undergoing revascularization procedures and, was also associated with a 20% reduction in the occurrence of mortality.

CARDIOVASCULAR DISORDERS – Cost Studies

PCV35
BUDGET IMPACT ANALYSIS OF ROUTINE GENTAMICIN-COLLAGEN IMPLANTS FOR THE PREVENTION OF SURGICAL SITE INFECTION (SSI) IN HIGH RISK CARDIOTHORACIC SURGERY PATIENTS
Satherley AW[1], Sayers J[2], Fitzsimons E[2]
[1]*GfK Bridgehead, Melton Mowbray, UK,* [2]*EUSA Pharma, Stevenage, UK*
OBJECTIVES: The SSI rate after cardiothoracic surgery is estimated at 7.3% by the UK Health Protection Agency (HPA) for high risk patients. This represents a burden on resources, through greater risk of in-hospital mortality and increased length of hospital stay (mean 22.1 extra days for deep SSI). Treatment guidelines recommend IV antibiotic prophylaxis before surgery; however a challenge in high-BMI and diabetic patients (high risk) is the inability of systemic antibiotics to sufficiently penetrate target tissue. It is however estimated that 40%-60% of SSIs are avoidable, with clinical data supporting additional use of local gentamicin-collagen for SSI prevention. The purpose of this study was to examine the budget impact case from a UK NHS perspective of routinely administering gentamicin-collagen local prophylaxis against SSI in high risk patients undergoing cardiothoracic surgery. **METHODS:** A literature review was undertaken regarding gentamicin-collagen efficacy in reducing SSI in cardiothoracic patients, NHS costs of SSI, and annual UK cardiothoracic patient numbers. The SSI rate in cardiothoracic surgery was obtained from HPA data. Findings were incorporated into a decision tree budget impact model to analyse potential savings from routine use of gentamicin-collagen in high risk cardiothoracic patients. **RESULTS:** Considering a cohort of 3710 high-risk cardiothoracic patients, annual NHS costs of SSI are £2,164,316. Administration of two gentamicin-collagen implants to each high risk patient would cost £200 per patient. Assuming a 59% reduction in SSI; this would prevent 197 sternal wound infections, with direct savings of £1,590,882 per year, a net saving of £229 per cardiothoracic surgery patient. **CONCLUSIONS:** Significant NHS and hospital trust savings may be achievable through routine use of gentamicin-collagen implants in high risk cardiothoracic surgery patients. A conservative estimate of high-risk patient numbers was used in the analysis, suggesting the scope for budgetary savings could exceed reported findings.

PCV36
EVALUATION OF TELEMEDICINE PROGRAM (ITHACA): INNOVATION IN THE TREATMENT OF ARTERIAL HYPERTENSION INCREASING THE COMPLIANCE AND ADHERENCE IN THE SECOND YEAR OF ITS IMPLEMENTATION (2011-2012)
Sicras A[1], Ibañez J[2]
[1]*Badalona Serveis Assistencials, Badalona, Spain,* [2]*Badalona Serveis Assistencials, Badalona, Barcelona, Spain*
OBJECTIVES: To evaluate effectiveness of an interventional strategy (disease management program (DMP)) supported by a telemedicine platform in patients with mild/moderate hypertension. **METHODS:** Quasi-experimental design, paired data with control group (1:2, patients were matched by age and gender). Study population and follow-up period: patients from 6 primary care centers in Badalona (Barcelona, Spain) were followed-up during 2011 and 2012. Study groups: intervention group (telemedicine program) and control group (usual clinical practice). The intervention consisted on establishing a permanent channel of interaction with the patient (telemedicine platform) and providing the patient with educational materials, clinical monitoring, SMS, phone calls, etc. Main measures: Demographic, co-morbidity, anthropometric and biochemical parameters, adherence to treatment, blood pressure control (BP: 140/90 mmHg), associated health care management costs and satisfaction surveys to professionals and patients. Statistical significance:p<0.05. **RESULTS:** A total of 750 patients were included (intervention group n=250, control group n=500). Mean age was of 64.2 years old 52.1% of patients were women. The control group was selected to show an optimal comparability in terms of demographic and morbidity measures between the two groups. The intervention group showed better compliance (87.9% vs. 71.4%, p=0.001). BP control was 52.5 vs. 53.1% (p=NS) initially and 63.2% vs. 55.6% at the end of the study (p<0.001) for the intervention group vs. control, respectively. The follow-up average cost per patient and year was € 377.9 vs. € 442.4, p<0.001 (reduction in intervention group: 66 €). 82% of health care professionals and 91% of patients were satisfied with the DMP. **CONCLUSIONS:** The DMP has improved adherence to treatment and BP control and has reduced health care management costs. If the study results were extrapolated to the overall population of Badalona, a potential saving of 1.7 million per year would be achieved.

PCV37
BUDGET IMPACT ANALYSIS OF APIXABAN FOR THE PREVENTION OF VENOUS THROMBO-EMBOLISM IN PATIENTS UNDERGOING ORTHOPEDIC REPLACEMENT SURGERY IN ITALY
Mantovani LG[1], Furneri G[2], Di Minno G[3]
[1]*Federico II University of Naples, Naples, Italy,* [2]*Charta Foundation, Milan, Italy,* [3]*giovanni.diminno@unina.it, Naples, Italy*
OBJECTIVES: Venous thromboembolism (VTE) is a common cardiovascular condition, frequently leading to severe complications and requiring high-cost health care interventions. New oral anticoagulants (nOACs) have demonstrated to be efficacious and safe in VTE prevention of patients undergoing total hip replacement (THR) and total knee replacement (TKR). This analysis is aimed present article aims to evaluate its economic impact in the perspective of the Italian SSN. **METHODS:** We conducted a budget impact analysis to estimate clinical outcomes and economic consequences associated to the reimbursement of apixaban in the prevention of VTE as a consequence of major orthopedic surgery, over a three-year time horizon. The analysis compared two alternative scenarios, with apixaban either reimbursed (Scenario B) or not reimbursed (Scenario A) by the Italian SSN. Only direct health care costs have been considered. **RESULTS:** According to market assumptions, it is estimated that 1.2%, 3.7%, and 6.5% of THR patients, and 1.2%, 3.8% and 6.7% of TKR patients, would be treated with apixaban over the first three years since launch. The introduction of apixaban, at the estimated daily cost of €2.48/die, would translate into a budget impact of €14.3 mln, €45.5 mln, and €81.4 mln at years 1, 2 and 3 since launch, respectively. This expenditure would be more than offset by savings, due to: i) reduction of prescriptions of alternative treatment options (other nOACs, low-molecular weight heparins, fondaparinux); ii) reduction of the economic burden attributable of CV complications of VTE. Finally, Scenario B resulted slightly favourable compared to Scenario A, leading to economic savings for about €50 thousands over three years. **CONCLUSIONS:** Reimbursement of apixaban does not determine a budget impact increase for Italian SSN, and offers an additional option to prevent high-cost event provoked by VTE. Its usage may be considered fully sustainable from a pharmacoeconomic viewpoint.

PCV38
ASSESSMENT OF THE BUDGETARY IMPACT OF IMPROVING THE USE OF EVIDENCE-BASED MEDICINE IN THE TREATMENT OF PATIENTS WITH HEART FAILURE AND LEFT VENTRICULAR DYSFUNCTION IN ENGLAND
Underhill SM[1], Branscombe N[2], Jofre-Bonet M[3]
[1]*Servier Laboratories Ltd., Slough, UK,* [2]*Les Laboratoires Servier, Suresnes, France,* [3]*City University London, London, UK*
OBJECTIVES: Heart failure places a significant burden on the resources of the NHS. The aim of this study was to compare from a budgetary perspective the current treatment of patients with heart failure and left ventricular dysfunction with an estimate of what could be achieved if the use of evidence-based medicine was optimised in accordance with national guidance. **METHODS:** Quality and Outcomes Framework prevalence and Hospital Episode Statistics data 2011/12 were analysed to determine the number of hospital admissions associated with patients with a diagnosis of heart failure for each Clinical Commissioning Group (CCG) and GP Practice in England. These data were adjusted for patients with left ventricular dysfunction who were in sinus rhythm and hospitalisation costs were applied. This was combined with the cost associated with the current use of evidence-based medicine to determine the total cost associated with this condition. This was compared with an estimate of total costs (hospitalisation and medication) if patients received the levels of evidence-based therapy, and outcomes, reported in the SHIFT trial. SHIFT was chosen as the largest and most recent contemporary trial in heart failure and left ventricular dysfunction, which reflects the optimal use of recommended therapies. Data for each CCG and GP practice in England is available via a model presented in Microsoft excel® or Apple numbers®. **RESULTS:** Increasing the use of evidence-based therapy to the levels achieved in the SHIFT trial can potentially release estimated funding of up to £175m for the population of England, £810,000 for a CCG with a population of 250,000 and £32,000 for a GP practice with a list size of 10,000. **CONCLUSIONS:** If the use of evidence-based therapy for patient's heart failure and left-ventricular dysfunction is increased from current levels, significant improvements in terms of patient outcomes and the use of NHS funding can be achieved.

PCV40
A BUDGET IMPACT ANALYSIS TO ESTIMATE THE ECONOMIC IMPACT OF DRUG ELUTING BALLOON FOR THE TREATMENT OF PERIPHERAL VASCULAR DISEASE
Corbo M[1], Beccagutti G[1], Manda B[2]
[1]*Medtronic Italia, Sesto San Giovanni, Italy,* [2]*Medtronic Vascular Inc., Santa Rosa, CA, USA*
OBJECTIVES: Drug Eluting Balloon (DEB) is a promising alternative for the treatment of patients with peripheral arterial disease, due to the potential reduction in re-intervention rates and cost-savings compared to other technologies commonly used. The objective of this analysis was to assess the economic impact of DEB and other endovascular therapies for patients with femoral-popliteal disease. **METHODS:** A budget impact model was developed to compare the relative impact in Italy of four different index procedure treatments (PTA with regular balloons, DEB, bare metal stents (BMS) and drug eluting stents (DES)) based on the

repeat procedure rates (TLR - target lesion revascularization) over 1 year. The model was developed from a Italian national health care system (NHS) perspective with a 5-year time horizon. A systematic literature review was carried out on TLR rates in patients with femoral-popliteal disease treated with one of the four treatment choices. Costs associated to each treatment are derived from the average DRG tariffs used for peripheral angioplasty procedures. A decision analytic model was developed to estimate total costs over 12 months of index procedures and possible revascularizations. **RESULTS:** Pooled 12-month TLR rates show clear patients benefit with DEB compared to PTA (8,6% vs 28,6%) and non-inferiority of DEB vs DES (9,4%) and BMS (11,5%). Total Italian DRG payments for index and repeat interventions (based on TLR rates estimation) across treatments showed that DEB was the least costly treatment strategy over 1 year, with saving of almost €1,000 per patient with DEB vs PTA. Based on these per-patient savings, the potential total savings amounted to approximately €2 million for an assumed annual increase of 5% in DEB adoption rate over 5 years. **CONCLUSIONS:** The analysis suggests clear patient benefit for DEB. Despite initial higher investments, DEB represents a cost-saving alternative to other technologies according to the NHS perspective.

PCV41

BUDGET IMPACT ANALYSIS OF RIVAROXABAN IN THE PREVENTION OF STROKE IN NON-VALVULAR ATRIAL FIBRILLATION PATIENTS IN ITALY

Capri S[1], Veneziano M[2], Ricciardi WG[3], D'Ausilio A[4], Pedone MP[5], Bianchi C[5]
[1]*Institute of Economics, Castellanza, Italy,* [2]*Catholic University of Sacred Heart, Roma, Italy,* [3]*Catholic University of Sacred Heart, Rome, Italy,* [4]*Creativ Ceutical, Luxembourg, Luxembourg,* [5]*Bayer Pharma, Milano, Italy*

OBJECTIVES: In Italy about 500,000 non-valvular atrial fibrillation (NVAF) patients have a major unmet medical need as they do not receive adequate anticoagulation therapy for stroke prophylaxis: many patients receive antiplatelet therapy, even when the guidelines recommend vitamin-K antagonists (VKA), or are not treated at all or have international normalized ratio inadequate control despite treatment with VKA. The purpose of this study was to perform a budget impact analysis of rivaroxaban - a novel oral anticoagulant (NOAC) - in NVAF patients with the highest unmet medical need from the Italian health care system (SSN) perspective. **METHODS:** Two scenarios were compared within a three-year timeframe: the actual scenario, where patients are treated according to current clinical practice (46% with VKA, 38% with antiplatelets, 17% non-treated) and a scenario where Rivaroxaban is present with increasing market shares. The event risks (ischemic and haemorrhagic stroke, systemic embolism, myocardial infarction and bleedings) were retrieved from the ROCKET-AF trial or from a network meta-analysis. Resource consumption was computed using mean regional tariffs. Since Rivaroxaban price is not officially published, the daily cost used ranges from €2.10 (price of the first NOAC approved in this indication in Italy) and the lowest Rivaroxaban price available in Europe (€1.94). The results of the analysis are displayed as a total costs difference between the two scenarios. **RESULTS:** A reduction in the total number of events and costs at SSN charge is shown since the first year from rivaroxaban introduction. The increase in pharmaceutical expenditure is offset by savings from a lower number of events to treat and absence of routine coagulation monitoring. **CONCLUSIONS:** The introduction of rivaroxaban in the national scenario is beneficial because it will provide a substantial reduction in the disease burden for patients and in costs for the SSN.

PCV42

COMPARISON OF DABIGATRAN ETEXILATE VERSUS WARFARIN, ASPRIN & NO TREATMENT FOR STROKE PREVENTION IN ATRIAL FIBRILLATION IN ENGLAND, UNITED KINGDOM, OVER 5 YEARS

Sunderland TJ[1], Zah V[2], McCarron C[1]
[1]*Boehringer Ingelheim, Berkshire, UK,* [2]*ZRx Outcomes Research Inc., Mississauga, ON, Canada*

OBJECTIVES: To estimate the number of clinical events and costs of these events for dabigatran etexilate (dabigatran) versus a combination of warfarin, aspirin and no treatment for stroke prevention in atrial fibrillation (AF) patients in an England, UK, setting over 5 years. **METHODS:** An interactive model was built in Microsoft Excel to calculate the following: • Total number of AF patients eligible for dabigatran • Number of clinical events for dabigatran, warfarin, aspirin and no treatment patients over a 5 year time horizon. Clinical events included were stroke (ischaemic, haemorrhagic, systemic embolism); major bleeding (intracranial and extracranial); all cause mortality; acute myocardial infarction • Total costs of clinical events for each treatment. The total cost per day for dabigatran is £2.20 per day; warfarin is £1.18; aspirin is £0.09; no treatment is £0.00. Warfarin had a TTR of 55% (from Jones et al 2005); aspirin and no treatment clinical event rates were from Roskell et al (2010). Dabigatran data was from the RE-LY trial **RESULTS:** The model estimates there are 822,527 patients with AF in England, of which 78% are eligible for dabigatran (641,571). After 5 years, patients treated with dabigatran versus 80% with warfarin; 10% aspirin; 10% no treatment are associated with: 1) 27,357 fewer strokes (16,938 fewer ischaemic storkes); 2) 14,413 fewer major bleeding events; and 3) An increase of £268,167,861 in drug budget; however there is an overall cost saving of £11,240,201. The overall cost saving is predominantly driven by savings in disability following stroke. **CONCLUSIONS:** Study indicates that due to a superior clinical profile, dabigatran may more than offset the increase drug budgets, resulting in cost savings, if used preferentially versus warfarin, aspirin or no treatment.

PCV43

COMPARISON OF DABIGATRAN ETEXILATE VERSUS WARFARIN FOR STROKE PREVENTION IN ATRIAL FIBRILLATION IN IRELAND OVER 5 YEARS

McCarron C[1], Sunderland TJ[1], Zah V[2]
[1]*Boehringer Ingelheim, Berkshire, UK,* [2]*ZRx Outcomes Research Inc., Mississauga, ON, Canada*

OBJECTIVES: To estimate numbers of clinical events (strokes, major bleeds, acute myocardial infarctions and deaths) and health care costs over a five year period in Ireland following a switch of antithrombotic therapy for atrial fibrillation (AF) from warfarin to dabigatran. **METHODS:** A model was built in Microsoft Excel and included an estimate of the number of Irish patients diagnosed with AF and eligible for treatment with dabigatran. It is assumed that all diagnosed AF patients eligible for oral anticoagulation currently receive warfarin and that all patients switch to dabigatran in Year 1, regardless of International Normalised Ratio (INR) control amongst warfarin patients. Differences in numbers of clinical events expected to occur based on a patient's antithrombotic treatment were estimated by applying event rates from literature sources. Costs were estimated from a HSE perspective and included costs of clinical events, disability costs and medication costs. **RESULTS:** A total of 28,332 Irish patients are estimated to have been diagnosed with AF and are eligible for dabigatran. Switching these patients from warfarin to dabigatran may avoid: 657 strokes; 792 major bleeds; 1,437 deaths. By Year 5, cumulative dabigatran drug costs were estimated at €7,670,870. Cost savings due to clinical events avoided amounted to €2,894,743 and savings on disability costs at €5,563,349, giving a total cost saving with dabigatran of €787,223. **CONCLUSIONS:** Use of dabigatran as compared to warfarin for stroke prevention in AF in the Irish setting may avoid a significant number of clinical events and result in overall cost savings.

PCV44

ECONOMIC BURDEN OF VENOUS THROMBOEMOBLISM ACROSS PATIENT POPULATIONS: A LITERATURE REVIEW

Claflin AB[1], Mitchell CR[2], Liu X[1], Phatak H[3], Mitchell SA[2]
[1]*Pfizer, Inc., New York, NY, USA,* [2]*Abacus International, Bicester, UK,* [3]*Bristol-Myers Squibb Company, Princeton, NJ, USA*

OBJECTIVES: To conduct a literature review on the economic burden of venous thromboembolism (VTE) (encompassing deep vein thrombosis (DVT) and pulmonary embolism (PE)) and related complications. **METHODS:** Eligible English-language studies published post-1990 were identified from electronic databases (Medline, EMBASE and Cochrane Library: accessed December 2012) and conference proceedings with no restriction on geographical location or patient population. All costs are reported in US$ adjusted to 2013 levels. **RESULTS:** Twenty-nine studies met eligibility criteria: United States (n=17), Canada (n=2), Australia (n=1), South America (n=1) and Europe (n=8). The estimated annual cost of VTE treatment is in excess of $2 billion in the USA and Europe and $153 million in Australia. This figure rises to $15.6–$34.8 billion in the US and to $1.78 billion in Australia on inclusion of complications, productivity loss and other societal costs. The cost of treating PE per patient ($12,567-$20,488) is higher than that of treating DVT ($2,912-$13,299). Hospitalisation is the main cost driver for VTE treatment, accounting for 56%-89% of all treatment costs. For patients with cancer, costs were 30-50% higher for those with VTE compared with those without VTE. VTE-related complications incur additional costs including: bleeding (up to $23,963 per patient with a major bleed); recurrent VTE (up to $18,122 per patient); post-thrombotic syndrome (increase of up to 75% in treatment cost); chronic thromboembolic pulmonary hypertension (up to $6,708 per patient); and heparin-induced thrombocytopenia (up to $18,779 per patient). **CONCLUSIONS:** Incident VTE events and related complications are associated with significant economic burden across several patient populations. Treating PE may cost up to five times more than treating DVT, with hospitalisation reported as the major cost driver of VTE treatment. Effective and convenient therapies associated with both a reduced incidence of bleeding and complications are required to further reduce the cost burden associated with VTE.

PCV45

PHARMACOECONOMIC ASPECTS OF ACTOVEGIN AND SOLCOSERYL IN THE TREATMENT OF RUSSIAN PATIENTS WITH ACUTE CEREBROVASCULAR ACCIDENTS

Ryazhenov VV[1], Gorokhova SG[1], Emchenko IV[1], Matveev NV[2]
[1]*I.M. Sechenov First Moscow State Medical University, Moscow, Russia,* [2]*N.I. Pirogov Russian National Research Medical University, Moscow, Russia*

OBJECTIVES: To assess the cost-effectiveness of actovegin and solcoseryl in the treatment of Russian patients with acute ischemic stroke and predict potential budget impact of the implementation of actovegin in routine clinical practice. **METHODS:** The pharmacoeconomic model was developed based on the data from Russian clinical trial performed by A. Fedin et al. (2000). Two groups of patients (100 persons each) hospitalized with acute ischemic stroke were included in the model. The first group of patients received conventional therapy + actovegin and the second group received conventional therapy + solcoseryl. Based on the reported by A. Fedin et al. time-dependent mortality reduction in actovegin-treated patients (mortality rate was 7% in patients started actovegin within the first 6 hours after stroke onset, 10% – in those started actovegin within the first 24 hours, 14% – in those started actovegin after more than 24 hours, and it was much higher in the control group – 21%) cost-effectiveness ratios (CERs) and indicator of economic rationality of costs of previous periods (IRPP) were calculated and compared. **RESULTS:** Estimated CERs varied from 46,348.82 to 50,121.40 RUB per one survivor in the actovegin group and from 50,900.56 to 53,585.17 RUB per one survivor in the solcoseryl group. Inefficient expenditures (IRPP) varied from 301,730.83 RUB to 603,461.67 RUB in the actovegin group, and were 873,453.57 RUB in the solcoseryl group. **CONCLUSIONS:** The study has demonstrated the preferred cost-effectiveness profile of actovegin as compared to solcoseryl in patients with acute ischemic stroke.

PCV46

PHARMACOECONOMIC BENEFITS OF CITICOLINE IN THE TREATMENT OF ACUTE ISCHEMIC STROKE IN RUSSIA

Ryazhenov VV, Gorokhova SG
I.M. Sechenov First Moscow State Medical University, Moscow, Russia

OBJECTIVES: To assess the cost-effectiveness of citicoline in the treatment of Russian patients with acute ischemic stroke and identify potential budget impact of the implementation of citicoline in routine clinical practice. **METHODS:** The pharmacoeconomic model was developed based on the data of meta-analysis performed by A. Davalos et al. (2002). Two groups of 100 patients each were included in the model: the first group of patients received conventional therapy and the second group (active treatment group) additionally received citicoline. It was assumed that citicoline was given to patients in the active treatment group in the following way: during the first

10 days since acute stroke onset, 2,000 mg was administered intravenously; from day 11 to the end of the treatment periods (74 days), 1,000 mg was administered per os. The time horizon adopted in the model was 12 weeks. Based on the data on effectiveness of citicoline in complete patient recovery after 3 months reported by A. Davalos et al., the cost-effectiveness ratios (CERs) were calculated and compared. **RESULTS:** Estimated CERs were 513,099.20 RUB per one patient recovered in control group and 435,368.00 RUB per one patient recovered in citicoline group. Furthermore, the costs of rehabilitation of patients were lower in the citicoline group as compared to control group, cost savings were estimated to be about 1,719,610.00 RUB. **CONCLUSIONS:** The study has demonstrated that the treatment of acute ischemic stroke with citicoline was more cost-effective and had the potential to reduce the rehabilitation expenses.

PCV48

REMOTE PATIENT MONITORING IN CRT-D RECIPIENTS MAY REDUCE USE OF HOSPITAL-BASED CARE

Stern S[1], Kansal AR[1], Amorosi SL[2], de Lissovoy G[3]
[1]*Evidera, Bethesda, MD, USA,* [2]*Boston Scientific, Natick, MA, USA,* [3]*Johns Hopkins University, Baltimore, MD, USA*

OBJECTIVES: Heart failure (HF) is a costly disease imposing a substantial health burden which affects 1-2% of Europeans. Hospital readmission for HF is a common occurrence with 25% of all patients readmitted within 30-days following initial hospitalization. Reducing readmission is an important component of managing HF costs and increasingly being targeted with health care policy reforms. The objective of this study is to examine how remote patient monitoring (RPM) may affect health care costs following the placement of a CRT-D device for patients with HF through the use of a simulation model. **METHODS:** The analysis was an individual patient event-based simulation from a US payer perspective based on a sample of patients from RAPID-RF, a multi-center prospective single-arm registry which enrolled 889 patients who received a CRT-D and RPM system (LATITUDE® Boston Scientific). The modeled population consisted of patients that had at least one alert for weight change, atrial tachycardia or ICD shock with a subsequent intervention (N=128). The population was limited to this subset to focus on the costs of changes in management due to RPM. A non-RPM control group was created by cloning each trial patient and simulating their response in the absence of RPM to the conditions that triggered each alert in the trial over one year using a decision tree which computed rates of hospitalization and physician contacts based on literature data. Event and hospitalization costs were estimated per Medicare (CMS) national average payment. **RESULTS:** RPM reduced total costs after the index procedure by $323/patient driven by a reduction in costs related to hospitalization admissions. The decrease in hospital admission cost was partially offset by RPM's increase in physician visits and telephone counseling. **CONCLUSIONS:** RPM has the potential to shift HF-related care from an inpatient setting to office-based care, resulting in cost savings to national payers.

PCV49

DABIGATRAN ETEXILATE IN PREVENTION OF STROKE FOR NONVALVULAR ATRIAL FIBRILLATION PATIENTS IN TURKISH HEALTH CARE SETTING; A STUDY ON COST CONTAINMENT OF SOCIAL SECURITY INSTITUTION (SSI)

Kececioglu S[1], Ulus P[2], Cukadar F[3], Ozkan M[3], Urganci B[3]
[1]*Boehringer Ingelheim Turkey, Istanbul, Turkey,* [2]*Boehringer Ingelheim Turkey, ISTANBUL, TURKEY, Turkey,* [3]*Boehringer Ingelheim Turkey, ISTANBUL, Turkey*

OBJECTIVES: Analysis of cost containment of SSI via use of Dabigatran Etexilate (150MG) versus current standard of care (Warfarin) in prevention of stroke for non valvular atrial fibrillation patients in Turkish health care setting. **METHODS:** All calculations are performed for a group of 1000 patients in each treatment arm per year (Treatment arms; Dabigatran 150MG & Warfarin 5MG – results are represented as "cost per patient per day"). Available clinical data is analyzed for calculation of event costs in each treatment arm (RE-LY study). Local costs of events are included from local literature. Microsoft Excel (2007) is used for calculations and construction of data tables. **RESULTS:** Direct cost of SSI (indirect costs are not included in this analysis) is calculated in each treatment arm. Difference of daily medication cost between Dabigatran Etexilate and Warfarin treatments is +3.12 TL/Day*Patient however, this difference is calculated as -3.34 TL/Day*Patient when medication cost is combined with total treatment cost (costs of thromboembolic&adverse events, INR monitoring, impairment). Dabigatran Etexilate offers a cost containment (saving) of 0.22 TL/Day*Patient in prevention of stroke for non valvular atrial fibrillation patients in Turkish health care setting. **CONCLUSIONS:** Limitation of this study is covering only direct cost data due to lack of local literature on indirect costs. Further analysis may be performed by non-interventional studies, which will define cost containment data via real life cost and effectiveness values. This study demonstrates that Dabigatran Etexilate treatment may sustain cost containment (saving) via reduction of direct cost of SSI with respect to current standard of care, in prevention of stroke in patients with atrial fibrillation in current Turkish health care system.

PCV50

COST SAVING AFTER SUTURELESS REPLACEMENT IN AORTIC VALVE STENOSIS: RESULTS FROM A PROPENSITY-MATCHED SCORE ANALYSIS IN GERMANY

Santarpino G[1], Giardina S[2], Pollari F[1], Vogt F[1], Pfeiffer S[1], Fischlein T[1]
[1]*Klinikum Nurnberg, Nurnberg, Germany,* [2]*Sorin Group, Milano, Italy*

OBJECTIVES: New sutureless aortic valve prostheses reduce the surgical time. Objective of this study is to asses if shorter operative times may also result in improved patient outcomes and the impact on the hospital costs. **METHODS:** Records of 547 patients that underwent aortic valve replacement with a bioprosthesis from March 2009 and May 2013 were identified. Based on a propensity score analysis 2 groups (Sutureless and Sutured) with 82 matched pairs were created from the 112 patients received a Perceval sutureless bioprosthesis and the 435 patients received a sutured valve. Hospital and follow up outcomes, resources consumption was recorded and compared between groups. Analysis was performed according the National Health Care system perspective. **RESULTS:** Preoperative characteristics and risk scores of the 2 groups were comparable. Hospital mortality was 3.7% in Sutured and 2.4% in Sutureless (p=0.65). Aortic cross-clamp, cardiopulmonary bypass time and operation time were 20%, 23% and 16% shorter in Sutureless (each one p<0.001).Sutureless required less blood transfusion (1.2±1.3 vs 2.5±3.7 units, p=0.005) with a similar incidence of postoperative bleeding (2 patients vs 5, p=0.221). Sutureless had a shorter intensive care unit stay (2.0±1.72vs 2.8±1.3 days, p<0.001), a shorter hospital stay (11.4±3.9 vs 17.3±13.7 days, p<0.001) and a shorter intubation time (9.5±4.6 vs 16.6±6.4 hours, p<0.001). A neurological event was recorded in 3 sutureless patients and in 6 sutures (p=0.248). Sutured has an higher incidence of postoperative atrial fibrillation, pleura effusions and respiratory insufficiency (p 0.015, 0.024 and 0.016, respectively). Reduced risk of post operative complication resulted in a dramatic reduction of resources consumption in the sutureless group allowing a saving of 50% of the complication related resource use. **CONCLUSIONS:** Shorter procedural times resulting from sutureless aortic valve replacement are associated with better outcomes and lower costs. Sutureless valve may be considered as the first-line treatment for patients underwent aortic valve replacement with a bioprosthesis.

PCV51

TRENDS IN THE COST-EFFECTIVENESS OF STROKE CARE

Urbina-Valdespino E[1], Saka Ö[1], Crichton S[2], Rudd A[2], Mcguire A[3], Wolfe C[2]
[1]*Deloitte, Diegem, Belgium,* [2]*King's College London, London, UK,* [3]*London School of Economics, London, UK*

OBJECTIVES: To assess the annual average costs and quality adjusted life years (QALYs) of stroke services in the UK before and after the introduction of the National Stroke Strategy (period: 2006-2011). **METHODS:** Data from the South London Stroke Register (SLSR) from 2006 to 2011 were used to populate a discrete event simulation (DES) model. Parameters, such as daily probability of survival and length of stay, included in the model were calculated by using Cox proportional hazard model and multivariate regression methods respectively. Barthel Index was used as proxy for measures of quality of life. Treatment costs were introduced in the model in order to calculate the total costs based on resource usage. The model simulated the stroke care delivery from stroke onset with 10-year follow up. Average cost and QALYs were calculated for every year from 2006 to 2011. **RESULTS:** The average total costs per treating a stroke patient decreased from £30,745 to £27,086 between 2006 and 2011 (p-value for trend < 0.001). This is mainly as a result of savings achieved in the inpatient phase due to a shorter LOS and a higher proportion of patients with mild disability. Per patient QALY's also increased from 2.2 to 3.1 during the same period (p-value for trend < 0.001), this is due to a higher proportion of patients having access to better organised stroke care. **CONCLUSIONS:** This study has demonstrated that stroke services in the UK have improved their value for money over time with constant gains in efficiency. The use of DES together with SLSR data allows the testing of the costs and outcomes of a whole stroke provision system or components of it and provide opportunities for retrospective (as done in this study) as well as prospective analysis (in the case of health technology assessment studies).

PCV52

DISCRETE EVENT SIMULATION MODEL OF PRIMARY PREVENTION OF STROKE: BENEFITS OF INCREASING COVERAGE TO UNSERVED PATIENTS

Urbina-Valdespino E[1], Saka Ö[1], Kleintjens J[1], Rudd A[2], Wolfe C[2]
[1]*Deloitte, Diegem, Belgium,* [2]*King's College London, London, UK*

OBJECTIVES: To assess the impact of a hypothetical increase in the stroke primary preventive care coverage in the UK. Productivity gains, using resource utilization as proxy, and monetary benefits were calculated. **METHODS:** Data from the South London Stroke Register (SLSR) from 2009 to 2011 were used to create a hypothetical cohort to populate a discrete event simulation (DES) model. The model simulated the stroke care delivery from primary preventive stroke care until discharge from stroke unit or general medical ward. Primary preventive care was defined as taking medications to control hypertension, high-cholesterol and also anticoagulants in patients with atrial fibrillation in order to prevent strokes. Treatment costs were introduced in the model in order to calculate the total costs based on resource usage. Hypothetical scenarios consisting in 10% incremental increase of primary preventive care for high-risk factors were tested. The reduction of strokes was given by relative risk reduction ratios extracted from clinical trials. **RESULTS:** Our findings indicate that for every 10% increase in the number of patients undergoing primary prevention treatment the number of strokes would be reduced by 1.2%. In a scenario where 50% of the untreated patients receive primary prevention 7,232 strokes would be reduced per year. For the same scenario, 47 hyper acute beds, 359 acute beds and 47 general medical ward beds could be saved in average. In total this would yield in £42.2 million of savings in the inpatient phase of stroke care. **CONCLUSIONS:** Our findings suggest that by enhancing primary prevention of stroke care in the UK, significant benefits can be achieved in terms of reductions in resource consumption and monetary savings as a result of averted strokes. The generation and analysis of these retrospective hypothetical scenarios, using real-world evidence on stroke, help evaluate policy choices in stroke care in the UK.

THE BURDEN OF RESISTANT HYPERTENSION IN 5 EUROPEAN COUNTRIES

Sapoval M[1], Hale BC[2], Armstrong S[3], Da Deppo L[4], Hertz D[3], Briggs A[5]
[1]*Interventional Radiology Department, Assistance Publique des Hôpitaux de Paris, Georges Pompidou European Hospital, Paris, France,* [2]*Boston Scientific, Natick, MA, USA,* [3]*GfK Bridgehead, Wayland, MA, USA,* [4]*Boston Scientific, Milan, Italy,* [5]*University of Glasgow, Glasgow, UK*

OBJECTIVES: Greater than 40% of Europeans over age 25 have hypertension, and 10% of those have medication resistant hypertension (RHT). In EU5 (France, Germany, Italy, Spain, UK) that results in 9.4 million persons with blood pressure above goal, despite treatment with 3+ medications. These patients have a greater than 30% risk of cardiovascular disease (CVD) over 10 years and an increased risk of end-stage renal disease (ESRD). This analysis sought to quantify the burden of RHT

in EU5, a subject about which nothing has been published to date. **METHODS:** A burden of illness model was constructed to examine the impact of RHT in EU5, specifically the incremental incidence, mortality and direct medical costs of CVD, which includes: coronary heart disease (CHD), congestive heart failure (CHF) and stroke. Framingham risk equations which included a coefficient for treatment resistance and SCORE risk charts were used to estimate the risk of CVD for patients with and without RHT. Transition probability data were taken from the literature to estimate the risk of death from CVD events, subsequent CVD events and ESRD. Direct costs for these events and their long-term consequences were taken from the literature and from country-specific drug and acute inpatient costs. **RESULTS:** The total direct medical cost of RHT in EU5 is estimated to be €3.9 billion in 2013. This does not include the cost for drugs to treat RHT, or other costs such as lost productivity not directly borne by the health care system. RHT will contribute to 188,000 cases of CHD, 57,400 strokes, 31,500 CHF and 1,400 ESRD and 30,000 deaths in 2013. **CONCLUSIONS:** The burden of RHT due to the increased incidence of CVD and ESRD is high. Reducing the incidence of CVD and ESRD through better blood pressure control should be a priority for health care decision makers.

PCV54

RETROSPECTIVE COSTING STUDY TO ESTIMATE BURDEN OF HEART FAILURE IN SPAIN

Llorens P[1], Crespo C[2], Pérez-Alcántara F[2]
[1]*Hospital General Universitario, Alicante, Spain,* [2]*Oblikue Consulting, Barcelona, Spain*

OBJECTIVES: To analyze and estimate resource utilization and associated costs, one year following an acute episode of heart failure (HF) in Spain. **METHODS:** Patient-flow data after index hospitalization for acute HF (AHF) were obtained from EAHFE database, an emergency (ER)-based registry containing records of all AHF patients treated in 29 Spanish hospitals (over 5,800 cases). Estimated medical resource utilization data during patients' ER and other wards stay, hospitalization, and first-year follow-up was collected from medical specialists through questionnaire. AHF episodes and hospitalizations incident rates were estimated through literature review and disease statistics in official sources. Cost data was retrieved from Spanish Pharmacists official sources and a national health care costs database (Euros, 2013). To assess uncertainty, sensitivity analysis was carried out. **RESULTS:** A total of 111,803 annual hospital admissions are estimated in Spain (2013). 92% of patients suffering an AHF episode are discharged alive and of these 90% survive the first month; 23% of these patients are discharged directly from ER, while the majority of those who are hospitalized, are admitted to Internal Medicine (53%) or Cardiology (17%) wards. On an average, patients are re-admitted 0.41 times within 1 year. Total direct costs in the first year following an AHF episode averages €6,822, of which 88% are incurred in hospital, with drugs and diagnostic tests accounting for less than 5% of all hospital costs. Follow-up costs, in average, split equally between drugs and outpatient visits/tests, but vary widely depending on local HF protocols. Extrapolation of results to the Spanish population suggests that the total burden of HF is more than €542 million per year. **CONCLUSIONS:** Treating HF patients within Spain is resource intensive. Costs are primarily incurred in hospital and are mostly driven by the length of stay.

PCV55

THE BURDEN OF ILLNESS OF CHRONIC THROMBOEMBOLIC PULMONARY HYPERTENSION: A MANAGED CARE PERSPECTIVE IN THE UNITED STATES

Joish VN[1], Muccino D[1], Kreilick C[2], Kamalakar R[2], Yao J[2], Mathai S[3]
[1]*Bayer HealthCare Pharmaceuticals, Inc., Wayne, NJ, USA,* [2]*Bayer HealthCare, Wayne, NJ, USA,* [3]*Johns Hopkins University School of Medicine, Baltimore, MD, USA*

OBJECTIVES: Chronic thromboembolic hypertension (CTEPH) is associated with considerable morbidity and mortality. The objective of this study was to describe the burden of illness in patients with CTEPH. **METHODS:** Data for this study came from a large commercial claims database. CTEPH patients were identified based on having >2 medical claims for either primary pulmonary hypertension (ICD-9 code:416.0) or chronic pulmonary heart disease (ICD-9 code:416.8), history of pulmonary embolism in the past one year (ICD-9 code:415.1, V12.51, 38.7; CPT-4 codes:36010, 37620, 75825, 75940; HCPCS codes:C1880) and either one claim for right heart catheterization or one claim of echocardiogram and diagnosed by a pulmonologist/cardiologist within 12 months of the medical claim. Demographic variables were extracted at a patient level from administrative files and economic variables, which included health care utilization and costs for outpatient, inpatient, emergency and pharmacy services came from the respective medical and pharmacy claim files and summarized at a per-patient-per-month (PPPM). Five controls were randomly picked and matched to each CTEPH patient on demographic characteristics. Incremental burden of CTEPH was estimated using non-parametric statistical tests between controls and CTEPH group. All costs were adjusted to 2012 base year using consumer price index. **RESULTS:** A total of 191 CTEPH patients were identified and matched to 955 controls. CTEPH group had significantly higher ($p<0.001$) PPPM health care utilization compared to the matched control across all drivers: outpatient (3.1 vs. 1.5), inpatient (0.13 vs. 0.02), emergency room (0.16 vs. 0.04), and pharmacy services (4.5 vs. 2.6). The increase in utilization translated in higher ($p<0.001$) total PPPM incremental costs of $5,007 in the CTEPH group with inpatient ($3,909 vs. $332) and pharmacy costs ($607 vs. $180) being as much as twelve and three times greater compared to controls. **CONCLUSIONS:** Health care resource use and costs for CTEPH patients is high from a managed care perspective.

PCV56

THE BURDEN OF ILLNESS OF PULMONARY ARTERIAL HYPERTENSION: A MANAGED CARE PERSPECTIVE IN THE UNITED STATES

Joish VN[1], Muccino D[1], Kreilick C[2], Kamalakar R[2], Yao J[2], Mathai S[3]
[1]*Bayer HealthCare Pharmaceuticals, Inc., Wayne, NJ, USA,* [2]*Bayer HealthCare, Wayne, NJ, USA,* [3]*Johns Hopkins University School of Medicine, Baltimore, MD, USA*

OBJECTIVES: Pulmonary arterial hypertension (PAH) is a progressive disease resulting in high health care resource use and costs. The objective of this study was to estimate the burden of illness in PAH patients. **METHODS:** Data came from a large commercial claims database. PAH patients were identified based on having >2 medical claims for primary pulmonary hypertension (ICD-9 code:416.0), and either one claim for right heart catheterization or one claim of echocardiogram and diagnosed by a pulmonologist/cardiologist within 12 months of the medical claim. The first medical claim during this period served as in the index date with 12 months prior to this event as baseline and 12 months post as follow-up period. Demographic variables were extracted at a patient level from administrative files and economic variables, which included health care utilization and costs for outpatient, inpatient, emergency and pharmacy services came from the respective medical and pharmacy claim files and summarized at a per-patient-per-month (PPPM). Five controls were randomly picked and matched to each PAH patient on demographic characteristics. Incremental burden of PAH was estimated using non-parametric statistical tests between controls and PAH group. All costs were adjusted to 2012 base year using consumer price index. **RESULTS:** A total of 2,245 PAH patients were identified and matched to 11,225 controls. PAH group had significantly higher ($p<0.001$) PPPM health care utilization compared to the matched control across all drivers: outpatient (2.6 vs. 1.5), inpatient (0.08 vs. 0.02), emergency room (0.1 vs. 0.04), and pharmacy services (4.2 vs. 2.6). The increase in utilization translated in higher ($p<0.001$) total PPPM incremental costs of $3,193 in the PAH group with inpatient ($1,665 vs. $345) and pharmacy costs ($790 vs. $178) being as much as five times greater compared to controls. **CONCLUSIONS:** Health care resource use and costs for PAH patients is high from a managed care perspective.

PCV57

COSTS OF ACUTE HEART FAILURE IN FRANCE

Bouee S[1], Laurendeau C[2], Detournay B[1], Kind B[3], Deschaseaux C[4], Ong SH[4], Lecomte P[4]
[1]*Cemka, Bourg la Reine, France,* [2]*Cemka-Eval, Bourg la Reine, France,* [3]*Novartis, Rueil-Malmaison, France,* [4]*Novartis Pharma AG, Basel, Switzerland*

OBJECTIVES: To describe the incidence and profile of patients hospitalised for acute heart failure (AHF); to assess the trajectories of patients before and after hospitalization; and to estimate the cost of AHF inpatients stays. **METHODS:** Patients with AHF were identified over a 5-year period (2006 - 2010) from the French PMSI (Programme de Médicalisation des Systèmes d'Information), a national disease-related group inpatient database. The PMSI database contains data related to all private and public hospital stays in France (about 20 millions/year). Heart failure was identified with the ICD-10, code I50. **RESULTS:** The numbers of patients hospitalised at least once per year for AHF increased from 144,043 in 2006 to 158,623 in 2010. These numbers lead to incidence rates of 2.28‰ in 2006 and 2.45‰ in 2010. The proportion of patients aged ≥75 increased from 71.0% in 2006 to 74.3% in 2010. Half of patients were male. The mean number of comorbidities was 9.6 in 2010. The mean length of stay was 9.5 days and 12.6 days per year (2010), as mean re-hospitalization for AHF within the same year was 22%. The mean annual number of AHF hospitalisations per patient was 1.3. The mean cost for an AHF hospitalisation in the acute setting was 4,713€ in 2010. The mean annual cost for all hospitalisations occurring for a patient hospitalised at least once in a year (2010) for AHF was 6,253€. Mean costs per hospital stay was higher if the patient died during hospitalisation (5,722€ vs. 4,627€, $p<0.001$). Extrapolation to the whole country leads to a yearly cost of nearly a billion of euros (991 millions). **CONCLUSIONS:** Incidence of AHF hospitalisation increased in the recent years. This analysis highlighted the high economic hospital burden of AHF in France.

PCV58

DISEASE BURDEN OF ISCHEMIC STROKE ALONG FIRST YEAR POST-STROKE IN SPAIN

Álvarez Sabín J[1], Masjuan J[2], Yébenes M[3], Mar J[4], Oliva J[5], González-Rojas N[6]
[1]*Hospital Vall D'Hebrón, Barcelona, Spain,* [2]*Hospital Ramón y Cajal, Madrid, Spain,* [3]*Pharmacoeconomics & Outcomes Research Iberia, Madrid, Spain,* [4]*Hospital Alto Deba, Mondragon, Spain,* [5]*Castilla-La Mancha University, Toledo, Spain,* [6]*Boehringer Ingelheim, Sant Cugat del Vallès (Barcelona), Spain*

OBJECTIVES: Stroke has catastrophic consequences resulting in death or disability in 80% of patients and representing a substantial burden on the health care system, as well as on patients, family, and society. Stroke is considered as the 2nd cause of burden of disease in Europe and ischemic stroke (IS) represents a high percentage of total strokes. The objective of the present study was to analyze the first year post-stroke burden of IS in Spain. **METHODS:** We performed an observational, multicenter, naturalistic and prospective study that included 16 hospitals (stroke units of National Health System hospitals) of 16 Spain regions. We took into consideration consumption of health care resources, social burden, productivity lost and health-related quality of live of patient and caregiver during the first year post-stroke. **RESULTS:** A total of 321 stroke patients were recruited. Mean age 72 years, 54.8% male. Basal NIH stroke scale was 9.11 and 28.9% presented moderate-high disability. 291 (90.7%) patients presented IS. Overall 1-year cost per IS was 27,596.53€. Direct health care costs were 8,623.35€ (31.25%), direct intrahospital health care costs supposed 69% (5,926.21€) of these costs. Direct non-health care costs were 18,377.75€ (66.59%), of which 16,515.09€ (59.84%) were informal care costs. Productivity lost was 595.43€ (2.16%). **CONCLUSIONS:** IS were the majority of total strokes in the study and represent a high burden on health care system and society, mainly due to hospitalization and informal care costs. Intrahospital costs were double than the published DRGs in Spain. Other diseases like Alzheimer or dementia represent a lower burden than stroke.

PCV59

FOLLOW-ON HEALTH CARE COSTS IN PATIENTS WITH ACUTE CORONARY SYNDROME (ACS)

Berger A[1], LaPensee K[2], Oster G[1]
[1]*Policy Analysis Inc. (PAI), Brookline, MA, USA,* [2]*The Medicines Company, Parsippany, NJ, USA*

OBJECTIVES: To review published estimates of post-acute-care costs over one year in patients with acute coronary syndrome (ACS). **METHODS:** Using the Medline and

Embase databases, we identified published reports of direct health care costs in ACS patients in the US; we limited attention to studies published in English between January 1, 2003 and July 30, 2012. Reference lists of all such studies also were scanned to identify additional sources. We abstracted information from all relevant reports on costs of recurrent events (e.g., myocardial infarction [MI], stroke, ACS-related readmissions) and cardiac procedures, as well as costs of cardiac-related outpatient visits and pharmacotherapy and total health care costs, in the year following ACS onset. As appropriate, estimates were converted to 2011 US dollars, using the medical-care component of the US Consumer Price Index. **RESULTS:** A total of 16 studies were identified that met all selection criteria. For persons with private health insurance coverage, estimated cost per recurrent event was lowest for bleeding ($7951) and highest for MI (range = $17,081 - $20,348); the cost of ACS-related admissions ranged from $6818 to $34,089. For Medicare beneficiaries, cost per recurrent event was lowest for other cardiovascular events ($4542 - $14,360) and highest for MI ($10,082 - $11,347); the cost of ACS-related admissions was $13,683. Mean total health care costs for patients with private insurance coverage ranged from $21,319 to $40,062 in the year following ACS onset; similar estimate was identified for Medicare beneficiaries. **CONCLUSIONS:** Costs of follow-on care are high in patients with ACS, due to recurrent events, revascularization, and routine follow-on care. In general, costs were higher for patients with private health insurance coverage than those with Medicare coverage.

PCV60

PATIENT-LEVEL COSTS OF CARDIOVASCULAR EVENTS AND PROCEDURES: HOW ROBUST IS THE EVIDENCE?

Nicholson G[1], Halbert R[1], Nordyke RJ[1], Willis V[1], Siemak B[1], Richhariya A[2], Gandra SR[2]
[1]*ICON, PriceSpective LLC, El Segundo, CA, USA,* [2]*Amgen, Inc., Thousand Oaks, CA, USA*

OBJECTIVES: Few studies have undertaken a global review of major cardiovascular conditions and events. This review summarizes the current literature for costs of: major cardiovascular diseases/events (angina, myocardial infarction, heart failure, stroke/transient ischemic attack, peripheral arterial disease); revascularization (coronary, cerebral, or peripheral); coronary heart disease mortality; and cerebrovascular mortality. **METHODS:** A systematic search of the scientific literature from 2007 through 2012 was conducted. English language articles reporting per-patient average direct medical costs of any cardiovascular event of interest in any country were included. Cost-effectiveness studies and primary prevention interventions were excluded. Cost of the event including initial hospitalization ("acute cost") and any re-hospitalizations or post-event follow-up ("follow-up cost") along with methodologies of each study were abstracted. **RESULTS:** A total of 176 articles representing 30 countries were abstracted. Coronary revascularization (N=46), stroke (N=43), and heart failure (N=31) articles were heavily represented. Acute cost estimates varied widely for all conditions/events (2013 USD): angina ($1,004-8,380); myocardial infarction ($570-$31,321); coronary revascularizations ($240-$129,747); heart failure ($536-$28,176); stroke ($577-$167,378); cerebral revascularizations ($7037-$57,884) peripheral arterial disease ($1241-23,144); peripheral revascularizations ($2297-$129,865); coronary heart disease inpatient mortality ($7,030-$25,556); cerebrovascular disease inpatient mortality ($6,197-$40,141). Similarly, wide variation was found for follow-up cost estimates, based on time horizons that range from 30-day re-hospitalization to the remainder of life post-initial event. The majority of studies were specific to the United States; for countries other than the US, cost estimates for each event were much less robust. Methodological differences between articles limit comparability of costs. **CONCLUSIONS:** Though estimates vary, the significant economic burden of these cardiovascular events is evident. A lack of robust literature in some conditions and countries combined with significant heterogeneity of study design and reporting makes comparison of cardiovascular event costs difficult. New research should identify a representative sample using study designs that allow for comparability.

PCV61

COSTS IN PATIENTS ALONG FIRST YEAR POSTSTROKE IN SPAIN

Álvarez Sabín J[1], Masjuan J[2], Casado MÁ[3], Mar J[4], Oliva J[5], González-Rojas N[6]
[1]*Hospital Vall D'Hebrón, Barcelona, Spain,* [2]*Hospital Ramón y Cajal, Madrid, Spain,* [3]*Pharmacoeconomics & Outcomes Research Iberia, Madrid, Spain,* [4]*Hospital Alto Deba, Mondragon, Spain,* [5]*Castilla-La Mancha University, Toledo, Spain,* [6]*Boehringer Ingelheim, Sant Cugat del Vallès (Barcelona), Spain*

OBJECTIVES: Atrial Fibrilation (AF) 5-folds stroke risk, which results in death or disability in 80% of individuals and the one-year mortality approaches 50%. The objective of the present study was to determine first year post-stroke costs in patients with or without AF. **METHODS:** We performed an observational, multicenter, naturalistic and prospective study that included 16 hospitals (stroke units of National Health System hospitals) of 16 Spain regions. We took into consideration all costs related to stroke: direct health care costs (inpatient and outpatient), societal cots (formal and informal care), and indirect costs (productivity lost) during the first year post-stroke. **RESULTS:** A total of 321 stroke patients were recruited, 291 (90.7%) with ischemic stroke (IS) and 30 (9.34%) with intracraneal hemorraghe (ICH); 160 with and 161 without AF. The mean age was 72±13 years, 54.8% was male, basal NIH stroke scale was 9.11±6.79 and 28.9% presented moderate-high disability. The overall cost per year was 27,711.10€. Direct health care costs: 8,491.22€ (30.64%), intrahospital costs were 68.8% (5,838.41€) of direct health care costs. Direct non-health care costs were 18,643.50€ (67.3% of total costs), and informal care supposed 89.5% of these costs. Indirect costs were 576.39€ (2.1% of total costs). ICH costs were higher than IS costs (28,895.04€ vs 27,596.53€). AF costs were higher than non AF but only formal care costs were statistically significant. The most explicative variables were age, male sex, NIH stroke scale, arterial hypertension comorbidity, and exitus along study. **CONCLUSIONS:** Stroke and its consequences represent an important use of health care and social resources during first year post-stroke, total costs of stroke represent more than 5% of public health care costs in Spain. Several studies from other countries showed similar health care costs but lower informal care costs, which where more than two-thirds of total costs in our study, with a very high burden over the family or informal carer.

PCV62

A COMPARISON OF THE ECONOMIC BURDEN AND HEALTH CARE UTILIZATIONS OF VETERAN PATIENTS DIAGNOSED WITH HYPERTENSION IN THE UNITED STATES

Wang L[1], Xie L[2], Du J[2], Li L[1], Baser O[3]
[1]*STATinMED Research, Dallas, TX, USA,* [2]*STATinMED Research, Ann Arbor, MI, USA,* [3]*STATinMED Research/The University of Michigan, Ann Arbor, Michigan, MI, USA*

OBJECTIVES: To compare the economic burden and health care utilizations of U.S. veteran patients diagnosed with hypertension. **METHODS:** A retrospective database analysis was performed using the Veterans Health Administration Medical SAS datasets from October 1, 2008 to September 30, 2012. Patients diagnosed with hypertension were identified using International Classification of Disease 9th Revision Clinical Modification (ICD-9-CM) diagnosis codes 401.x, 402.xx, 403.xx, and 404.xx, with the first diagnosis date designated as the index date. A comparison group of patients without hypertension but of the same age, region, gender and index year were identified and matched by baseline Charlson Comorbidity Index. The index date for the comparator group was randomly chosen to reduce selection bias. Patients in both groups were required to be at least 18 years old, and have continuous medical and pharmacy benefits 1 year pre- and 1 year post-index date. Study outcomes, including health care costs and utilizations, were compared between the disease and comparator groups using 1:1 propensity score matching. **RESULTS:** A total of 2,422,810 patients were included in the hypertension and comparison cohorts. After 1:1 matching, a total of 748,857 patients were matched from each group, and baseline characteristics were well-balanced. Patients diagnosed with hypertension utilized more health care resources for inpatient (8.21% vs. 1.01%, p<0.01), emergency room (ER) (12.78% vs. 3.60%, p<0.01), physician office (99.43% vs. 39.45%, p<0.01), outpatient visits (99.61% vs. 40.14%, p<0.01), and pharmacy visits (85.51% vs. 35.66%, p<0.01). The disease group also had higher patient expenditures for inpatient ($2,568 vs. $289, p<0.01), ER ($121 vs. $30, p<0.01), physician office ($2,541 vs. $767, p<0.01), outpatient visit ($2,844 vs. $853) and pharmacy visits ($544 vs. $191, p<0.01) than the comparison group. **CONCLUSIONS:** Results suggest that patients diagnosed with hypertension incurred significantly higher health care utilizations and costs compared to those without.

PCV63

THE COSTS OF SURGICAL AORTIC VALVE REPLACEMENT IN FRANCE

Goodall G, Candolfi P
Edwards Lifesciences, Nyon, Switzerland

OBJECTIVES: Surgical aortic valve replacement (sAVR) represents the gold standard for treatment in patients who require valve replacement therapy. However, the risks and costs are not uniform across all patients. We have examined the national hospital costs database of France to detail the variability of outcomes and costs in an attempt to allow improved decision making when deciding on appropriate interventions. **METHODS:** The Programme de Médicalisation des Systèmes d'Information (PMSI) hospital database for 2010 was examined and all discharge records retrieved for patients undergoing aortic valve replacement. In addition to the discharge costs information on hospital length of stay, mortality and Charlson risk score were also obtained. **RESULTS:** The mean cost for all 12,512 recorded sAVR procedures (defined as Groupe homogène de maladies (GHM) codes 05C02 and 05C03) in 2010 was €19,029 (median €17,349). Overall hospital mortality was 5.94% but increased to 26.06% depending on severity level and GHM code. Corresponding total costs increased if patients died prior to discharge by €11,007 and €9,200 for 05C02 and 05C03 respectively but also differed by severity, generally increasing together with mortality up to a maximum mean of €42,063. Hospital length of stay (LoS) also varied by severity levels with means of between 10.74 and 27.91 days dependent on severity. **CONCLUSIONS:** The costs and outcomes of sAVR vary enormously and a single point estimate cannot be used to adequately to reflect them. Therapeutic choices must be tailored to the individual patient and has the potential to generate substantial cost reductions for the payer by avoiding mortality and reducing LoS. We present this in the context of new treatment options for aortic valve replacement.

PCV64

ECONOMIC IMPACT OF STROKE EPISODE IN PATIENTS PREVIOUS DIAGNOSED WITH ATRIAL FIBRILLATION IN PRIVATE HEALTH SYSTEM IN BRAZIL

Araújo G[1], Santos AM[2], Preto MC[3], Bernardino GDR[4], Monteiro RC[4], Fujii RK[5], Donato BMK[6], Barbieri DE[7], Mould J[8], Manfrin DF[5], Fonseca M[9]
[1]*Axia.Bio, Sao Paulo, Brazil,* [2]*Axia.Bio Consulting, São Paulo, Brazil,* [3]*Bristol-Myers Squibb S/A, São Paulo, Brazil,* [4]*Bristol-Myers Squibb, São Paulo, Brazil,* [5]*Pfizer, Inc., São Paulo, Brazil,* [6]*Bristol-Myers Squibb Company, Wallingford, CT, USA,* [7]*Bristol-Myers Squibb – Brazil, São Paulo, Brazil,* [8]*Pfizer, New York, NY, USA,* [9]*Federal University of São Paulo / Axia.Bio Consulting, São Paulo, Brazil*

OBJECTIVES: Evaluate the costs of patients with known diagnosis of atrial fibrillation who received medical care related to stroke episodes, under the Private Healthcare system perspective. **METHODS:** A retrospective evaluation of a database with 3 million individuals was conducted to identify patients diagnosed with Atrial Fibrillation (AF) using the International Classification of Diseases version 10 (ICD10) I48 code (Flutter and atrial fibrillation) between 2009 and 2010. From the identified cohort, patients presenting the following codes: ICD10 I64, I63, I66 and I69, were further analyzed from 2009 to 2012. Costs associated to the episodes such as medications, exams, procedures, hospitalizations and others were evaluated. **RESULTS:** From 1898 patients presenting the AF diagnose identified in the database, 66 Presented a diagnosis of stroke. The 66 patients cost BRL 2,325,250.61 to the supplemental health service, being BRL 2,193,185.50 spent with 21 patients hospitalizations due to stroke. **CONCLUSIONS:** If not controlled, AF may impose a significant morbidity due to increased susceptibility for thromboembolic events such as stroke and its complications, causing important spending beyond hospitalizations and other significant direct and indirect costs to the private health care system.

PCV65

COST ANALYSIS FOR PATIENTS HOSPITALISED FOR HEART FAILURE IN GERMANY

Baierlein J[1], Hacker J[1], Brachmann J[2], Grewe PH[3], Noetzel J[4], Lecomte P[5], Neidhardt K[6]
[1]*Oberender & Partner, Healthcare Consultants, Bayreuth, Germany,* [2]*Klinikum Coburg, Coburg, Germany,* [3]*Klinikum Neumarkt i. d. OPf., Neumarkt i. d. OPf., Germany,* [4]*Klinikum Stuttgart, Stuttgart, Germany,* [5]*Novartis Pharma AG, Basel, Switzerland,* [6]*Novartis Pharma GmbH, Nuremberg, Germany*

OBJECTIVES: To calculate treatment costs for patients hospitalised for heart failure (HF) and analyse associated medical resource utilisation in a real-life care setting. **METHODS:** The study was designed as a retrospective medical record review of a cohort of 478 patients diagnosed and hospitalised for HF (as the primary diagnosis for hospitalisation with ICD-10 codes I11, I13 and I50 meeting the inclusion and exclusion criteria of RELAX-AHF, a randomised, placebo-controlled phase III-trial in acute HF) in three German hospitals. Costs and medical resource utilisation for HF treatment were extracted from datasets according to §21 KHEntgG (Hospital Reimbursement Act) and patient medical records from the full year of 2011. Costs of HF treatment were determined according to the cost calculation scheme of the German Institute for the Hospital Remuneration System (InEK). A multivariate regression model was developed to detect incremental effects. **RESULTS:** The mean cost per hospital stay was 3,518 € [3,203 €; 3,833 €; 95%CI 315 €]. Differences in costs between male and female patients were not significant. The mean length of stay (LOS) was 8.55 days [8.0; 9.1; 95%CI 0.55] with in-hospital mortality being 5.4% (26 of 478 patients). A total of 637 different active pharmaceutical agents and agent combinations were used. The percentage of patients treated with loop diuretics was 84%. About 8% of patients received nitrates (all formulations). The regression model showed a positive correlation for treatment costs with LOS and the amount of daily drug doses. **CONCLUSIONS:** This analysis highlights that HF is a condition that imposes considerable costs to the German health care system. Data suggests that there is a high use of diuretics and a low use of nitrates in a real-life care setting.

PCV66

COST-EFFECTIVENESS ANALYSIS OF APIXABAN VERSUS DABIGATRAN FOR PREVENTION OF STROKE IN PATIENTS WITH NON-VALVULAR ATRIAL FIBRILLATION IN SPAIN

Betegón Nicolás L[1], Escolar Albaladejo G[2], Canal Fontcuberta C[1], de Salas-Cansado M[3], Rubio-Rodríguez D[4], Rubio-Terrés C[5], Fernández Gallego V[1]
[1]*Bristol-Myers Squibb, Madrid, Spain,* [2]*Hospital Clinic, Barcelona, Spain,* [3]*Pfizer Spain, Alcobendas, Madrid, Spain,* [4]*Health Value, Madrid, Spain,* [5]*HealthValue, Madrid, Spain*

OBJECTIVES: To assess the cost-effectiveness of apixaban vs. dabigatran in stroke prevention in patients with non-valvular atrial (NVAF) fibrillation in Spain. **METHODS:** A Markov model was developed, with cycles of 6 weeks, throughout the patient's life and 10 health states. The analysis was made from the Spanish National Health System (NHS) and the societal perspective. The safety and efficacy of the drugs was obtained from a meta-analysis of pairwise indirect comparisons. Drug costs, (apixaban: 5 mg twice daily (BID); dabigatran: 110 mg BID or 150 mg BID), NVAF complications and disease management costs were obtained from Spanish sources. An annual discount rate of 3.5% for costs and health outcomes was applied. **RESULTS:** In a cohort of 1,000 patients with NVAF, apixaban could avoid numerous complications versus dabigatran during their lifetime (24 ischemic strokes and 28 related deaths vs. dabigatran 110 mg; 11 ischemic strokes, 29 bleedings and 19 deaths vs. dabigatran 150 mg). The use of apixaban was associated with 0.126 life years (LYG) and 0.107 quality-adjusted life-years (QALYs) gained when compared to dabigatran 110 and 150 mg, respectively. Apixaban was estimated to generate more costs per patient vs. dabigatran 110 mg from the NHS perspective (139 €) but overall savings could arise from the societal perspective (-524 €), with a cost per QALY gained of 1,299 € for the NHS. Apixaban was dominant (more effective and less costly than dabigatran 110 mg) from the societal perspective. The cost per QALY gained, from the NHS and societal perspective, compared with dabigatran 150 mg BID was 6,591 € and 10,676 €, respectively. Deterministic and probabilistic sensitivity analyses confirmed the stability of these results. **CONCLUSIONS:** Results suggest that apixaban is cost-effective versus dabigatran for the prevention of stroke in patients with NVAF in Spain.

PCV67

APPLICATION OF NEW FRENCH GUIDELINES FOR ECONOMIC EVALUATIONS: A COST-EFFECTIVENESS ANALYSIS OF APIXABAN IN PATIENTS WITH NON-VALVULAR ATRIAL FIBRILLATION IN FRANCE

Durand-Zaleski I[1], Cotté FE[2], Lanitis T[3], Godard C[2], Kachaner I[4], Kongnakorn T[5], Gaudin AF[6]
[1]*Santé Publique URCEco APHP, Créteil, France,* [2]*Bristol-Myers Squibb, Rueil-Malmaison, France,* [3]*Evidera, London, UK,* [4]*Pfizer, Paris, France,* [5]*Evidera, Lexington, MA, USA,* [6]*Bristol-Myers-Squibb, Rueil Malmaison, France*

OBJECTIVES: To evaluate the cost-effectiveness of apixaban in the prevention of stroke in patients with non-valvular atrial fibrillation (NVAF) from a French payer perspective. **METHODS:** A Markov model was developed in accordance to the new French guidelines of the Commission for Economic Evaluation and Public Health (CEESP) that also recommends applying efficiency frontier. A hypothetical cohort of patients with NVAF, 70 years old eligible for stroke preventive treatment (CHADS2≥1) was simulated over lifetime. Clinical events modeled included strokes, systemic embolism, intracranial hemorrhage, other major bleeds, clinically relevant non-major bleeds and myocardial infarction. Treatment efficacy and bleeding data was obtained from ARISTOTLE. Efficacy data are from published indirect comparisons. Acute medical costs of stroke and hemorrhage were obtained from a dedicated analysis of the French national hospitalization database (PMSI). Long-term medical costs and utility data were derived from the literature. Univariate and probabilistic sensitivity analyses (PSA) were also performed to assess the robustness of the model projections. **RESULTS:** Three strategies were strictly dominated: aspirin, dabigatran 110mg, and dabigatran in sequential dosages. Two others were extendidly dominated: rivaroxaban and dabigatran 150mg. The efficiency frontier was constructed by connecting the remaining strategies: warfarin and apixaban. Apixaban resulted in an incremental additional cost of 2,870€ and an incremental QALY of 0.189, corresponding to an ICER of 15,157€/QALY versus warfarin. The PSA indicated that the probabilities for apixaban being cost-effective versus warfarin were respectively 80% and 90% at the informal willing-to-pay thresholds of 30,000€ and 50,000€. Sensitivity analysis identified stroke risk with apixaban and intracranial hemorrhage risk with warfarin as the variables most influencing the results. **CONCLUSIONS:** Apixaban may be the most economically efficient alternative to warfarin in NVAF patients eligible for stroke prevention in France. All other strategies are dominated. However, uncertainty surrounding these results should be investigated through real life data.

PCV68

SCREENING STRATEGIES FOR HEART FAILURE IN PATIENTS WITH TYPE 2 DIABETES: ASSESSING COST-EFFECTIVENESS IN THOSE AGED 60 YEARS OR OVER

van Giessen A[1], Boonman-de Winter LJM[2], Rutten FH[1], Cramer MJ[1], Landman MJ[3], Liem AH[4], Hoes AW[1], Koffijberg H[1]
[1]*University Medical Center Utrecht, Utrecht, The Netherlands,* [2]*Center for Diagnostic Support in Primary Care, Etten-Leur, The Netherlands,* [3]*Meander Hospital, Leusden, The Netherlands,* [4]*Sint Franciscus Gasthuis Rotterdam, Rotterdam, The Netherlands*

OBJECTIVES: Heart failure is quite common in elderly patients with type 2-diabetes. Screening could potentially improve health outcomes at acceptable costs through early detection and adherence to current prescription guidelines. Based on a prospective study the cost-effectiveness of different screening strategies to detect heart failure in patients aged 60 years with type 2-diabetes was assessed. **METHODS:** Data obtained from our prospective study and literature were used in a Markov model with a lifetime horizon to evaluate the incremental cost-effectiveness ratio of five increasingly extensive screening strategies. Differences in survival rates estimated by the Seattle Heart Failure Model between patients with undetected versus detected heart failure, induced by medication use, were used to adjust input parameters for health states related to undetected heart failure. Estimates for costs, utilities, and transition probabilities were additionally adjusted to age and NYHA class. Scenario analyses were performed to evaluate the impact of screening age and medication prescription and effectiveness. Probabilistic sensitivity analysis was performed to assess robustness of the results. **RESULTS:** For both men and women usual care (no screening) had the highest probability of being cost-effective when the willingness to pay (WTP) was small. For WTP values in the range of €4,600/QALY-€27,000/QALY for men and €5,200/QALY-€40,000/QALY for women evaluation of the electronic medical record and symptoms had the highest probability of being cost-effective. For higher WTP values echocardiography was the preferred strategy. For all screening strategies cost-effectiveness improved if prescription of heart failure medication was optimal or screening was started at the age of 70 years. **CONCLUSIONS:** Screening for heart failure through evaluation of electronic medical record and symptoms has favorable cost-effectiveness and echocardiography may also be acceptable at higher WTP values. The benefits from screening could be much larger than currently identified when test outcomes would more often lead to proper medication prescription.

PCV69

COST-EFFECTIVENESS ANALYSIS OF APIXABAN VERSUS RIVAROXABAN FOR PREVENTION OF STROKE IN PATIENTS WITH NON-VALVULAR ATRIAL FIBRILLATION IN SPAIN

Canal Fontcuberta C[1], Escolar Albaladejo G[2], Betegón Nicolás L[1], de Salas-Cansado M[3], Rubio-Rodríguez D[4], Rubio-Terrés C[5]
[1]*Bristol-Myers Squibb, Madrid, Spain,* [2]*Hospital Clinic, Barcelona, Spain,* [3]*Pfizer Spain, Alcobendas, Madrid, Spain,* [4]*Health Value, Madrid, Spain,* [5]*HealthValue, Madrid, Spain*

OBJECTIVES: To assess the cost-effectiveness of apixaban versus rivaroxaban in the prevention of stroke in patients with non-valvular atrial fibrillation (NVAF) in Spain. **METHODS:** A Markov model was developed to simulate the evolution of NVAF patients throughout their lifetime. Cycle's length was 6 weeks and 10 health states such as stroke, bleeding and other cardiovascular complications were defined. Drug's safety and efficacy outcomes were obtained from a meta-analysis of pairwise indirect comparisons. The analysis was made from the Spanish National Health System (NHS) and the societal perspective. Apixaban and rivaroxaban pharmacological costs were calculated according to their recommended doses (5 mg twice daily (BID) and 20 mg once-a-day (QD), respectively). The cost of NVAF complications and disease management were obtained from Spanish sources. An annual discount rate of 3.5% for costs and health outcomes was applied. **RESULTS:** Model results illustrate that 1,000 patients with NVAF treated with apixaban during their lifetime could avoid numerous complications versus rivaroxaban (9 strokes, 10 intracranial bleedings, 1 systemic embolism, 32 major bleedings, 52 clinically relevant non major bleedings and 12 related deaths). The use of apixaban was associated with 0.062 life years (LYG) and 0.049 quality-adjusted life-years (QALYs) gained when compared to rivaroxaban. Due to the lower expected mortality of patients, apixaban generated more costs per patient vs. rivaroxaban from the NHS perspective (115 €), but savings would arise from the societal perspective (-241 €). Incremental cost-effectiveness ratio results were 1,855 € per LYG and 2,347 € per QALY gained for the NHS analysis. Apixaban was dominant (more effective and less costly than rivaroxaban) from the societal perspective. Deterministic and probabilistic sensitivity analyses confirmed these results. **CONCLUSIONS:** According to this analysis, apixaban is a cost-effective treatment compared with rivaroxaban for the prevention of stroke in patients with NVAF in Spain.

PCV70

REANALYZING USING BAYESIAN METHODS AND UPDATED DATA THE COST-EFECTIVENESS ASSUMPTIONS OF CAROTID ARTERY STENOSIS TREATMENTS

Smolen HJ
Medical Decision Modeling Inc., Indianapolis, IN, USA

Henriksson reported that surgery plus medical management can be considered cost effective as a treatment of asymptomatic carotid stenosis in 65 year-old men. He assumed a surgery relative risk reduction of 65.5%, or approximately an absolute risk reduction (ARR) of 8% in this population. However, data for the comparator arm (medical management alone) were dated and did not reflect efficacies of current medical therapies. **OBJECTIVES:** To analyze using Bayesian methods, asymptomatic carotid stenosis clinical trial data, and more current medical therapy data the probability of achieving this 8% ARR and an incremental cost per QALY of approximately $50,000 (US, inflated - 2013 dollars). **METHODS:** The outcome of interest from the clinical trials was the mean difference in the probability of any stroke or perioperative death between surgery (carotid endarterectomy [CEA]) and aggressive medical management (MM). The CEA data came from the Asymptomatic Carotid Atherosclerosis Study (ACAS) and the Asymptomatic Carotid Surgery Trial (ACST). The updated medical management data came from a systematic review published in the journal Stroke (Abbott, 2009). The Bayesian analysis employed a Beta-Binomial Model. **RESULTS:** The posterior distribution of the Bayesian analysis representing the ARR of CEA versus MM had a mean of 0.008 with an essentially zero probability of achieving the Henriksson assumption of 8% ARR. Using the mean of this posterior distribution, the resulting incremental cost per QALY exceeded $500,000 in 65 year-old men – a value unlikely to be considered cost effective in any country. **CONCLUSIONS:** Bayesian analysis allows the prediction of the probability that a treatment alternative exceeds a predefined threshold. A powerful feature of Bayesian analysis is the ability to incorporate additional and/or newer data. This newer data can drastically alter assumptions about the cost effectiveness of treatment alternatives.

PCV71

COST-EFFECTIVENESS OF TRANSCATHETER AORTIC-VALVE IMPLANTATION FOR SEVERE SYMPTOMATIC AORTIC STENOSIS IN INOPERABLE PATIENTS IN THE BRAZILIAN PRIVATE HEALTH CARE SYSTEM

Nishikawa AM[1], Paladini L[1], Queiroga M[2], Lemos P[2], Clark OAC[1]
[1]*Evidencias, Campinas, Brazil,* [2]*Sociedade Brasileira de Hemodinâmica e Cardiologia Intervencionista (SBHCI), São Paulo, Brazil*

OBJECTIVES: Aortic stenosis is the most common valvular heart disease in the elderly –its prevalence is estimated to be up to 5% in individuals over 75 years. Surgical replacement of aortic valve is considered the standard care and in the absence of serious coexisting conditions, the procedure is associated with low operative mortality. However, a significant proportion of patients cannot undergo surgery due to high surgical risk associated with advanced age or presence of multiple coexisting conditions. Treatment with transcatheter aortic-valve implantation (TAVI) is a therapy with potentially lower peri-procedure risk and has been used as a therapeutic option in this group considered inoperable. This study aims to develop a cost-effectiveness analysis of TAVI in patients with severe aortic stenosis who are not suitable for surgical treatment according to Brazilian Private System Perspective. **METHODS:** A Markov model was developed to compare TAVI *versus* standard therapy (drug treatment with or without aortic balloon valvuloplasty) with a 5-year time horizon. Outcomes in the model were based on safety and effectiveness (as measured by clinical outcomes of chance of successful implantation procedure and survival from PARTNER cohort B trial). Resource use included early perioperative complications (30 days) and late events. Cost data were obtained from Brazilian public lists (CMED/SIMPRO/CBHPM). Results were expressed as incremental cost-effectiveness ratio (ICER) per life years gained (LYG). Probabilistic sensitivity analysis was performed to confirm robustness of results. **RESULTS:** Compared with standard therapy with or without aortic balloon valvuloplasty, use of TAVI improves survival in 0.97 life years with an incremental cost of US$43,602, resulting an ICER of US$45,080/LYG. In an alternative scenario considering 10-year time horizon, ICER was 27,565/LYG. **CONCLUSIONS:** Use of TAVI results in improved survival with a low risk of serious adverse events, and demonstrates a cost-effectiveness profile when compared to other technologies already incorporated in Brazil.

PCV72

ECONOMIC EVALUATION OF IVABRADINE IN CHRONIC HEART FAILURE IN GREECE

Kourlaba G[1], Parissis J[2], Karavidas A[3], Beletsi A[4], Milonas C[5], Maniadakis N[6]
[1]*National and Kapodistrian University of Athens School of Medicine, Athens, Greece,* [2]*Attikon University Hospital, Athens, Greece,* [3]*Athens General Hospital, Athens, Greece,* [4]*SERVIER HELLAS Pharmaceuticals Ltd., Athens, Greece,* [5]*National School of Public Health, Athens, Athens, Greece,* [6]*National School of Public Health, Athens, Greece*

OBJECTIVES: In the SHIFT trial, ivabradine administered to chronic heart failure (CHF) patients in combination with standard therapy significantly reduced cardiovascular death and hospital admission for cardiovascular problems. An economic evaluation of ivabradine plus standard care against standard care alone, for the management CHF in patients with a baseline heart rate ≥75b.p.m. was conducted from the Greek third party-payer perspective. **METHODS:** An existing Markov model consisting of two health states for CHF NYHA classes I to IV (i.e. alive, dead) was adapted to the Greek health care setting. In each one month cycle, patients can either remain alive or die, during their life span or 29 months (i.e. within SHIFT trial period). Health state utilities were estimated from EQ-5D index scores obtained from the SHIFT clinical trial and using appropriate modeling techniques the data were extrapolated beyond the trial period. All costing data reflects the year 2013. Probabilistic sensitivity analyses (PSA) were conducted. Both cost and outcomes were discounted at 3.5% per year. **RESULTS:** Results for within trial analysis revealed that ivabradine had an incremental cost and incremental QALY of €905 and 0.05 respectively, leading to an incremental cost per QALY gained of €16,635/QALY. Ivabradine was a cost-effective alternative at a willingness to pay threshold of €36,000 per QALY gained Moreover, the cumulated lifetime analysis showed incremental cost of €2,792 and incremental QALY of 0.28. The ICER for ivabradine was calculated to be €9,986 per QALY gained. The PSA showed that the likelihood of ivabradine plus standard therapy being cost-effective at a threshold of €36,000/QALY was found to be 96% in both within trial and lifetime analysis. This result is driven by a reduction in mortality and hospitalisations and the associated costs of care. **CONCLUSIONS:** Ivabradine added to standard care could be a cost-effective treatment for the treatment in CHF patients in Greece.

PCV73

COST-EFFECTIVENESS ANALYSIS OF RIVAROXABAN IN SECONDARY PREVENTION OF ACS IN SWEDEN

Begum N[1], Van Hout B[1], Thurston S[1], Schoeman O[2], Fraschke A[3], Verheugt FWA[4]
[1]*Pharmerit Ltd., York, UK,* [2]*Bayer Pharma AG, Berlin, Germany,* [3]*Bayer AB, Solna, Sweden,* [4]*University Medical Center St. Radboud, Nijmegen, The Netherlands*

With 7 million deaths per year, ischaemic heart disease is the leading cause of mortality worldwide. In Acute Coronary Syndrome (ACS), the vast majority of fatal cardiovascular events occur after hospital discharge. Guidelines recommend antithrombotic treatment for secondary prevention after ACS. **OBJECTIVES:** To assess the cost-effectiveness of rivaroxaban 2.5mg BID in combination with standard antiplatelet therapy (ASA alone or in combination with a thienopyridine [clopidogrel or ticlopidine]) versus standard antiplatelet therapy alone for prevention of secondary events in ACS patients from a Swedish societal perspective. **METHODS:** A Markov model is used to capture single and multiple events, costs and utilities based on the time since index event to reflect clinical practice. For the first 2 years the model uses data from the ATLAS ACS 2-TIMI 51 clinical trial including efficacy, safety, treatment discontinuation and average patient age. After 2 years, transition probabilities were extrapolated using an exponential function method. Estimates for life expectancy, drug acquisition costs and other medical and indirect costs were derived from published Swedish sources. Cost and effects are discounted at 3.0%. Univariate and probabilistic sensitivity analyses were conducted with an assumed willingness to pay (WTP) threshold of SEK 500,000. **RESULTS:** For the base case scenario, incremental life time costs are estimated at SEK 10,000.44 (€1,156), incremental QALYs at 0.14, and incremental cost per QALY at SEK 71,245.76 (€8,236). Univariate sensitivity analyses indicate that the results are sensitive to changes in the cost of rivaroxaban and baseline utility value. At an assumed WTP of SEK 500,000, rivaroxaban in combination with standard antiplatelet therapy is expected to be cost-effective. **CONCLUSIONS:** From a Swedish societal perspective, secondary prevention with rivaroxaban 2.5mg BID in combination with standard antiplatelet therapy can be considered a cost-effective option for patients with ACS. Sensitivity analyses demonstrated that the results are robust.

PCV74

COST-EFFECTIVENESS ANALYSIS OF APIXABAN IN THE TREATMENT OF ATRIAL FIBRILLATION IN MEXICO

Galindo-Suárez RM[1], Davila-Veites A[2], Olguin-Sánchez JF[2], Haddad A[1], del Angel- Martínez J[2], Muciño-Ortega E[1]
[1]*Pfizer S.A. de C.V., Ciudad de México, Mexico,* [2]*Bristol-Myers Squibb Mexico, Mexico City, Mexico*

OBJECTIVES: The most common cardiac arrhythmia (atrial fibrillation, AF) increases the risk of morbidity and mortality. We estimated the health and economic consequences of the use of apixaban compared with warfarin reducing the risk of stroke in patients with AF, from the perspective of the Instituto Mexicano del Seguro Social (IMSS). **METHODS:** We performed a cost-effectiveness analysis using a Markov model (17 health states, six-week cycles), which simulates patients treated with warfarin (fixed dose: 5mg/day) or apixaban (10mg/day). Patients enter the model at age 70 and remain there until death (disease-related or according to Mexican life tables). Safety, efficacy and utilities were extracted from published sources. The costs of warfarin and AF-related clinical events were extracted from IMSS sources. The cost of apixaban was provided by the manufacturer. Costs are expressed in US$, 2013 and a 5% per-year discount rate was applied. Years of life and quality adjusted life years (QALYs) gained were the health outcomes. Univariate and probabilistic sensitivity analyzes were performed. **RESULTS:** The model estimated 7.645 life years and 5.454 QALYs in the apixaban arm, which means 0.147 and 0.160 gained life years and QALY's, respectively (regarding warfarin). The costs of apixaban and warfarin were US$14,943 and US$15,042, respectively (apixaban is a dominant alternative). Health gains with apixaban are driven by fewer event-related deaths (10/1000 patients at risk) as well as fewer hemorrhagic strokes (12) and bleeding (13 major bleeds, 41 clinically non-major bleeds) compared to warfarin-treated patients. Treatment costs are driven by drug acquisition cost (apixaban) and monitoring cost (warfarin). **CONCLUSIONS:** Apixaban is more effective and safer than warfarin reducing the risk of stroke associated with AF, as well as bleeding events. To achieve this improvement, no additional economic resources need to be invested, which makes apixaban a cost-saving intervention in the context of the IMSS.

PCV75

COST-EFFECTIVENESS OF APIXABAN VERSUS STANDARD OF CARE FOR THE PREVENTION OF STROKE: AN ANALYSIS OF PATIENTS WITH ATRIAL FIBRILLATION IN GREECE

Athanasakis K[1], Arzoumanidou D[1], Karampli E[1], Armelidou E[2], Giovas P[2], Petrikkou E[3], Kyriopoulos J[1]
[1]*National School of Public Health, Athens, Greece,* [2]*Pfizer Hellas, Athens, Greece,* [3]*BMS Hellas, Athens, Greece*

OBJECTIVES: Apixaban is an oral anticoagulant that has demonstrated a superior clinical profile compared to warfarin and aspirin in the management of patients with non-valvular Atrial Fibrilation (NVAF) and at least one additional risk factor for stroke. The objective of the present analysis was to assess the cost-effectiveness of apixaban against warfarin and aspirin for the prevention of stroke in patients with NVAF in Greece. **METHODS:** A Markov model that evaluated clinical events, quality adjusted life expectancy and costs for patients treated with apixaban and warfarin or aspirin (VKA-suitable and

VKA-unsuitable, respectively) formed the basis of the analysis. Clinical events (ischemic strokes, hemorrhagic strokes, intracranial hemorrhages, other major bleeds, clinically relevant non-major bleeds, myocardial infarctions and cardiovascular hospitalizations) were modeled over a lifetime horizon based on the clinical efficacy of each comparator, as reported by two phase-III clinical trials (ARISTOTLE and AVERROES). Resource use with regards to patient monitoring was elicited via an experts' panel (cardiologists & internists). Cost calculations reflect the local clinical setting, and followed a third-party payer perspective (Euros, year 2013, discounted at 3%). **RESULTS:** Apixaban was projected to reduce the occurrence of clinical events and increase quality adjusted life expectancy compared to warfarin and aspirin (an incremental increase of 0.225 and 0.274 QALYs per patient, respectively). Taking into account costs of medications, treatment and management of events, the incremental cost-effectiveness ratio for apixaban versus warfarin and aspirin was estimated at 12,154.6 €/QALY and 5,980.6 €/QALY gained, respectively. Extensive sensitivity analyses indicated that results were robust over a wide range of inputs. **CONCLUSIONS:** Based on the results of this analysis, apixaban can be a cost-effective alternative to warfarin and aspirin for the management of VKA-suitable and VKA-unsuitable patients with NVAF, respectively, in Greece.

PCV76

TOTAL COSTS AND OUTCOMES OF DRUG-ELUTING STENT PLACEMENT WITH INTRAVASCULAR ULTRASOUND (IVUS) COMPARED WITH ANGIOGRAPHY ALONE: A COST-EFFECTIVENESS ANALYSIS FROM THE PERSPECTIVE OF THE ITALIAN HEALTH SYSTEM

Wasserman M[1], Priest V[2], Alberti A[3], Gelera A[4], Stefanini L[4], Simmonds M[5]
[1]*Double Helix Consulting, London, UK,* [2]*Double Helix Consulting (APAC), Singapore, Singapore,* [3]*Istituto Clinico Sant'Ambrogio, Milan, Italy,* [4]*Boston Scientific, Milan, Italy,* [5]*Boston Scientific, Sydney, Australia*

OBJECTIVES: Intravascular ultra-sound (IVUS) allows physicians to generate a superior image of coronary arteries during percutaneous coronary interventions (PCI), providing a tomographic, 360-degree view of the arterial wall from the inside, which allows a more accurate and complete assessment than is possible with angiography. The purpose of this study was to understand the cost-effectiveness of IVUS compared with traditional angiography techniques in drug-eluting stent (DES) implantation, from the perspective of the Italian health system. **METHODS:** A Markov model was developed to extrapolate the comparative costs and outcomes of a theoretical population of 1000 patients undergoing DES implantation with traditional angiography alone, or in conjunction with IVUS. The model assesses cardiac events, including revascularisations and myocardial infarctions from a health system perspective. Outcomes with and without IVUS were based on a meta-analysis by Zhang et al (2013). Because of limited clinical evidence to inform the long-term outcomes of IVUS compared with angiography, the model either assumes the benefit of IVUS is conferred only in the first year of treatment, or that the benefit is maintained permanently. **RESULTS:** Using IVUS during PCI cost an average of €542 per patient, and yields an additional 0.022 quality adjusted life years (QALYs) per patient. In a population of 1,000 patients, IVUS led to a reduction of 6.7 revascularisations and 5.9 less myocardial infarctions (MI) over the lifetime of a patient. When the revascularisation and MI benefit of IVUS is assumed to extend for the patient's lifetime, angiography with IVUS costs €38 per patient and yields an additional 0.09 QALYs over a patient's lifetime; avoiding 13.4 MIs and 12.3 revascularisations per 1,000 patients. **CONCLUSIONS:** IVUS appears to be a cost-effective addition to traditional angiography in DES placement in Italy, with the increased upfront cost of IVUS offset by reduced cardiac events in IVUS-treated patients over time.

PCV77

COST-EFFECTIVENESS OF APIXABAN VERSUS OTHER NEW ORAL ANTICOAGULANTS FOR THE PREVENTION OF STROKE: AN ANALYSIS OF PATIENTS WITH ATRIAL FIBRILLATION IN GREECE

Athanasakis K[1], Arzoumanidou D[1], Karampli E[1], Armelidou E[2], Giovas P[2], Petrikkou E[3], Kyriopoulos J[1]
[1]*National School of Public Health, Athens, Greece,* [2]*Pfizer Hellas, Athens, Greece,* [3]*BMS Hellas, Athens, Greece*

OBJECTIVES: Apixaban, dabigatran (150 mg BID and 110 mg BID) and rivaroxaban are three novel oral anticoagulants (NOACs) currently approved for stroke prevention and systemic embolism in non-valvular atrial fibrillation (NVAF) patients. The objective of this analysis was to assess the cost-effectiveness (CE) of apixaban against other NOACs for the prevention of stroke in patients with NVAF in Greece. **METHODS:** A Markov model that evaluated clinical events, quality adjusted life expectancy and costs for patients treated with apixaban or other NOACs formed the basis of the analysis. Clinical events (ischemic strokes, hemorrhagic strokes, intracranial hemorrhages, other major bleeds, clinically relevant non-major bleeds, myocardial infarctions and cardiovascular hospitalizations) were modeled for a lifetime horizon. Due to lack of head-to-head comparisons, efficacy and safety data was derived from an indirect treatment comparison (ITC). The key pivotal trials, ARISTOTLE, ROCKET-AF and RE-LY, all included warfarin as a comparator therefore allowing for an ITC. Resource use with regards to patient monitoring was elicited via a panel of experts (cardiologists & internists). Cost calculations reflect the local clinical setting and followed a third-party payer perspective (Euros, year 2013, discounted at 3%). **RESULTS:** Apixaban was projected to reduce the occurrence of clinical events and increase quality-adjusted life expectancy and costs of treatment compared to other NOACs. Taking into account costs of medications, treatment and management of events, the incremental cost-effectiveness ratios for apixaban 5 mg BID versus dabigatran 150 mg BID, dabigatran 110 mg BID and rivaroxaban 20 mg QD were estimated at 15,403€/QALY, 4,955€/QALY and 10,130 €/QALY gained, respectively. Extensive sensitivity analyses indicated that results were robust over a wide range of inputs. **CONCLUSIONS:** Based on the results of this analysis, apixaban can be a cost-effective alternative to other NOACs, for the prevention of strokes in patients with NVAF in Greece.

PCV78

PHARMACOECONOMIC EVALUATION ACCEPTABILITY OF CLOPIDOGREL VERSUS ACETYLSALICYLIC ACID IN PATIENTS WITH CARDIOVASCULAR DISEASE FOR STROKE PREVENTION IN UKRAINE

Mishchenko O, Iakovlieva L, Adonkina V, Kyrychenko O, Gerasymovà O
National University of Pharmacy, Kharkiv, Ukraine

OBJECTIVES: The results of many clinical trials demonstrate the benefit of long-term antiplatelet therapy in reducing the risk of cardio- and cerebrovascular complications. Both acetylsalicylic acid (ASA) and clopidogrel are effective, but have potentially serious side effects, and clopidogrel is more expensive than ASA. The purpose of the study is to evaluate the pharmacoeconomic acceptance of clopidogrel versus ASA in patients with atherosclerotic vascular disease manifested as either recent ischaemic stroke, recent myocardial infarction, or symptomatic peripheral arterial disease to prevent non-fatal stroke and death rate according to the clinical trial CAPRIE from Ukrainian perspective. **METHODS:** Outcomes of the clinical study CAPRIE, modeling "decision tree" and analysis "cost-effectiveness" were used. **RESULTS:** The results of the clinical trial CAPRIE study showed, that clopidogrel is more effective versus ASA for reducing the risk of nonfatal stroke: absolute risk reduction is -2.7%. Model "decision tree" was built using the probabilities of events (nonfatal stroke and death) from the study CAPRIE. Direct costs were calculated taking into account the costs of antiplatelet therapy, of nonfatal stroke treatment (drugs, diagnosis, patient's stay in hospital) and the cost of rehabilitation after stroke. Indirect costs are not taken into account because the patients were of retirement age (62.5 years old). As a result of calculations it was found, that antiplatelet therapy with clopidogrel is more expensive and more effective (2 additional lives saved per 1000 patients over 1.91 years) compared with ASA. Due to the threshold of society "willingness to pay" per 1 life saved, or 1 QALY, use of clopidogrel as antiplatelet agent in patients with cardiovascular disease is economically profitable for Ukraine. **CONCLUSIONS:** The use of clopidogrel as an antiplatelet agent in patients with cardiovascular disease to prevent nonfatal stroke compared to the ASA is economically profitable for Ukraine.

PCV79

AN ANALYSIS OF THE COST EFFECTIVENESS OF LEFT ATRIAL APPENDAGE CLOSURE FOR THE PREVENTION OF STROKE IN PATIENTS WITH ATRIAL FIBRILLATION AND ABSOLUTE CONTRAINDICATIONS TO WARFARIN THERAPY

Reddy VY[1], Akehurst RL[2], Amorosi SL[3], Armstrong S[4], Holmes DR[5]
[1]*Mount Sinai School of Medicine, New York, NY, USA,* [2]*University of Sheffield, Sheffield, UK,* [3]*Boston Scientific, Natick, MA, USA,* [4]*GfK Bridgehead, Wayland, MA, USA,* [5]*Mayo Clinic, Rochester, MN, USA*

OBJECTIVES: Stroke and its associated disability costs the European Union an estimated €62 billion per year. Warfarin is the mainstay for stroke prevention in atrial fibrillation (AF), but many patients have absolute contraindications to this drug. The Watchman device for left atrial appendage closure (LAAC) received CE mark for stroke prevention in AF patients with contraindications to warfarin. This analysis sought to estimate the cost effectiveness of treating warfarin-ineligible AF patients with LAAC as compared to standard aspirin therapy. **METHODS:** A Markov model was developed comparing clinical outcomes and total costs between patients treated with LAAC or aspirin over 5 and 10 years based largely on clinical outcomes from the Aspirin and Plavix Registry (ASAP) and ACTIVE trials. Clinical events included ischemic stroke, TIA, systemic embolism, bleeding, and acute myocardial infarction as well as procedure-related events. Germany was chosen as the country of analysis because of its unique DRG for the LAAC procedure. Acute costs were taken from German DRGs and long-term disability costs were taken from the Berlin Acute Stroke Study. Sensitivity analysis was performed on clinical and cost inputs; the model was most sensitive to changes in the rate of ischemic stroke. **RESULTS:** LAAC demonstrated a benefit in terms of ischemic strokes and mortality avoided. The cost per ischemic stroke avoided was €91,020 and €24,722 at 5 and 10 years, respectively. The cost per life year gained for LAAC versus aspirin was €22,694 at 5 years and decreased to €5,859 at 10 years. **CONCLUSIONS:** LAAC is a cost-effective alternative to aspirin therapy in patients with contraindications to warfarin. Cost offsets achieved with LAAC become considerably more pronounced over time. This analysis highlights the importance of considering the lifetime costs of stroke prevention in AF, especially as the probability of both stroke and bleeding increases with patient age.

PCV80

COST-EFFECTIVENESS OF RIVAROXABAN IN THE PREVENTION OF STROKE IN NON-VALVULAR ATRIAL FIBRILLATION PATIENTS IN ITALY

Capri S[1], Veneziano M[2], Ricciardi WG[2], D'Ausilio A[3], Pedone MP[4], Bianchi C[4]
[1]*Institute of Economics, Castellanza, Italy,* [2]*Catholic University of Sacred Heart, Rome, Italy,* [3]*Creativ Ceutical, Luxembourg, Luxembourg,* [4]*Bayer Pharma, Milano, Italy*

OBJECTIVES: To perform a cost-effectiveness analysis of rivaroxaban (once-daily) in the prevention of stroke and systemic embolism of patients with non-valvular atrial fibrillation (NVAF) and in patients sub-groups from the perspective of the Italian health care system (SSN). **METHODS:** A Markov model was developed with a lifetime timeframe where a hypothetic NVAF patients' cohort is treated with Vitamin-K antagonists (VKAs), antiplatelet drugs (ASA) or no therapy. Patients remain stable or progress towards other health states (ischemic or hemorrhagic stroke, myocardial infarction and bleedings) until death. The base case compares rivaroxaban with VKAs. In subgroup analyses, rivaroxaban is compared with patients at highest unmet medical need: 1. VKA patients with poor INR control, 2. patients under ASA or 3. not treated. Clinical data were derived from ROCKET-AF trial or a network meta-analysis. Utility data were retrieved from published literature. Health care resources consumption was valued using average regional tariffs in Italy. Since rivaroxaban price is not officially published, the price of the first novel oral anticoagulant approved in this indication in Italy was considered. Model outcomes are expressed in terms of incremental cost per quality adjusted life year (QALY) gained (ICER). Univariate and probabilistic sensitivity analyses were performed **RESULTS:** In the base case, rivaroxaban showed to be cost-effective compared to VKA with an

ICER of €11,000/QALY which is below the threshold deemed acceptable from Italian payers (25.000€-40.000€). In the subgroups analyses, rivaroxaban demonstrated to be a dominant strategy (more effective and less costly). Sensitivity analyses showed the robustness of the results. **CONCLUSIONS:** Rivaroxaban is a cost-effective alternative to VKA and is cost-saving for the SSN in the treatment of NVAF patients at highest unmet medical need.

PCV81

COST-EFFECTIVENESS OF DABIGATRAN ETEXILATE FOR THE SECONDARY PREVENTION OF RECURRENT DEEP VEIN THROMBOSIS AND PULMONARY EMBOLISM IN THE UNITED KINGDOM

Wolowacz S[1], Brockbank J[2], Sunderland TJ[3], Gonschior AK[4]
[1]*RTI Health Solutions, Manchester, UK,* [2]*RTI Health Solutions, Didsbury, UK,* [3]*Boehringer Ingelheim, Berkshire, UK,* [4]*Boehringer-Ingelheim GmbH, Ingelheim Am Rhein, Germany*

OBJECTIVES: To estimate the cost-effectiveness of dabigatran etexilate (dabigatran) for the secondary prevention of deep vein thrombosis (DVT) and pulmonary embolism (PE) from the perspective of the UK National Health Service. **METHODS:** A Markov model was developed to estimate costs and outcomes over the lifetime of a cohort of patients receiving either dabigatran (150mg given orally, twice daily) or placebo for 6 months after having completed 6 to 18 months of anticoagulation treatment for a DVT or PE. Modelled events included recurrent DVT and PE, major bleeding (including long-term disability from intracranial haemorrhage), clinically relevant non-major bleeding, myocardial infarction, unstable angina, pulmonary hypertension, severe postthrombotic syndrome, and death. Efficacy and safety parameters were based on the RE-SONATE study; the period of follow-up was 6 months with an extension to 18 months. Probabilities of recurrent DVT and PE after trial follow-up were based on a prospective cohort study of 1,626 patients followed-up for a median of 50 months and were assumed to be equivalent in both treatment groups. Utility estimates were based on EQ-5D data collected in dabigatran trials and published literature. The mean duration of therapy was based on the RE-SONATE study; other costs were based on NHS Reference Costs and published literature. Costs and outcomes were discounted at 3.5% per annum. Univariate and probabilistic sensitivity analyses were performed. **RESULTS:** In the base-case analysis, mean total costs for dabigatran and placebo patients were £7,147 and £7,520 respectively; mean QALYs were 13.089 and 13.070 respectively. Dabigatran was dominant; the probability of cost-effectiveness at a willingness-to-pay threshold of £20,000 per QALY was 63%. In univariate sensitivity analysis, dabigatran was dominant in all analyses. **CONCLUSIONS:** This analysis suggests that dabigatran is likely to be cost-saving compared to placebo for the secondary prevention of DVT and PE in the UK.

PCV82

A HEALTH ECONOMIC EVALUATION OF FENOFIBRIC ACID IN COMBINATION WITH STATINS IN THE PREVENTION OF CARDIOVASCULAR DISEASE IN TAIWANESE MIXED HYPERLIPIDEMIA PATIENTS

Ramos M[1], Vellopoulou K[2], Lamotte M[3], Chang CJ[4], Carr E[5]
[1]*IMS Health, Barcelona, Spain,* [2]*IMS Health, Vilvoorde, Belgium,* [3]*IMS Health HEOR, Vilvoorde, Belgium,* [4]*Chang Gung University, Tao-Yuan, Taiwan,* [5]*Abbott Laboratories, Allschwil, Switzerland*

OBJECTIVES: Statins are the standard treatment for cardiovascular disease (CVD) prevention however, with limited effect on triglyceride (TG) and high-density lipoprotein-cholesterol (HDL-C) in mixed hyperlipidemia. Fenofibric acid (FA) is approved for co-administration with statins to reduce TG and increase HDL-C in patients with mixed hyperlipidemia at goal for LDL-C with statins. This study assesses the cost-effectiveness of FA combined with low (LDS) or medium (MDS) dose statins versus low, medium or high (HDS) dose statins alone in the prevention of CVD in Taiwanese patients with type 2 diabetes and mixed hyperlipidemia. **METHODS:** A 5-health-state Markov model for diabetic patients with mixed hyperlipidemia already treated with statin (TG:250mg/dl; HDL-C:35mg/dl; LDL-C:115mg/dl; TC:200mg/dl) was developed, using a lifetime horizon with annual cycles. PROCAM (first event) and Framingham (subsequent event) risk equations were used. Effects on TG, HDL-C and TC for each comparator were derived from pooled simvastatin, atrovastatin and rosuvastatin trials. Drug and event costs were based on official national databases. Annual discounting (5%) was applied to outcomes and costs. Incremental cost (€) per Quality of Life Gained (QALYG) was calculated from the Taiwanese Bureau of National Health Insurance perspective. **RESULTS:** Compared to LDS and MDS, treatment with FA+LDS resulted in higher costs (€2,225; €1,676) but more QALYG (0.311; 0.064), resulting in an incremental cost-effectiveness ratio of €7,161/QALYG and €26,375/QALYG respectively. Compared to HDS, FA+LDS costs were lower with slightly less QALYG (ICER: €183,490/QALYG). Compared to FA+MDS, FA+LDS was dominant with lower costs (-€900) and higher QALYG (0.004). Sensitivity analyses showed robustness of the results. The probability for FA+LDS being cost-effective (< GDP threshold €45,400) is 100% for both, LDS and MDS. **CONCLUSIONS:** In this specific mixed hyperlipidemia population, FA+LDS is likely to be a cost-effective alternative to LDS or MDS alone, potentially allowing for lower statin doses in preventing CVD.

PCV83

COST-EFFECTIVENESS OF STATINS FOR PRIMARY PREVENTION IN NEWLY DIAGNOSED TYPE 2 DIABETES PATIENTS IN THE NETHERLANDS

de Vries FM[1], Denig P[2], Visser ST[1], Hak E[1], Postma MJ[1]
[1]*University of Groningen, Groningen, The Netherlands,* [2]*University Groningen, Groningen, The Netherlands*

OBJECTIVES: Statins reduce the risk of cardiovascular events in patients with diabetes. The aim of this study is to determine whether statin treatment for primary prevention in newly diagnosed type 2 diabetes is cost-effective, taking non-adherence, baseline risk, and age into account. **METHODS:** A cost-effectiveness analysis was performed using a Markov model with a time horizon of 10 years. The baseline 10-year cardiovascular risk was estimated in a Dutch population of primary prevention patients with newly diagnosed diabetes from the Groningen Initiative to Analyse Type 2 Diabetes Treatment database (GIANTT), using the UKPDS risk engine. Statin adherence was measured as pill days covered (PDC) in the IADB.nl pharmacy research database. Cost-effectiveness was measured in costs per quality-adjusted life-year (QALY) form the health care-payers' perspective. **RESULTS:** For an average patient aged 60 at diagnosis, statin treatment was highly cost-effective at around €2,300 per QALY. Favourable cost-effectiveness was robust in sensitivity analysis. Differences in age and 10-year cardiovascular risk showed large differences in cost-effectiveness from more than €100,000 per QALY to almost being cost saving. For the average patient aged 40 at diabetes diagnosis, statin treatment for primary prevention was not cost-effective. **CONCLUSIONS:** Despite the non-adherence levels observed in actual practice, statin treatment is cost-effective for primary prevention in patients newly diagnosed with type 2 diabetes. Due to large differences in cost-effectiveness according to different risk and age groups, the efficiency of the treatment could be increased by targeting patients with relatively higher cardiovascular risk and higher ages.

DEVELOPMENT OF NOVEL IMAGING TESTS TO SELECT PATIENTS FOR INDIVIDUALIZED THERAPIES: ARE THEY WORTH FURTHER INVESTMENT?

Buisman LR, Rijnsburger AJ, Redekop WK
Erasmus University Rotterdam, Rotterdam, The Netherlands

OBJECTIVES: Patients with a recent transient ischemic attack (TIA) or minor ischemic stroke who receive medicines have a 10-year risk of about 16% for any recurrent stroke. Non-invasive molecular imaging technologies are currently being developed to improve individual stroke risk prediction. We estimated the potential lifetime cost-effectiveness of a novel imaging test for stroke prediction in an early stage of development. **METHODS:** Decision modelling was used to estimate the potential value of an add-on test that could identify which patients with a recent TIA or minor ischemic stroke should undergo surgery instead of receive medicines. The comparator was patient management according to Dutch guidelines. Test sensitivity and specificity were varied from 0-100% and its cost was set at €350. Different age- and gender-specific subgroups were examined to see how much cost-effectiveness varied. **RESULTS:** A perfect add-on test (100% sensitivity and specificity) for 60-year-old men appears to be cost-effective versus Dutch guidelines, with an estimated 0.61 QALY gain, €3,986 cost increase, and an incremental cost-effectiveness ratio (ICER) of €6,534/QALY gained. A test with sensitivity=60% and specificity=100% increases both health (0.14 QALYs) and costs (€2,888), resulting in an ICER of €20,338/QALY gained. Similarly, a test with sensitivity=100% and specificity=60% increases both health (0.29 QALYs) and costs (€5,784), resulting in an ICER of €19,946/QALY gained. **CONCLUSIONS:** An imaging test that improves risk prediction and therefore treatment decisions for patients with a recent TIA or minor ischemic stroke has the potential to optimize cost-effectiveness by reducing the risk of recurrent stroke. However, reduced sensitivity or specificity of the test reduces its cost-effectiveness versus the Dutch guidelines. Developers must consider if the minimum level of accuracy required to be cost-effective is close to the maximum capability of the test. Model-based analyses are valuable in facilitating decisions about investments in the further development of a test.

PERSONALIZED TREATMENT IN HEART FAILURE DISEASE MANAGEMENT IMPROVES OUTCOMES AND REDUCES COSTS

Cao Q, Postmus D, Hillege HL, Buskens E
University of Groningen, University Medical Center Groningen, Groningen, The Netherlands

OBJECTIVES: At the population level, disease management programs (DMPs) for heart failure (HF) have proven to be effective in increasing quality-adjusted survival and reducing the rate of hospital readmission. However, a systematic assessment as to whether these outcomes could still be improved upon by tailoring the content and structure of such DMPs to the risk profile of the individual patient has not yet been conducted. Using data from a previously conducted randomized controlled trial, the purpose of this study was to explore the clinical and health economic consequences of assigning different DMPs to different risk categories of HF patient. **METHODS:** The analysis was conducted alongside the COACH study, in which 1023 patients were randomly assigned to one of three DMPs: care-as-usual (routine follow-up by a cardiologist), basic additional support by a nurse specialized in HF management (HF-nurse), and intensive additional support by an HF-nurse. The Subpopulation Treatment Effect Pattern Plot (STEPP) methodology was applied to graphically establish suitable cut-offs for stratifying patients into different risk categories based on their predicted 18-month mortality risk. Separate cost-effectiveness analyses were subsequently performed within each of these strata to determine per risk category the DMP that would be optimal in terms of survival time and costs. **RESULTS:** Based on the STEPP analysis, a cut-off of 0.17 was selected to classify 346 (33.8%) patients as low risk and 677 (66.2%) patients as high risk. At a threshold value of €10,000 per life-year, this resulted in an 82.9% probability that intensive support would be optimal for low-risk patients and an 83.6% probability that basic support would be optimal for high-risk patients. **CONCLUSIONS:** Assigning different DMPs to different risk groups of patient improved outcomes and reduced costs. Tailoring the content and structure of such programs to the risk profile of the individual patient seems therefore desired.

PCV86

THE COST-EFFECTIVENESS OF DABIGATRAN AND THE OPPORTUNITY COST OF DELAYED SUBSIDISED ACCESS IN AUSTRALIA

Tilden D[1], Germanos P[2], Gordon J[2], Tocchini L[1]
[1]*THEMA Consulting Pty. Limited, Pyrmont, Australia,* [2]*Boehringer Ingelheim Pty Limited, North Ryde, NSW, Australia*

OBJECTIVES: Dabigatran was recommended by the Pharmaceutical Benefits Advisory Committee (PBAC) in March 2011 for the treatment of non-valvular atrial fibrillation (NVAF) but was not listed on the Pharmaceutical Benefits Scheme (PBS) for over two years. This analysis examines the cost-effectiveness of dabigatran and the opportunity cost of delayed reimbursement from a societal perspective. **METHODS:** This analysis estimated the costs for dabigatran compared with warfarin and a mixed comparator (warfarin/aspirin/untreated) reflective of current

practice. A societal perspective incorporated the following indirect costs: formal and informal long term care costs for stroke, productivity losses associated with stroke and carers, and productivity, out of pocket and travel costs associated with INR testing in both metropolitan and rural settings. The opportunity cost of a delayed dabigatran PBS listing was estimated over a 2 year period. Estimates were derived using the economic model presented to the PBAC. **RESULTS:** When incorporating a societal perspective, dabigatran was cost saving versus both warfarin and the mixed comparator. Dabigatran is estimated to save an average of $2,011 and $3,994 per patient per year for patients in metropolitan and rural settings respectively compared with current practice. In the more than two years since the initial PBAC recommendation of dabigatran it is estimated over 150,000 patients have been denied affordable access to treatment, resulting in $47.9 million in costs to Medicare, $5.2 million in patient out of pocket costs and 470,000 hours of lost productivity due to avoidable INR testing. Importantly, 4,059 strokes and 902 resultant deaths could have been avoided in this time compared to current practice. **CONCLUSIONS:** Dabigatran is a cost-effective treatment for stroke prevention in patients with NVAF in Australia and is cost saving compared to current therapy (warfarin, aspirin and no treatment) when a societal perspective is taken.

PCV87

COMPREHENSIVE OVERVIEW: EFFICACY, TOLERABILITY AND COST-EFFECTIVENESS OF IRBESARTAN

Gialama F[1], Maniadakis N[2]

[1]*National School of Public Health, ATHENS, Greece,* [2]*National School of Public Health, Athens, Greece*

OBJECTIVES: Hypertension represents a major health problem, affecting more than 1 billion adults worldwide. Irbesartan, an angiotensin II receptor blocker, is considered to be a highly effective treatment in the management of hypertension. Therefore this study aims to evaluate the efficacy, safety and tolerability profile, as well as the cost-effectiveness of irbesartan in the treatment of hypertension. **METHODS:** A review of the literature was conducted using the electronic databases Medline, Cochrane and HEED of search terms relating to irbesartan efficacy, tolerability and cost-effectiveness and the results were synthesized. **RESULTS:** Findings from the present analysis show that irbesartan either as monotherapy or in combination with other agents can have significant reductions in Blood Pressure, both systolic and diastolic, when compared to other alternative treatment options. Irbesartan was also found to have a renoprotective effect, independent of its blood pressure lowering effect in patients with type 2 diabetes and nephropathy. Irbesartan also delayed onset of end-stage renal disease (ESRD) and reduced the cumulative incidence of ESRD. Furthermore, Irbesartan demonstrated an excellent safety and tolerability profile. Overall adverse event incidence with irbesartan was comparable with other antihypertensive drugs. Most common adverse events were headache, fatigue and dizziness. In terms of economic analyses, compared to other antihypertensive therapy alternatives, irbesartan increased life expectancy and lead to substantial cost savings. **CONCLUSIONS:** Evidence indicates that treating patients with hypertension alone or with type II diabetes and nephropathy, can control hypertension, prolong life and reduce costs, in relation to other existing alternatives.

PCV88

INDIVIDUALLY TAILORED ELASTIC COMPRESSION THERAPY FOR THE PREVENTION OF POST THROMBOTIC SYNDROME

Bouman AC[1], ten Cate-Hoek AJ[1], ten Cate H[1], Joore MA[2]

[1]*Laboratory for Thrombosis and Hemostasis, Department of Internal Medicine, Maastricht University Medical Centre, Maastricht University, The Netherlands, Maastricht, The Netherlands,* [2]*Clinical Epidemiology and Medical Technology Assessment, Maastricht University Medical Centre; CAPHRI, Maastricht University, Maastricht, The Netherlands*

Post thrombotic syndrome (PTS) is a chronic condition that develops in up to 50% of patients after deep vein thrombosis and is characterized by debilitating complaints of the leg. Two randomized controlled trials (RCT) showed that elastic compression stocking (ECS) therapy for 2 years after DVT reduces the PTS incidence by approximately 50%. A recent management study showed that tailored duration of ECS therapy on individual patient characteristics may result in a reduction of ECS therapy of 18 months for 50% of patients with an even lower incidence of PTS. However, these results may be biased. **OBJECTIVES:** To explore the cost-effectiveness of individually tailored ECS therapy (IND) compared with a standard duration of 2 years ECS therapy (STANDARD), from a health care perspective in order to inform the design of an RCT comparing the two treatment options. **METHODS:** A decision-analytic probabilistic Markov model with lifelong time horizon was used. Health states in the model are: No PTS with stocking, No PTS without stocking, Mild to moderate PTS, Severe PTS, and Death. Transition probabilities, costs, and utilities were obtained from literature. The incidence of PTS was taken from the trials (STANDARD: 2-year incidence 24.5%) and the management study (IND: 2-year incidence 21.1%). The delta for non-inferiority of a future RCT was determined, and uncertainty was assessed in value of information analyses. **RESULTS:** Based on current evidence IND saves €2,292 and gains 0.14 quality adjusted life years (QALY) per patient compared to STANDARD. This result is however highly uncertain, and future research is valuable. The savings of IND amount to €306 when assuming equal incidence of PTS. If PTS incidence is 7% higher in IND, the treatment seizes to be cost-effective. **CONCLUSIONS:** Based on current limited evidence, IND may dominate STANDARD. Future research is worthwhile, and may be informed by this modeling study.

PCV89

THE COST-EFFECTIVENESS OF SCREENING FOR SILENT ATRIAL FIBRILLATION AFTER ISCHAEMIC STROKE

Levin LÅ[1], Husberg M[1], Rosenqvist M[2], Sobosinski-Doliwa P[2], Friberg L[2], Frykman-Kull V[2], Davidson T[1]

[1]*Linköping University, Linköping, Sweden,* [2]*Karolinska Institutet, Stockholm, Sweden*

OBJECTIVES: Prolonged brief intermittent arrhythmia screening has been suggested to substantially improve detection of silent paroxysmal atrial fibrillation (AF) in patients with a recent ischemic stroke/TIA. The purpose of this study was to estimate the cost-effectiveness of two screening methods for detection of silent AF, brief intermittent long-term ECG recordings at regular time intervals and short-term 24-hours continuous ECG (Holter-ECG) and to compare them to a no screening alternative in patients with a recent ischemic stroke. **METHODS:** The long-term (20 year) costs and effects of brief intermittent long-term ECG recordings at regular time intervals and short term continuous ECG are estimated with a decision analytic model combining the result of a clinical study and epidemiological data. The structure of a cost-effectiveness analysis was used in this study. The short term decision tree model analyzed the screening procedure until the onset of anticoagulant treatment. The second part of the decision model follows a Markov design simulating the patients for 20 years. **RESULTS:** Continuous 24 h ECG recording was dominated by intermittent ECG due to lower sensitivity and higher costs. The base case analysis compared intermittent-ECG screening with no screening of patients with recent stroke. The implementation of the screening program on 1000 patients resulted in 10,9 avoided strokes and the gain of 29,2 life years or 22,7 QALYs and cost savings of €55 000. **CONCLUSIONS:** Screening of silent AF by intermittent ECG recordings in patients with a recent ischaemic stroke is cost-effective use of health care resources saving costs, lives and quality of life.

PCV90

ISSUES WITH COST-EFFECTIVENESS MODELLING OF DIAGNOSTIC TESTS – CASE STUDY OF ISCHAEMIC CARDIOMYOPATHY

Thokala P, Thomas S, Campbell F

University of Sheffield, Sheffield, UK

OBJECTIVES: To estimate the cost-effectiveness of diagnostic pathways for assessing patients with ischaemic cardiomyopathy to identify patients with viable myocardium with a view to revascularisation. **METHODS:** A decision analytic model was developed to estimate the cost-effectiveness of diagnostic strategies for assessing patients with ischaemic cardiomyopathy. The different diagnostic pathways were applied to a hypothetical cohort of patients with ischaemic cardiomyopathy and the probability of successful identification of viable myocardium and non-viable myocardium was determined by the accuracy of the diagnostic pathway. It was assumed that patients diagnosed with viable myocardium would be managed promptly by revascularisation and that the patients diagnosed with non-viable myocardium would be on medical therapy. The model assigned each patient a risk of death and rehospitalisation depending upon whether they are truly viable and whether they had revascularisation or not. Each patient then accrued lifetime QALYs. Health care costs were also accrued through measuring diagnostic costs and treatment costs, depending on the pathway and their treatment status. **RESULTS:** All the diagnostic pathways are cost-effective when compared with no testing at current NICE threshold, this suggests that all the current services for diagnosing viable myocardium are a cost effective use of NHS resources irrespective of the diagnostic pathway used. For services that need to decide the most cost-effective strategy starting from scratch, then Stress CMR is the most cost-effective strategy. **CONCLUSIONS:** There are a number of issues with abstracting the data for cost-effectiveness modelling of diagnostic tests. For example, the diagnostic accuracy depends upon the type of index test, gold standard test and threshold used. Furthermore, the benefits of treatments after diagnosis are not always clear and might be linked to the type of diagnostic test. Appropriate caution needs to be taken when evaluating diagnostic tests.

PCV91

ECONOMIC EVALUATION OF IVABRADINE FOR CHRONIC HEART FAILURE NYHA II TO IV CLASS WITH SYSTOLIC DYSFUNCTION IN IRELAND

Lacey L[1], McAuliffe A[2], Poisson M[3]

[1]*Lacey Solutions Ltd., Skerries, Ireland,* [2]*Servier Ireland, Dun Laoghaire, Ireland,* [3]*Laboratoires SERVIER, Suresnes, France*

OBJECTIVES: Ivabradine is approved by the European Medicine Agency for the treatment of Chronic Heart Failure (CHF) NYHA II to IV class with systolic dysfunction in patients in sinus rhythm and whose heart rate is $\geq$ 75 bpm, in combination with standard therapy including beta-blocker therapy or when beta-blocker therapy is contraindicated or not tolerated. The study objective was to perform a cost-effectiveness analysis of ivabradine based on the outcomes of the SHIFT clinical trial from the perspective of the Irish Health Service Executive (HSE). **METHODS:** A six health state Markov model with health states for CHF NYHA classes I to IV, alive, and dead was adapted to the Irish health care setting. The economic evaluation compared the cost-effectiveness of ivabradine in combination with standard therapy versus standard therapy alone. A lifetime horizon was chosen in the base case analysis. Costs and effects were discounted at 4% per year. Deterministic and probabilistic sensitivity analyses were performed. Health state utilities were estimated from EQ-5D index scores obtained from the SHIFT clinical trial. The base case analysis was based on heart failure outcomes and associated costs. **RESULTS:** When used in addition to standard therapy, ivabradine increased discounted health care costs by €2169 for a 0.23 QALY gain, resulting in an incremental cost per QALY gained of €9,426. In no case of the deterministic sensitivity analysis did the cost per QALY gained increase above €20,000. The probability of the cost-effectiveness of ivabradine at a willingness to pay threshold of €45,000 per QALY gained was estimated to be approx. 100%. **CONCLUSIONS:** When used in addition to standard therapy, based on heart failure outcomes and associated costs, ivabradine had an incremental cost per QALY gained of €9,426 with an approximately 100% probability of being cost-effective at a willingness to pay threshold of €45,000 per QALY gained.

PCV92

THE COST-UTILITY OF CATHETER-BASED RENAL DENERVATION AS COMPARED TO CURRENT STANDARD OF CARE FOR RESISTANT HYPERTENSION IN BELGIUM

Jugrin AV[1], Caekelbergh K[1], Vanacker J[2], Vancauwenberghe L[2], Lamotte M[1]

[1]*IMS Health HEOR, Vilvoorde, Belgium,* [2]*MEDTRONIC INC., Brussels, Belgium*

OBJECTIVES: Hypertension affects 41% of male and 31% of female adults in Belgium; 13% of these are believed to be refractory to standard hypertension treatment (uncon-

trolled with ≥ 3 different classes of antihypertensive therapy). Catheter-based renal denervation (RDN) is a novel, minimally invasive therapy for treatment-resistant hypertension. The aim of this study was to assess the cost-utility of RDN as compared to current standard of care (SoC) for refractory hypertension in Belgium. **METHODS:** A lifetime state-transition, Markov model was used, with health-states encompassing possible long-term consequences of hypertension: stroke, myocardial infarction, angina, heart failure, end-stage renal disease. Risk equations were used to calculate the risk of events with changing systolic blood pressure (SBP). Reductions in SBP following RDN vs. SoC pertain to the results of the Symplicity HTN-2 randomized controlled trial. The underlying modeled cohort was defined similar to the same trial: mean baseline SBP 178 mmHg, mean age 58 years, 34% with diabetes mellitus. Costs pertained to published economic evaluations or public tariffs and reflected the Belgian payer perspective. Costs and health outcomes were discounted at a rate of 3%, and 1.5% respectively. **RESULTS:** Projected lifetime costs were 21,743€ and 24,558€ in the SoC and RDN arms respectively, while total projected life years were 16.43 and 17.23. RDN increased patients' quality of life with 0.93 quality-adjusted life years (QALYs) vs. SoC. This resulted in an incremental cost-utility ratio (ICUR) of 3,020€/QALY. Results were most sensitive to changes in SBP reductions, and the cost of RDN procedure, but remained under a willingness to pay (WTP) threshold of 20,000€/QALY. Probabilistic sensitivity analyses showed acceptable cost-effectiveness in 100% of cases, under a WTP threshold of 20,000€/QALY. **CONCLUSIONS:** Results of these analyses suggest that, under the current model settings, catheter-based RDN procedure could be a cost-effective strategy for resistant hypertension in Belgium.

PCV93

COST-EFFECTIVENESS ANALYSIS OF ATORVASTATIN COMPARED TO SIMVASTATIN IN THE PREVENTION OF CARDIOVASCULAR DISEASES IN THE CZECH REPUBLIC

Klimes J, Vocelka M, Dolezal T, Kruntoradova K
Institute of Health Economics and Technology Assessment, Prague, Czech Republic

OBJECTIVES: To assess the impact of atorvastatin compared to simvastatin use in the Czech Republic on cardiovascular diseases (CVD), Life-Years Gained (LYG) and Quality-Adjusted Life Years (QALY), based on the real proportional consumption of both statins in particular strengths (10 mg, 20 mg, 40 mg). **METHODS:** Life-time cost-effectiveness Markov cohort model was developed with 1 year cycle length and 5 health sates, i.e. Alive without CVD, Alive with experience of CVD, Non-fatal CVD, Fatal CVD and Death. The probability of transition among health states were derived from Framingham equations or from SCORE equations (probability of the first non/fatal CVD), Czech life-tables (background mortality) and international cohort studies (probability of subsequent CVD). Patients enter the model with base-line risk characteristics: age, proportions of males, diabetics, smokers, level of systolic blood pressure and cholesterol (total and HDL) level. The efficacy data for particular statin and its strength were derived from latest meta-analyses. Drug acquisition costs of atorvastatin 10 mg and 20 mg were 10% higher compared to simvastatin 20 mg and 40 mg. The costs of fatal, non-fatal CVD and one-year follow-up after CVD were 1,410 EUR, 1,460 EUR and 580 EUR. Probabilistic sensitivity analysis (PSA) using a willingness to pay (WTP) threshold equal to 1 times GDP per capita (14,300 EUR) was applied. **RESULTS:** Over a life-time horizon, atorvastatin compared to simvastatin provides 8.14 QALYs vs. 8.07 QALYs, 11.33 LYG vs. 11,24 LYG, 44.8% vs. 46.3% of non-fatal CVD and 28.2% vs. 29.4% of fatal CVD. The increment of total costs was 330 EUR for atorvastatin, ICER for atorvastatin vs. simvastatin was then 4,720 EUR/ QALY. **CONCLUSIONS:** The use of atorvastatin generates 0.07 QALYs more compared to simvastatin per patient in the Czech Republic. There is a 98.5% probability of atorvastatin being cost-effective at the selected WTP.

PCV94

NOVEL ORAL ANTICOAGULANTS VERSUS WARFARIN – A BUSINESS CASE ANALYSIS

You J
The Chinese University of Hong Kong, Shatin, Hong Kong

OBJECTIVES: The decision on whether to use more expensive novel oral anticoagulants (NOACs) or invest resources for quality improvement of warfarin therapy requires inputs of both clinical and economic outcome analyses. Outcomes of NOACs comparing to warfarin therapy at various levels of patient-time in therapeutic range (TTR) in patients with atrial fibrillation were examined from health care provider's perspective. **METHODS:** A Markov model was designed to compare life-long economic and treatment outcomes of warfarin and NOACs in a hypothetical cohort of 65-year-old atrial fibrillation patients with $CHADS_2$score 2 or above. Model inputs were derived from clinical trials published in literature. Outcome measure was incremental cost per quality-adjusted life-year (QALY) gained (ICER). **RESULTS:** Expected cost and QALYs of NOACs were USD96,602 and 9.957, correspondingly, in base-case analysis. Using USD50,000 as the threshold of willingness-to-pay per QALY, NOACs therapy was cost-effective when TTR of warfarin therapy was 60%, or monthly cost of warfarin management increased by 1.5-fold or above to achieve 70% TTR. Warfarin therapy was cost-effective when TTR of warfarin was 70% with no increment in monthly cost of care, or when TTR reached 75% with monthly cost of warfarin care increased up to 2.5-fold. At TTR 60%, 70% and 75%, NOACs was cost-effective when monthly drug cost was <USD208, <USD135-200 and <USD96-160, respectively. 10,000 Monte Carlo simulations showed NOACs to be cost-effective in 77.2%, 52.7% and 31.7% of time at TTR of 60%, 70% and 75%, respectively. **CONCLUSIONS:** Acceptance of NOACs as cost-effective was highly depended upon drug cost, anticoagulation control for warfarin, and anticoagulation service cost.

PCV95

SCREEN OR NOT TO SCREEN FOR PERIPHERAL ARTERIAL DISEASE: GUIDANCE FROM A DECISION MODEL

Vaidya A[1], Joore MA[2], tenCate-Hoek AJ[1], tenCate H[1], Severens JL[3]
[1]*Maastricht University, Maastricht, The Netherlands,* [2]*Clinical Epidemiology and Medical Technology Assessment, Maastricht University Medical Centre; CAPHRI, Maastricht University, Maastricht, The Netherlands,* [3]*Erasmus University Rotterdam, Rotterdam, The Netherlands*

OBJECTIVES: Asymptomatic Peripheral Arterial Disease (PAD) is associated with greater risk of acute cardiovascular events. American heart association and American college of cardiology clinical practice guidelines recommend low dose aspirin to reduce the cardiovascular events and mortality in PAD patients. As asymptomatic PAD often remains undiagnosed, opportunities for secondary prevention are missed in primary care. Therefore, there is a clinical need of early detection of asymptomatic PAD and to initiate the appropriate preventive treatment. United States preventive services task force's recommendation against screening is heavily criticized and expansion of the evidence base for PAD screening is recommended in 2011 in a focussed update of the guidelines. This study aims to determine the value of PAD screening using ankle brachial index test in high risk individuals using decision analytic modelling. **METHODS:** A Markov model was developed to evaluate the cost effectiveness of selective PAD screening in high risk individuals followed by preventive treatment compared to no screening and no preventive treatment. The analysis was conducted from the societal perspective using a lifetime time horizon. To address the parameter uncertainty, probabilistic sensitivity analysis was performed. **RESULTS:** Screening and preventive treatment of identified PAD patients with low dose aspirin is a dominant strategy producing higher mean quality adjusted life years per patient for a lower lifetime cost. The cost effectiveness acceptability curves show that 100% simulations favour screening followed by preventive treatment at a willingness to pay threshold of 400 Euros. **CONCLUSIONS:** This decision analysis suggests that the targeted screening and secondary prevention of cardiovascular events in the identified patients, is a highly cost effective public health intervention. This study results may provide one of the building blocks of evidence expansion for advocating PAD screening and to promote its more widespread use to detect and treat PAD patients.

PCV96

COST-EFFECTIVENESS OF INCREASING STATIN ADHERENCE FOR PRIMARY AND SECONDARY PREVENTION IN COMMUNITY PHARMACIES

Vegter S[1], Oosterhof P[1], van Boven JF[1], Stuurman-Bieze AGG[2], Hiddink EG[2], Postma MJ[1]
[1]*University of Groningen, Groningen, The Netherlands,* [2]*Health Base Foundation, Houten, The Netherlands*

OBJECTIVES: Therapy persistence is important to achieve optimal clinical benefits of statin therapy. The aim of this study was to determine the cost-effectiveness of pharmaceutical care in community pharmacies, aimed to increase persistence with statin therapy for both primary and secondary prevention of cardiovascular events (CVEs). **METHODS:** The effectiveness of the Dutch pharmaceutical care program MeMO on improving statin therapy persistence was measured in 500 patients and compared to 502 control patients. Time-investments of the program were also collected. Markov models with lifelong time-horizons were developed to estimate the influence of the program on CVEs: stroke, myocardial infarction (MI), revascularization and mortality. The efficacy of statins, taken from large clinical trials in primary and secondary prevention, were adjusted for therapy persistence. A Dutch health care provider's perspective was adopted for the analysis and probabilistic sensitivity analyses were performed. **RESULTS:** Patients in the MeMO program had a lower risk for non-persistence, RR = 0.50 (0.40-0.63), the effect was similar in primary and secondary prevention. In a cohort of 1,000 patients, 60% of whom had a history of CVE, the MeMO program resulted in a reduction of 8 non-fatal strokes, 2 fatal strokes, 16 non-fatal MIs, 7 fatal MIs and 14 revascularizations. Additional medication, disease management and intervention costs in the MeMO program were €375,000; the cost-savings due to reduced CVEs were €450,000. Thus, the MeMO program resulted in 83 quality-adjusted life-years (QALYs) gained and cost-savings of €75,000. Clinical benefits and cost-savings were highest in the secondary prevention population. **CONCLUSIONS:** Pharmaceutical care in community pharmacies can improve statin therapy persistence, resulting in more optimal prevention of CVEs. The MeMO program resulted in considerable clinical benefits and overall cost-savings. Persistence and adherence improving programs in community pharmacies may provide good value for money and health care insurers should consider reimbursing these activities in The Netherlands.

PCV97

COST-EFFECTIVENESS ANALYSIS OF IVABRADINE IN CHRONIC HEART FAILURE IN THE POLISH SETTING

Borowiec L[1], Faluta T[1], Filipiak KJ[2], Niewada M[3], Wrona W[4]
[1]*Medical Department, Servier Poland, Warsaw, Poland,* [2]*1st Chair and Department of Cardiology, Medical University of Warsaw, Warsaw, Poland,* [3]*Department of Experimental and Clinical Pharmacology, Medical University of Warsaw, Warsaw, Poland,* [4]*HealthQuest Sp z o.o. Sp. k., Warsaw, Poland*

OBJECTIVES: To estimate cost-effectiveness of ivabradine used in treatment of chronic heart failure in Poland, using model based on individual patient data from pivotal SHIFT trial adapted using contemporary real-life epidemiology, treatment pattern and cost country-specific data. **METHODS:** Economic model based on SHIFT trial was originally developed for the UK setting and published. Based on the model, in November 2012 NICE gave its positive guidance for the analysed technology in line with EMA registered indication, acknowledging a range of conservative assumptions. Current study utilizes the NICE model populated with most recently published local data. General mortality was estimated from Polish life tables for the year 2010. Unit cost and expected rate of hospitalizations on standard treatment was based on publication in Polish Heart Journal. Standard treatment cost was based on official listing of reimbursed drugs. Average cost of ivabradine (5mg and 7.5mg, 56 tabs) was based on popular drug database (Kamsoft, April 2013). Exchange rate of National Bank of Poland 1 EUR=4.1759 PLN was applied (May 2013). **RESULTS:** At current pharmacy price (55.60 EUR / 56 tabs), incremental cost-utility ratio for ivabradine on top of standard treatment vs standard treatment alone is estimated at 10 230 EUR / QALY, well below the official cost-effectiveness threshold defined at 3*DGP *per capita* (25 336 EUR). Sensitivity analysis revealed that in order to exceed the cost-effectiveness threshold, price would have to be increased to 113.60 EUR (+104%). **CONCLUSIONS:** Conservative analysis shows that ivabradine used on top of standard treatment (ACE inhibitor, beta-blocker, MR antagonist, ±diuretics) in

patients suffering from chronic heart failure is a highly cost-effective health technology in the Polish setting, according to the criterion defined in Reimbursement Law. Robustness of this finding is demonstrated by the fact that cost-effectiveness is retained even at a price double vs base-case.

PCV98

STATIN COST-EFFECTIVENESS IN PATIENTS WITH PREVIOUS CORONARY HEART DISEASE: A SYSTEMATIC REVIEW OF THE COST-EFFECTIVENESS ANALYSIS DERIVED FROM SINGLE RANDOMISED CLINICAL TRIALS

Luque A[1], Nobre MRC[2]
[1]*Sao Paulo University, Sao Paulo, Brazil,* [2]*InCor - HCFMUSP, São Paulo, Brazil*

OBJECTIVES: Large randomized clinical trials (RCT) evidenced the benefits of statins in reducing major cardiovascular events in patients with established coronary heart disease (CHD). These multinational trials are likely to provide internally valid evidence. Cost-effectiveness analysis based on single trials costs and effects are common and represent the potential net benefit of an intervention in a well-controlled environment. The aim of this study is to systematically review the cost-effectiveness studies based on statins single trials in patients with previous CHD. **METHODS:** We searched to identify all literature relating to the cost-effectiveness of statins in the secondary prevention in patients with established CHD. Only studies with the effectiveness data extracted from a single RCT and clinical outcomes such as quality assessment, mortality or cardiovascular events rate were included. The cost per QALY was classified according to the WHO, following three categories of cost-effectiveness, Highly cost-effective, Cost-effective and Not cost-effective, adjusted with GDP per capita based on purchasing power parity (constant 2005 international USD). **RESULTS:** Twenty-one studies were included in the final analysis, covering a period range from 1996 to 2009. 7 large RCTs represented the origin of efficacy data. Most of studies assumed a full compliance, the Markov models were used in 11 out 21 studies. Time horizon ranged from 5 years to time life, with 10 years being the predominant choice. 9 studies performed a cost-utility analysis and showed the average cost per QALY, 8 of them classified as highly cost-effective and 1 cost-effective. Cost per QALY was sensitive for drug price, time horizon and event rates, 6 of this models models worked with composite endpoints. **CONCLUSIONS:** Statins are highly cost-effective in patients with CHD when effect size came from single well designed RCTs. Models heterogeneity and composite endpoints can decrease the robustness of the results.

PCV99

THE COST-EFFECTIVENESS OF CATHETER ABLATION AS FIRST-LINE TREATMENT

Aronsson M, Walfridsson H, Janzon M, Walfridsson U, Levin LÅ
Linköping University, Linköping, Sweden

OBJECTIVES: It has been suggested that radiofrequency catheter ablation could take priority over antiarrhythmic drugs as first-line treatment of paroxysmal AF, due to better efficiency, and fewer serious side effects. The objective of this study was to evaluate the cost-effectiveness of treating paroxysmal atrial fibrillation with radiofrequency catheter ablation as first-line treatment. **METHODS:** A decision-analytic Markov model was developed to study long-term effects and costs of catheter ablation compared to antiarrhythmic drugs as first-line treatment. **RESULTS:** Small, positive clinical effects were found in the overall population, a gain of an average 0.06 quality-adjusted life years (QALYs) to an incremental cost of €3033, resulting in an incremental cost-effectiveness ratio of €50 570/QALY. However, the incremental cost-effectiveness ratio of a 45-year-old patient was approximately €3434/QALY, while a 65-year-old costs €108 937 per QALY. **CONCLUSIONS:** Radio-frequency catheter ablation as first-line treatment is a cost-effective strategy for younger patients with paroxysmal atrial fibrillation. However, the cost-effectiveness of using catheter ablation as first-line therapy in older patients is uncertain, and in most of these cases antiarrhythmic drug therapy should be attempted before catheter ablation.

PCV100

ACTIVE-IMPLANTABLE CARDIAC DEVICES: IS THERE ROOM FOR COST SAVINGS IN PORTUGUESE HOSPITALS?

Pelicano-Romano J[1], Oliveira-Martins S[1], Mota-Filipe H[2], Cabrita J[1]
[1]*Faculty of Pharmacy, University of Lisbon, Lisbon, Portugal,* [2]*INFARMED – National Authority of Medicines and Health Products, IP, Lisbon, Portugal*

OBJECTIVES: Portugal is facing an economic crisis that demands a tight control over all hospitals' expenditures, namely with medical devices, whose market price is not yet regulated or documented. This study aims to describe the number and value of the Active-Implantable Cardiac Devices (AICD) bought by Portuguese hospitals in 2011, as well as to quantify potential savings that can be obtained shifting utilisation from higher to lower prices. **METHODS:** In February 2012, 42 hospitals were asked by INFARMED – National Authority of Medicines and Health Products, IP, about the number, type and value of the AICD acquired, using an ad-hoc developed software. Potential savings analysis was performed at two levels: AICD sub-groups (according to Portuguese Medical Device Nomenclature) and individual device reference. Within each level, three cost-minimization scenarios were conceptualized based on the minimum price reported (scenario 1), the average between the average price and the minimum one (scenario 2) and the average price (scenario 3). **RESULTS:** During 2011, 73.8% of the hospitals enrolled (n=31) bought AICD, comprising 16,815 devices, at a cost of 40,217,411 euros. In numbers, the most common AICD were pacemakers (44.8%), whereas cardioverter-defibrillators were related to a higher expenditure ratio (51.5% of total cost). Based on the AICD sub-groups analysis, the potential savings were 14.5 million euros in scenario 1 (44.1% of total cost), 7.4 million euros in scenario 2 (22.5%) and 1.8 million euros in scenario 3 (5.3%). Following this scenario order, the device reference approach estimated savings of 6.2 million euros (18.8%), 3.4 million euros (10.3%) and 1.1 million euros (3.3%), respectively. **CONCLUSIONS:** Significant potential savings were found, being greater when analysing AICD subgroups, assuming equal efficiency and safety for all devices within these clusters. Despite scenario 1 higher savings, scenario 2 seems the most realistic and feasible, when trying to accomplish a sustainable health care system.

PCV101

COST ANALYSIS OF ALPROSTADIL (PROSTAVASIN®) AS TREATMENT FOR PATIENTS WITH PERIPHERAL ARTERIAL DISEASE STAGES III AND IV COMPARED WITH LUMBAR SYMPATHECTOMY IN MEXICO

Carlos F[1], Gasca R[1], Aguirre A[2], Naranjo M[2]
[1]*R A C Salud Consultores S.A. de C.V., Mexico City, Mexico,* [2]*UCB de Mexico, S.A. de C.V., Mexico, D.F., Mexico*

OBJECTIVES: Peripheral arterial disease is associated with significant adverse outcomes, especially in patients with critical limb ischemia (CLI; stages III and IV). At 6 months, the risk of amputation is 35%, and mortality 20%. In patients unsuitable for interventional therapy, treatment with prostanoids may help reduce the risk of adverse outcomes. We aimed to assess the average cost of alprostadil (prostaglandin E_1) as treatment for patients with CLI compared with lumbar sympathectomy from the perspective of The Mexican Social Security Institute (IMSS). **METHODS:** In a clinical trial, alprostadil and lumbar sympathectomy showed similar response rates (Petronella P, et al. Nutr Metab Cardiovasc Dis 2004;14:186–92).Therefore, we conducted a cost minimization analysis based on the direct medical costs of alprostadil (40 µg twice-daily or 60 µg once-daily) administered over 28 days versus lumbar sympathectomy. Relevant costs included acquisition and infusion for alprostadil, and surgical procedure besides hospitalization (9 days) for lumbar sympathectomy. Unit cost for infusion was assumed to be equivalent to an emergency visit at first level of care at IMSS; unit cost of the surgical procedure and standard hospital stay (per day) correspond to the official values for these items at the second level of care at IMSS. UCB Pharma provided the cost for alprostadil. All costs are in 2013 Mexican pesos (MXN; 12.88 MXN = 1 USD, 17.23 MXN = 1 Euro). **RESULTS:** Costs per patient would be lower with both alprostadil 40 µg twice-daily ($59,640) and alprostadil 60 µg once-daily ($37,884) than with lumbar sympathectomy ($66,084), leading to savings of $6,444 (9.8%) and $28,200 (42.7%), respectively. Alprostadil use remained cost-saving versus lumbar sympathectomy in most of the scenarios evaluated through sensitivity analysis. **CONCLUSIONS:** These results suggest alprostadil is a cost saving intervention when compared with lumbar sympathectomy for patients with CLI from the Mexican public health care perspective.

PCV102

THE COST-EFFECTIVENESS OF APIXABAN COMPARED TO WARFARIN, ASPIRIN, RIVAROXABAN AND DABIGATRAN IN IRELAND

Kelly J[1], Griffith G[2], Fortune P[3], Lister S[4]
[1]*Pfizer Healthcare Ireland, Dublin, Ireland,* [2]*Pfizer UK, Tadworth, UK,* [3]*Bristol-Myers Squibb Ireland, Dublin, Ireland,* [4]*Bristol-Myers Squibb, Uxbridge, UK*

OBJECTIVES: The objective of this pharmacoeconomic evaluation was to determine whether apixaban, compared to warfarin, dabigatran and rivaroxaban in patients suitable for vitamin K antagonists (VKA), or to aspirin in VKA-unsuitable patients, is a cost-effective treatment for the prevention of stroke or systemic embolism (SE) in adult patients with non-valvular atrial fibrillation (AF) with one or more risk factors. **METHODS:** A Markov model was constructed consisting of 18 health states, using a 6-week cycle length and a lifetime time horizon. Baseline characteristics were taken from a 2011 GPRD study. Clinical inputs were derived from a network meta-analysis of the efficacy and bleeding outcomes from the three warfarin-controlled trials ARISTOTLE, RE-LY and ROCKET-AF, and the single aspirin-controlled trial AVERROES. Local unit costs and utility data were assigned to the appropriate model health states to calculate total Quality-Adjusted Life Years (QALYs) and costs. Univariate and probabilistic sensitivity analyses (PSA) were conducted. **RESULTS:** Apixaban was associated with an ICER vs warfarin of €11,087. Against the less-commonly used anti-coagulants, apixaban was cost-effective against each at the €45,000 willingness-to-pay threshold. Apixaban provided more QALYs than all other therapies. Compared to warfarin, apixaban produced savings in avoided cost of stroke, intracranial haemorrhage, INR monitoring, and bleeding. Apixaban was cost-effective across all patient subgroups of INR control (centre Time in Therapeutic Range) and $CHADS_2$ stroke risk categories 1 and 2. One-way sensitivity analyses, scenario analyses, and probabilistic sensitivity analyses confirmed that the findings were robust to changes in key parameters. The probability that apixaban was the most cost-effective therapy at a willingness-to-pay threshold of €45,000 per QALY was 93% and 100% in the VKA-suitable and VKA-unsuitable populations, respectively. **CONCLUSIONS:** Apixaban can be considered cost-effective for the prevention of stroke and SE in people with non-valvular AF, at a threshold of €45,000/QALY, under standard decision rules.

PCV103

ECONOMIC EVALUATION OF APIXABAN FOR THE PREVENTION OF STROKE IN ATRIAL FIBRILLATION IN THE NETHERLANDS

Stevanovic J[1], Pompen M[2], Le HH[1], Rozenbaum MH[3], Postma MJ[1]
[1]*University of Groningen, Groningen, The Netherlands,* [2]*Bristol-Myers Squibb, Woerden, The Netherlands,* [3]*Pfizer Nederland, Capelle aan den Ijssel, The Netherlands*

OBJECTIVES: Stroke prevention is the main goal in treating patients with atrial fibrillation (AF). Treatment with anticoagulants, such as vitamin-K antagonists (VKAs; e.g. warfarin and cumarines), was demonstrated to be an effective strategy. However, even though VKAs are the current standard therapy recommended by different guidelines, the significant risk of bleeding and the requirement for a regular monitoring are limiting its use. Apixaban is a novel oral anticoagulant (NOAC) associated with significantly lower hazard rates for stroke/systemic embolism, major hemorrhage and discontinuations, compared to VKAs. This study evaluated the cost-effectiveness (CE) of apixaban compared to VKAs in the base-case analysis and alternatively to other NOACs for stroke prevention in non-valvular AF patients in The Netherlands. **METHODS:** A global Markov model developed by United BioSource Corporation was modified to reflect the use of oral anticoagulants in The Netherlands. The model used efficacy data from a published indirect treatment comparison of NOACs and cost data from Dutch costing studies as inputs. Following health states were included in the model: non-valvular AF, primary and recurrent ischemic and hemorrhagic stroke, systemic embolism, myocardial infarction, intracranial hemorrhage, other major and non-major bleedings, treatment

discontinuations and death. Main outcomes were quality adjusted life years (QALY) and costs. Univariate and probabilistic sensitivity analyses (PSA) were conducted on the incremental cost-effectiveness ratio (ICER). **RESULTS:** In the base-case analysis, apixaban treatment compared to VKAs has an ICER well below an informal minimal willingness-to-pay threshold of €20,000/QALY for The Netherlands (i.e. around € 7,000/QALY). PSA showed that the results of the base-case analysis were quite robust. Potentials exist for apixaban to be dominant over the other NOACs, rivaroxaban and dabigatran depending on hazard ratios, risks for complications and local price levels. patients in The Netherlands. **CONCLUSIONS:** In patients with AF, we found apixaban to be a cost-effective option in The Netherlands, compared to VKAs.

PCV104

A SOCIETAL PERSPECTIVE COST-UTILITY ANALYSIS OF RIVAROXABAN COMPARED WITH ENOXAPARIN SODIUM IN PATIENTS UNDERGOING TOTAL HIP OR TOTAL KNEE REPLACEMENT SURGERY

Stollenwerk B[1], Le L[1], Zindel S[1], Müller D[2], Klug F[1], Stock S[2]
[1]*Helmholtz Zentrum München - German Research Center for Environmental Health, Neuherberg, Germany,* [2]*University of Cologne, Cologne, Germany*

OBJECTIVES: Several cost-effectiveness analyses exist that compare rivaroxaban with enoxaparin sodium as thrombosis prophylaxis in patients undergoing total hip replacement (THR) or total knee replacement (TKR) surgery. However, none of these refers to a societal perspective, and thus indirect costs have so far not yet been included. The objective of this research was to conduct a cost-utility analysis from the German societal perspective, based on a life-time horizon. **METHODS:** A decision-tree was used to calculate the short term consequences of treatmentby classifying whether subjects experienced a deep a vein thrombosis, a pulmonary embolism, a major bleeding, death due to the surgery, or no event. Furthermore, we designed a Markov model to quantify the long-term consequences. The main health effect was based on the RECORD 1 and RECORD 3 trials. A semi-micro simulation approach was applied to reflect the age and gender distribution of the target population. Probabilistic, deterministic and structural sensitivity analyses were performed to assess the robustness of the results. **RESULTS:** Rivaroxaban dominated enoxaparin sodium in the case of TKR. This dominance was robust within sensitivity analysis. In contrast, the point estimate of the cost-effectiveness ratio in the case of THR was €867,018 per quality-adjusted life year (QALY). However, there was a wide variation within the probabilistic sensitivity analysis: the dots were substantially scattered over three quadrants of the cost-effectiveness plane. Compared to previous analyses, the selection of effectiveness data seems to have a significant impact of the results. **CONCLUSIONS:** Rivaroxaban was found to dominate enoxaparin sodium after TKR, whereas the evidence regarding THR is unclear. Results were similar to previous analyses from the third-party payer perspective.

PCV105

TELEMONITORING AFTER DISCHARGE FROM HOSPITAL WITH HEART FAILURE – COST-EFFECTIVENESS MODELLING OF ALTERNATIVE SERVICE DESIGNS

Thokala P, Baalbaki H, Brennan A
University of Sheffield, Sheffield, UK

OBJECTIVES: To estimate the cost-effectiveness of home telemonitoring (TM) or structured telephone support (STS) strategies versus usual care for adults recently discharged (within 28 days) after a heart failure (HF) exacerbation in England and Wales. **METHODS:** A Markov model was used to evaluate a) STS via human to machine (HM) interface, b) STS via human to human (HH) contact, and c) TM, against d) usual care. Given heterogeneity in the interventions, cost-effectiveness analysis was performed using bottom up costing scenarios regarding costs of devices, monitoring and medical care to deal with alerts. Costs and quality adjusted life years (QALYs) over a 30 year (patient lifetime) horizon were estimated based on monthly probabilities of death and monthly risks of hospitalisations (HF-related complications or other causes) estimated from clinical effectiveness parameters computed using a network meta-analysis of randomised controlled trials. **RESULTS:** Base case monthly costs per patient were: £27 for usual care, £119 for STS HM, £179 for STS HH and £175 for TM. TM was the most cost-effective strategy in the scenario using these base case costs. Compared with usual care, TM had an estimated incremental cost effectiveness ratio (ICER) of £9,552/QALY, whereas STS HH had an ICER of £63,240/QALY against TM. STS HM was dominated by usual care. Probabilistic sensitivity analysis (PSA) showed 44% chance of TM being cost-effective at a willingness to pay threshold of £20,000 per QALY, with STS HH 36%, STS HM 18% and usual care 2%, respectively. Scenario analyses performed using higher costs of usual care, higher costs of STS HH and lower costs of TM do not substantially change the conclusions. **CONCLUSIONS:** Cost-effectiveness analyses suggest TM was an optimal strategy in most scenarios, but there is considerable uncertainty in relation to clear descriptions of the interventions and robust estimation of costs.

PCV106

LIFETIME COST-EFFECTIVENESS OF ISOLATED AORTIC VALVE REPLACEMENTS ASSOCIATED WITH THE MINI-INVASIVE IMPLANTATION OF A NEW SUTURELESS AND COLLAPSED VALVE IN FRANCE AND UNITED KINGDOM

Pradelli L[1], Giardina S[2], Ranucci M[3]
[1]*AdRes HE&OR, Turin, Italy,* [2]*Sorin Group, Milano, Italy,* [3]*IRCSS Policlinico San Donato, San Donato Milanese, Italy*

OBJECTIVES: Mini-invasive aortic valve replacement (MiAVR) has several advantages over full sternotomy (FS), mainly less surgical trauma, decreased blood loss, lower mortality and faster recovery. Perceval S is an aortic valve which is implanted without need for suturing and a collapsed profile, thus allowing a significant reduction of cross-clamping times, an independent risk factor for worse outcomes, allowing to expand the pool of operable patients with MiAVR. **METHODS:** A patient-level simulation model fully coded in WinBugs was updated and extended to predict lifetime effectiveness and costs of isolated AVR procedures associated with this new valve in France and UK, as compared to traditional valve implants, from the cost perspective of the third party payer. Unit costs and health state-specific utilities were retrieved from official and literature sources. Two price scenarios were evaluated, one in which the sutureless valve is sold at the double, and one at the triple price of its comparator. Future costs and outcomes are discounted at a yearly 3.5% rate. **RESULTS:** In the first cost scenario, the model predicts that on average MiAVR with Perceval S instead of traditional sutured valves in FS would yield incremental 0.29 LYs (0.20 QALYs) and savings for about 3,000 € and 3,250 £, in France and UK, respectively. In the second cost scenario, Perceval S in MiAVR still remains dominant, with savings for 550 € and 740 £, in France and UK, respectively. Deterministic threshold analysis indicates that the sutureless valve would retain acceptable cost-effectiveness (at willingness-to-pay thresholds of 30,000€ and 20,000£ per QALY) as long as its price does not exceed 5.6 and 4.9 times that of the traditional valve, in France and UK, respectively. **CONCLUSIONS:** The sutureless valve in combination with MiAVR offers the opportunity to improve outcomes in isolated AVR at a reduced cost to the third party payers.

PCV107

COST UTILITY ANALYSIS OF SCREENING AND TREATMENT OF HYPERLIPIDEMIA IN CHINESE ADULTS AGED 45 AND ABOVE

Zhang XG[1], Wu JJ[1], Chen CI[2], Xie XP[2], Liu L[3], Yang L[1]
[1]*Peking University, Beijing, China,* [2]*Pfizer China, Beijing, China,* [3]*Pfizer Inc. and Weill Medical College of Cornell University, New York, NY, USA*

Serum total and LDL cholesterol levels are high (13.9% for borderline high LDL- cholesterol) and increasing in China. Hyperlipidemia is a main risk factor for cardiovascular and cerebrovascular diseases. Screening is one of the effective prevention methods; however, there has been no appraisal of the cost-effectiveness of blood lipid screening in China. **OBJECTIVES:** To determine the cost-utility of blood lipid screening and subsequent interventions versus no screening for the prevention and treatment of hyperlipidemia and its complication. **METHODS:** Cost utility analysis based on a Markov model was conducted for a cohort of Chinese adults aged 45 and abovefrom screening to death. Published clinical trials and epidemiological studies retrieved from electronic bibliographic databases; supplementary data obtained from CVD patients survey in China. Markov model simulated the long term effects of screening and no screening strategies from the aspects of cost and effectiveness. The model assumed a 30 year time horizon, and costs and benefits were discounted at 5%. The willingness-to-pay threshold is ¥100,000/QALY. Sensitivity analyses were conducted to evaluate assumptions of the model and to identify which model inputs had most impact on the results. **RESULTS:** Estimated costs for each quality adjusted life year (QALY) gained among no screening population were ¥6325.8, with cumulative costs of ¥77112 and cumulative utility of 12.19, and ¥5783.5 for screened population with cumulative costs of ¥72178 and cumulative utility of 12.48, respectively. The results showed the blood lipid screening was associated with increased QALY and potentially cost-saving as compared with no screening. Sensitivity analyses demonstrated robustness of the results. **CONCLUSIONS:** Based on this Markov model, blood lipid screening is likely to be cost-effective option compared with no screening for the prevention and treatment of hyperlipidemia and its complication among Chinese aged 45 and above.

PCV108

COST-EFFECTIVENESS OF DRUG-ELUTING STENTS VERSUS BARE METAL STENTS IN EGYPTIAN DIABETIC PATIENTS

ElSisi G, Ragab S, Ashraf R, Elmahdawy M
Central Administration for Pharmaceutical Affairs, Cairo, Egypt

OBJECTIVES: Cost-effectiveness of Drug eluting stents (DES) versus bare metal stents (BMS) in Egyptian diabetic patients with chronic coronary artery disease from a patient perspective was evaluated over a time horizon of 3 years. **METHODS:** A cohort Markov process model with five health states: stent, coronary artery bypass surgery (CABG), non-fatal myocardial infarction (MI), percutaneous coronary intervention (PCI) and death was derived from published data. The transition probabilities from the index procedure to death, MI, PCI, and CABG were derived from an updated, previously published meta-analysis of RCTs comparing DES with BMS in patients with coronary artery disease. Relative risk reduction, restenosis risks, mortality rates, utilities were derived using published sources. Direct Medical costs were obtained from 4 top-rated cardiology hospitals in Egypt. All costs and effects were discounted at 3.5% annually. All costs were reported in Egyptian pounds of the financial year 2013. Deterministic sensitivity analysis was conducted. **RESULTS:** In the overall population, total costs for DES and BMS were 20,664 EGP and 11,957 EGP respectively. Total QALYs for DES and BMS were 2.26 and 2.05 respectively. The incremental cost-effectiveness ratio (ICER) for DES versus BMS was 41,616 EGP/QALY. DES is cost effective because it is less than 3 times GDP/capita in Egypt (57,566 EGP). Results between DES and BMS were most sensitive to the Mortality rate of both DES and BMS. **CONCLUSIONS:** World Health Organization recommends that interventions that cost more than 3 times GDP/capita for one Disability Adjusted Life Year (DALY) avoided should not be reimbursed. Despite DALY is different from QALY but we can assume that they are similar to be able to put a value on the outcome. DES represents a good value for money compared to BMS in Egyptian diabetic patients with chronic coronary artery disease.

PCV109

COST-UTILITY ANALYSIS OF CORONARY ARTERY CALCIUM SCORE TO GUIDE STATIN THERAPY IN PATIENTS WITH ELEVATED C-REACTIVE PROTEIN AND LOW LDL CHOLESTEROL LEVELS

Silva Miguel L[1], Ferreira AM[2]
[1]*CISEP (Research Centre on the Portuguese Economy), Lisbon, Portugal,* [2]*Hospital de Santa Cruz and Hospital da Luz, Carnaxide and Lisbon, Portugal*

OBJECTIVES: Using statins in primary prevention is controversial given the low event rate and the difficulty to identify patients who really benefit. Coronary calcium score has been identified as a strong predictor of cardiovascular events, being recommended for risk stratification in intermediate risk individuals. This study aims to assess, from the Portuguese societal perspective, the cost-utility of determining coronary calcium score to guide the use of statins in individuals with elevated C-reactive protein and low LDL cholesterol. Three strategies are compared: no treatment, test and treat accordingly, and treat every patient with rosuvastatin 20mg. **METHODS:**

A Markov model was developed to predict the occurrence of myocardial infarction, stroke, coronary revascularization and death. The model considers a lifetime horizon and a 3.5% discount rate. Clinical inputs were derived from the JUPITER trial and from a cohort of the MESA study fulfilling JUPITER inclusion criteria. Event costs were obtained from the literature. Rosuvastatin 20mg cost incorporates a discount to reflect the introduction of generics within a maximum of 5 years. **RESULTS:** Coronary calcium score determination and subsequent primary prevention in individuals with a score exceeding 100 dominates no treatment. Implementing primary prevention in those patients with positive score, and not just those with score above 100, implies a willingness to pay around 40,000€ per QALY. Finally, primary prevention in all individuals is not cost-effective when compared to primary prevention in those with positive calcium score as it is associated with a cost per QALY of more than 600,000€. **CONCLUSIONS:** Determination of coronary calcium score is cost-effective as it allows to identify those patients that will benefit most from primary prevention. Primary prevention in patients with calcium score greater than 100 should be implemented. The implementation of this strategy in other patients with positive calcium score depends on the willingness to pay for a QALY.

PCV110

LIFETIME COST-EFFECTIVENESS OF ISOLATED AND CONCOMITANT AORTIC VALVE REPLACEMENTS IN GERMANY

Pradelli L[1], Giardina S[2], Ranucci M[3]

[1]*AdRes HE&OR, Turin, Italy,* [2]*Sorin Group, Milano, Italy,* [3]*IRCSS Policlinico San Donato, San Donato Milanese, Italy*

OBJECTIVES: Aortic valve replacement (AVR) is the most common heart valve operation, accounting for a conspicuous part of all valve surgery performed in the elderly. Prolonged aortic cross-clamping times are an independent risk factor. Perceval S is a new aortic valve which is implanted without need for suturing and a collapsed profile, thus allowing a significant reduction of cross-clamping times and to expand the pool of patients operable with mini-invasive aortic valve replacement (MiAVR) among isolated AVR candidates. Aim of this simulation study was to predict costs and outcomes of isolated AVR procedures associated with this new valve in Germany, as compared to traditional valve implants, from the cost perspective of the third party payer. **METHODS:** A previously published probabilistic, patient-level simulation model fully coded in WinBugs was updated with new clinical data and the evaluation extended to evaluate lifetime cost-effectiveness from the perspective of the third party payer. Unit costs and health state-specific utilities were retrieved from official and literature sources; the price of the sutureless valve is hypothesised twice as much as for traditional valves. Future costs and outcomes are discounted at a yearly 3.5% rate. **RESULTS:** The model predicts that on average the use of the Perceval S in MiAVR instead of traditional sutured valves in full sternotomy among isolated AVR candidates, would yield incremental 0.29 LYs (0.20 QALYs) per patient, with an associated saving around 3,500 €, thus representing a dominant option when compared to traditional surgical AVRs. In concomitant procedures, on average the use of the Perceval S valve instead of traditional sutured valves is expected to yield incremental 0.21 LYs (0.16 QALYs) per patient, with an associated saving of over 4,400 €, also representing a dominant alternative. **CONCLUSIONS:** Sutureless valves may improve outcomes in AVR at a reduced cost to the third party payers.

PCV111

STROKE PREVENTION IN NON-VALVULAR ATRIAL FIBRILLATION: SYSTEMATIC REVIEW OF COST-EFFECTIVENESS STUDIES

Costa S, Ramos JC, Braga AC, Pereira J

Universidade Nova de Lisboa, National School of Public Health, Lisboa, Portugal

OBJECTIVES: To conduct a systematic review of cost-effectiveness studies of newer oral anticoagulants for stroke prevention in atrial fibrillation versus warfarin and understand its implications for policy and for further research. **METHODS:** We searched DARE, Cochrane, NICE, Tufts, NHS EED, Science Direct and PubMed through May 2013 to identify studies of oral anticoagulants dabigatran, rivaroxaban and apixaban versus warfarin for stroke prevention in non-valvular atrial fibrillation in patients at a moderate-to-high risk of stroke initiating anticoagulation for/near lifetime using either a societal or health care perspective. A separate analysis was performed for ISPOR abstracts. **RESULTS:** Ten studies were identified, most based on one randomized trial per therapy, 3 reported an ICER above commonly accepted WTP levels. ICERs ranged from $9,099–$86,000 for dabigatran and $3,190–$55,757 for rivaroxaban. Apixaban was found to be cost-effective $11,400–$24,312. Upon PSA, dabigatran was cost-effective 40% to 98%, apixaban 44.1% to 60%, and rivaroxaban 2.1% to 80% of the time, for the lowest reported WTP. Variations in ICERs occurred between studies that used the same efficacy data. Key variables influencing variations include differences in costs; assumptions for INR monitoring and utilization of health care resources; and the probabilities of adverse event. Effectiveness, compliance, adverse events and INR management were derived from clinical trials. Additional data from recent abstracts reported similar trends. **CONCLUSIONS:** For this indication, novel agents seem to be cost-effective alternatives to warfarin, despite variations across countries. However, cost-effectiveness may depend on: prices of medicines in each country; the proportion of actual patients' time within the INR therapeutic range; and the actual real-world effectiveness, safety, and utilization of these therapies. More head-to-head RCTs and pragmatic trials are required. Future cost-effectiveness studies of these new therapies should be periodically repeated during the lifecycle of medicines under real-world utilization and should also incorporate budget impact analysis.

PCV112

PHARMACOECONOMIC ANALYSIS OF IVABRADINE USE IN BELARUS

Kozhanova I[1], Romanova I[1], Gavrilenko L[1], Sachek M[2]

[1]*Belarusian State Medical University, Minsk, Belarus,* [2]*The Belarusian Center for Medical Technologies, Computer Systems, Administration and Management of Health, Minsk, Belarus*

OBJECTIVES: Cost-effectiveness and cost-utility analysis of ivabradine use in patients with stable angina with left ventricular systolic dysfunction has been performed to determine economic advisability of its applying in Belarus. **METHODS:** Markov model with 12-month cycle duration and 10-year time horizon has been constructed on the basis of a systematic review of literature, national surveillance data, local health services market and drugs market estimation. Four conditions were included: stable process, non-fatal event (cardiac infraction or unstable angina), surgical revascularization, death. Number of patients with stable angina who stayed alive and QALY till the end of the last analyzed cycle of the model has been used as a measure of efficiency and utility. One-sided determinate sensitivity analysis has been conducted. Incremental values have been calculated. Direct medical expenses have been evaluated. Value of triple GDP per capita per year (10790 euro) has been used as threshold. **RESULTS:** Research showed clinical advantage of treatment scheme with ivabradine as compared to "traditional therapy" concerning the amount of patients who stayed alive by the end of the last cycle of model (7275 vs. 6421 persons in total population and 8136 vs 6993 in patients with heart rate >70 pbm) and QALY number (77635 vs. 69253 in total population and 84138 vs. 73031 in patients with heart rate >70 pbm years). The sensitivity analysis showed that in 9.09% of cases ivabradine was the prevailing technology, in 90.91% the cost per QALY did not exceed the threshold. The average counted incremental cost per QALY was 3836 Euro. **CONCLUSIONS:** The analysis showed the pharmacoeconomic acceptability of ivabradine use by patients with stable angina with left ventricular systolic disfunction and heart rate $\geq$ 70 bpm at prescription of the medication in optimal dosage which ensures minimal market value of the medication.

PCV113

LIFETIME COST-EFFECTIVENESS OF CONCOMITANT AORTIC VALVE REPLACEMENTS IN FRANCE AND THE UNITED KINGDOM

Pradelli L[1], Giardina S[2], Ranucci M[3]

[1]*AdRes HE&OR, Turin, Italy,* [2]*Sorin Group, Milano, Italy,* [3]*IRCSS Policlinico San Donato, San Donato Milanese, Italy*

OBJECTIVES: Aortic valve replacement (AVR) is the most common heart valve operation, accounting for a conspicuous part of all valve surgery performed in the elderly. Prolonged aortic cross-clamping times are an independent risk factor for worse outcomes. Perceval S is a new aortic valve which is implanted without need for suturing and a collapsed profile, thus allowing a significant reduction of cross-clamping times. **METHODS:** A patient-level simulation model fully coded in WinBugs was updated and extended to predict lifetime effectiveness and costs of concomitant AVR procedures associated with this new valve in France and UK, as compared to traditional valve implants, from the cost perspective of the third party payer. Two price scenarios were evaluated, one in which the sutureless valve is sold at the double, and one at the triple price of its comparator. Unit costs and health state-specific utilities were retrieved from official and literature sources. Future costs and outcomes are discounted at a yearly 3.5% rate. Uncertainty is evaluated through the incorporated probabilistic sensitivity analysis and deterministic threshold analyses. **RESULTS:** The model predicts that on average the use of the Perceval S valve instead of traditional sutured valves would yield incremental 0.21 LYs (0.16 QALYs) per patient, with an associated saving of about 5,100 € and 4,400 £ in France and UK, respectively, in the first scenario, and of 2,600 € and 1,900 £, in the second. Deterministic threshold analysis indicates that the sutureless valve would remain averagely dominant as long as its price does not exceed 4.1 and 3.8 times that of the traditional valve, in France and UK, respectively. **CONCLUSIONS:** The sutureless valve offers the opportunity to improve outcomes in concomitant AVR at a reduced cost to the third party payers.

PCV114

IMPACT OF CARDIOVASCULAR DISEASE ON LABOUR FORCE PARTICIPATION: BIVARIATE PROBIT ANALYSIS

Civil EF[1], Ilhan MN[1], Yildirim J[2]

[1]*Gazi University Faculty of Medicine, Ankara, Turkey,* [2]*TED University, Ankara, Turkey*

OBJECTIVES: Health status plays an important role in individuals' labour supply decision. Chronic diseases, such as cancer, diabetes mellitus, cardiovascular disease, mental illness and disabilities are reported to have strongest effect on individual transitions on the labour market. Among them, cardiovascular disease (CVD), in addition to being the leading cause of death, is likely to affect individuals' employment decision. The aim of this study is to investigate the impact of clinically diagnosed cardiovascular disease on labour supply, taking account of the observed and unobserved factors that influence the risk of cardiovascular disease and labour force participation. **METHODS:** Study subjects were randomly selected from Gazi University general internal medicine outpatient clinic. Demographic, health and employment status data have been compiled for five hundred and fifteen study subjects who applied to the clinic between December 2012 and February 2013. The bivariate probit method has been utilized to investigate the impact of incidence of cardiovascular disease on employment status. **RESULTS:** Empirical results indicate that cardiovascular disease have a strong negative impact on labour market outcomes, particularly for men, and that education level, gender, hypertension have significant indirect effects on labour force participation. Analysis results suggest that there is a correlation between the labour force participation and the incidence of cardiovascular disease, revealing that single equation models might be misspecified. **CONCLUSIONS:** As cardiovascular disease has a significant negative impact on employment status, public health programs need to address this issue and provide treatment strategies and prevention efforts to alleviate the destructive impact on societal productivity.

PCV115

REAL WORLD RESOURCE USE ASSOCIATED WITH TRANSCATHETER AORTIC VALVE IMPLANTATION AND CONVENTIONAL AORTIC VALVE REPLACEMENT SURGERY

Awad W[1], Mathur A[1], Baldock L[2], Oliver S[2], Kennon S[1]

[1]*The London Chest Hospital, London, UK,* [2]*pH Associates Ltd., Marlow, UK*

OBJECTIVES: To define hospital and post discharge-related resource use for patients undergoing Transcatheter Aortic Valve Implantation (TAVI) and conventional Aortic Valve Replacement (AVR) surgery within a single UK hospital. **METHODS:** A local

service evaluation of patients undergoing TAVI or AVR between January 2011 and May 2012 captured data until 6-months post-procedure, collected from hospital records and via a General Practitioner questionnaire. The main endpoints were mortality, hospital length of stay (LoS), discharge destination, readmission and post-discharge resource use. Subgroup analyses were performed for AVR patients aged ≥80 (AVR≥80) and with Euroscore of ≥10 (AVR≥10). **RESULTS:** Results given as means (standard deviation) for TAVI (n=51), AVR (n=188), AVR≥80 (n=48) and AVR≥10 (n=47) respectively, unless otherwise stated. Age in years was 83 (3.06), 71 (13.11), 84 (2.72), 79 (7.12), Logistic Euroscore1 was 24.74 (11.90), 8.07 (6.44), 12.01 (6.04), 16.45 (6.58) and post-operative LoS in days was 11.51 (11.16), 10.88 (10.82), 14.31 (16.66), 15.19 (17.67). For patients discharged alive, 0 of 48 (0%), 13 of 180 (7%), 6 of 46 (13%) and 4 of 44 (9%), had an unplanned cardiac-related readmission within 30-days of discharge. Time to readmission was 74.6 (52.9), 31.1 (37.2), 15.4 (10.5) and 16.7 (12.8) days. **CONCLUSIONS:** Despite TAVI being performed in an older, higher risk population the LoS is similar to AVR. Most strikingly there were no cardiac-related readmissions within 30-days for TAVI and time to first readmission was significantly longer. This evaluation suggests that TAVI is clinically appropriate and provides economic advantages in both the hospital and post discharge setting in this high risk group. Many patients undergoing TAVI are considered unfit for surgery and hence TAVI offers a treatment that delivers similar results to traditional AVR surgery without the high risk associated with surgery.

CARDIOVASCULAR DISORDERS – Patient-Reported Outcomes & Patient Preference Studies

PCV116
PERSISTENCE WITH MEDICATIONS: A DISCRETE CHOICE EXPERIMENT OF PREFERENCES AMONG HYPERTENSIVE PATIENTS

Fargher EA, Morrison V, Plumpton CO, Hughes DA
Bangor University, Bangor, UK

OBJECTIVES: To examine patients' stated preferences for persisting with medications using a discrete choice experiment (DCE) and to explore the relationship with clinical, demographic and psycho-social variables. **METHODS:** A 4-attribute DCE (mild side-effects, potentially life-threatening but rare side-effects, dose frequency, treatment benefits) with 3-levels identified from literature and expert opinion was developed using a fractional factorial design. Scenarios were folded into nine forced binary choices: Which medicine would you be most likely to continue taking? The survey was translated, piloted and approved for eleven European countries. Target sample was 100≤n≤323 patients prescribed anti-hypertensives per country, recruited by posters in community pharmacies or general practices. Results were analysed in STATA using a random effects logit model. **RESULTS:** A total of 2856 patients from Austria (n=323), Belgium (n=180), England (n=323), Germany (n=265), Greece (n=289), Hungary (n=323), The Netherlands (n=237), Poland (n=323) and Wales (n=323) completed the online questionnaire. All four attributes influenced persistence with treatment (p<0.01). Patients were willing to forego chance of improvements in treatment benefits (%) in order to improve other attributes: -36.10% (95% CI: -41.24 to -32.94) for a very rare risk of life-threatening side-effects; -18.66% (95% CI: -21.51 to -16.67) for once daily dose frequency; -0.74% (95% CI: -0.85 to -0.67) to reduce the risk of mild ADR by 1%. Likelihood ratio tests showed that models controlling for clinical, demographic and psycho-social variables were significantly different from the base-case. There was limited evidence that self-reported adherence influenced stated preferences to persist. **CONCLUSIONS:** Patients were willing to trade potential benefits, harms, and convenience in responding that they would persist with treatment. Clinical, demographic and psycho-social factors influence the extent of the trade-offs between these attributes. Persistence may therefore be enhanced directly, through selection of medicines meeting preferred levels of attributes, or indirectly through targeting modifiable psycho-social factors that affect trade-off choices.

PCV117
ILLUSTRATION OF THE COMBINED EFFECT OF PATIENT'S ADHERENCE AND INDIVIDUAL BIOLOGICAL CHARACTERISTICS ON BLOOD PRESSURE

Tousset E[1], Lowy A[2], Ong SH[2], Vrijens B[1]
[1]*MWV Healthcare, Visé, Belgium,* [2]*Novartis Pharma AG, Basel, Switzerland*

OBJECTIVES: With the recognition that adherence is commonly imperfect, even with once daily regimen, 'forgiveness' is becoming acknowledged as an important characteristic in predicting real-world effectiveness. Forgiveness is typically reported as a group average value, ignoring person-to-person variability. Here we illustrate an alternative way of estimating and presenting information on drug forgiveness which allows the estimation of the combined effect of imperfect adherence and variable forgiveness. **METHODS:** Adherence data from 4783 patients with hypertension were used in these simulations. A projected dosing history over 365 days was obtained from each of these individual adherence profiles. Longitudinal clinic systolic blood pressure (SBP) collected from 4879 patients after drug withdrawal were analysed using non linear mixed effect models, allowing the estimation of the between-patient variability in the loss of effect (the 'offset'). Projected SBP profiles were obtained by combining each dosing history with 100 offset curves randomly sampled from the variance-covariance matrix estimated in the previous step. Re-samplings were performed in the resulting dataset using two adherence distributions described in the literature to estimate the proportion of time patients who achieved the maximal effect on SBP over a treatment period of 365 days. **RESULTS:** In the first population, 90% of the patients achieved the maximal effect during 95% of the time, whereas, in the population presenting a lower adherence, about 80 % maintained the maximal effect during 95% of the time. **CONCLUSIONS:** The impact imperfect adherence on response is mitigated by drug forgiveness. This methodology reveals the person-to-person variability in clinical effectiveness which is hidden when forgiveness is considered as a group-average quantity, and shows that the agent studied provides a reliable clinical effectiveness despite imperfect adherence. Ultimately, this approach could be used to compare drugs with different levels of forgiveness and/or regimens in the presence of non-adherence.

PCV118
TWO SIMPLE METHODS OF MEASURING ADHERENCE IN HYPERTENSIVE PATIENTS ARE PREDICTIVE OF BLOOD PRESSURE CONTROL: POOLED ANALYSIS OF 17,516 PATIENTS FROM SEVEN VALSARTAN STUDIES

Villa I[1], MacDonald K[2], Denhaerynck K[3], Sun D[4], Vancayzeele S[5], Brié H[5], Aerts A[6], Abraham I[7]
[1]*Universidad de Concepcion, Concepcion, Chile,* [2]*Matrix45 LLC, Earlysville, VA, USA,* [3]*Matrix45, Basel, Switzerland,* [4]*University of Arizona, Tucson, AZ, USA,* [5]*Novartis Pharma AG, Vilvoorde, Belgium,* [6]*Novartis Pharma, Vilvoorde, Flemish Brabant, Belgium,* [7]*University of Arizona College of Pharmacy Center for Health Outcomes and PharmacoEconomic Research/ Matrix45 LLC, Earlysville, VA, USA*

OBJECTIVES: Hypertension is a common chronic disease and risk factor for many other conditions. Despite effective treatments, few patients achieve recommended blood pressure targets. Among the variables related with poor antihypertensive outcomes, patient adherence appears to be especially influential. Adherence assessment should fit seamlessly into the clinical encounter, which requires simple methods. We evaluated whether adherence assessments through a single-item query and a visual analogue scale (VAS) are independent predictors of controlled systolic (SBP), diastolic (DBP), and combined systolic/diastolic (SBP/DBP) blood pressure (BP). **METHODS:** Pooled analysis of 17,516 patients treated with valsartan as second-line therapy from seven Belgian studies. Adherence was assessed at baseline and 90 days using two methods: a single query derived from the Basel Assessment of Adherence Scale ("Do you recall not having taken your medication sometime in the past four weeks?") and a physician-rated VAS (0-100 range). Logistic regression was used to model BP control as a function of these two measures. Controlled BP was defined as <140mm/90mmHg (<130/80mmHg for diabetics). **RESULTS:** BP control rates at 90 days were 39.3% for SBP, 59.4% for DBP, and 33.8% for SBP/DBP. 79% of patients identified as adherent under the single query reached BP control, with odds ratios of 0.66 (95%CI=0.62-0.71, p<0.001) for SBP, 0.68 (95%CI=0.63-0.73, p<0.001) for DBP, and 0.64 (95%CI=0.59-0.70, p<0.001) for SBP/DBP. Of those patients with a physician-rated VAS adherence score of 80 or more, 81% reached BP control, with odds ratios of 0.93 (95%CI=0.86-1.00, p<0.001) for SBP, 0.79 (95%CI=0.73-0.85, p<0.001) for DBP, and 0.91 (95%CI=0.84-0.99, p<0.001) for SBP/DBP. **CONCLUSIONS:** The two simple methods of measuring adherence, the single query and VAS, are independent predictors of blood pressure control. These measures can be integrated seamlessly into routine clinical practice. These findings must be validated in other health conditions and therapeutic areas.

PCV119
VALIDITY OF SELF-REPORTED DOSE OF PATIENTS USING WAFARIN IN CLINICAL PRACTICE

Dumas S[1], Rouleau Mailloux E[2], Tardif JC[2], Talajic M[3], Dubé MP[2], Perreault S[1]
[1]*Université de Montréal, Montreal, QC, Canada,* [2]*Université de Montréal, Montréal, QC, Canada,* [3]*Montreal Heart Institute, Montreal, QC, Canada*

OBJECTIVES: Warfarin is an oral anticoagulant used for the prevention of thrombosis, and many adjustments are needed to achieve a therapeutic INR. The dose of warfarin is important to establish an association between clinical and safety outcomes and the exposure. To evaluate the validity of the weekly dose of warfarin as reported by the patient compared to the weekly prescribed dose. **METHODS:** This study was based on an ongoing prospective cohort of new warfarin-users to assess the genetic and clinical risks associated with the effectiveness and safety of warfarin. Demographic and clinical data were collected from 219 patients who began the treatment between May 1st, 2010 and Oct. 31st, 2011 at the Montreal Heart Institute. They were followed-up each three months for a year. The primary outcome is the concordance between the reported and prescribed weekly dose of warfarin. The secondary outcome is the difference between the means of reported and prescribed warfarin weekly doses. A t-test and a Pearson correlation are used for the secondary outcome and a generalized mixed linear model with repeated measures is used for the primary outcome. **RESULTS:** Patients had a mean age of 67.7, 58.9% were men and 70.3% had atrial fibrillation. No significant difference between the means of reported and prescribed warfarin weekly dose (Pearson coefficient = 0.969). However, we observed that the correlation was weak at 3 months for patients in the low dose group and in the high dose group (Pearson coefficient = 0.806 and 0.829, respectively). Mixed linear model analysis detected no association between the covariates and the concordance. **CONCLUSIONS:** This study demonstrates that the weekly reported dose correlates well with the prescribed dose patients in a prospective cohort study. Furthermore, the effect was similar whether measured in new-onset users of warfarin and up to 12 months of use.

PCV120
EFFECTS OF THE OCCURRENCE OF A FIRST CARDIOVASCULAR EVENT ON STATIN ADHERENCE IN TYPE 2 DIABETES: A MATCHED COHORT DESIGN

de Vries FM[1], Denig P[2], Vegter S[1], Bos HJ[1], Postma MJ[1], Hak E[1]
[1]*University of Groningen, Groningen, The Netherlands,* [2]*University Groningen, Groningen, The Netherlands*

OBJECTIVES: Adherence to statin therapy is important for an effective reduction in cardiovascular events. We aimed to assess the effect of the occurrence of a first cardiovascular event on adherence rates in type 2 diabetes patients using a matched cohort design. **METHODS:** A matched cohort study was performed within the IADB. nl pharmacy database among type 2 diabetes patients, who initiated statin treatment for primary prevention. Index patients experienced a first event (index date) after initiation whereas reference patients did not. Index and reference patients were matched on gender, age at statin initiation, statin initiation date, adherence level before the index date and follow-up period. Adherence was measured as percentages of days covered and classified into: non-adherent, partial-adherent or full-adherent. Adherence rates were measured from statin initiation until the index date, and from the index date until end of follow-up, for reference patients in both cases the same follow-up period was used. Mean adherence rates between index and reference before and after were compared by the use of an independent samples

T-test. **RESULTS:** From the 855 index patients 375 could be matched to a reference patient. Mean adherence rates before the index date were 79% for both groups. After the index date, mean adherence rates were 81% for index patients and 71% for reference patients (p-value <0.001). Index patients were more likely to become full-adherent and less likely to become non-adherent. 26% of the index patients used more statins after the event than before whereas 20% used less. **CONCLUSIONS:** Patients receiving a statin are likely to become more adherent after the occurrence of a cardiovascular event during statin treatment. One in five of these patients, however, become less adherent showing there are still important health and economic benefits to achieve by tailoring the management of individual patients.

PCV121

HEALTH STATE IN PATIENTS WITH ATRIAL FIBRILLATION ON NEW ORAL ANTICOAGULANTS AS ASSESSED WITH THE NEW EQ-5D-5L QUESTIONNAIRE: PREFER IN AF REGISTRY

Brüggenjürgen B[1], Ammentorp B[2], Darius H[3], De Caterina R[4], Le-Heuzey JY[5], Pittrow D[6], Reimitz PE[2], Schilling RJ[7], Schwertfeger M[2], Zamorano JL[8], Kirchhof P[9]
[1]*Steinbeis-University-Berlin GmbH, Berlin, Germany,* [2]*Daiichi Sankyo Europe, Munich, Germany,* [3]*Vivantes Klinikum, Berlin, Germany,* [4]*G. d'Annunzio University, Chieti, Italy,* [5]*Georges Pompidou Hospital, René Descartes University, Paris, France,* [6]*Technical University Dresden, Dresden, Germany,* [7]*Barts and St Thomas Hospital, London, UK,* [8]*University Hospital Ramón y Cajal, Madrid, Spain,* [9]*University of Birmingham Centre for Cardiovascular Sciences and SWBH NHS Trust, Birmingham, UK*

OBJECTIVES: New oral anticoagulants (NOACs) have the promise to change the management of patients with atrial fibrillation (AF), and can be used in lieu of vitamin K antagonists (VKAs) or antiplatelet drugs (AP). We aimed to obtain contemporary data on the health state of AF patients under everyday practice conditions at the time of introduction of NOACs. **METHODS:** PREFER in AF is a non-interventional study that prospectively documents AF patients in terms of clinical characteristics, management, quality of life and other outcome parameters. The new EuroQol EQ-5D-5L descriptive system was applied in PREFER in AF to obtain patient-reported generic health-related quality of life information and utility scores to inform resource allocation decisions. **RESULTS:** Of the 7243 AF patients (63.1% males, mean age 71.5 ± 10.7 years), 2159 (30.0%) had paroxysmal, 1731 (24.0%) persistent, 517 (7.2%) long-standing persistent, and 2793 (38.8%) permanent AF. Comorbidities were highly prevalent. On the visual analogue scale, the mean score in 5674 patients (78.3% EQ-5D participation rate) was 67.7 ±18.4 points, with no major differences between patients on NOACs (68.4), VKAs (67.6), AP (69.7), or VKAs+AP (65.5), respectively. Problems of any severity were reported for mobility, self-care, usual activities, pain/discomfort and anxiety/depression in 50.1%, 20.7%, 45.0%, 55.4%, and 47.1%. The overall utility index was 0.85 ±0.17. The 319 patients on NOACs had the same utility index as the 182 patients without VKAs or AP (0.80 in both groups), whereas the 2937 patients on VKAs, the 342 on AP or the 425 patients on VKAs+AP had lower indices (0.77 vs. 0.77 vs. 074). **CONCLUSIONS:** Patients with AF present with reduced self-reported quality of life compared to the general population. Patients receiving NOACs had a slightly higher quality of life, possibly illustrating that this type of treatment is initially given to "healthier" populations compared to established VKA therapy.

PCV122

QUALITY OF LIFE IN PATIENTS WITH VENOUS THROMBOEMOBLISM: A SYSTEMATIC LITERATURE REVIEW

Rao N[1], Liu X[2], Claflin AB[2], Phatak H[3], Mitchell SA[1]
[1]*Abacus International, Bicester, UK,* [2]*Pfizer, Inc., New York, NY, USA,* [3]*Bristol-Myers Squibb Company, Princeton, NJ, USA*

OBJECTIVES: A systematic review was conducted to determine the quality of life (QoL) in patients with venous thromboembolism (VTE). VTE encompasses deep vein thrombosis (DVT) and pulmonary embolism (PE) and may be associated with long-term complications including post-thrombotic syndrome (PTS) in up to 50% of patients following symptomatic DVT. **METHODS:** Eligible English language studies reporting QoL and utility scores for VTE (published since 1990 from any geographical location) were identified from electronic databases (Medline, EMBASE and Cochrane Library: accessed December 2012) and conference proceedings. **RESULTS:** Thirty studies (VTE=4; DVT=23; PE=3) that were eligible for inclusion were conducted in Europe (n=11), Canada (n=9), United States (n=7), or were multinational (n=3). A total of 14 unique generic (n=8) and disease-specific (n=6) instruments were reported. The generic SF-36 (n=18), and the disease-specific VEINES QoL/Sym (n=12) were the most frequently used instruments. In general, the QoL of patients with VTE was significantly impaired in all domains – physical, social and psychological – compared with the general population, measured using both disease-specific and generic instruments. QoL scores tended to improve during follow-up with the greatest improvement reported between 1–4 months following an initial event. Factors associated with poor QoL were identified: older age, obesity, female gender, comorbidities, and recurrent VTE events. Patients with PTS reported long-term worsening of QoL and functional disability compared with patients without PTS following an initial VTE event, with the impact on QoL increasing with severity of disease. However, in contrast to disease-specific QoL instruments, the impact of PTS on QoL was not consistently reported with generic questionnaires. **CONCLUSIONS:** Initial VTE events and long-term complications, such as PTS, are significantly associated with reduced patients' QoL in physical, psychological, and social domains. Disease-specific measurements should be further developed to assess the long-term impact of VTE recurrence, PTS, and bleeding associated with anticoagulant use.

PCV123

AN ANALYSIS OF EQ-5D QUALITY OF LIFE DATA FOR A COST-EFFECTIVENESS ANALYSIS OF IVABRADINE PLUS STANDARD CARE VERSUS STANDARD CARE ALONE IN CHRONIC HF

Griffiths A[1], Paracha N[2], Branscombe N[3], Cowie MR[4], Sculpher M[2]
[1]*Research Economics, Solihull, UK,* [2]*Oxford Outcomes, Oxford, UK,* [3]*Les Laboratoires Servier, Suresnes, France,* [4]*Imperial College London, London, UK*

OBJECTIVES: SHIFT examined the effect of adding ivabradine, a heart rate lowering therapy, to optimised standard therapy in chronic heart failure (HF) patients (n=6505). This study reports methods and results for an analysis of SHIFT patient quality of life data used to inform the UK cost-effectiveness analysis for ivabradine. **METHODS:** EQ-5D quality of life data were collected for patients in countries with a validated questionnaire (n=5313). EQ-5D data were analysed using regression techniques appropriate for repeated observations across individuals over time. **RESULTS:** Ivabradine was associated with a significant gain in patient quality of life (utility). Utility values were estimated to range between 0.82-0.46 [standard care, New York Heart Association (NYHA) class I-IV] and between 0.84-0.47 (ivabradine, NYHA I-IV). Hospitalisations were strongly associated with a reduction in utility, this reduction varied according to NYHA class from -0.07 (NYHA I) to -0.21 (NYHA IV). Patients with more severe heart failure symptoms (NYHA III and IV), were found to suffer a greater loss in utility given a hospitalisation than patients with milder symptoms (NYHA I and II). **CONCLUSIONS:** Ivabradine was associated with a significant improvement in quality of life. In addition, hospitalisation was found to significantly reduce patient quality of life; ivabradine is consequently expected to convey further quality of life benefits by avoiding the temporary utility loss associated with hospitalisations. Cumulatively, over a patient's life time, this may generate important gains in quality of life for ivabradine versus standard care.

PCV124

HEALTH OUTCOMES AT 6 TO 120 MONTHS SINCE HEART TRANSPLANT IN SPAIN: CLINICAL STATUS, HEALTH RELATED-QUALITY OF LIFE AND UTILITY ASSESSMENT

Cuervo J[1], Delgado JF[2], Crespo MG[3], Crespo MA[1], Rebollo P[1]
[1]*LASER Analytica, Oviedo, Spain,* [2]*Hospital 12 de Octubre, Madrid, Spain,* [3]*Complejo Hospitalario A Coruña, A Coruña, Spain*

OBJECTIVES: To evaluate the outcomes related to heart transplantation in adult recipients at 6±1 (Group I),12±2 (Group II), 36±6 (Group III), 60±10 (Group IV) or 120±20 (Group V) months after receiving the allograft. **METHODS:** A multicenter, cross-sectional study was conducted in different transplant units from Spain (n=14). Patients (aged >18 years) with a heart transplant (HTx) due to congestive heart failure and living with a single functioning graft were proposed to participate. Clinical status was assessed with the New York Heart Association Scale. Besides, participants completed the Kansas City Cardiomyopathy Questionnaire (KCCQ) and the EQ-5D. Other measures of social support and caregivers' burden were also included. Differences between groups were studied (Chi-squared, Kruskal-Wallis and Mann-Whitney U with Bonferroni correction tests). Multivariate regression analyses were applied to examine the association of clinical and socio-demographic variables with questionnaires' scores. **RESULTS:** A total of 303 transplant recipients (77.9% males) with a mean age(SD) of 56.4(11.4) years were included. High levels of health-related quality of life (HRQoL) were found at all stages after transplant. However, a slight decrement was detected after 10 years since transplantation ($p \leq 0.033$). EQ-5D utility mean(SEM) scores were: Group I-0.81(0.03)-; Group II-0.82(0.03)-; Group III-0.85(0.03)-; Group IV-0.86(0.02)-; Group V-0.75(0.03)--). VAS values (EQ-5D) were close to those of the general population, with the exception of patients at 10 years since transplantation whose scores were lower. Multivariate analyses showed that this decrement in well-being was related to comorbid medical conditions, severe vascular disease of allograft and the number of hospitalizations (EQ-5D: 48.4% of explained variance, $F_{4,164}= 38.46$, $p<0.001$; KCCQ-overall functional score-: 45.0% $F_{3,198}= 54.073$, $p<0.001$). **CONCLUSIONS:** : HTx outcomes in Spain seem to be satisfactory with good achievements in HRQoL and utility scores.

PCV125

THE RELATION BETWEEN THE MODIFIED RANKIN SCALE (MRS) SCORES AND UTILITY WEIGHTS: RESULTS FROM A SURVEY AMONG COMMUNITY DWELLING LONG TERM STROKE SURVIVORS

Greenberg D[1], Ginsberg G[2], Ziv A[3], Litmanovitch-Goldstein D[3], Tanne D[4], Chodick G[5], Balicer RD[6], Dankner R[3]
[1]*Ben-Gurion University of the Negev, Beer-Sheva, Israel,* [2]*Ministry of Health, Jerusalem, Israel,* [3]*The Gertner Institute for Epidemiology and Health Policy Research, Tel Hashomer, Israel,* [4]*Tel-Aviv University, Tel-Aviv, Israel,* [5]*Maccabi Healthcare Services, Tel Aviv, Israel,* [6]*Clalit Health Services, Tel Aviv, Israel*

OBJECTIVES: The modified Rankin Scale (mRS) is frequently used in clinical studies to measure the level of disability following stroke and TIA. As the mRS is a disease-specific instrument, it can not be easily translated into preference-based utility-weights to be used in cost-effectiveness analyses (CEAs). Data on utility-weights by the mRS disability level are limited. We estimated the relation between mRS scores and utility-weights in a convenience sample of "real-world" stroke survivors. **METHODS:** During a personal interview of 148 community dwelling long-term stroke survivors attending day-care rehabilitation centers throughout Israel, we estimated the level of disability using the mRS, ranging from: no symptoms/disability (mRS=0), to severe disability (mRS=5). Patients also completed the EuroQoL (EQ-5D) questionnaire, the most commonly used instrument for obtaining utility values. Utility-weights were calculated using the EQ-5D UK tariffs. Health states may range from -0.594 to 1, where 1.0 is defined as perfect health and zero represents death. **RESULTS:** Mean age (±SD) of patients was 65.8±9.8, ranging from 28-85 years, with male predominance of 73.6%. Over 80% of patients were married, living with their spouse or family. The vast majority (92%) of patients did not work at the time of interview, mainly due to the stroke. Mean time from first stroke was 7.2±5.9 years and 1/3 of respondents experienced >1 stroke events. Mean utility-weights (±SD) were as follows: mRS 0-1(N=31), 0.748±0.231; mRS 2-3 (N=78), 0.395±0.317; mRS 4-5 (N=38), 0.055±0.277. Nineteen percent of patients had a utility-weight < 0 representing a health state considered worse than death. **CONCLUSIONS:** While utility-weights of stroke survivors with no symptoms/no significant disability (mRS 0-1), are comparable to those used in published CEAs, patients with moderate and severe disability (mRS 4-5) show

an extremely low quality of life. These findings should be considered in future planning of interventions in stroke patients.

PCV126
MEASURING HEALTH-RELATED QUALITY OF LIFE BY EXPERIENCES: THE EXPERIENCE SAMPLING METHOD
Maes IH[1], Joore MA[2], Anteunis LJ[1], Peters ML[3], Delespaul PA[3], Schruers K[3], Horn Y[4], White MP[5]
[1]Maastricht University Medical Centre, Maastricht, The Netherlands, [2]Clinical Epidemiology and Medical Technology Assessment, Maastricht University Medical Centre; CAPHRI, Maastricht University, Maastricht, The Netherlands, [3]Maastricht University, Maastricht, The Netherlands, [4]Adelante Zorggroep, Hoensbroek, The Netherlands, [5]University of Plymouth, Plymouth, UK
OBJECTIVES: To determine the feasibility of using the Experience Sampling Method (ESM) to obtain accounts of the momentary experience of Health Related Quality of Life (HRQOL) and compare these to retrospective global measures of HRQOL and utilities derived from choice under uncertainty. **METHODS:** An experience-sampling study of 139 participants from three different patient groups and a control sample examined the momentary experience of HRQOL (mom-HRQOL). Global retrospective HRQOL measures were also administered. Feasibility of was determined by assessing willingness to participate in the study and by analysing the percentage of drop-outs and the number of completed beep questionnaires. Bivariate correlations between mom-HRQOL and momentary positive affect (PA), negative affect (NA) and physical symptoms (PS) for each participant were determined. Furthermore, correlations between mom-HRQOL, PA, NA and PS on the one hand and retrospective global health (EQ-VAS), the EQ-5D utility, the SF-6D utility and the TTO on the other hand were determined. **RESULTS:** The overall participation rate was low but there were no drop-outs and the number of completed beeps was comparable to other studies. For most participants, the correlation between mom-HRQOL and momentary PA, NA and PS was in the expected direction. Correlations between ESM data on HRQOL, PA, NA and PS and retrospective measures were moderate to high, with the exception of the TTO. **CONCLUSIONS:** Overall, this study extends our knowledge of the similarities and differences between ESM data on HRQOL, feelings and symptoms and retrospective measures of HRQOL, which may aid future health care research and decision making.

PCV127
PATIENTS WITH HYPERTENSION IN PRIMARY CARE IN SPAIN: MANAGEMENT, SELF-PERCEPTION AND SATISFACTION
Sánchez-Piedra C, García-Pérez S, Sarría Santamera A
Agencia de Evaluación de Tecnologías Sanitarias (AETS), Madrid, Spain
OBJECTIVES: EUprimecare is a European Union project aimed at analyzing the costs and quality of the different models of primary care (PC) in Europe. The aim of this paper is to analyze the management of patients with hypertension in PC services in Spain compared to other European countries, the satisfaction of these patients with PC services and their self-perceived health status. **METHODS:** Cross-sectional study. We conducted a population survey by telephone among PC users in each of the consortium countries (Germany, Spain, Estonia, Finland, Hungary, Italy and Lithuania). The questionnaire included information on sociodemographic characteristics, health status, satisfaction, utilization of PC services, and frequency of some interventions carried out by PC professionals. The survey was conducted to 431-432 PC users in each country (Ntotal = 3020). We use satisfaction, health status and sociodemographic variables to consider the situation of patients with hypertension in PC. **RESULTS:** The percentage of users of primary care services who reported having hypertension in Spain was 21.6% (N = 93), lower than the overall average (34.9%). 97% of patients resident in Spain were diagnosed by their primary care physicians versus 82.6% of the European average. The 91.4% of patients in Spain claimed to be in treatment to hypertension (EU average= 92.3%) and in 92.9% of cases the treatment was prescribed by their PC doctors (EU average= 84.5%). Only 7.5% of patients claimed that their health was poor or very poor, the lowest proportion of all countries evaluated. **CONCLUSIONS:** The patient with hypertension in Spain is diagnosed and managed by PC professionals more frequently than in other European countries. The self-perception of these patients in Spain is good and they were satisfied with the services of AP. The overall satisfaction of the patients with AP services was high but not significantly different from other countries.

PCV128
USER PREFERENCES FOR STROKE SERVICES IN WALES
Fargher EA, Plumpton CO, Roberts GW, Owen H, Burton CR
Bangor University, Bangor, UK
OBJECTIVES: To investigate patient and family carer preferences for stroke support services. **METHODS:** Discrete choice experiment (DCE) using a fractional factorial design, folded into nine binary choices, containing four attributes: format of service (group, individual); service provider (hospital stroke team, primary care, voluntary sector); provision of additional social and leisure activities (provided, not provided); and time to plan and make the journey (1,2,4 hours). Attributes and levels were defined by a review of policy documentation and two workshops with patients and family carers (n=8). Patients (six months post-stroke) and their family carers were recruited from four stroke-services in Wales, to complete a paper questionnaire including the DCE and validated instruments to facilitate pre-specified sub-group analyses. Data were analysed in STATA using a random effects logit model. Marginal rate of substitution (MRS) used journey time as the value attribute. **RESULTS:** A total of 144/474 (30%) eligible patients requested the questionnaire, 80 (56%) completed (mean age 70.8 years (sd 11.1). A total of 34/74 family carers who requested the questionnaire completed. All four attributes were significant for patients ($p<0.05$), only format of service and journey for carers. Patients preferred support services on an individual basis (p=0.00, MRS=128.61 minutes), with additional social and leisure activities (p=0.00, MRS=64.07 minutes). Family carers were willing to trade more journey time for services provided on an individual basis (p=0.00, MRS=273.73 minutes). Sub-group analysis showed significant differences between established (>315 days post-stroke) and early patients. Models accounting for patient health utility were significantly different ($p<0.05$). **CONCLUSIONS:** These findings complement the more descriptive summaries of a comprehensive matrix of sources of support within regions and localities (Department of Health, 2007), with which people living with stroke may interact. Exploring what patients and carers consider important in the provision of stroke support services, will ensure that service re-design is user-focused to maximum utility.

PCV129
PATIENTS PREFERENCES FOR LONG-TERM TREATMENT AFTER ACUTE CORONARY SYNDROME: A DISCRETE-CHOICE EXPERIMENT AND ANALYTIC HIERARCHY PROCESS
Mühlbacher AC, Bethge S, Kaczynski A, Juhnke C
Hochschule Neubrandenburg, Neubrandenburg, Germany
OBJECTIVES: Diseases of the cardiovascular system are the main causes of death in Germany and other industrial countries. Different therapeutic approaches exist as well as several treatment options. How people who have suffered from an acute coronary syndrome, value aspects of their medical treatment is not very well analyzed until today. The objective of this empirical investigation was to evaluate patient's preferences regarding different antiplatelet medication options following an acute coronary syndrome. **METHODS:** Primary method was a Discrete-Choice-Experiment that included 6 patient-relevant attributes. Furthermore an Analytic-Hierarchy Process (AHP) was used to test the applicability of the method and to compare the results. The Discrete-Choice-Experiment (DCE) was conducted using a fractional factorial NGene-design with priors and the statistical data analysis used a random effect logit model. AHP was conducted using the eigenvalue method. **RESULTS:** The preference analysis of N=683 patients showed a clear dominance for the attribute "reduction of the risk of death" (DCE coef.: 0.803; AHP coef.: 0.402.). Rank 2 in AHP the "reduction of heart attack risk" (DCE coef: 0.464; AHP coef.: 0.272.) and in the DCE was "shortness of breath" (DCE coef.: 0.550; AHP coef.: 0.165.). The side effect of "bleeding" (DCE coef.: 0.400; AHP coef.: 0.117.) joined accordingly. The "frequency of administration" was less important in DCE and AHP (DCE coef: 0.025; AHP coef. 0,044.). **CONCLUSIONS:** The results of both methods generated an almost equal ranking of the included features. The highest value for patients within a treatment decision was the mortality reduction. The consideration of patient preferences in therapeutic decisions implies stronger patient focus and can at the same time be used for the development of effective therapies after acute coronary syndrome. The preference data generated can be used for health care decision makers and stakeholders to represent the patient's benefit at the same time.

PCV130
COMPARING THE PERFORMANCE OF THE EQ-5D-5L WITH THE EQ-5D-3L IN STROKE PATIENTS IN JAPAN
Noto S[1], Izumi R[1], Moriwaki K[1], Igarashi A[2], Ikeda S[3], Fukuda T[4], Shiroiwa T[4], Kobayashi M[5], Saito S[6], Shimozuma K[7]
[1]Niigata University of Health and Welfare, Niigata, Japan, [2]Tokyo Univ. Faculty of Pharmacy, Tokyo, Japan, [3]International University of Health and Welfare, Otawara City, Tochigi, Japan, [4]National Institute of Public Health, Saitama, Japan, [5]CRECON Research & Consulting Inc, Tokyo, Japan, [6]Okayama University, Okayama, Japan, [7]Ritsumeikan University, Kusatsu, Japan
OBJECTIVES: To assess the performance of the EQ-5D-5L Japanese version compared with the EQ-5D-3L in clinical setting targeted at patients with stroke in Japan. **METHODS:** The stroke patients were recruited from six rehabilitation hospitals in Japan. The proxy of the patients completed a questionnaire including the two versions of the EQ-5D. We tested the inconsistency, the redistribution properties, and the ceiling effect. **RESULTS:** A total 533 patients were recruited: 61% male, 15-99 (mean=67) years old. Diagnoses of patients were infarction (54.6%), hemorrhage (35.5%), and other (9.9%). The proportion of inconsistent responses (i.e., 3L responses that were at least two levels away from the 5L responses) was 3.6%. In particular the proportion in MOBILTY was 14.6%. Regarding redistribution, 52-61% of the patients answering level 2 with the 3L version redistributed their responses to levels 2 or 4 with the 5L version. A relative 3% reduction of the ceiling effect was found. **CONCLUSIONS:** Our findings suggest that the EQ-5D-5L Japanese version performs better in at least some properties analyzed. Further study is necessary to clarify other psychometric properties.

PCV131
A RETROSPECTIVE STUDY COMPARING COMPLIANCE, PERSISTENCE, AND BLOOD PRESSURE CONTROL BETWEEN FREE-DRUG AND SINGLE-PILL COMBINATION THERAPIES IN KOREAN HYPERTENSIVE PATIENTS
Hong JM[1], Kim EG[1], Min K[2], Min J[3], Shin K[4], Yang BM[1]
[1]Seoul National University, Seoul, South Korea, [2]Ajou University School of Medicine, Suwon, South Korea, [3]Institute of Health and Environment, Seoul National University, Seoul, South Korea, [4]Novartis Korea, Seoul, Seoul, South Korea
OBJECTIVES: Existing evidences indicate that single-pill antihypertensive combinations (SPC) have greater rates of adherence and more effective lowering of blood pressure than free-drug combinations (FC). SPC therapy has been used in Korea for the purpose of achieving optimal blood pressure control. However it is questioned whether such existing positive evidence toward SPC from western countries can be found in the Korean population. **METHODS:** This study compared compliance, persistence and blood pressure change of SPC versus FC using the medical charts of 1,940 patients from 17 Korean general hospitals (GH1-17). The hypertensive patients with SPC or FC prescription, more than 40 years old, no history of hospitalization, visited GH1-17 from January 1, 2010 to December 31, 2011 were included. Compliance was compared using the Medication Progression Ratio (MPR), calculated as the ratio between the days medication was taken and days in a time interval. Persistence was measured as the number of days from the index date to the therapy discontinuation date. The blood pressure (BP) change was calculated as the difference between the first and the last visit. **RESULTS:** Overall compliance measured by MPR was 0.71 for the SPC group and 0.69 for the FC group, with the difference being statistically significant.

This was especially evident for SPC patients in the 40~64 year age group (0.71 for SPC, 0.69 for FC) and patients with two or more comorbidities (0.73 for SPC, 0.69 for FC) (P= 0.0011). However, no statistical significance was observed for the difference both in persistence and the BP change between the two groups. **CONCLUSIONS:** Our study suggests that compliance tends to be improved by the use of SPC compared with FC. Unlike the previous western studies, it was hard to find a significant increase in persistence or BP change with SPC therapy in this study.

PCV132

HEALTH RELATED QUALITY OF LIFE AND DEVICE-ACCEPTANCE IN PATIENTS WITH IMPLANTABLE CARDIOVERTER-DEFIBRILLATORS AND TELEMONITORING

Leppert F[1], Siebermair J[2], Kääb S[2], Greiner W[3]
[1]*Bielefeld University, Bielefeld, Germany,* [2]*University of Munich, Munich, Germany,* [3]*School of Public Health, Bielefeld University, Bielefeld, Germany*

OBJECTIVES: Telemedical systems (TMS) and data management for implantable cardioverter-defibrillators (ICD) promise to reduce costs and optimize patient care. Depressive symptoms are common among patients with an ICD and the health related quality of life (HRQoL) is affected by the underlying disease and the implanted device, respectively. TMS might improve the HRQoL of patients and ICDs acceptance due to closer monitoring and, thereby, an increased level of perceived safety. In this RCT, changes in the level of depression, HRQoL and ICD-acceptance over a period of six months after ICD-implantation were investigated. **METHODS:** A total of 161 patients (80.7% male; age: 64,1±14,6; 82% with coronary disease, 11% with DCM) with an ICD were randomized at the day of implantation into intervention (n=82) or control group (n=79). The intervention group was equipped with a telemonitoring-system that transferred ICD-data from the patients' home to the medical practitioner. The control group received regular care. Patients were asked to fill out three questionnaires (the generic EQ-5D, the depression specific HADS and the device specific FPAS); the follow-up period was six month, with postal surveys on a monthly basis. **RESULTS:** Nine patients dropped out before survey completion. A total of 140 patients filled out at least two sets of questionnaires and were included in the analyses. After six months the mean improvement in the HRQoL (EQ-5D-Index) in the telemonitoring group was 10.7 points compared to baseline (p=.006) while the mean change in HRQoL in the control group was 5.5 (p=.138). FPAS and HADS-D showed small but non-significant advantage for the telemonitoring group. **CONCLUSIONS:** Preliminary results suggest that TMS have the ability to improve HRQoL of patients with ICDs. Results on effects towards depression and anxiety and enhancement of ICDs acceptance are also promising. Since ICDs are used in chronic diseases a longer follow-up period seems to be required to validate the effects.

PCV133

FURTHER VALIDATION OF A NEW QUESTIONNAIRE TO MEASURE SATISFACTION WITH MEDICAL CARE IN PATIENTS WITH ATRIAL FIBRILLATION (SAFUCA) IN SPAIN

Ruiz MA[1], Villasante F[2], González-Porras JR[3], Franco E[4], Aranguren JL[5], Tuñón JL[6], González-López TJ[7], De Salas-Cansado M[8], Collados C[8], Pardo A[9], Soto J[8]
[1]*Autonoma University, Madrid, Spain,* [2]*José Marvá, Madrid, Spain,* [3]*Universitary Hospital of Salamanca, Salamanca, Spain,* [4]*San Carlos Hospital, Madrid, Spain,* [5]*Clínica Madrid, Madrid, Fuenlabrada, Spain,* [6]*Universidad Autónoma de Madrid, Madrid, Spain,* [7]*Hospital Universitario de Burgos, Burgos, Spain,* [8]*Pfizer S.L.U, Alcobendas, Spain,* [9]*Universidad Autonoma de Madrid, Madrid, Spain*

OBJECTIVES: To assess convergent and divergent validity of a new questionnaire (SAFUCA) developed to measure satisfaction with medical care in patients with non valvular atrial fibrillation. **METHODS:** The 25-item reduced version instrument was administered along with the Treatment Satisfaction Questionnaire for Medication (TSQM), and 5 Visual Analog Scales (VAS) measuring: Health Related Quality of Life (HRQoL), Effectiveness and Overall Satisfaction assessed by the patient; and Effectiveness and Tolerability assessed by the clinician. A convenience sample of 230 patients recruited at 7 health centers (5 hospitals and 2 primary care centers) in Spain was used. Second Order Exploratory Factor Analysis (SO-EFA) and correlation with VAS scales were computed. **RESULTS:** SAFUCA dimensions correlated (p<0.001) higher with corresponding TSQM dimensions (e.g.: Effectiveness r=0.450, Convenience r=0.457, Undesired Effects r=-0.340, Overall satisfaction r=0.651), while SO-EFA made evident differences regarding the assessment of satisfaction with INR controls, interference in QoL and Medical Care. Correlation pattern between VAS scores was significantly different between primary care centers and hospitals, with a higher correlation between patient and clinician scores observed in primary care (e.g.: Effectiveness r_{PC}=0.430 vs. r_H=0.057). Similarly, correlation patterns between VAS concurrent scales and SAFUCA dimensions differed between center types. While high correlations between Effectiveness dimension and patient satisfaction VAS were observed in both cases (r_{PC}=0.521 vs. r_H=0.516), correlation of Tolerability with Undesired Effects differed between centers (r_{PC}=-0.474 vs. r_H=-0.085). **CONCLUSIONS:** The 25-item questionnaire exhibits good convergent and divergent validity values. Differences between types of health care centers in correlation patterns were meaningful and worth of further research.

PCV134

HEALTH RELATED QUALITY OF LIFE AT SIX MONTHS POST DISCHARGE IN PATIENTS WITH HEART FAILURE

Escobar A[1], Bilbao A[1], Fernandez-Soto ML[2], Sanchez Haya E[2], Gonzale-Saenz de Tejada M[1], Trancho Z[1], Lafuente I[3], Quiros R[4], Garcia Perez L[5], Navarro G[6]
[1]*Basurto University Hospital (Osakidetza).Red de Investigación en Servicios Sanitarios y Enfermedades Crónicas (REDISSEC)., Bilbao, Spain,* [2]*Donostia University Hospital (Osakidetza)., Donostia, Spain,* [3]*Galdakao-Usansolo Hospital (Osakidetza)., Galdakao, Spain,* [4]*Hospital Costa del Sol.Marbella, Marbella, Spain,* [5]*D. Servicio Canario de Salud.Red de Investigación en Servicios Sanitarios y Enfermedades Crónicas (REDISSEC), Santa Cruz, Spain,* [6]*Corporació Sanitària Parc Taulí, Sabadell, Spain*

OBJECTIVES: There are few studies in Spain about outcomes at six months in terms of health-related quality of life (HRQoL) in patients hospitalized by heart failure (HF). The objective of the study was to evaluate changes in HRQoL from baseline to six months post discharge in patients with HF through three questionnaires, SF-12, EQ-5D-3L and Minnesota Living with Heart Failure questionnaire (MLHFQ). **METHODS:** This is a prospective study with 976 patients admitted by HF. Patients completed questionnaires during their hospitalization and at six months. The MLHFQ is a specific instrument which has 21 items with an overall scale, physical (8 items) and emotional (5 items) subscales. MLHFQ items are scoring from 0 (best) to 5 (worse). Total score ranges from 0 to 105, physical domain from 0 to 40 and emotional from 0 to 25. SF-12 has two dimensions, Physical Summary Score (PCS) and Mental Summary Score (MSC) which scores range from 0 (worst) to 100 (best). EQ-5D has been measured according to the Spanish tariffs by time trade-off and the visual analogic scale. We used general linear model to study gains in each dimension adjusted by baseline score, age, gender and readmissions in the previous 6 months. **RESULTS:** Mean age was 76.0 (SD=10.4), there were a 53.3% of men and 33.1% of readmissions in the previous six months. Regarding all questionnaires and dimensions, baseline status influence in gains, the worse the baseline the more the gains. Likewise men have greater gains and patients readmitted lower in all domains. Age has an influence in all domains but emotional dimension of MLHFQ and MSC of SF-12. **CONCLUSIONS:** Adjusted by baseline score and readmissions, men have greater improvements in all domains of MLHFQ, SF-12 and EQ-5D. On the other hand, the younger the patients the higher the improvement is, however age does not have any influence in psychological domains.

PCV135

INTERNATIONAL NORMALIZED RATIO (INR) MONITORING AND PERCENT TIME IN THERAPEUTIC INR RANGE (TTR) HAVE IMPACT ON PATIENT'S QUALITY OF LIFE? APPLICATION OF BETA REGRESSIONS IN A PROSPECTIVE 3 MONTHS SETTING

Soini EJ[1], Koskela T[2], Ryynänen OP[3]
[1]*ESiOR Oy, Kuopio, Finland,* [2]*Department of General Practice, University of Tampere, Tampere, Finland,* [3]*Department of Public Health and Clinical Nutrition, University of Eastern Finland, and General Practice Unit, Kuopio University Hospital, Kuopio, Finland*

OBJECTIVES: Warfarin anticoagulation is monitored using international normalized ratio (INR); specified with the narrow/wide 2.0–3.0/1.9–3.5 therapeutic target range, and converted to time in the therapeutic range (TTR, total percentage of time the INR reading is within the INR therapeutic range). We explored the impact of I) INR monitoring and II) TTR on patients' quality of life (QoL). **METHODS:** A total of 647 unselected patients visiting 3 health centres in Pirkanmaa district (31.01–11.02.2011), Finland participated to prospective study. To assess INR monitoring or TTR and QoL, Beta regressions were applied in Stata and EQ-5D-3L-based QoL (Smithson&Verkuilen transformation) 3 months after the baseline visit was the dependent variable. The covariates were $CHADS_2$(congestive heart failure, hypertension, age>75, diabetes mellitus, stroke) score, other comorbidities, baseline QoL, time difference (days) between dependent variable measurement and mean TTR time point (subgroup model), and INR monitoring (yes/no in total population) or TTR % (subgroup model). **RESULTS:** A total of 28 patients (46.43% male; means: age 73.21 years, $CHADS_2$-score 2.39, other comorbidities amount 1.71, baseline QoL 0.8334, INR tests 4.21, 66.31%/82.86% INR measurements on the narrow/wide range) had INR measurements ("warfarinization group") during the 3 months follow-up. 27 patients had calculable TTR (Rosendaal method) that was 69.29%/86.66% on the narrow/wide range. In the beta regression (N 393, +1 marginal change), $CHADS_2$-score (-0.021), other comorbidities amount (-0.030), baseline QoL (+0.350), and INR monitoring (p=0.299, -0.042, SE 0.044) predicted QoL. The mean adjusted QoL with/without INR monitoring in the warfarinization-like group was 0.794/0.836. In subgroup Beta regression including only warfarinization patients, higher TTR levels predicted lower QoL (p<0.050, +1 %-unit marginal change -0.006 [SE 0.007]; discrete change -0.284 in the wide range from 35.3% to 100.0%). **CONCLUSIONS:** INR monitoring may predict QoL loss and, surprisingly, higher TTR predicts lower QoL. Larger studies are needed to confirm the potential relationship between TTR and QoL.

PCV136

CORONARY ARTERY DISEASE, DIABETES, AND HEALTH-RELATED QUALITY OF LIFE: FINDINGS OF A COHORT STUDY FROM INDIA

Shah BS[1], Deshpande SS[2]
[1]*KSV University, Gandhinagar, India,* [2]*KB Institute of Pharmaceutical Education and Research (KBIPER), Gandhinagar, India*

OBJECTIVES: Assess health-related quality of life (HRQoL) of patients with CAD. **METHODS:** The main observational study cohort enrolled consecutive patients admitted in ICU at tertiary care hospital and diagnosed with CAD. Demographic information, risk factors for CAD, and angiographic findings were collected. EQ-5D was administered at 1-year follow-up. EQ-5D levels were dichotomized: 'no problems' (level 1), 'any problem' (levels 2 and 3). Linear stepwise regression was used to assess predictors of all 5 health states (mobility, self-care, usual activities, pain/discomfort, anxiety/depression). The independent variables studied include age, hypertension, diabetes, CHF, gender, prior MI, final diagnosis, MI type, and final treatment. Respondents reporting problems EQ-5D dimensions were stratified by presence of diabetes and compared. **RESULTS:** Of 960 CAD patients enrolled for the main cohort study (30% diabetic), 306 (male, 230; diabetics, 64) responded HRQoL questionnaire at 1-year. On liner regression, presence of diabetes was independent predictor of 4/5 EQ-5D HRQoL dimensions: mobility (p=0.019), problems performing usual activities (p=0.041), pain/discomfort (p<0.001); anxiety/depression (p=0.001). At 1-year, mean EQ-5D utility index score and VAS score were significantly lower for diabetes vs non-diabetics (0.76±0.13 vs. 0.83±0.15, p=0.0003 and 67.8 ± 8.8 vs. 73.6±5.4, p=0.0001, respectively) with more problems with performing usual activities (56.3% vs. 41.3%, p=0.04), pain or discomfort (51.6% vs. 17.8%, p=0.0001) as well as anxiety/depression (32.8% vs 14.9%, p=0.002). **CONCLUSIONS:** Among CAD

patients with diabetes, HRQoL was lower across all health dimensions measured by the EQ-5D; except mobility and self-care. Individualised therapeutic management programs could be considered in order to improve the HRQoL of CAD patients with diabetes.

PCV137
TRANSLATION AND CULTURAL ADAPTATION OF PATIENT PERCEPTION OF ARRHYTHMIA QUESTIONNAIRE IN POLAND
Farkowski MM[1], Golicki D[2], Pytkowski M[1], Szumowski L[1], Wood KA[3], Szwed H[1]
[1]Institute of Cardiology, Warsaw, Poland, [2]Department of Experimental and Clinical Pharmacology, Medical University of Warsaw, Warsaw, Poland, [3]Duke University School of Nursing, Durham, NC, USA
OBJECTIVES: Patient Perception of Arrhythmia Questionnaire (PPAQ) is a disease-specific questionnaire designed to measure symptoms and health-related quality of life in patients suffering from a group of arrhythmias collectively called supraventricular tachycardias (SVT). There is no valid translation of PPAQ available in Poland, which hinders research in this area with Polish arrhythmia patients. The aim of this study was to conduct initial content validity testing through translation and cultural adaptation of the English language version of the PPAQ to the Polish language. **METHODS:** The whole project was conducted according to ISPOR Principles of Good Practice for the Translation and Cultural Adaptation Process for Patient-Reported Outcomes (PRO) Measures published in 2005. **RESULTS:** In 2011, the PPAQ was translated into Polish and cultural adaptation was performed on 20 patients with SVT (12 male, age 54.9±17.4). Issues concerning close meanings of symptom names and language-dependant gender-related distinctions were identified. The former was solved by cooperation with experts in arrhythmia and latter by incorporating patients' preferences during cognitive debriefing. **CONCLUSIONS:** The Polish translation was well accepted by patients during this translation and initial content validity testing. Issues arisen during the translation process may recur in other translations and be resolved in similar manner.

PCV138
HEALTH-RELATED QUALITY OF LIFE IN PATIENTS ALONG FIRST YEAR POSTSTROKE IN SPAIN
Álvarez Sabín J[1], Masjuan J[2], Torres C[3], Mar J[4], Oliva J[5], González-Rojas N[6]
[1]Hospital Vall D'Hebrón, Barcelona, Spain, [2]Hospital Ramón y Cajal, Madrid, Spain, [3]Pharmacoeconomics & Outcomes Research Iberia, Madrid, Spain, [4]Hospital Alto Deba, Mondragon, Spain, [5]Castilla-La Mancha University, Toledo, Spain, [6]Boehringer Ingelheim, Sant Cugat del Vallès (Barcelona), Spain
OBJECTIVES: Atrial fibrillation (AF) 5-folds stroke risk, which results in death or disability in 80% of individuals and one-year mortality approaches 50%. The objective of the present study was to analyze the health-related quality of live (HRQoL) one year post-stroke in patients with or without AF and the burden of caregivers. **METHODS:** We performed an observational, multicenter, naturalistic and prospective study that included 16 stroke units from different Spanish regions. We used EQ-5D and VAS to test patients HRQoL and Zarit Burden Inventory to estimate the caregiver burden. We collected information at hospital entry for patients, 3 and 12 months post-stroke both for patients and carers through direct physician interviews. **RESULTS:** A total of 321 stroke patients were recruited, 160 with and 161 without AF. EQ-5D was completed by 274 patients - 127 with AF and 147 without AF -, and VAS by 249 - 113 with and 136 without AF -. The average utility scores of EQ-5D were 0.57, 0.62, and 0.65. We found a statistically significant difference between AF and non-AF obtained at hospital entry (p=0.029) and 12 months post-stroke (p=0.023). There were no differences between hospital visits (p=0.112). If we took into consideration the age of patients, the absence or presence of AF in EQ-5D scores, lost its significance (p=0.099). VAS average scores were 45.81, 44.15 and 45.74. VAS results showed non-significant differences neither by AF presence (p=0.396) nor time (p=0.613). Caregiver burden was higher in AF than non-AF patientes (46.47 vs 40.93 2nd visit and 45.29 vs 38.73 3rd visit) and the difference was statistically significant (p=0.007 and p=0.002). **CONCLUSIONS:** Stroke has a deep impact on patients HRQoL with no improvement over time. In the same line, caregivers also support an important burden related to stroke and specially in AF patients.

PCV140
TREATMENT SATISFACTION IN PATIENTS WITH ATRIAL FIBRILLATION ON NEW ORAL ANTICOAGULANTS AS MEASURED WITH PACT-Q2: PREFER IN AF REGISTRY
Brüggenjürgen B[1], Ammentorp B[2], Darius H[3], De Caterina R[4], Le-Heuzey JY[5], Pittrow D[6], Reimitz PE[2], Schilling RJ[7], Schwertfeger M[2], Zamorano JL[8], Kirchhof P[9]
[1]Steinbeis-University-Berlin GmbH, Berlin, Germany, [2]Daiichi Sankyo Europe, Munich, Germany, [3]Vivantes Klinikum, Berlin, Germany, [4]G. d'Annunzio University, Chieti, Italy, [5]Georges Pompidou Hospital, René Descartes University, Paris, France, [6]Technical University Dresden, Dresden, Germany, [7]Barts and St Thomas Hospital, London, UK, [8]University Hospital Ramón y Cajal, Madrid, Spain, [9]University of Birmingham Centre for Cardiovascular Sciences and SWBH NHS Trust, Birmingham, UK
OBJECTIVES: The great majority of patients with atrial fibrillation (AF) require anticoagulation in order to prevent strokes or other thromboembolic events. We aimed at obtaining detailed and current information on patients' satisfaction with their ongoing anticoagulation treatment. **METHODS:** PREFER in AF (The PREvention oF thromboembolic events – European Registry in Atrial Fibrillation) is a current non-interventional study performed in France, Germany, Austria, Switzerland, Italy, Spain and UK. A total of 7243 consecutive patients with ECG-confirmed AF in the previous 12 months are followed up prospectively. The 'Perception of Anticoagulant Treatment Questionnaire' is a valid and reliable instrument that allows the assessment of patients' expectations (PACT-Q1) and satisfaction regarding anticoagulant treatment, as well as patients' opinion about treatment convenience of use (PACT-Q2). **RESULTS:** A total of 5049 patients (69.7%) received antithrombotic treatment and were willing to fill out the PACT-Q2 questionnaire at baseline. 77.1% of these were on vitamin K antagonists (VKAs), 6.4% on new oral anticoagulants (NOACs), 5.2% on antiplatelets (AP) and 11.0% on VKA+AP combinations. In the "convenience" dimension, the overall score (0-100 range) was 82.9 ±17.3. The score was higher in the NOAC group (88.1 ± 13.0) compared to the VKA (82.1 ± 17.5), AP (87.0 ± 17.9) or VKA +AP groups (83.2 ± 16.8), respectively. In the "anticoagulant treatment satisfaction" dimension of the PACT-Q2, the overall score was 63.4 ±15.9. Again, this score was higher in the NOAC group (66.6 ±16.6) compared to the VKA (63.2 ±15.9), AP (63.7 ±16.8), or VKA + AP groups (62.8 ±15.0), respectively. **CONCLUSIONS:** Overall, patients on current anticoagulation achieve relatively high values on the convenience scale, but moderate values on the satisfaction scale. While differences in group size and patient characteristics need to be taken into account, patients on NOACs compared to patients on VKAs tend to rate their convenience and treatment satisfaction higher.

PCV141
CHRONIC PATIENTS' WILLINGNESS TO PAY FOR AN ALTERNATIVE DRUG WITH INNOVATIVE CHARACTERISTICS
Skroumpelos A[1], Kyriopoulos II[1], Mylona K[1], Anastasiou L[2], Pavi E[1]
[1]National School of Public Health, Athens, Greece, [2]Novartis Hellas, Metamorfosi, Greece
OBJECTIVES: Aim of the study was to investigate whether chronic patients are willing to pay an extra amount of money in order to switch to another drug that it is either on patent, more effective or simpler in dose. **METHODS:** A cross-sectional study was conducted among 1600 chronic patients suffering from diabetes, hypertension, COPD and Alzheimer. Logistic regression analysis was carried out to explore the factors that influence patients' decision on willingness to pay (WTP) for an alternative drug with innovative characteristics. **RESULTS:** Of the 1600 patients approached, 1594 responded to the survey (99.6%). A total of 40% stated that they would be willing to pay more for a patent drug, 57.5% for a more effective drug and 37.5% for a simpler in dose drug. The average additional amount per month that they would be willing to spend was estimated at 23.6€ for a patent drug, 24.1€ for a more effective drug and 21.9€ for a simpler in dose drug. Statistical analysis revealed that WTP for a patent drug was statistically significant related with the patient's income (OR,1.24;95%CI, 1.14-1.34) while WTP for a more effective or a simpler in dose drug was positively related with the patient's income (OR,1.25;95%CI, 1,13-1,39 and OR, 1,14;95%CI, 1.05-1.24 respectively) and educational level (OR,1.06;95%CI, 1,01-1.13 and OR, 1.06;95%CI, 1.01-1.13, respectively). **CONCLUSIONS:** Half of chronic patients demonstrate absolute willingness to increase spending for an innovative drug, which highlights the significance they attribute to pharmaceuticals for the management of their condition. The remaining's 50% reluctance may be attributed to the extended trust on their current pharmaceutical treatment and to the efforts and money spent in order to control their condition. However, patients with higher socioeconomic status are more likely to express WTP which reflects the economic burden imposed by chronic conditions, and the role of education in shaping patient attitudes.

CARDIOVASCULAR DISORDERS – Health Care Use & Policy Studies

PCV143
EVALUATION OF THE LENGTH OF HOSPITAL STAY FOR PATIENTS WITH ATRIAL FIBRILLATION
Volz F[1], Kloss S[1], Muschaweck F[2], Wilke M[3], Leverkus F[1]
[1]Pfizer Deutschland GmbH, Berlin, Germany, [2]Bristol-Myers Squibb GmbH & Co. KGaA, Munich, Germany, [3]Dr. Wilke GmbH, Munich, Germany
OBJECTIVES: Identification of differences in the length of hospital stay for patients with atrial fibrillation (AF) with and without oral anticoagulation (OA). Longer stays of patients could lead to an economical burden for the hospital because of the Diagnosis Related Groups (DRG) system in Germany and the compensation with case-based lump sum. **METHODS:** We conducted a retrospective study using an electronic DRG benchmarking database. This database contains DRG data from 208 hospitals in Germany with over 2,800,000 inpatient cases per year. In total, 10,912,922 cases from the year 2010 to 2012 were analyzed. 661,845 cases fulfilled the inclusion criteria and were analyzed according the statistical analysis plan including matched pair analyses. **RESULTS:** Cases with AF and surgical intervention compared to cases without AF and with surgical intervention have a significantly longer pre-operation length of stay (+0.74 days) and a significantly longer hospital stay (+1.5 days). Furthermore cases with chronic AF (=AF+OA) have a significantly longer total length of stay in the hospital (+0.86 days). For the cases with AF and bleeding vs. cases without bleeding, there is no significant difference in the total length of stay, but there is a significantly longer stay of 0.82 days compared to the average length of stay in the DRG-catalogue. **CONCLUSIONS:** Patients with AF and with or without OA could be an economic burden for the hospital, because the increased length of stay in hospital leads to higher costs whereas the existing compensation diagnosis-based lump sum is not affected by increased treatment days. The new oral anticoagulants could lead to shorter stays of patients with AF by shortening the bridging periods compared to OA like vitamin K antagonists. Further studies should be conducted to figure out the causes for longer hospital stays of patients with AF.

PCV144
ADHERENCE TO WARFARIN TREATMENT IN BRAZIL: SYSTEMATIC REVIEW OF THE LITERATURE
Feijo LF[1], Clark OAC[2], Monteiro RC[3], Fujii RK[4], Donato BMK[5], Bernardino GDR[3], Barbieri DE[6], Mould J[7], Manfrin DF[4]
[1]Evidências consultoria, Campinas, Brazil, [2]Evidencias, Campinas, Brazil, [3]Bristol-Myers Squibb, São Paulo, Brazil, [4]Pfizer, Inc., São Paulo, Brazil, [5]Bristol-Myers Squibb Company, Wallingford, CT, USA, [6]Bristol-Myers Squibb – Brazil, São Paulo, Brazil, [7]Pfizer, New York, NY, USA

OBJECTIVES: To review the literature about adherence to warfarin treatment in Brazil. **METHODS:** A systematic review of the literature and a wide search in LILACS (Literatura Latino Americana e do Caribe em Ciências da Saúde) and MEDLINE (Medlars On Line) electronic databases were conducted to identify studies with the key words: "warfarin" and "Brazil". The combination of terms was used as reference for the analysis. Search was restricted to randomized controlled trials (RCT), systematic reviews, meta-analysis and prospective clinical trials (PCT). **RESULTS:** A total of 77 studies were identified, from which only 22 met inclusion criteria: 1 meta-analysis, 5 RCTs, 8 systematic reviews and 8 PCTs. Only 1 study described adherence to treatment. From a total of 229 randomized patients, 119 received warfarin. Adherence to treatment was observed in 42% (p=0.001) of patients using warfarin considering an average of 57+-18 months of follow-up, INR < 2 in 37.54 % and INR > 2 in 11.18 %. Multivariate analysis estimated that every 1% of INR <2, the risk of a thromboembolic event increases 8.4%. **CONCLUSIONS:** The systematic review of the literature showed lack of data regarding Brazilian patients under warfarin treatment. The only available study did not define adherence and it did not investigate the underlying causes of non-adherence. Thus, it is recommended the conduction of further studies in order to provide better understanding of anticoagulant therapies compliance in Brazilian patients.

PCV145

COMPLIANCE WITH PREVENTIVE RECOMMENDATIONS IN PRIMARY CARE AND RATE OF POTENTIALLY AVOIDED HOSPITALIZATIONS BY DIABETES, CHRONIC HEART FAILURE OR CHRONIC PULMONARY OBSTRUCTIVE DISEASE

Aizpuru F[1], Latorre A[1], Ibañez B[2], López-Picado A[1], Millan E[1]
[1]*Basque Health Service, Vitoria-Gasteiz, Spain,* [2]*NavarraBIOMED, Pamplona, Spain*

OBJECTIVES: Potentially avoidable hospitalizations (PAH) are increasing in Spain and account for more than 3% of all the discharges. One of the hypothesis to explain PAH lies on the suboptimal management of chronic disease at ambulatory level of care. In this study we aim at explaining the association between compliance with preventive recommendations in primary care and observed rate of PAH. **METHODS:** Compliance with evidence-based preventive recommendations regarding diabetes mellitus (DM), chronic heart failure (CHF) and chronic obstructive pulmonary disease (COPD) was calculated for the 1,350 general practitioners of the Basque Health Service and compared with the annual (2011) observed rate of PAH between their patients' panel (mean panel≈1,500 adults; population covered=1,942,873). PAH was defined by a restrictive set of ICD-9 criteria following recommendations of the Spanish group of studies on Variability in Medical Practice. Multilevel poisson regression was used and age, sex, status socioeconomic (SSE) and hospital of reference were entered as covariates. **RESULTS:** After adjusting by all the covariates, higher compliance of recommendations such as periodical spirometry or assessment of the correct use of bronchodilator inhalers shows association with lower rates of PAH by COPD ($p<0.05$). Periodical foot care, oftalmological exam or assessment of the cardiovascular risk is non-significantly ($0.15\geq p\geq 0.05$) but consistently associated to lower rates of PAH by DM. No link was observed between compliance or recommendations for CHF and PAH due to this cause. The independent effect of the SSE was strong in all the diseases ($p<0.001$) (higher rates as privation increases). Variations regarding the hospital of reference were also observed. **CONCLUSIONS:** Adequate compliance of evidence-based recommendations limits, modestly but consistently, the incidence of PAH due to DM or COPD. The SSE and the hospital of reference explain part of the observed variability in hospitalization by chronic disease.

PCV146

VALUE CHAIN ANALYSIS FOR CARDIAC DEVICES

Lucas F[1], Tsai P[2]
[1]*Pope Woodhead and Associates, St. Ives, UK,* [2]*Cambridge University, Cambridge, UK*

OBJECTIVES: We investigated opportunities to cost-effectively improve health outcomes for patients eligible for ICD, sICD and CRT-D devices. This area was chosen because of the high cost of these devices and the significant amount of uncertainty on how to use them in a cost effective way. Also, we aimed to explore value-added services to patients and physicians, and the area appeared to have potential for this. **METHODS:** We conducted a value chain analysis. The first step was to clarify the care pathway and identify places where outcome or efficiency were poor; the second step was to prioritise the associated problems based on their importance (health/cost impact) and the feasibility of addressing the root causes in the short to medium term; the third step was to propose ways to address the priority problems and add value in the care pathway. To do this, we conducted secondary research, and primary research mainly focused on the UK (20 in-depth discussions with cardiologists, patients and manufacturers). **RESULTS:** A core issue was the lack of good evidence-based criteria to identify which patients would benefit most from the various devices. Referral to device implantation and funding were seen as below the levels expected given current clinical and HTA guidelines; the gap might even increase given the expectation that future guidelines may call for higher implantation rates. The proposed solutions focused on increasing awareness of the guidelines for more effective referral to specialist centres, supporting more flexibility in local funding, and taking advantage of the rich, continuous data that the devices themselves could provide with a view to eventually improve eligibility criteria. **CONCLUSIONS:** It is increasingly difficult to achieve health gains through new therapies. Therefore, focusing on improving referral and delivery pathways of current therapies may be quite effective at increasing health gains and/or efficiency.

PCV147

IMPACT OF SWITCHING ON HEALTH CARE COSTS AND OUTCOMES IN GENERIC DRUG POLICIES

Kalo Z[1], Abonyi-Tóth Z[2], Rokszin G[2], Katona L[3], Ágh T[4], Inotai A[4]
[1]*Eötvös Loránd University, Budapest, Hungary,* [2]*RxTarget, Szolnok, Hungary,* [3]*Semmelweis University, Budapest, Hungary,* [4]*Syreon Research Institute, Budapest, Hungary*

OBJECTIVES: Price erosion is considered the key success criterion of generic drug policies. For chronic drug therapy, however, persistence with the original drug substance is equally important. Low persistence may result in poor health outcomes, lead to increased health care costs. Our objective was to estimate the impact of switching drug therapy on health and economic outcomes as a consequence of the Hungarian drug policy in hypertension. **METHODS:** We retrieved 4-year medical records of hypertensive patients, who had at least 10 prescriptions of original losartan or losartan HCT in the 12 months prior to patent expiry. We allocated patients to 3 groups based on switching history in the 12 months after patent expiry. Group 1 patients were switched to another patented antihypertensive product without risk for generic substitution (n=953). Group 2 patients were switched to generic losartan or losartan HCT, but did not change the generic brand in 12 months (n=630). Group 3 patients were switched at least twice among different generic brands in 12 months (n=1144). We calculated the incidence of major cardiovascular events (MACE) and overall health care cost (289.42 HUF/EUR 2012 average exchange rate) in each group. **RESULTS:** Total 3-year health care costs were €9,728, €6,594, €8,227, the incidence of MACEs was 13.3%, 9.8%, 12.3% in Group 1, 2 and 3 respectively. **CONCLUSIONS:** In chronic diseases switching to generic drugs reduces health care costs. However, frequent switching among generic brands may result in negative health outcomes and increased health care costs. Suboptimal implementation of generic drug policies in chronic diseases may compromise expected benefits (i.e. same health gain at lower costs). Potential confounding factors may limit the generalizability of our conclusions.

PCV148

ASSESSMENT OF GENERIC DRUG POLICY IMPLEMENTATION BY MEASURING PERSISTENCE WITH ANTIHYPERTENSIVE DRUG THERAPIES AFTER PATENT EXPIRY

Abonyi-Tóth Z[1], Kalo Z[2], Ágh T[3], Inotai A[3], Katona L[4], Rokszin G[1], Jozwiak-Hagymásy J[3]
[1]*RxTarget, Szolnok, Hungary,* [2]*Eötvös Loránd University, Budapest, Hungary,* [3]*Syreon Research Institute, Budapest, Hungary,* [4]*Semmelweis University, Budapest, Hungary*

OBJECTIVES: There are two important success criteria of generic drug policies in chronic diseases after patent expiry: price erosion and persistence. Our objective was to assess the implementation of generic drug policies on these criteria between 2007-2011 in Hungary by comparing the continuation of angiotensin receptor blockers after patent expiry of original therapies. **METHODS:** In Hungary the first generic losartan was launched in 2007; losartan HCT in 2009; valsartan/valsartan HCT in 2011. From the National Health Insurance Fund database, we selected prescription records of hypertensive patients with at least 10 prescriptions of original losartan (Group 1; n=2637), losartan HCT (Group 2; n=7598) and valsartan/valsartan HCT (Group 3; n=38098) in the last 12 months prior to patent expiry. We compared antihypertensive therapies in 12 months after the reimbursement of first generic drug in each group. Antihypertensives were categorized into preferred (continued antihypertensive therapy with same active ingredient generic drugs), and non-preferred (continuation on original drug therapy; switching to other patented drug(s) without risk for generic substitution; switching to generic drugs with other active ingredient(s); discontinuation of reimbursed antihypertensive drug therapies) policy outcomes. **RESULTS:** After patent expiry 76.2% and 68.9% of Group 1&2 patients continued the original losartan or losartan HCT therapy for 12 months, and only 3.9% and 8.5% were switched to generic losartan/losartan HCT. In Group 3, 33.6% of patients were switched to generic valsartan/valsartan HCT, 42.8% received other generic drugs or drug combinations, whilst 14.5% were switched to other patented products. **CONCLUSIONS:** Despite significant changes in the generic drug policies in Hungary in 2007, 2009 and 2011 not more than one-third of hypertensive patients changed to generic drugs during 12 months after first generic entry. These findings indicate suboptimal generic drug policy in a chronic disease with significant public health implications.

PCV149

CROSS-COUNTRY COMPARISON OF PRESCRIBING PATTERNS VERSUS PORTUGAL AND POTENTIAL COST-SAVINGS

Costa S, Guerreiro JP, Baptista A, Teixeira I, Torre C
Centre of Health Research & Evaluation (CEFAR), National Association of Pharmacies (ANF), Lisbon, Portugal

OBJECTIVES: To review the consumption pattern of ambulatory high expenditure therapeutic groups in Portugal following prescribing guidelines set forth by the Memorandum of Understanding; to perform a cross-country comparison of utilization patterns focusing on quality prescribing indicators identified by the EURO-MED-STAT and/or major international prescribing guidelines; and to perform a cost-saving scenario analysis if more rational European prescribing patterns were undertaken in Portugal. **METHODS:** Cross-national drug utilization study with data from seven European countries: Portugal, Denmark, England, Finland, The Netherlands, Norway and Sweden. Data from Portugal retrieved from hmR Pharmacy Sales Information System, a nationwide database with representative pharmacy dispensing data. Data from other countries was selected from published literature and/or public databases. Cost-saving analysis with assumptions: average annual cost per defined daily dose (DDD) from Portugal and simulations to measure the impact on total expenditure of international utilization patterns (DDD proportion) versus Portuguese pattern. **RESULTS:** Portugal has the highest consumption of oral antidiabetic combinations (19.3% in 2010), of Antagonists Reception Blockers (ARBs) (31% in 2009), and of rosuvastatin (22.2% in 2011). A total of 236 Million euro annual cost-savings was estimated in scenarios of more rational prescribing: 100 Million euro (58% decrease in costs of antidiabetic agents in 2010) when simulating the Dutch oral antidiabetic prescribing pattern; 106 Million euro when simulating the Danish antihypertensive prescribing pattern (20% decrease in antihypertensive costs in 2009); and 26 Million euro when simulating the UK statin prescribing pattern (13% decrease in statin costs in 2011). **CONCLUSIONS:** It is crucial to optimize prescribing patterns in Portugal, in order to achieve a more rational use of medicines and a sustained control of pharmaceutical expenditure. Besides prescribing

guidelines, health prevention / monitoring strategies, involving coordinated actions between primary care and pharmacies, are valuable resources to consider.

PCV150
A REVIEW OF THE APPLICATION OF INTERNATIONAL REFERENCE PRICING IN UKRAINE'S PILOT HYPERTENSION REIMBURSEMENT SCHEME
Rainova K, Izmirlieva M, Ando G
IHS, London, UK
OBJECTIVES: The Ukrainian government has been considering ways to improve the population's access to medicines by offering limited reimbursement access. For this purpose, the government has expressed its interest in implementing International reference pricing (IRP). The pilot hypertension programme, which introduced a system of IRP for certain hypertension drugs, was introduced in mid-2012. The government is currently looking to revise the pricing and reimbursement mechanism and to expand the list of drugs eligible for reimbursement under the scheme. This study examines the pilot hypertension programme and its impact in terms of achieving its objectives so far. **METHODS:** Secondary research focused on analysing the current pharmaceutical market and health care situation in Ukraine, with a specific focus on the hypertension market. The study then assessed the pricing and reimbursement methodology which is currently in place, the programme's objectives, and its impact on volume and value of the antihypertensives market. **RESULTS:** Hypertension was chosen for the pilot programme due to the high prevalence of the condition in the country. While, for the full year 2012, the weighted average cost per package in the antihypertensive drug segment decreased by 1.4% compared to the previous year, the volume of retail sales increased 16.8%. Furthermore, as of January 2013, the prices of these drugs had been falling every month from July till December 2012 compared to the corresponding months of 2011. **CONCLUSIONS:** With the pilot hypertension programme, the government is hoping to lower drug prices and thereby improve affordability. Considering that the pilot scheme could be followed by programmes in other therapeutic areas, including a government proposal to include IRP for insulin treatments, the structure and effectiveness of the hypertension programme, and the subsequent amendments to it, could substantially impact the development of any other potential programmes in the future.

PCV151
HOW COMPLEX IS THE COMPETITION IN REGULATED PHARMACEUTICAL MARKETS?
Colak B[1], Timur A[2]
[1]*University of South Florida, Tampa, FL, USA,* [2]*Hodges University, Johnson School of Business, Naples, FL, USA*
OBJECTIVES: This paper constitutes an attempt at investigating processes of dynamic competition in pharmaceuticals, with reference to the nature and intensity of price competition in relation to patent expiry and different regulatory regimes. The paper uses comprehensive data on a selection of in-patent and off-patent (generic) cardiovascular medicines from IMS from the five largest European pharmaceutical markets - UK, Germany, France, Italy, Spain - to analyze the impact that pricing and reimbursement regulation and product differentiation have on market structure, diffusion and prices. **METHODS:** The paper develops a panel data model to explain the determinants of brand-name prices and generic prices both before and after patent expiry, the impact of generic entry and generic penetration on market share and prices of brand-name drugs, the competition patterns in their off-patent sector, the determinants of generic diffusion in the presence of generic competition, and the relationship between originator branded and generic prices under different regulatory regimes. The structure of the data allows these questions to be explored at molecule level and at product level. At all levels the originator and generic markets are observable. **RESULTS:** Despite the proliferation of generic policies in many countries, prices in the off-patent sector do not decline as fast as originally thought. Entry into the generic market is positively influenced by regulation through reference pricing and opportunities for product differentiation. Elements of product differentiation within generics promote diffusion, but do not reduce prices. And, health insurance does not capitalize fully on the cost advantage of generic medicines. **CONCLUSIONS:** The results suggest that the relationships between the dynamics of original drug prices, patent expiry, and generic competition are complex and differentiated across countries. The level of generic penetration remains low in some of them and a sharp contrast exists between countries.

PCV152
PRESCRIPTION PATTERNS OF ANTIHYPERTENSIVE AGENTS IN T2DM PATIENTS VISITING TERTIARY CARE CENTRE IN NORTH INDIA
Raval A[1], Dhanaraj E[2], Bhansali A[3], Yadav R[2]
[1]*West Virginia University, Morgantown, WV, USA,* [2]*National Institute of Pharmaceutical Education and Research, Mohali, India,* [3]*Post-Graduate Institute of Medical Education and Research, Chandigarh, India*
OBJECTIVES: Hypertension management is of a paramount importance in diabetic patients for cardiovascular risk reduction. Hence, we evaluated prescribing pattern of antihypertensive in T2DM (type 2 diabetes) patients and compare with existing recent guidelines. **METHODS:** A cross-sectional study involving evaluation of all T2DM patients referred to endocrinology unit at tertiary care centre for hypertension, comorbid complications, and recording prescription. Utilization of 5 different antihypertensive drug classes was compared for all patients receiving 1, 2, 3, 4, or more drugs. Logistical regression was used to assess likelihood of prescription of drugs and/or therapy for specific conditions mentioned in the guidelines. **RESULTS:** Out of 1358, T2DM enrolled patients 1186 (87%) had hypertension (males 52%, females 48%). The median duration (IQ) of hypertension diabetics was 4 (1-10) years. A total of 25% patients had controlled BP and 75% with uncontrolled blood pressure (13% isolated systolic hypertension, 6% isolated diastolic hypertension, and 55% both elevated). Overall, ACE inhibitors (ACEIs) were prescribed the highest (59%) followed by angiotensin receptor blockers (ARBs) (52%), calcium channel blockers (CCBs) (29%), diuretics (27%), and beta-blockers (14%). Overall, 55% of T2DM patients were on polytherapy, 41% on monotherapy, and 4% had no antihypertensive treatment. Polytherapy was more predominant with age, duration of diabetes, duration of hypertension, and comorbid complications. **CONCLUSIONS:** Although prescribing pattern of antihypertensive showed adherence to existing evidence-based guidelines, higher proportion of uncontrolled hypertensive patients was found.

PCV153
INITIAL ANTICOAGULATION THERAPY IN PATIENTS WITH VENOUS THROMBOEMBOLISM AND IMPAIRED RENAL FUNCTION: RESULTS OF AN OBSERVATIONAL STUDY
Boettger B[1], Wehling M[2], Bauersachs R[3], Amann S[4], Wilke T[1]
[1]*IPAM - Institut für Pharmakooekonomie und Arzneimittellogistik, Wismar, Germany,* [2]*Universität Heidelberg - Medizinische Fakultät Mannheim, Mannheim, Germany,* [3]*Klinikum Darmstadt GmbH, Darmstadt, Germany,* [4]*Staedtisches Klinikum Muenchen GmbH, Muenchen, Germany*
OBJECTIVES: Patients undergoing initial therapeutic anticoagulation after a venous thromboembolic event (VTE) with severely impaired renal function (RI-VTE-patients) are at high risk of accumulating the anticoagulants resulting in an increased risk of bleeding events. Current guidelines/approved summary of product characteristics (SPC) recommend usage of specific anticoagulants only, monitoring of aXa-activity, and/or dose-adjustment (in the case of enoxaparin) for initial therapeutic anticoagulation of RI-VTE-patients. This study investigates the treatment of German RI-VTE-patients and evaluates whether guideline/SPC recommendations are implemented in the practice of real life care. **METHODS:** We conducted a chart review in 5 German hospitals. All VTE patients treated in these hospitals from 01/01/2007-31/12/2011 were included. RI was defined as CrCl<30ml/min. Treatment did not conform to the recommendations in guidelines/SPCs, if: a) A drug was used that is contraindicated according to the SPC; b) The recorded daily dose of enoxaparin was higher than the recommended weight-adjusted dose. **RESULTS:** Of 5,263 VTE patients identified, 709 (13.5%) cases could not be documented due to missing charts (601) or no documented creatinine serum levels (108). Of the remaining 4,554 patients (mean age ±SD 67.4 years ±15.7; 53.0% female; weight 80.2 kg ±20.0; 54.5% deep VT), 337 (7.4%) had a mean estimated GFR<30ml/min; additionally 1,630 (35.8%) had a minimum eGFR<60ml/min. In 19 (5.6%) of these cases, patients were treated with a drug not recommended for use, 21 (6.2%) did not receive any initial anticoagulation treatment and 91 (27.0%) received a higher than recommended dosage of enoxaparin. Additionally, for 22 patients (6.5%) receiving enoxaparin, no weight information was recorded and it is therefore unlikely that the dosage was adjusted correctly. **CONCLUSIONS:** VTE treatment in RI-VTE-patients differs remarkably from labelled recommendations; over-dosage of enoxaparin is common. It seems fair to assume that these patients are facing a higher risk of adverse reactions in particular bleeding events.

PCV154
ATTITUDES OF PHYSICIANS TOWARD IMPLEMENTING SHARED MEDICAL APPOINTMENTS AT NATIONAL GUARD FAMILY MEDICINE CENTERS IN RIYADH
Alhowimel MH
National Guard Health Affairs, Riyadh, Saudi Arabia
OBJECTIVES: To determine the attitude of physicians in three family medicine centers (FMCs) at the National Guard Health Affairs (NGHA) toward the implementation of the Shared Medical Appointment (SMA) approach compared to the current individual appointment approach. **METHODS:** A cross-sectional survey study was conducted by distributing a structured questionnaire among the 79 FMCs' physicians at NGHA in Riyadh, Saudi Arabia. The first part of the questionnaire was an introduction, the second part has requested socio-demographic information, and the third part consisted of 12 statements measuring physicians' attitude toward implementing SMA and the current individual appointment approach. Responses were measured using 5-points Likert Scale. Seventy-nine self-administered questionnaires were distributed to physicians' mail-boxes and the completed questionnaires were collected from mail-boxes at each clinic. Data collection was done from December 10 to 15, 2011. Data were entered and analyzed by the Statistical Package for Social Science (SPSS.16). Descriptive analysis was conducted using frequencies, percentages, and mean (SD). Inferential analysis was conducted using one way ANOVA and Mann-Whitney tests to detect statistically significant differences in responses. A significance level of 0.05 was used. The validity and reliability of the instrument was measured using Pearson's correlation and Cronbach's Alpha, respectively. **RESULTS:** A totla of 78 valid questionnaires were returned yielding a response rate of 99 %. The average attitude scores were 3.75 toward the SMA approach and 2.98 toward the current Individual Appointment approach. The average attitude scores were significantly different at all dimensions (Mann Whtiney P-value < 0.001) in favor of SMA except for patient privacy which was in favor of current individual appointment approach. Subgroup analysis by socio-demographic variables indicated that males and Saudi national physicians have higher positive attitude toward SMA. **CONCLUSIONS:** There is positive attitude of all physicians toward SMA compared to the current individual appointment approach. This attitude was affected by gender and nationality.

PCV155
ANALYSIS OF RE-HOSPITALISATIONS FOR STROKE AND TRANSIENT ISCHEMIA RECURRENCE AND ASSOCIATED COSTS IN THE BURGUNDY REGION IN FRANCE
Marty R[1], Jouaneton B[2], Giroud M[3], Mougin P[4], Roze S[1]
[1]*HEVA HEOR, Lyon, France,* [2]*HEVA, Lyon, France,* [3]*CHU Dijon, Dijon, France,* [4]*Bayer HealthCare Pharmaceuticals, Loos, France*
OBJECTIVES: To assess the re-hospitalisations rates for stroke (ST) and transient ischemia (TI) recurrences as well as related inpatient costs through the French national Hospitals Medical Health Information database (PMSI). **METHODS:** A retrospective hospital administrative-claims analysis was carried out based on the Diagnoses Related Groups (DRG)-data of four hospitals within the Burgundy region along the 2006-2011 period. In each of the four hospitals, three cohorts were followed up over two years. Patients were excluded if any related hospitalisation for ST or TI occurred in the preceding two-years (identification through ICD-10 diagnosis codes). One and two-year re-hospitalisations rates for ST and/or IT were calculated.

Re-hospitalisations were taken into account if they occurred after one month following inclusion and regardless of the location of the hospital at the national level. Alternatively, 'all' re-hospitalisations rates regardless the related diagnosis were also assessed. Inpatient costs were valued based on reference tariffs according to French National Social Health Payer perspective. **RESULTS:** Around 1750 patients were followed per cohort across the four hospitals starting from 2009, 2010 and 2011. One-year re-hospitalisations rates for ST and TI ranged from 2.9% to 7.1%. The median time to re-hospitalisation ranged between 1.5 to 9.3 months. Two-year re-hospitalisations rates for ST and TI ranged from 4.5% to 10.4%. Two-year re-hospitalisations rates regardless of related diagnosis in acute and/or rehabilitative settings ranged between 45.5% to 65.1%. Mean costs (+/-SD) per inpatient stay for ST and TI were 4'645€ (+/-3'821) in acute setting (2013 EUR). When excluding TI, mean costs were 5'293€ +/-4'225€. Hospitalization costs varied depending on sub-type of stroke, severity, co-morbidities and also year of costing. **CONCLUSIONS:** Such short term data on recurrence rates and inpatient costs might be useful when estimating potential benefits of any secondary prevention intervention aiming at reducing stroke relapses.

PCV156

STATINS IN CANADA: THE CASE FOR DISINVESTMENT

Richter T, Amegatse W, Lee K
CADTH, Ottawa, ON, Canada

OBJECTIVES: We examined the economic consequences of generic switching within the statin market for public plans in Canada between 2000 and 2012. **METHODS:** We extracted data (number of units, costs, and claims) for all statins reimbursed by Canadian public drug plans for the period 2000-2012 (sources: IMS Brogan and Canadian Institute for Health Information). **RESULTS:** Public plans paid $11.2 BN to reimburse statins for 2 MM patients between 2000 and 2012. The annual cost of reimbursing statins peaked at $1.3 BN in 2009. Generic atorvastatin was listed by public plans in 2010, and the proportion of statin reimbursement attributable to generics increased from 18% in 2009 to 75% in 2012, reflecting a 76% increase in generic switching. During the same period, the unit cost of brands and generics fell by 25% and 49%, respectively. The combined effect of increased generic switching and lower unit costs resulted in a 55% decrease in the total cost of statins, from $1.3 BN in 2009 to $582 MM in 2012. Annual savings attributable to generic switching increased 10-fold between 2000 and 2012, from $7 to $709 MM. The efficiency at which potential savings has been captured through generic switching increased from 8% to 74% from 2000 to 2012; we project that this will generate savings of ~$800 MM annually through 2015. Increasing generic switching to 100% could generate up to an average of $135 MM annually in additional savings **CONCLUSIONS:** Although substantial savings have been generated by generic switching within the statin class, increasing generic switching could generate additional savings. One strategy to capture these additional savings would be disinvestment: if branded statins were de-listed from public plans if a generic version were available, this would increase generic switching, increase the efficiency at which potential savings are captured, and increase total savings.

ATRIAL FIBRILLATION'S BURDEN OF DISEASE IN PORTUGAL

Gouveia M[1], Borges M[2], Alarcão J[2], Caldeira D[2], Pinheiro L[2], Sousa R[2], Ascenção R[2], Costa J[3], Vaz-Carneiro A[2]
[1]*Católica Lisbon School of Business and Economics, Lisbon, Portugal,* [2]*Center for Evidence Based Medicine, Faculty of Medicine, University of Lisbon, Lisbon, Portugal,* [3]*Institute of Molecular Medicine, Lisbon, Portugal*

OBJECTIVES: To estimate the Disability Adjusted Life-Years (DALY) attributable to Atrial Fibrillation (AF) during 2010 in Portugal, including both AF and AF related stroke. **METHODS:** The analysis requires two types of data. The first is an extended set of epidemiological data, which resulted from a compilation of the prevalence and mortality data for AF and for stroke in Portugal. For the distribution of mortality by age, gender and cause of death the WHO Europe mortality database was used. The analysis also uses the results of FAMA, a study of the prevalence of AF in Portugal. Incidence rates were estimated from a review of the international literature. The second type of data concerns the relative risk (RR) of stroke for patients with AF. RR values by age group from the Framingham Study were used. Disability weights were taken from the Global Burden of Disease 2010. **RESULTS:** A total of 3863 deaths in Portugal in 2010 were related to AF, with 813 having AF listed as cause of death and the remaining 3.050 being stroke deaths attributable to AF. The AF attributable deaths are roughly 3.6% of total deaths in the country. The estimate total DALYs was 9.814 (2.251 for AF listed as the cause of death and 7.563 for stroke as cause of death attributed to AF). **CONCLUSIONS:** AF is an important cause of disease burden in Portugal. As reference, AF DALYs are roughly twice the estimated DALYs for skin cancer. AF should receive adequate attention from policy makers.

PCV158

SIMULATING THE POTENTIAL IMPACT OF IMPROVED BLOOD PRESSURE CONTROL ON CLINICAL AND ECONOMIC OUTCOMES IN RUSSIA

Kontsevaya A[1], Alperin P[2], Shum K[3], Eriksson JA[4], Vigdorchik A[5], Shalnova S[1], Boytsov S[1], Hughes D[6]
[1]*National Research Center for Preventive Medicine, Moscow, Russia,* [2]*Archimedes, Inc., San Francisco, CA, USA,* [3]*Archimedes Inc., San Francisco, CA, USA,* [4]*OptumInsight, Stockholm, Sweden,* [5]*Novartis Russia Pharma LLC, Moscow, Russia,* [6]*Novartis International AG, Basel, Switzerland*

OBJECTIVES: Russia faces a high burden of cardiovascular (CV) disease. Prevalence of all CV risk factors, especially hypertension, is high. Elevated blood pressure (BP) is generally poorly controlled, and medication usage is suboptimal. With a disease model simulation we assessed the impact of improved systolic blood pressure (SBP) control on the number and costs of CV events potentially averted in the hypertensive Russian population. **METHODS:** The Archimedes Model, a detailed computer model of human physiology, disease progression, and health care delivery was adapted to the Russian setting. Intervention scenarios of achieving SBP control rates (defined as SBP <140) of 30%, 40%, 50%, and 60% were simulated by modifying adherence rates of an anti-hypertensive medication combination and compared with current care (23.9% BP control rate). 100,000 hypertensive simulated individuals were modeled over a 10 year time horizon. Outcomes of major adverse cardiovascular events; stroke, myocardial infarction (MI) and CV death were reported. Direct health care costs of strokes and MIs were derived from official Russian statistics and price lists. **RESULTS:** To achieve SBP control rates of 30%, 40%, 50%, and 60%, adherence rates to the anti-hypertensive treatment program were 11.1%, 29.4%, 47.6%, and 65.9% respectively. CV death relative risk reductions were 5.0%, 13.2%, 21.4%, and 29.6%, respectively. For the current estimated 43,855,000 person Russian hypertensive population, each control rate scenario resulted in an absolute reduction of 398,097, 1,050,715, 1,703,334 and 2,355,952 CV deaths, and a reduction of 458,781, 1,210,881, 1,962,981, and 2,715,081 stroke/MI diagnoses. Averted direct costs from current care (225,781) were 12,834, 33,873, 54,913 and 75,952 million Rubles, respectively. **CONCLUSIONS:** Our simulation implies that a clinically significant number of CV events in the Russian hypertensive population may be prevented by achieving BP control through an antihypertensive drug combination. Averted costs may be re-allocated to strengthen evidence-based, preventive interventions.

PCV159

WHAT FACTORS PREDICT THE DECISION TO TREAT ACUTE CORONARY SYNDROME INVASIVELY? EVIDENCE FROM CLINICAL PRACTICE

Fakhouri WK[1], Belger M[1], Larkin L[2], McCollam PL[3], Rennie KL[4], Donaldson R[4], Di Tanna GL[4], Neasham D[4]
[1]*Eli Lilly & Company, Surrey, UK,* [2]*Lilly UK, Hampshire, UK,* [3]*Eli Lilly & Co, Indianapolis, IN, USA,* [4]*Evidera, London, UK*

OBJECTIVES: To describe UK patients with acute coronary syndrome (ACS) who receive percutaneous coronary intervention (PCI) or are medically managed only (MM) and evaluate factors affecting approaches to treatment. **METHODS:** Patients registered with a general practice participating in the Clinical Practice Research Datalink (CPRD) with Hospital Episode Statistics (HES)-linked data were included if they had an ACS-related hospitalization (January 2008-December 2009). Logistic regression analyses were used to assess what characteristics at ACS-related hospitalization date were associated with PCI or MM classified at 30-days post-hospitalisation date (30DHD). **RESULTS:** A total of 10,753 ACS patients were identified (60% male, 67% aged ≥ 65, 81% had NSTEMI or UA at index date); 30DHD, 74% were MM and 26% had PCI. Factors associated with receiving PCI were STEMI at hospitalization (OR 3.73, 95% CI 3.30, 4.22); patients with previous PCI pre-hospitalization (OR 1.29, CI 1.07, 1.55) and current smokers (OR 1.16, CI 1.02, 1.32). Patients less likely to receive PCI included women (OR 0.67, CI 0.60, 0.75), those with previous ACS hospitalization (OR 0.69, CI 0.59, 0.80), those prescribed: statins 12 months pre-hospitalization date (OR 0.75, CI 0.67, 0.85), diuretics (OR 0.72, CI 0.61, 0.85), ACE inhibitors (OR 0.84, CI 0.75, 0.95), proton pump inhibitors (OR 0.86, CI 0.77, 0.96), those previously diagnosed with congestive heart disease (OR 0.54, CI 0.42, 0.71), atrial fibrillation (OR 0.67, CI 0.54, 0.83), stroke/TIA (OR 0.77, CI 0.63, 0.93) or renal disease (OR 0.82, CI 0.71, 0.95). Age and BMI were significant as continuous variables with non-linear effects. **CONCLUSIONS:** This is the first large-scale UK study using real-world data to assess socio-demographic and clinical predictors for PCI in ACS, and indicates that NSTE-ACS patients and those with comorbidities are more likely to be MM. This will be discussed in light of current treatment of STEMI and NSTE-ACS in the EU.

PCV160

THE PHARMACOECONOMIC OF CARDIOLOGY IN RUSSIA

Popov VV[1], Gorokhova SG[2], Gorokhov VD[1], Ryazhenov VV[2]
[1]*Scientific Clinical Center of JSC Russian Railways, Moscow, Russia,* [2]*I.M. Sechenov First Moscow State Medical University, Moscow, Russia*

OBJECTIVES: To analyze the current state and the trends of pharmacoeconomic research in cardiology in Russia. **METHODS:** We have reviewed all main databases of scientific publications (PubMed, eLibrary.ru etc.) as well as individual journals, conference abstracts and web-sites for the period 2007–2013. **RESULTS:** It was found that cardiology becomes one of the most popular topics for pharmacoeconomists, partly because of its significance for public health and the growing amount of state funding for the prevention of CVD in recent years. Cardiovascular problems make up 16-25% of congress abstracts and 26% of applications for Da.Signa, the only award in pharmacoeconomics in Russia. Most publications in our analysis dealt with arterial hypertension (44%), coronary heart disease (16%) and chronic heart failure (7%). A wide range of original and generic drugs were included into these researches, however in most cases there was a prevalence of cost-efficiency analysis and modeling methods based on the results of non-Russian clinical trials and meta-analyses. Overwhelming majority of the results were published in Russian and therefore are not available for the non-Russian-speaking reader. **CONCLUSIONS:** During the last five years, a great number of pharmacoeconomic research in cardiology have been performed and published. However, there is a need of clinical trials that would consider the Russian specifics and health care standards. Pharmacoeconomic analysis should become an integral part of clinical trials, especially in case of drug therapy of myocardial infarction, stroke and other conditions, where the differences exist between the Russian and foreign practice. Some of the analyzed publications should be updated because of the recent changes in health care standards.

PCV161

THE VOLUME-OUTCOME RELATIONSHIP AND MINIMUM VOLUME STANDARDS – EMPIRICAL EVIDENCE FOR GERMANY

Mennicken R, Hentschker C
Rheinisch-Westfälisches Institut für Wirtschaftsforschung e.V., Essen, Germany

OBJECTIVES: To analyze the volume-outcome relationship for patients with intact abdominal aortic aneurysm (AAA) and hip fracture (HIP) and define hypothetical minimum volume standards to assess changes in access. **METHODS:** The analysis is based on administrative data coming from the German system of diagnosis related groups of about 18.6 million hospital cases of 1780 German hospitals for the year 2007. The data includes detailed information on patient characteristics used for

risk-adjustment. Furthermore, we have a ZIP-code for each patient and the exact address for every hospital. Addresses of hospitals and the centroids of all German ZIP codes were geo-coded. For the empirical analysis, we use multiple logistic regression analysis. We supplement our analysis by showing changes in access to hospitals if a minimum volume standard is introduced. **RESULTS:** Patients with hip fracture who are treated in hospitals with less than 58 cases per year have an average probability of death of 5.1 % compared to an average mortality of 3.1 % for patients who are treated in hospitals with more than 151 cases. For patients with AAA the case volume effect is lower. However, compared to patients treated in hospitals with less than 15 cases per year, the average probability of death for patients treated in hospitals with more than 68 cases is 1.0 percentage points less. We show that minimum volume standards seem possible without compromising overall access. **CONCLUSIONS:** The estimation results suggest that around 380 deaths could have been presumably avoided, if around 20,000 patients in the smallest hospitals would have been treated in the largest hospitals instead. Furthermore, we show that minimum volume standards do not compromise overall access measured in travel times. However, to ensure an adequate access in all areas, a few "sole providers" in some regions seem necessary.

PCV162

THE SHORT-TERM IMPACT OF PARTICULATE MATTER EXPOSURE ON THE RISK OF PRESCRIPTION OF CARDIORESPIRATORY DRUGS IN ITALY

Conti S, Lafranconi A, Fornari C, Madotto F, Cesana G
University of Milano - Bicocca, Monza, Italy

OBJECTIVES: Drug prescriptions recorded in health care administrative databases (HADs) can be an indicator of moderate health outcomes (undetectable through hospitalization or death registries) correlated to particulate matter (PM) exposure. This study is aimed at assessing the short-term effect of PM_{10} exposure on the risk of cardiorespiratory drug prescription in Lombardy, a region in northern Italy. **METHODS:** For each resident in seven cities of Lombardy, we identified all prescriptions of selected respiratory, cardiovascular and antidiabetic treatments recorded during 2005-2006 in data warehouse DENALI, which gathers HADs of Lombardy health system. The Regional Environmental Protection Agency of Lombardy provided time-series of daily mean PM_{10} concentration. We applied a time-stratified case-crossover design matched by day of week and fitted separate Cox proportional hazard models for each respiratory and cardiovascular treatment. Confounding was accounted for using a method, which we developed, based on the time-series of prescription of antidiabetics. Analyses were replicated for delayed effects of PM up to 6 days and for warm and cold season. **RESULTS:** The study area counted 470,300 residents, requiring 655,805 prescriptions. Mean PM_{10} concentration was 48µg/m^3 (SD 32µg/m^3). Overall, we estimated that rises in PM_{10} concentration were associated with an immediate increment in the risk of prescription of inhalant adrenergics (0.32% for increments of 10µg/m^3 in PM_{10} concentration; 95%CI:0.00,0.65), antiarrhythmics (0.52%; 95%CI:0.16,0.87) and nitrates (0.51%; 95%CI:0.27,0.76). Increased PM_{10} exposure was also positively associated with the prescription of inhalant glucocorticoids during the warm season and of inhalant adrenergics, antiarrhythmics and nitrates during the cold season. **CONCLUSIONS:** The significant association that we detected between PM concentration and drug prescriptions suggests that PM exposure may impact public health not only through severe but also through moderate adverse events. Further investigation is needed and given the usual difficulty retrieving information on moderate outcomes, HADs represent a valuable data source.

PCV163

HYPERCHOLESTEROLEMIA'S BURDEN OF DISEASE IN PORTUGAL

Gouveia M[1], Borges M[2], Augusto M[2], Caldeira D[2], Alarcão J[2], Pinheiro L[2], Sousa R[2], Fareleira F[2], Ascenção R[2], Costa J[2], Laires P[3], Fiuza M[4], Dias NC[4], Martins S[4], Belo A[4], Vaz Carneiro A[2]
[1]*Católica Lisbon School of Business and Economics, Lisbon, Portugal,* [2]*Center for Evidence Based Medicine, Faculty of Medicine, University of Lisbon, Lisbon, Portugal,* [3]*Merck, Sharp & Dohme, Oeiras, Portugal,* [4]*Sociedade Portuguesa de Cardiologia, Lisbon, Portugal*

OBJECTIVES: To estimate the impact of hypercholesterolemia (HYP) on population health in Portugal. **METHODS:** We estimate the Disability Adjusted Life-Years (DALY) attributable to HYP in 2010. The DALY include both years lost to premature death and years lost to disability. HYP is a risk factor for Acute Myocardial Infarction (ICD 9 410), other Coronary Heart Diseases (ICD 9 411-414) and for Ischemic Stroke (ICD 9 433-434). In order to estimate the attributable fractions to HYP of the diseases considered a microsimulation approach was used by using Framingham equations on data from individual observations in the VALSIM database. A total cholesterol equal to the mean for observations above 200 mg/dL was imputed to all individuals under statin treatment. In a counterfactual scenario HYP was eliminated (reducing total cholesterol to 200 mg/dL and increasing HDL to 40 mg/dL in all cases with HYP). The resulting proportional change in the probability of events was taken as the HYP attributable fraction of the diseases studied. **RESULTS:** In Portugal the prevalence of HYP in 2010 was estimated at 55,5% of the population over 18 (56,7% male and 54,5% female). In 2010 there were 1689 deaths attributable to HYP. This number can be broken down by gender (640 males and 1050 females) or by disease (481 from Acute Myocardial Infarction, 235 from other ischemic heart disease and 974 from ischemic stroke). DALY for premature death were estimated at 7263, and DALY for disability at 8239. Of the total 15502 DALY attributable to HYP 6132 were for ischemic stroke and 9369 for coronary disease. Gender decomposition of this total was 8012 for males and 7489 for females. **CONCLUSIONS:** The analysis suggests that HYP is an important cause of disease burden in Portugal and that it should remain a major target for health policy interventions.

PCV164

UTILIZATION OF ROUTINE DATA FOR REGIONALIZED EPIDEMIOLOGY IN AUSTRIA - THE EXAMPLE OF ISCHEMIC HEART DISEASE (ICD9 410-414)

Endel G[1], Fülöp G[2]
[1]*Main Association of Austrian Social Security Institutions, Vienna, Austria,* [2]*Gesundheit Österreich GmbH - GÖG, Vienna, Austria*

OBJECTIVES: Monitoring the performance of the health care system requires timely and robust information highlighting the burden of disease on a regional level. The development of the performance measures over time may be attributed to changes in organization and management of the system. **METHODS:** As routine data the ATHIS 2006/2007 (a standardized health interview survey), the cause of death registry 2006 and 2007, the hospital discharge datasets from the Austrian DRG system 2006/2007 (KDok/DLD) and diagnoses for the outpatient sector derived from pharmaceutical claims data 2006/2007 (ATC→ICD) - are used to describe the burden of disease regarding Ischemic Heart Disease (ICD9 410–414) with different regional granularity. Methods and results are compared with epidemiological data extracted from a literature search on this topic. To explore the similarity of the results of these different methods of measurement a systematic review of regional correlation is being elaborated. Correlations pointing to a high analogy of the findings in spite of the differences in dimensions measured on the one hand and contra intuitive correlations on the other hand were further explored. **RESULTS:** The review of regional correlation indicates promising close links between the burden of disease derived from ATC→ICD, ATHIS and cause of death registry data. Hospital discharge data, however, show some contra-intuitive relations towards the other data sets. **CONCLUSIONS:** The use of routine data yields promising opportunities for monitoring the Austrian health care system in a timely and comprehensible way. It enables different aggregation levels regarding regions and periods and leads the way to further research addressing underlying causes for the observed regional variation. The methodology can be transferred to other areas of diseases.

PCV165

ASSESSING THE IMPACT OF ORGANIZED SCREENING FOR ABDOMINAL AORTA ANEURYSMS IN AUSTRIA – FOLLOWING EUNETHTA CORE INFORMATION

Urach C[1], Zauner G[2], Wilbacher I[3], Endel G[3], Miksch F[2], Breitenecker F[1]
[1]*Vienna University of Technology, Vienna, Austria,* [2]*dwh Simulation Services, Vienna, Austria,* [3]*Main Association of Austrian Social Security Institutions, Vienna, Austria*

OBJECTIVES: Abdominal Aorta Aneurysms (AAAs) refers to distension of the abdominal aorta. It is a common disease among 65+ year old people with increasing importance due to overageing of the population. Currently, AAAs in Austria are only incidentally detected and due to its asymptomatic course often overlooked therefore the impact of an organized screening program in Austria was evaluated. **METHODS:** An agent based simulation model for Austria's population was developed. Each agent represents a person which has an individual development of its aorta depending on age, sex, and smoking habits. Identification of risk factors and parameterization of the model was performed in the IFEDH project (FFG grant number 827347). The observed persons are 65 years old at simulation start and the observed time horizon is 20 years. The chosen screening strategy which is compared to current practice corresponds to the EUnetHTA scheme with an assumed 40% participation. **RESULTS:** Events like ruptures, deaths or treatment are recorded and accumulated over the whole simulation time. Additionally, because many figures of the model depend on probabilities, the point in time when patients benefit from the intervention with 95% probability is calculated. Ruptures are reduced from 786 to 531, death cases from 571 to 433 whereas the costs per life year gained are about 7500 €. Significant differences can be observed after about four years. Although incidence is much higher among men, it is remarkable that screening is more cost-effective for women due to higher risk of rupture and life expectancy. **CONCLUSIONS:** The agent based simulation model allows detailed analysis of groups with specific properties, e.g. smokers, other age groups and different screening strategies. It also allows decision makers to estimate when the impact of the intervention, in this case organized screening, can be observed or measured within the real population.

PCV166

ADDED VALUE AND FUTURE ADOPTION OF A NEW MEDICAL IMAGING TECHNOLOGY FOR INTERVENTIONAL CARDIOLOGY

Meeks MDME[1], Steuten LMC[2], Sahyoun C[1], Ijzerman MJ[2]
[1]*Philips Healthcare, Best, The Netherlands,* [2]*University of Twente, Enschede, The Netherlands*

OBJECTIVES: To estimate the potential added value of an ultrasound-fluoroscopy fusion technology and to support product development and marketing positioning of the technology in interventional cardiology, using a combination of research methods. **METHODS:** Stakeholder analysis was carried out to determine the professionals involved in the adoption process. Literature search indicated which procedures could benefit most from the imaging technology. Subsequently, the current workflow and associated resource use of those procedures was compared with the expected workflow after potential technology adoption. Decision criteria to adopt the new imaging technology were evaluated with the analytical hierarchy process (AHP). Finally, a value based pricing approach was used to estimate the value of the technology to specific types of hospitals. **RESULTS:** Intervention cardiologists were identified as key stakeholders in the adoption of technology. The AHP showed that reduction in complication rates is the most important criterion for adopting a new imaging technology, whereas the purchase price seemed less important. Various procedures could benefit from the new technology, as this may shorten procedural times and facilitate communication between intervention cardiologists and imaging professionals. Value based pricing analysis showed that cost savings could be expected as a result of reduced procedure times, especially in centers of expertise with medium to high procedure volumes. **CONCLUSIONS:** The ultrasound-fluoroscopy fusion technology can provide added value in specific cardiac interventions, especially in hospitals with medium to high procedure volumes. Early assessment of potential added value and adoption criteria timely and effectively supported the product development phase. It informed various decision makers on the factors influencing the expected value of and uncertainties surrounding a future adoption of the technology.

PCV167

DIVERGENCE OF HTA DECISIONS ACROSS COUNTRIES: CASE ANALYSIS OF IVABRADINE

Thivolet M[1], Rémuzat C[2], Kornfeld A[1], Toumi M[3]
[1]*Creativ-Ceutical, Paris, France,* [2]*Creativ-Ceutical France, Paris, France,* [3]*University Claude Bernard Lyon 1, Lyon, France*

OBJECTIVES: In 2012, ivabradine was centrally approved by the EMA for Chronic Heart Failure treatment. Through ivabradine NICE and HAS decisions analysis, the objective of this policy research is to illustrate the divergence of HTA decisions despite a consistent efficacy, effectiveness and economics information. **METHODS:** NICE and HAS reports were fully reviewed with a focus on decisions outcomes. Then, convergences and divergences between HAS and NICE decisions were highlighted. **RESULTS:** NICE recommended for use ivabradine for patient with NYHA class II to IV with systolic dysfunction, with sinus rhythm with a heart rate ≥ 75 bpm, in combination with standard therapy or when beta-blocker therapy is contraindicated or not tolerated, and with a left ventricular ejection fraction ≤ 35%. Decision made by NICE was mainly based on results of one subgroup defined post hoc on the request of EMA. HAS rated the actual benefit of ivabradine as important for the labelled indication, nevertheless HAS distinguishes 2 subpopulations: one with minor improvement of actual benefit - patient with NYHA class II to III with systolic dysfunction in sinus rhythm with the heart rate ≥ 77 bpm and in which beta-blockers are contraindicated or not tolerated- for the other patients, HAS stated that ivabradine does not provide improvement in actual benefit. HAS based its decision mainly on the results of one subgroup defined a priori in which ivabradine was superior to each individual components of the primary combined endpoint. **CONCLUSIONS:** While EUnetHTA attempts to provide a coordinated opinion on comparative effectiveness, HTA decisions continue to be divergent across Europe. Ivabradine NICE and HAS decisions divergences exemplify once more the inconsistency of HTA decisions and highlight the obstacle for the establishment of a jointed EUHTA body.

PCV168

QUALITY IMPROVEMENT INITIATIVES FOR PATIENTS ON WARFARIN IN PRIMARY CARE

Molony S[1], O'Leary A[2], Usher C[2], Molony D[3]
[1]*Royal College of Surgeons in Ireland, Dublin, Ireland,* [2]*National Centre for Pharmacoeconomics, Dublin, Ireland,* [3]*Mallow Primary Healthcare Centre, Mallow, Ireland*

OBJECTIVES: The primary objective of this study was to report the clinical outcomes, i.e. routine calculation of time in therapeutic range (TTR), bleed events and thromboembolic events for patients on warfarin in a general practice following the introduction of quality improvement initiatives. A secondary objective was to estimate the cost of care of these patients managed from the perspective of the general practice. **METHODS:** Clinical data were analysed annually using a General Practice database, adapted to allow calculation of TTR for all patients prescribed warfarin for the years 2009 (baseline), to 2011 (Year 2). Decision trees were constructed to reflect typical episodes of care for patients with atrial fibrillation (AF). Resource use and unit cost data were applied to each node in the decision tree. The probabilities of events occurring were derived from the literature and expert clinical opinion. A 60% TTR was used as a reference criterion for patient outcomes. Ethical approval for the study was obtained. Analysis was performed in SPSS®. **RESULTS:** The TTR at baseline was 54%, rising to 61% in Year 1 and 63% in Year 2. One patient suffered a haemorrhagic stroke in the baseline year (TTR 71%), and in the same year there were 4 thromboembolic events. No major haemorrhagic or thromboembolic events have been recorded in the follow-up years. The median cost per patient with AF was €276 (using a median of 12 INR tests per annum). **CONCLUSIONS:** The introduction of routine assessment of TTR in the practice has resulted in a significant improvement in care as demonstrated by the rise in TTR values, and adherence to international best-practice criteria. Clinically significant outcomes on patient care are also evident with the absence of major bleed events or thromboembolic breakthrough events. The study highlights the feasibility and benefits of enhanced care at local level.

MENTAL HEALTH – Clinical Outcomes Studies

PMH1

EFFICACY OF LONG-ACTING INJECTABLE ANTIPSYCHOTIC THERAPIES IN MAINTENANCE TREATMENT OF SCHIZOPHRENIA: A MIXED TREATMENT COMPARISON (MTC) OF DOUBLE-BLIND RANDOMIZED CLINICAL TRIALS

Majer IM[1], Gaughran F[2], Sapin C[3], Beillat M[3], Hennequin M[1], Treur M[1]
[1]*Pharmerit International, Rotterdam, The Netherlands,* [2]*South London and Maudsley NHS Foundation Trust, London, UK,* [3]*Lundbeck SAS, Issy les Moulineaux, France*

OBJECTIVES: Treatment with antipsychotic medication is an important element of relapse prevention in the management of schizophrenia. However, approximately 50% of patients with schizophrenia miss taking >30% of their medication, therefore the use of long-acting injectable (LAI) formulations is an important option for patients partially or non-adherent to oral formulations. This study aimed to compare LAIs in terms of efficacy and safety. **METHODS:** A systematic literature review in PubMed, EMBASE, Cochrane, PsychINFO and conference abstracts was conducted to identify relevant randomized controlled trials of LAIs in maintenance treatment in schizophrenia. Selection criteria included long-term follow-up, stable patients and minimamilly one LAI treatment arm. The primary efficacy outcome was relapse rate; rate of discontinuation due to treatment-related adverse events (AEs) was also considered in this analysis. Data on discontinuation parameters were analyzed by applying a MTC competing risks model appropriate for multinomial distribution of data using WinBUGS. **RESULTS:** Six trials (study follow-up from 24 to 53 weeks) were identified, allowing comparisons of aripiprazole (oral and LAI), risperidone LAI, paliperidone LAI, olanzapine (oral and LAI), haloperidol LAI and placebo. The total patient number was 3402, of which 534 (16%) received aripiprazole. Compared to placebo the risk of relapse was the smallest for aripiprazole LAI (mean hazard ratio [HR]=0.26, 95% confidence interval [CI] 0.12-0.50) and risperidone LAI (HR=0.29, 95% 0.05-0.83). The risk of discontinuation due to AEs was lower than placebo for aripiprazole LAI (HR=0.72) and higher than placebo for the other LAIs (paliperidone LAI: HR=5.08, risperidone LAI: HR=12.06, olanzapine LAI: HR=6.58, haloperidol LAI: HR=4.19). **CONCLUSIONS:** The MTC suggests that aripiprazole LAI is at least as efficacious in the management of relapse prevention as other LAIs with an advantage over other LAIs in terms of discontinuation due to AEs. This study provides support for formulary decision-making in the absence of head-to-head data.

PMH2

RISK OF PSYCHIATRIC AND NEUROLOGICAL DISEASES IN PATIENTS WITH WORKSPACE MOBBING EXPERIENCE IN GERMANY: A RETROSPECTIVE DATABASE ANALYSIS

Kostev K[1], Rex J[1], Schröder-Bernhardi D[1], Mergenthaler U[1], Waehlert L[2]
[1]*IMS Health, Frankfurt am Main, Germany,* [2]*Fresenius University of applied sciences, Idstein, Germany*

OBJECTIVES: In recent years workplace mobbing attracts notice in public and science. Victims of workplace mobbing frequently suffer from depressions, somatic symptoms, may develop alcoholism or other substance abuse disorders and show increased risk of suicidal behavior. The aim of this study was to calculate the number of patients with a workspace mobbing documentation and their diagnosis profile in general practices in Germany between 2003 and 2012 based on the data from a large epidemiological database. **METHODS:** This retrospective study analysed longitudinal routine care data collected by general practitioners in Germany (IMS® Disease Analyzer). Data from patients with notice as workplace mobbing (N=2653) and without such notice (N=2653) from 199 general medical practices in Germany (Disease Analyzer database; 01/2003 to 12/2012) were matched for age (41 ± 13 years), gender (male: 33%), health insurance (private: 5%) and retrospectively analyzed. Odds Ratio (OR; Logistic regression) for depression, anxiety, somatoform disorder, migraine and sleep disorder (follow-up: 3 years) were calculated. **RESULTS:** In 2003, 24 (projected to national level: 2448) patients were documented as mobbing victims; this number continuously increased to 429 (projected to national level: 43758) in 2012. Shares of female patients and mean age have not significantly changed from 2003 till 2012. In workspace mobbing persons there was a increased risk of depression (OR: 4.11, p<0.001), anxiety (OR: 2.76, p<0.001), somatoform disorder (OR: 3.51, p<0.001), migraine (OR: 1.41, p=0.003) and sleep disorder (OR: 2.32, p<0.001). **CONCLUSIONS:** This retrospective database analysis showed that experience of workspace mobbing was associated with increased prevalence of psychiatric and neurological problems. Further research is required to understand this complex issue.

PMH3

POINTS TO CONSIDER IN MULTIREGIONAL TRIALS USING PHQ-9: A META-ANALYSIS ON PHQ-9

Ueki H, Kaneko M, Narukawa M
Kitasato University, Graduate School of Pharmaceutical Science, Tokyo, Japan

OBJECTIVES: As the cultural adaptation process of PROs (Patient Reported Outcome instruments), every version of PROs should be validated. However, little is known whether those validated PROs are identical in terms of the test performance (operating characteristics). In this study, we investigated PHQ-9 (Patient Health Questionnaire-9 for depression) using the meta-analysis. **METHODS:** We searched PubMed for studies examining diagnostic accuracy of PHQ-9. Then we extracted or retrieved 2 x 2 data from each study and meta-analysis was performed using Bivariate model (Reitsma et al. 2005). As the language versions of PHQ-9 and regions where the studies were conducted would be potential confounding factors, we performed meta-regression. Bivariate meta-analysis of the subgroup (region, language) was explored. **RESULTS:** Twenty-eight studies met our inclusion criteria. Univariate meta-regression showed that all the covariates assessed such as language, region significantly contributed to the heterogeneity of sensitivity (I^2=82.7) and specificity (I^2=92.5) among the studies. Meta-analysis of subgroup of the regions and languages was made using bivariate model; studies conducted in North America (6 studies), Europe (13 studies), or Asia & others (9 studies); LogitSe of North America, Europe and Asia& other were 1.66, 1.45, and 1.48, respectively. Logit Sp of these regions was 1.87, 1.90 and 2.22, respectively. **CONCLUSIONS:** Results suggest that operational characteristics would influenced by the regions, language version of PHQ-9. Therefore, when considering a multiregional study using PHQ-9 as screening tool, there would be a chance of some imbalance among regions. Therefore, before initiation of the clinical studies, efforts need to minimize the heterogeneity of the definite diagnosis, e.g. training to the investigators, or central diagnosis.

PMH4

RESULTS FROM THE "AUTOR" STUDY, A EUROPEAN OBSERVATIONAL STUDY IN PEDIATRIC PATIENTS WITH ATTENTION-DEFICIT/HYPERACTIVITY DISORDER

Haynes V[1], Lopez-Romero P[2], Anand H[3]
[1]*Eli Lilly and Company, Indianapolis, IN, USA,* [2]*Eli Lilly and Company, Madrid, Spain,* [3]*Eli Lilly and Company, Surrey, UK*

OBJECTIVES: To investigate factors associated with changes in attention-deficit/hyperactivity disorder (ADHD) symptom severity and quality of life (QoL) in patients who were responders and stable on their pharmacotherapy at study entry. **METHODS:** "AUTOR" is a European prospective, observational study investigating factors associated with ADHD severity changes during a 2-year follow-up period in patients aged 6-17 years. At baseline, patients had received the same pharmacotherapy for 3-8 months and had a Clinical Global Impression (CGI)-ADHD-Severity score of mild or lower and a CGI-ADHD-improvement score of improved/very much improved since treatment initiation. Data were collected at naturally occurring visits coinciding with observation windows (postbaseline): 0, 3, 6, 9, 12, 18, and 24 months, and ±6 weeks. ADHD symptom severity worsening was defined as a ≥2-point increase from baseline in CGI-ADHD-Severity score. The Child Health Profile-Child Edition (CHIP-CE) was used to measure QoL. Multivariate logistic regression was used to assess the association of different factors with changes in ADHD severity at any time postbaseline. Mixed-model repeated measures (MMRM) regression was used to estimate adjusted differences between treatments. Propensity scoring was used to adjust for imbalanced covariates before treatment comparisons. **RESULTS:** Data were analyzed from 704 patients (mean [standard

deviation] age 10.7 [2.75] years, 99% Caucasian, 82% male, 76% combined ADHD subtype). Variables associated with worsening severity were: baseline parental occupation (P=.003), poorer school outcomes (P<.001), and use of psychoeducation (P=.004). Initial use of nonstimulants (vs. stimulants) was associated with significant improvement on the CHIP-CE total score at 3 months and 9-24 months postbaseline. The estimated adjusted difference between treatments was –6.0 (95% confidence interval: –7.9, –4.1) at 24 months postbaseline. **CONCLUSIONS:** In this observational study, worsening of ADHD symptoms was associated with initial use of psychoeducation, parental occupation, and poorer school outcomes. Initial treatment with nonstimulants (vs. stimulants) was associated with improved QoL.

PMH5

CLINICAL OUTCOMES IN SCHIZOPHRENIA TREATED WITH DONEPEZIL IN COMBINATION WITH ANTIPSYCHOTICS

Ballesteros J[1], Guillen V[1], Zabala A[1], Santos B[1], Rueda JR[2], Solà I[3]
[1]*University of the Basque Country UPV/EHU, Leioa, Spain,* [2]*University of the Basque Country, UPV/EHU, Leioa, Spain,* [3]*Iberoamerican Cochrane Center, Barcelona, Spain*

OBJECTIVES: To assess the efficacy of a cognitive enhancer, donepezil, as an adjuvant treatment to antipsychotics on clinical outcomes of schizophrenia. **METHODS:** Systematic review with meta-analysis to obtain appropriate evidence from randomized clinical trials (RCTs) on the efficacy of donepezil plus antipsychotics versus placebo plus antipsychotics in patients diagnosed with schizophrenia for the following outcomes: general psychopathology, positive/negative symptoms, and depressive symptoms. Effect size estimates corrected for small sample size trials (Hedges' g) were calculated for parallel trials and cross-over trials. Negative values for Hedges' g denote an effect favouring the combined treatment. When needed, values for the cross-over correlation were imputed from available individual data to obtain the Hedges' g estimates. The individual estimates were pooled with a random-effects meta-analysis. **RESULTS:** Seven trials (4 cross-over, 3 parallel) were included. Four trials provided data on the Positive and Negative Syndrome Scale (PANSS) for total and general psychopathology scores. Three trials provided data for PANSS positive scores and 5 trials provided data for PANSS negative scores. Three trials provided data on depression scores. The combined treatment did not show differences in any of the assessed outcomes: PANSS total scores (g = -0.57, 95% CI = -2.11 to 0.96, I^2 = 67%); PANSS General Psychopathology scores (g = -0.20, 95% CI = -0.74 to 0.34, I^2 = 0%); PANSS positive symptoms (g = -0.06, 95% CI = -0.73 to 0.60, I^2 = 0%); PANSS negative symptoms (g = -0.43, 95% CI = -1.98 to 1.12, I^2 = 86%); depression scores (g = -0.35, 95% CI = -1.20 to 0.49, I^2 = 0%). **CONCLUSIONS:** The combination of donepezil with antipsychotic treatment does not improve clinical outcomes in schizophrenia.

PMH6

RESPONDER ANALYSIS OF FUNCTIONAL HEALTH AND WELL-BEING IN MDD: A POOLED ANALYSIS OF SF-36 RESULTS FROM THREE PHASE III TRIALS WITH LEVOMILNACIPRAN SR

Blum SI, Hallman LA, Tourkodimitris S, Gommoll C
Forest Research Institute, Jersey City, NJ, USA

OBJECTIVES: Levomilnacipran (1S,2R-milnacipran) is a potent and selective serotonin and norepinephrine reuptake inhibitor (SNRI) with approximately 2-fold greater potency for reuptake inhibition of norepinephrine than serotonin. Levomilnacipran SR is in late-stage clinical development for the treatment of major depressive disorder (MDD) in adults. A pooled analysis of Phase III studies was conducted to evaluate the effects of levomilnacipran SR treatment on functional health and well-being. **METHODS:** Pooled analysis of three double-blind, placebo-controlled, Phase III randomized clinical trials (Clinicaltrials.gov #NCT00969709, NCT00969150, NCT01034462), which included one fixed-dose (levomilnacipran SR 40, 80 or 120 mg/day or placebo) and two flexible-dose (levomilnacipran SR 40-120 mg/day or placebo) studies that included the acute version of the SF-36v2 health survey. Percentage of responders following 8-weeks of treatment (observed cases) with levomilnacipran SR or placebo were compared for each individual health domain and the Physical (PCS) and Mental (MCS) Component Summary scores based on individual patient-level responder criteria for minimally important differences. Estimates of odds ratios, 95% confidence intervals and p-values were from a logistic regression model with study and treatment as factors, baseline score as covariate and a study-by-treatment interaction term. **RESULTS:** Compared with placebo-treated patients, a greater percentage of patients who were treated with levomilnacipran SR were considered as responders. Homogeneity of OR could be assumed for the individual health domains and component summary scores except for the Bodily Pain scale (study-by-treatment interaction p-value=0.0123). Pooled OR [95%-CI] for being a responder were as follows: MCS=1.705 [1.292-2.250]; PCS=1.285 [0.972-1.700]; General Health=2.324 [1.763-3.064]; Social Functioning=1.698 [1.295-2.226]; Vitality=1.608 [1.250-2.068]; Mental Health=1.579 [1.203-2.072]; Role-Emotional=1.453 [1.121-1.882]; Physical Functioning=1.382 [1.032-1.850]; and Role-Physical=1.341 [1.005-1.788]. All OR (except PCS) were statistically significant (p<0.05). **CONCLUSIONS:** Compared with placebo, patients who are treated with levomilnacipran SR are more likely to achieve meaningful improvement in multiple domains of health as measured by the SF-36 Health Survey.

DO POLICY MEASURES IMPACT ON COST CONSCIOUSNESS OF HEALTH CARE PROFESSIONALS?

Jakovljevic M[1], Vukovic M[2], Antunovic M[1], Dragojevic Simic V[3], Velickovic Radovanovic R[4], Siladji-Mladenovic D[5], Jankovic N[6], Rankovic A[7], Kovacevic A[3], Antunovic M[3], Markovic V[8], Chia-Ching C[9], Tetsuji Y[10]
[1]*Faculty of medical Science, Kragujevac, Serbia and Montenegro,* [2]*Health Centre, Valjevo, Serbia and Montenegro,* [3]*Military Medical Academy Belgrade, Belgrade, Serbia and Montenegro,* [4]*The Faculty of Medicine, University of Nis, Nis, Serbia and Montenegro,* [5]*University Clinical Center Vojvodina, Novi Sad,, Novi Sad, Serbia and Montenegro,* [6]*The Faculty of Medical Sciences University of Kragujevac, Kragujevac, Serbia and Montenegro,* [7]*University Clinical Center Kragujevac, Kragujevac, Serbia and Montenegro,* [8]*The Faculty of Medical Sciences, University of Kragujevac, Kragujevac, Serbia and Montenegro,* [9]*School of Health Sciences & Practice, New York Medical College, U.S.A., NY 10595, NY, USA,* [10]*Center for Children and Childhood Studies, Rutgers University, Camden, NY, USA*

OBJECTIVES: To assess health care professional's judgments on economic consequences of prescribed medical interventions and their responsiveness of different health care policy measures aiming for increasing their cost-consciousness. **METHODS:** The design encompassed the nation-wide-cross-sectional hierarchical levels of health care facilities across the geographical regions. Authors used validated and standardized Likert scale of Health Economic Awareness (HEA) adjusted for local setting to evaluate health care professionals by face-to-face interviews. The questionnaire comprehended clinician'sattitudes on: Clinical-Decision-Making-Alternative-Interventions (CDMAI); Quality-of –Health-care (QHC); and Cost-Containment-Policy (CCP). This survey was conducted in two waves before and after policy intervention in 40 hospitals and primary care facilities in fifteen cities in Serbia from January 2010-December 2012. A total of 649 participants were interviewed before the intervention and 651 after the intervention. Core Republican Health Insurance Fund adopted and disseminated the package of cost containment measures through the Nation-wide pharmacoeconomic guidelines which principally targeted at prescribers. Pharmacists, physicians and dentists were examined by the scores of CDMAI, QHC, CCP and HEA. **RESULTS:** Pharmacists and dentists had a higher average score (mean±s.d.) of CDMAI by the pharmacists (1.200±0.421) and the dentists (1.195±0.560) than the score of physicians (1.017±0.453). Dentists had the highest average score of CCP (2.127±0.598) and then the score of physicians (1.976±0.529). The score of pharmacists was the lowest (1.854±0.461).There were no impacts of the interventions on the professional behaviors regarding the scores of QHQ, CDMAI, CCP, and HEA. **CONCLUSIONS:** Health economic awareness has differed substantially among of different health care professionals. Health policy measures were implemented to reduce non-cost-effective prescribing behaviors but the effects are non-clear-cut evidences. This experimental study is a pioneering effort in the wider Balkans region.

PMH8

EFFICACY AND SAFETY OF AGOMELATINE IN DEPRESSED THAI PATIENTS INCLUDING THE ELDERLY DEPRESSED POPULATION

Suraaroonsamrit B
Somdet Chaopraya Institute of Psychiatry, Somdet Chaopraya Hospital, Bangkok, Thailand

OBJECTIVES: To assess the efficacy and safety of agomelatine using pharmacovigilance during 12-week follow-up. **METHODS:** Agomelatine 25-50 mg was prescribed open label to patients with depressive disorders diagnosed by psychiatrists based on DSM-IV/ICD-10 criteria. Treatment options were intent-to-treat. All 480 patients, including 97 elderly patients were followed up at week 2 if dose titration was necessary. Efficacy was assessed using Montgomery-Äsberg Depression Rating Scale(MÄDRS) and clinical global impression of improvement (CGI-I) and of severity (CGI-S) scales, at weeks 2, 6, and 12. Data on adverse effects and for reports were gathered through patient interviews. **RESULTS:** Of 480 patients, 20-86 years (mean[SD] 49.6[14.5]), 247(51.5%) were men and 97(20.2%) were elderly (65 to 86; mean[SD] 71.1[5.0]). Among all patients, 225(46.9%) and 255(53.1%) were depressed with a single episode and recurrent episodes. Patients with recurrent episodes were taking various classes of antidepressants, including selective serotonin reuptake inhibitors in 328(50.9%) patients. Generalized anxiety disorder was a concurrent diagnosis in 95(24.3%) of patients. The respective mean(SD) baseline CGI-S, CGI-I, and MADRS scores of 3.90(0.68), 4.15(0.76), and 22.59(3.77) were reduced to 2.1(0.31), 1.11(0.37), and 9.19(2.03), with respective reductions in mean(SD; 95% CI) scores of 1.78(0.75;1.72-1.85), 2.98(0.78;2.91-3.05), and 13.39(4.36; 13.00-13.78). Similar efficacy was evidenced for elderly depressed patients (N=97), in whom mean(SD) MADRS score at baseline 22.37(4.79) was consistently significantly reduced to 14.61(3.04), 10.76(3.04), and 8.72(1.91) at weeks 2, 6, and 12, respectively. After 12 weeks, overall remission (MADRS score <10) was seen in 68.4% of patients with moderate to severe (MADRS >25) depression and in 73.4% of elderly depressed patients. The mild adverse events reported were dizziness(9.5%), headache(7.4%), difficulty sleeping(6.3%), and nausea(3.1%). There were no cases reported of alanine transaminase levels three times above upper limit of normal. **CONCLUSIONS:** Agomelatine has proven to be a safe and effective new antidepressant in intent-to-treat analysis of depressed, including elderly, patients in daily clinical practice in Thailand.

PMH9

COMPARATIVE EFFICACY AND METABOLIC SIDE EFFECTS OF LURASIDONE FOR THE MANAGEMENT OF ACUTE SCHIZOPHRENIA: A SYSTEMATIC LITERATURE REVIEW AND MIXED TREATMENT COMPARISON WITH FIRST AND SECOND GENERATION ANTIPSYCHOTICS

Guelfucci F[1], Watt M[1], Vimont A[2], Roïz J[3], Cadi-Soussi N[4]
[1]*Creativ Ceutical, London, UK,* [2]*Creativ-Ceutical, Paris, France,* [3]*Creativ-Ceutical, London, UK,* [4]*Takeda Pharmaceuticals International GmbH, Glattpark-Opfikon (Zurich), Switzerland*

OBJECTIVES: Second generation antipsychotics (SGA) are associated with increased risk of metabolic side effects. A systematic literature review and mixed treatment comparisons (MTC) were performed to assess the efficacy and the metabolic side effects of antipsychotics, and more especially to compare lurasidone to other widely used antipsychotics in patient with acute schizophrenia. **METHODS:** This review included short-term (≤12 weeks) randomised controlled trials (RCTs) in patients with an acute phase of schizophrenia. The literature search was based on the NICE guidelines on treatment for schizophrenia published in 2010. A systematic search in the most comprehensive medical databases of peer-reviewed articles (MEDLINE, EMBASE, CENTRAL) was conducted until June 2012 to update the evidence. In addition to lurasidone, eight comparators were considered: amisulpride, aripiprazole, haloperidol, olanzapine, quetiapine, risperidone, ziprasidone and placebo. A Bayesian ramdom effect MTC was performed on efficacy outcomes (PANSS total score and CGI-S score) and metabolic side effects (weight, triglycerides, total cholesterol level and fasting glucose level). **RESULTS:** Thirty-nine RCTs involving 12,721 patients were included. Results showed that lurasidone had similar efficacy

to others antipsychotics in terms of PANSS total score and CGI-S score and a similar effect as compared to placebo on all metabolic outcomes. The probability to have a lower impact than aripiprazole on weight increase and fasting glucose level was respectively 75.5% and 65.9%. Probabilities to have a lower impact on cholesterol level and triglycerides compared to olanzapine, quetiapine or riperidone varied from 98% to 100%. **CONCLUSIONS:** Efficacy has been demonstrated for all reviewed treatments vs. placebo, with a similar effect. Lurasidone had a similar effect as compared to placebo and a less negative impact than olanzapine, quetiapine and risperidone on weight increase, triglycerides, total cholesterol level and than olanzapine on fasting glucose level.

PMH10

RELATIVE EFFICACY AND ACCEPTABILITY OF VORTIOXETINE VERSUS MARKETED ANTIDEPRESSANTS

Llorca PM[1], Lançon C[2], Brignone M[3], Rive B[3], Salah S[4], François C[5]
[1]*Centre Hospitalier Universitaire, Clermont-Ferrand, France,* [2]*Hopital Sainte-Marguerite CHU, Marseille, France,* [3]*Lundbeck S.A.S., Paris, France,* [4]*Keyrus Biopharma, Paris, France,* [5]*Lundbeck S.A.S., Issy-les-Moulineaux, France*

OBJECTIVES: Vortioxetine (Lu AA21004) is an investigative multimodal antidepressant which demonstrated efficacy, safety and tolerability in Major Depressive Episode (MDE). The comparison of vortioxetine to marketed antidepressants guides decison makers and clinicians in their choice of treatment. The main study objective was to generate comparative evidence for the efficacy and acceptability of vortioxetine in MDE. **METHODS:** Indirect comparisons were performed by meta-regression analysis, an extension of classical random-effect meta-analyses, to compare vortioxetine to agomelatine, escitalopram, duloxetine, sertraline, venlafaxine IR/XR and vilazodone. To ensure comparability between studies, in terms of selection of patient population and exposure to treatment, only investigational drug and placebo arms from pre-registration placebo-controlled studies were included in the base case analyses. The main outcomes were efficacy, measured as the standardized mean difference between active treatment and placebo control in the change from baseline to 2 months of the primary endpoint (MADRS or HAM-D total score), and acceptability (the withdrawal rate due to adverse events) and expressed as the logarithm of the odds ratio (OR) between active treatment and placebo. Sensitivity analyses were performed with the inclusion of post-marketing authorization studies, adjustment for age/gender and on response and remission. **RESULTS:** For efficacy, treatment effect estimates and p-values for vortioxetine versus comparators were: -0.16(0.11) versus agomelatine (negative effect favours vortioxetine); 0.09(0.42) versus duloxetine; -0.05(0.70) versus escitalopram; -0.04(0.83) versus sertraline; 0.12(0.33) versus venlafaxine IR/XR and -0.24(0.11) versus vilazodone. For acceptability, all but one OR (<1) favoured vortioxetine: 1.77(0.03) versus agomelatine; 0.75(0.26) versus duloxetine; 0.67(0.28) versus escitalopram; 0.30(0.01) versus sertraline; 0.47(0.01) versus venlafaxine and 0.64(0.18) versus vilazodone. Meta-regression adjusted for age and gender demonstrated the robustness of the estimated differences between treatments, as did sensitivity analyses including post-marketing trials. **CONCLUSIONS:** Vortioxetine is a promising intervention with efficacy comparable to marketed antidepressants in MDE and a favourable acceptability profile.

PMH11

DRUG TREATMENT OF ATTENTION-DEFICIT/HYPERACTIVITY DISORDER (ADHD) IN AUSTRIA

Hinteregger M[1], Füzi J[2], Reichardt B[3]
[1]*Main Association of Austrian Social Security Institutions, Vienna, Austria,* [2]*Sickness Fund Burgenland, Eisenstadt, Austria,* [3]*Sickness Fund Burgenland, Eisenstadt, Burgenland, Austria*

OBJECTIVES: The therapy of Attention Deficit/Hyperactivity Disorder (ADHD) with methylphenidate or atomoxetine, formerly only related to children and adolescents, is now extended to the adult population. Little is known about treatment patterns in Austria. The aim of this study was to evaluate the medication patterns of ADHD in 2012 in Austria, stratified by age and sex. **METHODS:** The data analysis refers to the accounting data of the 13 major Austrian health insurance funds, covering more than 97% of the Austrian population. Provided in a pseudonymised manner, with availability of the individual patient parameters age and sex, all dispensed medication of methylphenidate or atomoxetine is included in the descriptive analysis. The prevalence of ADHD medication is evaluated regarding age and sex. Furthermore the prescribed daily dose in relation to the defined daily dose is pointed out. **RESULTS:** A total of 9120 patients with ADHD medication in 2012 are included in the analysis (22% female). One per cent of all patients with ADHD medication is in the age cohort of under 6 years, 47% are between 6 and 13, 22% are between 14 and 17, and 30% are adults (18+). The relation between the defined daily dose (ddd) to the prescribed daily dose (pdd) shows that 86% of children and adolescents have less than 366 pdd in the whole year and only 1% has more than 732 pdd. 81% of the adults have less than 366 pdd and 6% have more than 732 pdd. **CONCLUSIONS:** While the variety of prescribed daily dose per patient is homogeneous during childhood and adolescence, this parameter spreads widely in adults. This could be an indicator of overuse or misuse. As the results reflect the prescription reality they can be used as a solid basis for further discussions, future evaluations and interventions about ADHD medication in Austria.

PMH12

TREATMENT DISPARITY AMONG PATIENTS DIAGNOSED WITH DEPRESSIVE DISORDER IN WORKING POPULATION BASED ON CLAIMS DATABASE IN JAPAN

Onishi Y[1], Furukawa TA[1], Hinotsu S[2], Kawakami K[1]
[1]*Kyoto University, Kyoto, Japan,* [2]*Okayama University, Okayama, Japan*

OBJECTIVES: Treatment disparity by gender and age among patients with depressive disorder in working population has not been examined in Japan. This study examined treatment disparity by gender and age among patients newly diagnosed with depressive disorder based on the claims database of health insurance societies between 2008 and 2011 in Japan. **METHODS:** Retrospective cohort database (N=600,000) was followed up for four years to identify patients (18 ≤ age ≤ 65) with newly diagnosed depressive disorder. The patients were followed up for one year after the index date (the first date of diagnosis). Psychotropic drugs used to treat depressive disorder included first- and/or second-generation antidepressant, benzodiazepine, sulpiride, and antipsychotics. The treatment duration and time to treatment by gender and age were evaluated by Cox regression model. **RESULTS:** A total of 5,464 patients (men: 3,483, mean age: 36.1±9.9) with depressive disorder was identified. Median treatment duration was 123 days (men: 150 days, women 92 days). 90.1% of patients was prescribed at least one psychotropic drug within 30 days from the first date of diagnosis (84.5% in women and 93.1% in men). The proportion of patients who were prescribed at least one psychotropic drug for the first time after 6 months from the index date was 5.6% (men: 3.8%, women: 9.1%). The result showed that older patients were more likely to be treated longer period. In addition, men tend to be prescribed at least one psychotropic drug in a shorter period of time from the index date compared to that in women. **CONCLUSIONS:** This study suggested the trend of treatment disparity between men and women as well as age in working population with regard to treatment duration and time to prescription. Further study is needed for generalizability.

PMH13

THE BURDEN OF TREATMENT CHANGE IN MAJOR DEPRESSIVE DISORDER: COMPARISON OF SWITCH VERSUS NON-SWITCH PATIENTS IN THE PERFORM STUDY

Boulenger JP[1], Haro JM[2], Lamy FX[3], Brignone M[3], Caillou H[4], Rive B[3], Saragoussi D[3]
[1]*CHU de Montpellier, Montpellier, France,* [2]*Parc Sanitari Sant Joan de Déu, CIBERSAM, Universitat de Barcelona, Barcelona, Spain,* [3]*Lundbeck S.A.S., Issy-les-Moulineaux, France,* [4]*Inferential, Paris, France*

OBJECTIVES: PERFORM (Prospective Epidemiological Research on Functioning Outcomes Related to Major depressive disorder) is a 2-year prospective observational cohort study conducted in Europe (France, Germany, Spain, Sweden and UK). Objectives are to describe the functioning of patients with major depressive disorder (MDD) and factors associated with functional impairment. Here we compare characteristics and outcomes of patients switching antidepressant treatment (ADT) with those initiating ADT at baseline, on an interim 1000-patient dataset. **METHODS:** Outpatients were recruited from primary or secondary care. Inclusion criteria were: DSM-IV-TR diagnosis of MDD, age 18-65 years, initiation or first switch to an ADT, in monotherapy. In addition to socio-demographics and disease history, data collection included clinician assessments (MADRS and CGI-S) and patient-rated scales evaluating depression (PHQ-9), functioning (SDS), work productivity (WPAI-SHP) and quality of life (QoL - EQ-5D). **RESULTS:** Of 947 analysable patients at inclusion, 213 (23%) patients were switching (76% for lack of efficacy), *versus* 716 (77%) initiating ADT. Switchers were slightly older (mean age 46 *versus* 43 years) and more often female (77% *vs.* 72% women). Switching patients had more severe symptom profiles: more had previous depressive episodes (34% *vs.* 24%) and previous suicide attempts (16% *vs.* 12%). Severity of current episode was greater for switchers (46% *vs.* 36% with a CGI-S score above "markedly ill"; 48% *versus* 38% with a PHQ-9 score above the severe depression threshold). MADRS scores were similar: 18.1 *versus* 17.6. QoL was poorer for switchers (EQ-5D: 0.449 *vs.* 0.567), as was overall patient functioning (47% *vs.* 36% with an SDS total score in the highest quartile), while no difference was found for absenteeism (35% *vs.* 34%) and presenteeism (49% vs. 50%) (WPAI-SHP). **CONCLUSIONS:** Patients switching ADT had more severe symptom profiles, lower quality of life and higher functional impairment, compared to non-switching patients.

PMH14

PATIENT-REPORTED COGNITIVE DYSFUNCTION NEGATIVELY IMPACTS FUNCTIONING IN PATIENTS WITH MAJOR DEPRESSIVE DISORDER – PRELIMINARY FINDINGS FROM THE PERFORM STUDY

Saragoussi D[1], Haro JM[2], Boulenger JP[3], Jönsson B[4], Knapp M[5], Caillou H[6], Chalem Y[1], Milea D[7], François C[1]
[1]*Lundbeck S.A.S., Issy-les-Moulineaux, France,* [2]*Parc Sanitari Sant Joan de Déu, CIBERSAM, Universitat de Barcelona, Barcelona, Spain,* [3]*CHU de Montpellier, Montpellier, France,* [4]*Stockholm School of Economics, Stockholm, Sweden,* [5]*London School of Economics and Political Science, London , UK,* [6]*Inferential, Paris, France,* [7]*Lundbeck Singapore PTE LTD., Singapore, Singapore*

OBJECTIVES: PERFORM (Prospective Epidemiological Research on Functioning Outcomes Related to Major depressive disorder) is a 2-year prospective observational cohort study conducted in Europe to describe the functioning of patients with major depressive disorder (MDD) and factors associated with functional impairment. Here we report the impact of patient-reported cognitive dysfunction (PRCD) on quality of life (QoL), work and overall functioning at baseline, on a preliminary 1000-patient dataset. **METHODS:** Outpatients were recruited from primary or secondary care. Inclusion criteria were: DSM-IV-TR diagnosis of MDD, 18-65 years old, initiation or first switch to an antidepressant, in monotherapy. Functioning was assessed by the SDS (Sheehan Disability Scale), work productivity by the WPAI-SHP (Work Productivity and Activity Impairment Questionnaire) and QoL by the EQ-5D (EuroQol-5 Dimensions) and SF-12 (12-Item Short-Form Health Survey). PRCD was assessed by the Perceived Deficit Questionnaire 5-item (PDQ-5). Descriptive analyses stratified on PDQ-5 quartiles were complemented with ANCOVA adjusted for severity of depression. **RESULTS:** At inclusion, over 947 analysable patients, mean PDQ-5 score (ranging from 0 to 20) was 11.5 (SD=4.4). PRCD was associated with impairment of overall functioning, QoL and productivity. SDS total scores were 14.4, 18.5, 20.2, and 23.6 (first to fourth PDQ-5 quartiles, respectively) (p<0.001). Similar patterns were observed for WPAI-SHP presenteeism scores (impairment while working: from 36.9% in first quartile to 64.4% in fourth quartile, p<0.001; overall work impairment: from 41.5% to 71.3%, p<0.001). These associations remained statistically significant after adjustment for baseline depression severity in multivariate analyses. A negative impact of PRCD was also observed on sick-leave length and on QoL. **CONCLUSIONS:** At inclusion, subjective cognitive dysfunction in depressed patients was associated with poorer functioning, work productivity and QoL. This is in addition to any negative impact of the

severity of depression on these outcomes. These preliminary results need to be confirmed on the full dataset.

PMH15

FACTORS ASSOCIATED WITH EARLY RESPONSE TO OLANZAPINE AND CLINICAL AND FUNCTIONAL OUTCOMES OF EARLY RESPONDERS TREATED FOR SCHIZOPHRENIA IN CHINA

Ye WW[1], Montgomery W[2], Kadziola Z[3], Liu LL[1], Xue HBH[1], Treuer T[4]
[1]Lilly Suzhou Pharmaceutical Co., Ltd. Shanghai Branch, Shanghai, China, [2]Eli Lilly Australia Pty Ltd., West Ryde, Australia, [3]Eli Lilly GmbH, Vienna, Austria, [4]Eli Lilly & Company, Budapest, Hungary

OBJECTIVES: To identify factors associated with early response at 4 weeks of treatment with olanzapine and to assess whether early response is associated with better longer-term outcomes for patients with schizophrenia in China. **METHODS:** A post-hoc analysis was conducted using data from the Chinese schizophrenia subgroup (n=330) of a multicountry, 6-month, prospective, observational study of outpatients with schizophrenia/bipolar mania who were initiated or switched to oral olanzapine. Stepwise logistic regression controlling for baseline clinical characteristics, participation in weight education program at baseline, and compliance with antipsychotics over first 4 weeks of olanzapine treatment was used to identify factors associated with early response. Mixed Models Repeated Measures with baseline covariates were used to compare outcomes over time between early responders and early non-responders to olanzapine. **RESULTS:** A total of 130 patients (40%) achieved early response. The models revealed that significant factors associated with a higher likelihood of achieving early response were higher CGI-Sevirity score (OR=1.51, 95% CI: 1.15-1.97), fewer years since first diagnosis (OR=0.94, 95% CI: 0.90-0.98), a greater number of social interactions (OR=1.22, 95% CI: 1.05-1.40), participation in a weight education program (OR=1.81, 95% CI: 1.04-3.15) at study entry, and high medication compliance with antipsychotics during the first 4 weeks of treatment (OR=2.98, 95% CI: 1.59-5.58). When compared to early non-responders, early responders achieved a significantly higher endpoint response and significantly greater symptom improvement at end point (CGI-Severity) and a greater improvement in level of functional outcomes (all $p<0.05$). **CONCLUSIONS:** High levels of compliance to prescribed antipsychotic and participation in a weight education program were associated with early response in schizophrenia patients in China. Early response was associated with greater improvement in symptomatic, functional and quality-of-life outcomes at 6 months compared to early non-response. Current findings are consistent with previous research outside of China.

PMH16

FACTORS ASSOCIATED WITH PAIN PERSISTENCE IN PATIENT WITH DEPRESSION DURING A 3 –MONTH FOLLOW-UP PERIOD

Novick D[1], Montgomery W[2], Aguado J[3], Kadziola Z[4], Peng X[5], Brugnoli R[6], Haro JM[7]
[1]Eli Lilly & Co, Windleasham, UK, [2]6. Eli Lilly Australia Pty. Ltd., Sydney, Australia, [3]Parc Sanitari Sant Joan de Deu, CIBERSAM, Sant Boi de Llobregat, Spain, [4]Eli Lilly GmbH, Vienna, Austria, [5]Eli Lilly and Company, Indianapolis, IN, USA, [6]Sapienza University, Rome, Italy, [7]Parc Sanitari Sant Joan de Déu, CIBERSAM, Universitat de Barcelona, Barcelona, Spain

OBJECTIVES: Patients with major depressive disorder (MDD) frequently suffer from concomitant pain symptoms, which are associated with higher depression severity and worse quality of life. We describe the baseline factors associated with pain persistence in patients with MDD during a 3-month follow-up period. **METHODS:** Patients from Asia (n=909) presenting with a new or first episode of MDD were enrolled in a 3-month prospective observational study. This report analyzes the 709 (78%) patients assessed at baseline and 3 months. Demographics, depressive symptoms (Hamilton Depression Scale), overall severity (Clinical Global Impression Severity score), somatic symptoms (Somatic Symptom Inventory) and quality of life (Euro QOL -5D) were assessed. Logistic regression models were fitted to assess the relationship between baseline factors and pain persistence during follow-up. **RESULTS:** Of the 709 patients analyzed , 349 (49%) had pain at baseline. Forty three per cent of the patients (151) having pain at baseline still presented with pain at 3-months. Patients with persistent pain had more frequently suffered from previous MDD episodes (54% vs 39%) , were less likely to be older than 60 (11 vs. 21%), and had a higher number of medical comorbid conditions (14% vs 5% with two or more co-morbidities). The logistic model adjusting for other baseline covariates confirmed these results. **CONCLUSIONS:** A high proportion of patients with depression who presented with pain at baseline still suffered from pain symptoms at 3 months. A history of depression and the presence of other medical conditions were risk factors for pain persistence at 3-months.

PMH17

BAYESIAN ANALYSIS OF MALFORMATION OUTCOME IN SELECTIVE SEROTONIN REUPTAKE INHIBITOR (SSRI) USE DURING PREGNANCY: AN INDIRECT COMPARISON OF CITALOPRAM, FLUOXETINE, PAROXETINE, AND SERTRALINE

Ip Q, Smith KW, Malone DC
University of Arizona, Tucson, AZ, USA

OBJECTIVES: Assessing the safety of selective serotonin reuptake inhibitor (SSRI) use during pregnancy is complicated, especially given the array of treatment option. The objective of this study was to evaluate the risks of fetal malformation of SSRI use during pregnancy. **METHODS:** A search for prospective studies evaluating fetal malformation with maternal use of citalopram, fluoxetine, paroxetine, or sertraline was conducted using the databases of MEDLINE, PsycINFO and EMBASE for the period of 1974 to March 21, 2013. The key terms used were: 'serotonin reuptake inhibitors', 'pregnancy', 'prospective studies'. The inclusion criteria in addition to prospective studies included: 1) malformation outcome; 2) citalopram, fluoxetine, paroxetine, and/or sertraline; 3) drug exposure in first trimester; and 4) compared to control group of either 'no SSRI exposure' or 'nonteratogenic agents'. The exclusion criteria included: 1) evaluation of SSRI as a drug class, and 2) venlafaxine or bupropion. A Bayesian random-effects indirect treatment comparison model was used to perform the analysis. **RESULTS:** The search resulted in 64 articles. Eight articles met inclusion/exclusion criteria. The combined odds ratio was 1.72 (95% CI: 1.432 to 2.070), indicating the odds of fetal malformation is higher among women taking antidepressants than those not receiving SSRIs. In the pairwise analysis, 2 of the 14 pairwise comparisons were statistically significant: fluoxetine compared to control (OR 1.774, 95% CI 1.008 to 2.925); paroxetine compared to control (OR 1.752, 95% CI 1.057 to 2.953). The resulting pairwise odds ratios suggested a lowest odds of malformation to highest odds was citalopram, sertraline, paroxetine, fluoxetine. **CONCLUSIONS:** The risk of malformation is an important consideration when treating pregnant women. This study suggests that there is an increase in the odds of fetal malformation when exposed to SSRIs in utero during the period of organogenesis. The risk appears to be highest with fluoxetine and paroxetine, and lower for citalopram.

BUDGET IMPACT OF PALIPERIDONE PALMITATE IN AUSTRIA

Ransmayr S[1], Mehnert A[2], Mahlich JC[3]
[1]University of Vienna, Vienna, Austria, [2]Janssen Pharmaceutica NV, Beerse, Belgium, [3]Janssen-Pharmaceutical companies of Johnson & Johnson, Neuss, Germany

OBJECTIVES: The costs of schizophrenia in Austria are high and new long acting injectable (LAI) antipsychotics might be able to reduce costs due to a reduction of hospital stays. We aim to estimate budget effects of the introduction of a new LAI (Paliperidone Palmitate) in Austria. **METHODS:** A budget impact analysis was conducted that took direct costs of illness into account (i.e. costs for inpatient and outpatient services and drug costs). We used official Austrian remuneration prices as input parameters. The robustness of the model was checked by means of deterministic sensitivity analyses with regard to switch rates to Paliperidone Palmitate and rehospitalisation rates. **RESULTS:** According to our calculations, direct total costs of schizophrenia in Austria reach € 254.36 million a year. The drug costs are € 26.14 million and the costs for inpatient and outpatient services are € 228.22 million. Within the next five years, drug costs will slightly decrease to € 25.77 million due to a bigger market share of generic Quetiapine which offsets the higher drug costs of Paliperidon palmitate. The use of Quetiapine is associated with a higher rate of rehospitalisation. Therefore, costs for inpatient and outpatient services will increase to € 228.65 million, which results in an overall effect of € 60,000 additional costs compared to the situation without paliperidone palmitate. **CONCLUSIONS:** The introduction of a new treatment of schizophrenia in Austria is budget neutral.

PMH19

ASSOCIATION BETWEEN COGNITIVE FUNCTION AND 3 MONTH HEALTH CARE COSTS AMONG PATIENTS INITIATING AN ANTIDEPRESSANT FOR DEPRESSIVE DISORDER IN AN AMBULATORY CARE SETTING

Kurlander JL[1], Walker V[1], Essoi B[1], Samp J[2], Akhras KS[2], Yang J[2]
[1]OptumInsight, Eden Prairie, IL, USA, [2]Takeda Pharmaceuticals International, Inc., Deerfield, IL, USA

OBJECTIVES: Depression is associated with reduced cognitive function and significant health care costs; however, the extent to which these two are related remains unclear. This study compared follow-up health care costs for major depressive disorder patients with and without cognitive dysfunction after antidepressant (AD) initiation. **METHODS:** A large US health plan affiliated with OptumInsight was used to identify depressed patients with a newly prescribed AD who could be surveyed to assess cognitive function. Patients with neurological diseases associated with cognitive dysfunction were excluded. Patients were mailed a survey invitation and consent form. Patients maintained eligibility by confirming a depressive diagnosis and no excluding diagnoses. Consenting, eligible patients were interviewed by telephone and completed 4 cognitive function tests. Patients were classified as "cognitive normal (CN)" or "cognitive dysfunction (CD)" based on test scores relative to normative data. All-cause health care costs in the 3 months post-AD initiation were calculated from pharmacy and medical claims. T-tests compared 3-month costs of CN versus CD. Gamma models with log link compared health care costs between CD and CN patients, adjusting for race, sex, age, education, employment, depression severity, and comorbidities. **RESULTS:** A total of 13,537 patients were invited to participate in the study and 564 patients maintained eligibility and completed the study. Patients were mostly female (80%), mean age was 41 years, 98% had a high school degree or higher, and 84% were employed. A total of 45% (n=255) met criteria for CD. Mean health care costs were $4,996 for all patients. Costs were $6,457 for the CD group compared to $3,787 for the CN ($p = 0.038$). In the gamma models with costs as the outcome, CD patients had costs 1.43 times higher than CN patients (95% CI: 1.13, 1.81). **CONCLUSIONS:** In this study population, health care costs were significantly higher in patients with cognitive dysfunction compared to those without cognitive dysfunction.

ASSESSING THE ECONOMIC BURDEN AND HEALTH CARE UTILIZATIONS OF VETERAN PATIENTS DIAGNOSED WITH POST-TRAUMATIC STRESS DISORDER IN THE UNITED STATES

Xie L[1], Dysinger AH[1], Wang L[2], Du J[1], Huang A[2], Baser O[3]
[1]STATinMED Research, Ann Arbor, MI, USA, [2]STATinMED Research, Dallas, TX, USA, [3]STATinMED Research/The University of Michigan, Ann Arbor, Michigan, MI, USA

OBJECTIVES: To assess the economic burden and health care utilizations of patients diagnosed with post-traumatic stress disorder (PTSD) in the U.S. veteran population. **METHODS:** Patients diagnosed with PTSD were identified (International Classification of Disease 9th Revision Clinical Modification [ICD-9-CM] diagnosis code 309.81) from the Veterans Health Administration (VHA) dataset from October 01, 2009 through September 30, 2011. The first diagnosis date was designated as the index date. A comparator group was created by identifying patients without PTSD but with the same age, region, gender and index year, and who were matched by baseline Charlson Comorbidity Index. A randomly chosen index date served to

minimize selection bias. Patients in both groups were required to be at least 18 years old, and have continuous medical and pharmacy benefits 1 year pre- and 1 year post-index date. One-to-one propensity score matching was applied to compare follow-up health care costs and utilizations between patients with and without PTSD. **RESULTS:** A total of 938,138 patients were identified for the PTSD and comparison cohorts. After 1:1 matching, a total of 333,303 of patients were matched from each group, and baseline characteristics were balanced. Patients diagnosed with PTSD used more health care resources for inpatient (8.57% vs. 2.58%, p<0.01), emergency room (13.45% vs. 7.15%, p<0.01), physician office (99.59% vs. 55.67%, p<0.01), outpatient (99.64% vs. 56.46%, p<0.01), and pharmacy visits (89.97% vs. 56.47%, p<0.01) than patients in the comparator cohort. The PTSD cohort also incurred higher health care costs for inpatient ($2,587 vs. $719, p<0.01), emergency room ($133 vs. $66, p<0.01), physician office ($3,404 vs. $1,254, p<0.01), outpatient ($3,735 vs. $1,430) and pharmacy visits ($629 vs. $362, p<0.01). **CONCLUSIONS:** Study results suggest that the economic burden and health care utilizations were significantly higher for patients with PTSD versus those without.

PMH21

COMPARING THE HEALTH CARE COSTS AND UTILIZATIONS BETWEEN PATIENTS WITH ANXIETY VERSUS THOSE WITHOUT

Xie L[1], Wang L[2], Du J[1], Li L[2], Baser O[3]
[1]*STATinMED Research, Ann Arbor, MI, USA,* [2]*STATinMED Research, Dallas, TX, USA,* [3]*STATinMED Research/The University of Michigan, Ann Arbor, MI, USA*

OBJECTIVES: To compare health care costs and utilizations between patients with anxiety versus those without in the U.S. veteran population. **METHODS:** A retrospective database analysis was performed using the Veterans Health Administration (VHA) Medical SAS datasets (01OCT2008-30SEP2012). Patients diagnosed with anxiety were identified (ICD-9-CM: 300.xx) from October 01, 2009 through September 30, 2011. The first diagnosis date was designated as the index date for the anxiety group. A group of non-anxiety patients of the same age, region, gender and index year were identified and matched by baseline Charlson Comorbidity Index (CCI) as the comparison group. The index date for the comparator group was randomly chosen to reduce the selection bias. Patients in both groups were required to be at least 18 years old, and have continuous medical and pharmacy benefits 1 year before and 1 year after the index date. One-to-one propensity score matching was applied to compare the health care costs and utilizations during the follow-up period between the anxiety and comparison groups, adjusted for baseline demographic and clinical characteristics. **RESULTS:** A total of 928,724 patients were identified for the anxiety and comparison cohorts. After 1:1 matching, 338,373 of patients were matched from each group and the baseline characteristics were well-balanced. Patients with anxiety had higher percentages of inpatient (11.03% vs. 2.74%, p<0.01), emergency room (18.64% vs. 7.50%, p<0.01), physician office (99.53% vs. 59.16%, p<0.01), outpatient (99.68% vs. 59.91, p<0.01) and pharmacy visits (91.42% vs. 59.13%, p<0.01). The anxiety group had higher expenditures in inpatient ($3,347 vs. $782, p<0.01), emergency room ($204 vs. $68, p<0.01), physician office ($3,527 vs. $1,435, p<0.01), outpatient ($3,948 vs. $1,621) and pharmacy visits ($745 vs. $429, p<0.01) than the comparison group. **CONCLUSIONS:** Results suggest that patients diagnosed with anxiety used significantly more health care resources and incurred significantly higher health care costs compared to patients without.

PMH22

METHODOLOGICAL CHALLENGES OF COST-OF-ILLNESS STUDIES ON DEMENTIA: AN INTERNATIONAL SYSTEMATIC REVIEW

Schaller SU[1], Mauskopf JA[2], Kriza C[1], Wahlster P[1], Kolominsky-Rabas PL[1]
[1]*Centre for Health Technology Assessment (HTA) and Public Health (IZPH), University of Erlangen-Nuremberg, Erlangen, Germany,* [2]*RTI Health Solutions, Research Triangle Park, NC, USA*

OBJECTIVES: Increasing prevalence of dementia highlights the need for a better understanding of the cost burden for health policy makers. By descriptive analysis of specific cost impacts, cost-of-illness (COI) studies are an essential instrument for decision making and planning of health care services. Therefore the purpose of this study was to review COI studies of dementia in order to analyze cost components and underlying methods in an international context. **METHODS:** A systematic review according to the PRISMA-guidelines was conducted from 2002-2012 in order to identify COI studies related to dementia, searching the PubMed, Cochrane, EMBASE and NHS Economics Evaluations databases. Annual outcomes per patients were analyzed for total, direct, indirect and informal costs. **RESULTS:** In total 25 studies were evaluated. Total costs showed an annual range from USD 3.512 to USD 59.526 in 14 health care systems. This is due to the fact, that the composition of cost components and corresponding methods indicated a large heterogeneity in terms of both – study characteristics (e.g. diagnosis, care setting, disease stratification) and composition of cost components. The majority of studies (92%, n=23) included direct costs, however different cost components and underlying measurements were applied. Almost two thirds (60%, n=15) of the studies included informal costs, whereas 9 used the replacement cost approach and 6 studies the opportunity cost approach. **CONCLUSIONS:** Outcomes of COI studies in dementia indicate a large range, due to differences in health care systems, but also because of methodological approaches and cost components included. Dementia as a long-lasting and progressive disease affects multiple cost dimensions and thereby poses a complex challenge for policy makers. In addition, international guidelines on cost analysis of dementia are lacking. Standards regarding the methodology of COI studies in dementia by the scientific community would be useful. Funded by the European Commission, ICT-FP7, project-ID-287509.

PMH23

DIFFERENTIAL RESOURCE USE AND COSTS AMONG INPATIENTS AND OUTPATIENTS WITH SCHIZOPHRENIA IN TIANJIN, CHINA

Liu LL[1], Ye WW[1], He X[2], Wu J[2], Montgomery W[3], Xue HBH[1]
[1]*Lilly Suzhou Pharmaceutical Co., Ltd. Shanghai Branch, Shanghai, China,* [2]*Tianjin University, Tianjin, China,* [3]*Eli Lilly Australia Pty Ltd., West Ryde, Australia*

OBJECTIVES: To estimate the direct total and component medical costs for inpatient and outpatient care for patients with schizophrenia in Tianjin, China. **METHODS:** Data were extracted from the Tianjin Urban Employee Basic Medical Insurance database. Patients (N=2125) who were aged ≥18 years, at least 1 diagnosis of schizophrenia and 12-month continuous enrollment after their first observed schizophrenia diagnosis between 2008 and 2010 were included. Psychiatric-related inpatient and outpatient direct medical costs were estimated. **RESULTS:** During the study period, 60.8% of patients had at least one inpatient admission and 39.2% used only outpatient services. The mean (± SD) total annual cost for inpatients was $2771.9±2175.6, with 88.9% ($2465.4±2022.5) due to non-drug medical costs and 11.1% ($306.6±461.7) for medications. Total annual costs for the outpatient only group were $230.6±487.3 with 4.4% ($10.1±40.8) for non-drug medical costs and 95.6% ($220.5±470.3) for medications. Antipsychotics accounted for 50.4% of the total annual medication costs in the inpatient group and 60.0% in outpatient only group. On average, inpatients had 2.2 psychiatric hospitalizations and 2.2 outpatient visits. Outpatient only group had 5.9 outpatient visits. The highest costs per psychiatric-related inpatient admission were general care and non-drug treatment (49.8%), followed by examinations (21.6%), bed fee (14.6%), and medications (7.8%). The majority of costs for outpatient visits were due to medications (96.2%). **CONCLUSIONS:** Patients who were hospitalized for schizophrenia incurred considerably more costs than those who were only treated at outpatient setting in Tianjin China, primarily driven by non-drug medical care. This suggests that the use of more effective treatments to minimize the risk of hospitalization could lead to reduced total health care costs.

PMH24

HEALTH CARE RESOURCE UTILIZATION AND DIRECT MEDICAL COSTS AMONG PATIENTS WITH SCHIZOPHRENIA IN TIANJIN, CHINA

He X[1], Wu J[1], Liu LL[2], Montgomery W[3], Ye WW[2], Xue HBH[2]
[1]*Tianjin University, Tianjin, China,* [2]*Lilly Suzhou Pharmaceutical Co., Ltd. Shanghai Branch, Shanghai, China,* [3]*Eli Lilly Australia Pty Ltd., West Ryde, Australia*

OBJECTIVES: To estimate the health care resource utilization and direct medical costs of patients with schizophrenia in Tianjin, China. **METHODS:** Data were obtained from the Tianjin Urban Employee Basic Medical Insurance database. Adult patients with ≥ 1 diagnosis of schizophrenia and 12-month continuous enrollment after the first observed schizophrenia diagnosis between 2008 and 2010 were included. Both all-cause and psychiatric-related resource utilization and direct medical costs were estimated. Two-sample t-test was used to assess cost difference. A multiple linear regression model was applied to identify factors associated with total cost. **RESULTS:** A total of 2125 patients were included, with mean age of 52.3 years, 49.3% male and 55.7% retired. 60.8% of the patients experienced ≥1 psychiatric-related hospitalizations during the study period. Median (min-max) length of stay was 88 (1-365) days per admission and 91 (1-365) days per patient-year. 58.9% of the patients experienced ≥1 psychiatric related outpatient visits. Median number of outpatient visits was 4 (1-82). Mean (±SD) total all-cause and psychiatric-related direct medical costs were $2863.5±2638.4 and $1774.5±2123.3 per patient-year respectively, with significant difference between hospitalized and non-hospitalized patients ($3953.0 vs. $1176.9, p<0.001; $2771.9 vs. $230.6, p<0.001). The regression model revealed that patients with more hospitalizations/outpatient visits and non-retired patients were more likely to incur higher psychiatric-related annual costs. **CONCLUSIONS:** Costs related to treatment with schizophrenia was considerable in Tianjin China, driven mainly by psychiatric hospitalizations. Patients with psychiatric-related hospitalizations used more medical resources and had higher direct medical cost than patients who were not hospitalized.

PMH25

SOCIO-ECONOMIC IMPACT OF ALZHEIMER'S DISEASE IN GREECE: PILOT STUDY

Kaitelidou D[1], Kalogeropoulou M[2], Mougias A[3], Galanis P[2], Kontodimopoulos N[2], Pasaloglou S[4], Siskou O[2]
[1]*National and Kapodistrian University of Athens, Athens, Greece,* [2]*Center for Health Services Management and Evaluation, National and Kapodistrian University of Athens, Athens, Greece,* [3]*Nestor Psychogeriatric Association, Athens, Greece,* [4]*Novartis Hellas, Metamorfosi, Greece*

OBJECTIVES: The economic burden of Alzheimer disease goes beyond the direct health cost as the disease has significant economic and social impact on both patients themselves and their families (carers). Despite the fact that Greece is plagued by the economic crisis, with major cuts in health expenditure, very little is known about the cost of chronic diseases and the most cost-effective ways to manage them. The study's' aim is to estimate, for the first time in Greece, the cost of Alzheimer's disease, per each severity stage, evaluating apart from the direct costs of disease, the cost of carers. **METHODS:** The pilot sample was 46 patients from two Alzheimer centers. A cost analysis was conducted from the socio-economic perspective. Data regarding the carers' time were collected via a questionnaire developed by the researchers of this study and was partly based on the research tool CATS (Caregiver Activities Time Survey) as it was adopted by Jacobsen et al. (2011). **RESULTS:** The total annual cost of the disease was estimated at €12,140 (SD: 6,555.9) for the mild stage (MMSE* 30-21), at €13,735 (SD: 7,858.7) for the moderate stage (MMSE 20-11), and €22,666 (SD: 8,467.2) for the severe stage (MMSE 10-0) (for outpatient cases), 87% higher compared to the mild stage of disease. On average, from the total cost of disease, 77% was the cost of the primary and the secondary caregiver, 8.7% is the cost of medication and 5% is the hospitalization cost. Productivity loss of the primary caregiver exceeds 5% of the total cost per patient in mild stage. **CONCLUSIONS:** As the patient gets worse and goes from mild to more severe stages, the total health care cost increase. It is important, when possible, to prolong the stay of patients in the early stages of the disease.

SCHIZOPHRENIA AND NEGATIVE SYMPTOMS – BURDEN OF THE DISEASE IN SEVEN CENTRAL AND EASTERN EUROPEAN (CEE) COUNTRIES: THE RESULTS OF THE LITERATURE REVIEW

Walczak J[1], Augustyńska J[1], Miernik K[1], Stelmachowski J[1], Pieniazek I[1], Obrzut G[1],

Pogroszewska A[1], Szkultecka-Debek M[2], Paulic G[3], Maric D[3], Sinisa A[3], Pecenak J[4], Tavcar R[5], Indrikson A[6], Jankovic S[7], Pulay AJ[8], Rimay J[9], Varga M[9], Sulkova I[10]
[1]*Arcana Institute, Cracow, Poland,* [2]*Roche Polska Sp. z o.o., Warsaw, Poland,* [3]*Roche Ltd., Zagreb, Croatia,* [4]*Faculty of Medicine, Comenius University, Bratislava, Slovak Republic,* [5]*University Psychiatric Hospital, Ljubljana, Slovenia,* [6]*Roche Eesti OÜ, Estonia, Tallinn, Estonia,* [7]*Faculty of Medical Science, Univercity of Kragujevac, Kragujevac, Serbia and Montenegro,* [8]*Semmelweis University, Budapest, Hungary,* [9]*Roche (Magyarorszag) Kft, Hungary, Budaörs, Hungary,* [10]*Roche Slovensko, s.r.o., Bratislava, Slovak Republic*

OBJECTIVES: To gather data concerning burden of schizophrenia in seven Central and Eastern European (CEE) countries (Croatia, Estonia, Hungary, Poland, Serbia, Slovakia, Slovenia) taking into account: epidemiology, clinical guidelines and recommendations, current standards of care, costs of illness, resource utilisation, health-related quality of life (HRQoL), stigmatisation and discrimination related to schizophrenia. The project focused on negative symptoms (NS). **METHODS:** A targeted search was performed focused on publications issued from 1995 onwards and indexed in the following databases: PubMed, Cochrane Library, and Centre for Review and Dissemination. Moreover, searches for literature in local languages from each country of interest were conducted. **RESULTS:** Fourteen reviews related to schizophrenia epidemiology were identified and revealed that the mean incidence of schizophrenia varied greatly from 0.04 to 0.58 per 1,000 population and lifetime prevalence from 0.4% to 1.4%. At least one negative symptom was found to be present in 57.6% of schizophrenia patients and in 50–90% of individuals experiencing their first schizophrenia episode. Primary NS were observed in 10–30% of patients. Mortality of schizophrenia patients was greater than in the general population (Standardised Mortality Ratio varies between 2.58 and 4.3), potentially due to increased suicide risk, effect of illness on lifestyle and environment, and side effects of disease treatment. Identified guidelines indicate a role for second-generation antipsychotics in NS treatment, nevertheless the development of novel therapeutic approaches should be pursued actively. Thirty-seven primary publications identified from the seven CEE countries which relate to HRQoL of patients and caregivers revealed that the disease greatly affects HRQoL of hospitalised patients and has a significant negative impact on caregivers' QoL. **CONCLUSIONS:** The literature review confirmed that schizophrenia is one of the most common and burdensome mental illnesses, with NS present in a relatively large percentage of patients.

PMH27

NEW ESTIMATES OF THE DIRECT MEDICAL COST OF ATTENTION-DEFICIT/HYPERACTIVITY DISORDER (ADHD) IN GERMANY

Schlander M[1], Trott GE[2], Banaschewski T[3], Schwarz O[4]
[1]*University of Heidelberg, Wiesbaden, Germany,* [2]*University of Wuerzburg, Aschaffenburg, Germany,* [3]*University of Heidelberg, Mannheim, Germany,* [4]*Institute for Innovation & Valuation in Health Care, Wiesbaden, Germany*

OBJECTIVES: To assess the excess direct medical costs associated with a diagnosis of attention-deficit/hyperactivity disorder (ADHD) in Germany. **METHODS:** Nordbaden is a region in Southwestern Germany with a population of 2.74 million. Regional sociodemographics and health care provider density are well understood and reflect, with few exceptions, respective national averages. The Nordbaden database covers the total regional population insured by SHI (2.24 million lives), integrating administrative data from the organization of physicians registered with statutory health insurance (SHI) and SHI, allowing patient-centered evaluation of health care utilization and direct medical cost for years 2003 to 2009. Patients with a diagnosis of ADHD were compared to a control group matched by age, gender, and type of health insurance within SHI. Here we report on years 2006-2009, as nonpharmacological therapy-related cost data were not fully available for earlier years. **RESULTS:** Average annual total cost per ADHD patient increased from €897 in 2006 to €1,006 in 2009 (controls, €261 in 2006 and €337 in 2009). Cost per patient correlated positively with age, and female patients were generally more costly than males (total as well as excess costs). Increasing severity and comorbidity were also associated with higher costs per patient. Physician services constituted the major cost component (on average, overall, €653 per case in 2009), followed by pharmacological therapy (€330 in 2009). **CONCLUSIONS:** The average excess cost (from the perspective of German SHI) per ADHD patient (over all age groups and irrespective of gender, compared to matched controls) was €669 per year in 2009. Extrapolation from the regional to the national level suggests annual outpatient treatment costs attributable to ADHD in the magnitude of €500 million (2009), from the payer's perspective of SHI. This estimate compares to total annual expenditures for health services by German SHI of €160 billion in 2009.

PMH28

A SYSTEMATIC REVIEW OF COST-OF-ILLNESS STUDIES AND COST-EFFECTIVENESS ANALYSES IN BORDERLINE PERSONALITY DISORDER

Brettschneider C[1], Riedel-Heller S[2], König HH[1]
[1]*University Medical Center Hamburg, Hamburg, Germany,* [2]*University of Leipzig, Leipzig, Germany*

OBJECTIVES: The borderline personality disorder (BPD) is a common mental disorder. It is frequently associated with various mental co-morbidities and causes a fundamental loss of functioning. Furthermore, economically relevant consequences such as high utilization of inpatient and emergency room treatment or reduced productivity at work have been reported. The aim of this study is to present the existing health economic evidence regarding BPD and to point out implications for further research. **METHODS:** We performed a systematic literature search in MEDLINE, EMBASE, PsycInfo and NHSEED to identify cost-of-illness studies (COI), cost-effectiveness analyses (CEA) and other cost studies (OCS) regarding BPD. Cost data were inflated to the year 2010 and converted into US-$ using purchasing power parities (PPP). Quality assessment of the studies was performed by means of a standardised quality checklist. **RESULTS:** We identified three COI, eight CEA and six OCS. The methodical quality was moderate. Depending on study perspective and considered cost categories cost per patient and year ranged from 18,306 US-$ PPP to 69,231 US-$ PPP. A co-morbid conduct disorder was reported to be the most influential factor for increased health care costs. All CEA analysed psychotherapy interventions. While CEA reporting cost per avoided parasuicide event indicated favourable incremental cost effectiveness ratios, CEA reporting cost per quality-adjusted life years (QALY) indicated just weak cost-effectiveness. **CONCLUSIONS:** BPD is associated with high costs. Available COI provide a first insight into the structure of cost and its predictors. There are no CEA regarding medication for BPD. Evidence regarding the cost-effectiveness of psychotherapy interventions is ambiguous. Future research should promote the understanding of the economic aspects of BPD and determine the societal value of its treatment. In this context high methodical standards are particularly important.

HEALTH INSURANCE COST OF EPILEPSY IN HUNGARY: A COST OF ILLNESS STUDY

Oberfrank F[1], Donka-Verebes É[2], Boncz I[3]
[1]*Institute of Experimental Medicine (IEM)., Budapest, Hungary,* [2]*Integra Consulting zRt., Budapest, Hungary,* [3]*University of Pécs, Pécs, Hungary*

OBJECTIVES: To calculate the annual health insurance treatment cost of epilepsy disease in Hungary. **METHODS:** The data derive from the financial database of the Hungarian National Health Insurance Fund Administration (NHIFA), the only health care financing agency in Hungary. We analyzed the health insurance treatment cost and the number of patients for the year 2010. The following cost categories were included into the study: out-patient care, in-patient care, CT-MRI, PET, home care, transportation, general practitioner, drugs and medical devices. **RESULTS:** The Hungarian National Health Insurance Fund Administration spent 6.341 billion Hungarian Forint (HUF) (23.026 million EUR) for the treatment of epilepsy patients. The annual average expenditure per patient was 41900 HUF (152.1 EUR) while the average expenditure per one inhabitant was 633 HUF (2.3 EUR). Major cost drivers were pharmaceuticals (6.3 % of total health insurance costs), general practitioners (13.1 %) and acute inpatient care (11.4 %). The number of patients with epilepsy was 151 per 100000 populations. We found the highest patient number in pharmaceutical budget (151357 patients), out-patient care (131280 patients) and general practitioners (86704 patients). **CONCLUSIONS:** Epilepsy disease represents a significant burden for the health insurance system. Pharmaceutical treatment is the major cost driver for epilepsy disease in Hungary.

PMH30

HEALTH CARE RESOURCE UTILIZATION AND COSTS ASSOCIATED WITH ATYPICAL ANTIPSYCHOTICS USE IN CHILDREN AND ADOLESCENTS WITH ATTENTION DEFICIT/HYPERACTIVITY DISORDER IN QUEBEC, CANADA

Lachaine J[1], Sikirica V[2], De G[3], van Stralen J[4], BenAmor L[1], Hodgkins P[2], Yang H[5], Heroux J[6]
[1]*University of Montreal, Montreal, QC, Canada,* [2]*Shire, Wayne, PA, USA,* [3]*Analysis Group, Inc., New York, NY, USA,* [4]*Center for Pediatric Excellence, Ottawa, ON, Canada,* [5]*Analysis Group, Inc., Boston, MA, USA,* [6]*Groupe d'analyse, Montreal, QC, Canada*

OBJECTIVES: To compare health care resource utilization (HRU) and costs among children/adolescents with attention deficit/hyperactivity disorder (ADHD) in Quebec, Canada, who received an atypical antipsychotic (AAP) as either augmentation or alternative therapy to stimulant, before vs. after initiating the AAP. **METHODS:** Patients (6–17 years) with ≥2 documented ADHD diagnoses (ICD-9 codes: 314.0–314.9), who used stimulants for ≥30 days and either switched to an AAP or augmented stimulants with an AAP, were identified in Quebec's health care database, the Régie de l'assurance maladie du Québec between 03/2007 and 02/2012. Patients with a documented diagnosis for which AAPs are indicated were excluded. All-cause and ADHD-related HRU and costs (from a public payer's perspective in 2012 Canadian dollars) were compared between the 6-month period before (pre-index) and after (post-index) patients' first AAP prescription claim. **RESULTS:** A total of 453 children/adolescents met the inclusion criteria (54.5% switched from stimulants to AAPs and 45.5% augmented stimulants with AAPs). The mean age was 10.4 years (SD=2.5) and 25.4% were female. The most prevalent documented mental comorbidities in the pre-index period were adjustment reaction (7.1%), anxiety disorder (5.1%), and learning disability (4.4%). Risperidone (81.7%) and quetiapine (16.3%) were the most common AAPs initiated. Compared to the pre-index period, patients incurred, on average, more all-cause outpatient visits and costs (3.2 vs. 4.6; $207 vs. $303), prescription fills and costs (13.3 vs. 22.2; $710 vs. $889), total medical costs ($644 vs. $1,096), and total health care costs ($1,354 vs. $1,985) (all $p<0.05$) during the post-index period. Similarly, ADHD-related total health care costs ($835 vs. $1,269; $p<0.05$) were higher during the post-index period; all-cause and ADHD-related total health care costs increased by 46.6% and 52.0%, respectively. **CONCLUSIONS:** Children/adolescents with ADHD, who received an AAP as either augmentation or alternative therapy to stimulant, incurred higher HRU and costs after AAP initiation, mostly through ADHD-related HRU.

PMH31

REGISTER BASED ANALYSIS OF TREATMENT COSTS OF SECOND GENERATION ANTIPSYCHOTICS IN SCHIZOPHRENIA

Borsi A, Takacs P, Feher L
Janssen Cilag Hungary, Budapest, Hungary

OBJECTIVES: The goal of our research was to assess and calculate the costs of antipsychotic treatment of schizophrenia patients in Hungary, using the database of the National Health Insurance Fund (NHIF). Based on the results of a recently published study using real world data (Bitter et al. 2013.) we focused especially on the costs linked to the early medication discontinuation and poor adherence of schizophrenia patients. **METHODS:** In Hungary all medicines which are purchased with reimbursement are documented in the centralized register of the NHIF since 1998. We analyzed the Payer's database taking into account the time to treatment discontinuation results of the Bitter et al. study. We calculated the yearly average costs of schizophrenia treatment both per patient, and both per substance

between 2006 and 2012. **RESULTS:** Our findings indicate that in the assessed time period an average yearly amount of approximately €5,5 million (calculation based on yearly average EUR/HUF exchange rates) is spent on second generation antipsychotics, which are prescribed and purchased with reimbursement but finally not used by the patients due to early medication discontinuation. Based on our calculations, the average yearly treatment costs of antipsychotics increased from €612 (2006) to €974 (2012) per patient in the assessed time period. The analysis of the NHIF database resulted, that the average yearly expenditure on different antipsychotics, varied between €173 and €2420 per patient. **CONCLUSIONS:** All-cause medication discontinuation is a major concern in the treatment of schizophrenia both from a clinical and both from a health economic perspective. In order to ensure resources are spent cost-effectively, it is crucial to identify methods which can improve treatment continuation and adherence of schizophrenia patients in the future.

PMH32

ADJUNCTIVE THERAPY WITH PREGABALIN IN GENERALIZED ANXIETY DISORDER PATIENTS WITH PARTIAL RESPONSE TO SSRI TREATMENT: A COST-CONSEQUENCES ANALYSIS IN MEDICAL PRACTICE IN SPAIN

Carrasco JL[1], Olivares JM[2], Alvarez E[3], Pérez M[4], López-Gómez V[4], Rejas J[5]
[1]*Department of Psychiatry, Hospital Clínico San Carlos, Madrid, Spain,* [2]*Hospital Meixoeiro, Complejo Hospitalario Universitario, Vigo, Spain,* [3]*Department of Psychiatry, Hospital de la Santa Creu i San Pau, Barcelona, Spain,* [4]*Pfizer S.L.U., Alcobendas, Madrid, Spain,* [5]*Pfizer S.L.U., Alcobendas/Madrid, Spain*

OBJECTIVES: To compare the effect of adjunctive therapy with pregabalin versus usual care (UC) on health care costs and clinical and patients consequences in Generalized Anxiety Disorder (GAD) subjects with partial response (PR) to previous SSRI course in medical practice in Spain. **METHODS:** Post-hoc analysis of patients with PR to SSRI monotherapy enrolled in a prospective 6-month naturalistic study. PR was defined as a Clinical-Global-Impression scale score >3 and insufficient response with persistence of anxiety symptoms >16 in the Hamilton-Anxiety scale. Two groups (based on psychiatrist judgment) were analyzed 1) adjunctive therapy (AT) with pregabalin (150-600 mg/day) to existing therapy; or 2) usual care (switching to a different SSRI or adding another anxiolytic different than pregabalin). Costs estimation used year-2009 prices for GAD related health care resources utilization. Consequences were a health profile based on the combination of psychiatrist-based-measurements [HAM-A, CGI and Montgomery-Asberg-Depression-Rating (MADRS) scales], and patient-reported-outcomes [sleep (MOS-sleep), disability (WHO-DAAS II) and quality-of-life/quality-adjusted-life-year gain (EQ-5D)]. Changes in both health care costs and scale scores were compared separately at end-of-trial visit by a general-linear-model with covariates. **RESULTS:** Four-hundred-eighty-six newly prescribed pregabalin and 239 UC GAD patients [mean (SD) HAM-A 26.7 (6.9) and CGI 4.1 (0.5)] were analyzed. Adding pregabalin was associated with significantly higher mean (95% CI) score reductions vs. UC in HAM-A [-14.9(-15.6;-14.2) vs. -11.2(-12.2;-10.2), p<0.001] and MADRS [-11.6(-12.2;-10.9) vs. -7.8(-8.7;-6.8), p<0.001]. Changes in all patient-reported-outcomes favored significantly patients receiving pregabalin, including QALY gain; 0.13(0.12;0.14) vs. 0.09(0.07;0.10), p<0.001. Health care costs were significantly reduced in both cohorts yielding similar 6-month costs; €1543 (1375;1711) UC and €1497 (1380;1614) pregabalin, p=0.661. The effect of sex on costs and consequences were negligible. **CONCLUSIONS:** In medical practice, GAD patients with PR to SSRI experienced greater consequences improvements with adjunctive therapy with pregabalin versus UC, without increasing health care cost. The effect of pregabalin was independent of patient gender.

PMH33

COST-EFFECTIVENESS OF ANTIDEPRESSANT AFTER 24 MONTHS OF TREATMENT BASED ON DISCRETE EVENT SIMULATION MODELING (DESM): AGOMELATINE VERSUS MATRIX COMPARATOR OF ESCITALOPRAM, SERTRALINE AND VENLAFAXINE IN A THAI SETTING

Satra T, Ngamthipwatthana T
Faculty of Medicine, Siriraj Hospital, Mahidol University, Bangkok, Thailand

OBJECTIVES: To compare cost-effectiveness of agomelatine versus an escitalopram-sertraline-venlafaxine matrix comparator. **METHODS:** A DESM describes course of depressive disorders with acute , continuation, and maintenance treatment of depression in Thai setting for 24 months. A sample of 250,000 patients with 100 simulations were assumed with Exigo® model. Antidepressants were analyzed for treatment of episodes(12-24 weeks),continuation phase(6-9 months), maintenance phase over 2 years follow-up. Data inputs included Thai data on disease parameters; Cost included antidepressants, drugs for insomnia, sexual side-effects, cognitive behavioral therapy(CBT), electroconvulsive therapy(ECT) and mean cost of psychiatric visits. Impact measures were derived from a systemic review. Results were presented as cost(Thai-Baht currency-THB) per Life-Year-Remission(LYR) averted and Quality-Adjusted Life Year(QALY) compared with branded antidepressants in the matrix comparator (46%escitalopram, 33%sertraline, 21%venlafaxine). Model simulation initiated with either agomelatine 25mg or comparators(escitalopram10mg,sertraline100mg,venlafaxine 150mg by random selection). Relapse cases required dose increase fro each antidepressant, addition of CBT and ECT. Data on impact of treatment on quality of life in patients free from relapse, sexual side effects, insomnia were taken from cochrane database. **RESULTS:** During 24 months, patients treated with agomelatine cost 15,814.2THB and 20,232.0THB per LYR and QALY gains, whereas with comparator cost 17,999.6THB and 23,431.7THB per LYR and QALY gains. As a result, the incremental cost-effectiveness ratio(ICER) shows that agomelatine is the most cost-effective antidepressant for episodic treatment with/without continuation or maintenance phase, its cost being lower than comparator by 153,283 and 83,645 THB per LYR and QALY. These results were robust, probability sensitivity analysis suggested that agomelatine was effective for a willingness-to-pay of 300,000THB,95%CI of -146,120.4 to -179,651.0THB per QALY, with probability of >0.90. **CONCLUSIONS:** Based on the model, agomelatine is the most cost-effective treatment option as compared with escitalopram,sertraline, and venlafaxine in a matrix comparator, with regard to side effects especially sexual dysfunction, agomelatine should be considered as the most cost-effective option for treatment of depression.

PMH34

COST-EFFECTIVENESS OF PALIPERIDONE PALMITATE FOR THE TREATMENT OF SCHIZOPHRENIA IN GERMANY

Zeidler J[1], Mahlich JC[2], Greiner W[3], Heres S[4]
[1]*Leibniz University Hannover, Hannover, Germany,* [2]*Janssen-Pharmaceutical companies of Johnson & Johnson, Neuss, Germany,* [3]*School of Public Health, Bielefeld University, Bielefeld, Germany,* [4]*Technical University of Munich, Munich, Germany*

OBJECTIVES: Treatment with antipsychotic medication is an important element of relapse prevention in the management of schizophrenia and can reduce inpatient stays. Recently, the long-acting atypical antipsychotic paliperidone long-acting injectable (PLAI), a once-monthly LAI antipsychotic, was approved for treatment of schizophrenia in Germany. The study aims at estimating, based on a previously published model, the cost-effectiveness of paliperidone long-acting injections compared to other common antipsychotic treatment strategies in patients diagnosed with schizophrenia in Germany. **METHODS:** A Markov decision analytic model was adapted to the German health care system. The model considers the cost-effectiveness for PLAI as a maintenance treatment for patients with schizophrenia from the payer perspective. The patients transition between eight health states on a monthly basis over a 5-year time horizon. As therapeutic strategies PLAI, quetiapine, risperidone long-acting injections (RLAI), oral olanzapine, oral risperidone, zuclopenthixol decanoate, olanzapine long-acting injections (OLAI), oral typical and oral atypical were compared. Probability of relapse, level of adherence, side effects and treatment discontinuation were derived from the Swedish original model. Input factors regarding resource use and costs were estimated and adjusted for the German health care system. A probabilistic sensitivity analyses using cost-effectiveness scatter plots was performed to visualize the robustness of the results. **RESULTS:** In base case scenario PLAI is superior to RLAI in gained quality adjusted life years (QALYs) and avoided relapses. Relative to all other treatment strategies PLAI is more effective with regard to gained QALYs and avoided relapses but results in higher treatment costs over a 5-year horizon in base case scenario. The results were tested in probabilistic sensitivity analyses **CONCLUSIONS:** PLAI dominates RLAI and compared to the other treatment strategies PLAI has shown to be more effective but results in higher costs in base case scenario.

PMH35

COST EFFECTIVENESS ANALYSIS FOR THE USE OF EXTENDED RELEASE QUETIAPINE AS ADJUNCTIVE THERAPY IN MEXICAN ADULT PATIENTS WITH MAJOR DEPRESSIVE DISORDER NON-RESPONDERS TO ANTIDEPRESSANT TREATMENT

Polanco AC[1], Ascencio ISI[1], Salazar A[2], González LA[2], Pizarro M[3], Soto H[2], Characheo L[2]
[1]*AstraZeneca, México, D. F., Mexico,* [2]*Health Solutions Consulting, D. F., Mexico,* [3]*Hospital Infantil de Mexico Federico Gomez, Mexico City, Mexico*

Depression is present in 10% of patients attending primary care services and is generally not identified. In Mexico it is estimated a prevalence of 12% to 20% among adults between 18-65 years old. Up to 75% of patients treated with a selective inhibitor of serotonin reuptake (SSRIs) are not responding adequately. Atypical antipsychotics are an effective alternative for these patients. **OBJECTIVES:** To evaluate the cost-effectiveness (CE) of extended release (XR) quetiapine as adjunctive therapy (AT) in patients with major depressive disorder (MDD) that doesn't respond to antidepressant treatment (AD), compared with other antipsychotics listed in the Mexican Formulary (aripiprazole and olanzapine). **METHODS:** A Markov model was developed to perform and incremental analysis with weekly cycles during eight weeks time horizon, based on the meta-analysis developed by Komossa et.al in 2010. Health states: remission, relapse and discontinuation of treatment. The model estimates the remission time gained (RG) by each AT alternative. The analysis was done from society perspective, considered direct costs, and reported in 2013 US dollars. **RESULTS:** Patients with AT with quetiapine XR had 1.83 weeks of RG, while patients under aripiprazole and olanzapine obtained 1.5 and 1.72 weeks of RG, respectively. Quetiapine XR compared to olanzapine generated an additional cost per patient of $94.70, with additional RG of 0.11 weeks and ICER of $881.73. Quetiapine XR dominated extendedly to aripiprazole. Robustness of results were confirmed by additional deterministic and probabilistic sensitivity analysis. **CONCLUSIONS:** The use of quetiapine XR as adjuvant treatment for non-responders patients is a cost-effective compared to aripiprazole and olanzapine, and could be considered as an option in an institutional setting.

PMH36

HOW SHOULD AN ANTIDEPRESSANT WITH REDUCED RISK OF SEXUAL DYSFUNCTION BE POSITIONED IN TREATMENT STRATEGIES FOR PATIENTS WITH MAJOR DEPRESSIVE DISORDER?

Massetti M[1], Vataire AL[2], Cristeau O[2], Toumi M[3], Aballea S[4]
[1]*University Paris-Est Creteil Val de Marne, Paris, France,* [2]*Creativ-Ceutical, PARIS, France,* [3]*University Claude Bernard Lyon 1, Lyon, France,* [4]*Creativ-Ceutical, Paris, France*

OBJECTIVES: Sexual dysfunctions (SD) is a common adverse event of antidepressants. It has a lasting impact on quality of life and is associated with an increased risk of early treatment discontinuation. Using an open-source Discrete Event Simulation model (https://open-model-mdd.org/), we performed a cost-effectiveness analysis comparing alternative sequences of treatments, to determine whether an antidepressant with moderate efficacy and reduced risk of SD should be positioned before or after a treatment with high efficacy and average risk of SD. **METHODS:** The model used was designed to simulate costs and QALYs in cohorts of patients with major depressive disorder (MDD), under alternative treatment strategies over 5 years. Each strategy consisted of up to 4 lines of treatment, with possibility to switch to different drugs when a patient experienced adverse events or lack of efficacy. We

compared two strategies based on hypothetical treatments: under strategy A, an antidepressant with high response rate/high SD rate was prescribed in first-line and an antidepressant with moderate response rate/low SD rate available in second-line; under strategy B, the positions of these two drugs were reversed. Efficacy and safety parameters were obtained from a meta-analysis and other parameters, from the literature. Costs were estimated for the UK, from payer perspective. **RESULTS:** The numbers of QALYs were estimated at 3.660 QALYs (SE=0.013) and 3.649 (SE=0.012) under strategies A and B respectively. Costs were estimated at £3,894 (SE=60) and £3,918 (SE=61). **CONCLUSIONS:** Positioning an antidepressant with moderate efficacy and reduced risk of SD before or after a treatment with high efficacy and average risk of SD had no significant impact in terms of average costs and QALYs. Thus, differences in efficacy and tolerability can offset each other. In practice, the choice of first-line treatment should take account of patient preferences.

PMH37

COST-EFFECTIVENESS OF INJECTABLE ATYPICAL LONG-ACTING ANTIPSYCHOTICS FOR CHRONIC SCHIZOPHRENIA IN POLAND

Hemels M[1], Einarson TR[2], Zilbershtein R[3], Schubert A[4], Skrzekowska-Baran I[5], Van Impe K[6]

[1]Janssen Cilag, Birkerød, Denmark, [2]University of Toronto, Toronto, ON, Canada, [3]PIVINA Consulting Inc., Mississauga, ON, Canada, [4]Janssen Cilag Poland, Warszawa, Poland, [5]Janssen-Cilag Polska, Warszawa, Poland, [6]Janssen Cilag Germany, Neuss, Germany

OBJECTIVES: To determine the cost-effectiveness of paliperidone palmitate (PP-LAI; paliperidone long-acting injectable), a new once-monthly long-acting antipsychotic therapy, compared with risperidone long-acting injectable (RLAI) administered biweekly for treating chronic schizophrenia in Poland from the National Health Fund (NHF) perspective. **METHODS:** We adapted a 1-year decision tree model to the Polish health care system with literature-derived data (e.g., length of stay in hospital, treatment patterns, resource utilization) and clinical expert inputs. Costs in 2012 euros were obtained from published sources or in case of non-reimbursed drug price, directly from producer. Drugs compared were PP-LAI, a new treatment option, and RLAI, the established treatment for Polish patients. Clinical rates were derived from published trials. Model outputs included expected cost/patient as well as rates of hospitalization, emergency room visits, days free of symptoms, and quality-adjusted life-years (QALYs). One-way sensitivity analyses were applied to major inputs. As well, all inputs were varied simultaneously in probabilistic sensitivity analyses using 10,000 iterations. **RESULTS:** Despite its higher acquisition cost, PP-LAI had a lower expected cost per patient treated when the benefits are included in the estimation model. PP-LAI was associated with 0.824 QALYS, 323 days with stable disease and 44.6% hospitalization. RIS-LAI had 0.817 QALY, 317 stable days and 51.3% hospitalizations. PP-LAI dominated RIS-LAI in the base case and in 55.0% of 10,000 simulations, and was cost-effective in 76.6%. However, cost-effectiveness was sensitive; it was lost with modest increases for PP-LAI or decreases for comparison drugs with respect to drug prices, relapse rates and adherence rates. Because it is injected monthly as opposed to biweekly, it saves caregiver time. **CONCLUSIONS:** From the viewpoint of the National Health Fund of Poland, as compared with RLAI, PP-LAI is a cost-effective drug that has the potential to reduce health care costs.

PMH38

MOOD STABILIZERS AND ATYPICAL ANTIPSYCHOTICS IN MAINTENANCE THERAPY FOR BIPOLAR DISORDER: A COST-EFFECTIVENESS ANALYSIS

Zimmermann IR[1], Kiyomoto HD[2], Alexandre RF[2], Nobre MRC[3], Diaz MDM[4]

[1]Universidade de Brasília, Brasília, Brazil, [2]Ministry of Health, Brasília, Brazil, [3]INCOR - HCFMUSP, Sao Paulo, Brazil, [4]Universidade de São Paulo, São Paulo, Brazil

OBJECTIVES: To evaluate the cost-effectiveness of using a combination of atypical antipsychotic agents and mood stabilizers in maintenance treatment of bipolar disorder in Brazil **METHODS:** Analyzing cost-effectiveness, taking direct costs, from the perspective of Brazil's Ministry of Health and its public health system (local acronym SUS), using a Markov model with transitions between possible states: euthymia, mania, depression, discontinuation and death. Efficacy data to populate the model were extracted from clinical trials and prospective cohort studies while direct cost data came from the public health system's databases (current values of 2012, exchange rate: US$ 1 = R$ 2.21). For a hypothetical cohort of 2000 euthymic individuals aged 40, maintenance therapy costs and outcomes were simulated over quarterly cycles through a timeframe that reached an effectiveness of <1 day in remission, for up to 30 years. Discount rates and half-cycle correction were applied, also, sensitivity analyses were run. **RESULTS:** The available efficacy data enabled the analysis to include only a combination with quetiapine. After twelve years (48 cycles) tracking the hypothetical cohort, there were 512 acute episodes (285 depression and 227 mania) for monotherapy against 306 (166 depression and 139 mania) for the quetiapine combination. The incremental cost-effectiveness ratio (ICER) for the quetiapine combination therapy was US$ 565.64 per additional month in remission. The sensitivity analysis with all variables demonstrated the model's robustness, while dosage and quetiapine-price variations had most impact, showing an ICER ranging from US$ 381.88 to US$ 811.24 per additional month in remission. **CONCLUSIONS:** Maintaining the euthymia in bipolar disorder has a clinical relevance, especially, because of its impact on functional capacity in this population. In this context, in specific populations, the ICER shown may justify the use of the therapeutic strategy presented here. This reimbursement by public systems should also consider its budget impact.

PMH39

PATIENT-LEVEL MARKOV MODEL TO ASSESS ECONOMIC IMPACT OF NEW ANTIPSYCHOTICS INTRODUCTION IN SCHIZOPHRENIA

Millier A[1], Vimont A[1], Cadi-Soussi N[2], Murthy V[3], Toumi M[4]

[1]Creativ-Ceutical, Paris, France, [2]Takeda Pharmaceuticals International GmbH, Glattpark-Opfikon (Zurich), Switzerland, [3]Takeda Global R&D Europe, London, UK, [4]University Claude Bernard Lyon 1, Lyon, France

OBJECTIVES: Antipsychotic treatments can cause several side effects, such as weight gain, metabolic syndrome, which could lead to cardiovascular complications (CVC). A number of models are available for the evaluation of the economic impact of antipsychotics in schizophrenia, but few of them properly consider metabolic syndrome and associated complications. The objective of this study was to build a new model to reflect the real patient therapeutic management of patients with schizophrenia. **METHODS:** An expert meeting was set up to validate the design of the model, and to list all outcomes that should be included in the model structure. The model was programmed in Excel 2010, with VBA coding. **RESULTS:** The expert meeting validated the premise that the aim of the treatment is to prevent relapses, affecting patients' quality of life and generating substantial costs. A patient-level Markov model structure was used, to simulate a cohort of patients with schizophrenia over lifetime, with 6-month cycles. Five lines of treatments are considered in the model. With up to 3 comparators in the first cycle, it models patients' treatment adjustment, and provides the flexibility to specify at any line of treatment a specific distribution of antipsychotics. The model considers treatment response, associated side effects (weight gain, sexual dysfunction, EPS and sedation), diabetes diagnosis and CVC (coronary heart disease and stroke). Non-response and compliance (based on side effects) drive relapse and hospitalization. Each relapse is assumed to require a treatment switch. Patients are also allowed to escape from the health care system, or to die, due to natural death, suicide or CVC-related death. Finally, extensive deterministic and probabilistic sensitivity analyses are also implemented. **CONCLUSIONS:** This new economic model allows taking into account all key features of schizophrenia, in a transparent way.

PMH40

COST-EFFECTIVENESS OF ASENAPINE VERSUS ATYPICAL ANTIPSYCHOTICS USED IN TURKEY IN THE TREATMENT OF SCHIZOPHRENIA

Pala M[1], Özdemir S[1], Ozdemir O[2]

[1]Lundbeck, Istanbul, Turkey, [2]Yorum Consultancy Ltd., Istanbul, Turkey

OBJECTIVES: Asenapine is a new atypical antipsychotic approved in Turkey for the treatment of schizophrenia and bipolar I disorder. Asenapine has demonstrated comparable efficacy over olanzapine in controlling both positive and negative symptoms of schizophrenia in the long-term. However, unlike olanzapine, asenapine is associated with a favorable metabolic profile as well as with a minimal weight gain. Post-hoc analyses of a clinical study vs. olanzapine illustrated higher incidence of developing metabolic syndrome (MetS) with olanzapine than with asenapine after 52 weeks of treatment. The aim of this study is to assess the cost-effectiveness of asenapine in schizophrenia compared with the most widely used atypical antipsychotics in Turkey with a focus on the long-term consequences of MetS which increases the risk of diabetes and cardiovascular diseases (CVD). **METHODS:** Perspective of National Pharmaceutical Reimbursement Authority was applied and life expectancy horizon was adopted. Annual risks of metabolic syndrome were derived from randomized clinical studies of asenapine and indirect comparison of other atypical antipsychotics vs. olanzapine. Risks of developing diabetes and CVD were based on published risk models. Treatment costs associated with metabolic consequences as well as cost of atypical antipsychotics were derived from local sources. Number of diabetes and CVD avoided is used as effectiveness measure in the model. **RESULTS:** Asenapine dominates (more effective and less expensive) all atypical antipsychotics in the treatment of schizophrenia. Compared to olanzapine, quetiapine, aripiprazole, risperidone and paliperidone (all genericized except paliperidone), asenapine was associated with incremental total costs of 1908 TL, 1298 TL, 314 TL, 841 TL and 1958 TL; and associated with incremental total number of diabetes & CVD avoided of 0.046, 0.029, 0.001, 0.028 and 0.028 respectively. **CONCLUSIONS:** The lower incidence of developing MetS associated with asenapine compared to olanzapine and other atypicals is associated with lower treatment costs and lower incidence of diabetes and CVD in Turkey.

PMH41

COST-EFFECTIVENESS OF ASENAPINE VERSUS ATYPICAL ANTIPSYCHOTICS USED IN TURKEY IN THE TREATMENT OF BIPOLAR I DISORDER

Pala M[1], Özdemir S[1], Ozdemir O[2]

[1]Lundbeck, Istanbul, Turkey, [2]Yorum Consultancy Ltd., Istanbul, Turkey

OBJECTIVES: Asenapine is a new atypical antipsychotic approved in Turkey for the treatment of bipolar I disorder (BD-I) and schizophrenia. Asenapine has demonstrated comparable antimanic efficacy over olanzapine in a head-to-head study. However, unlike olanzapine, asenapine is associated with a favorable metabolic profile as well as with a minimal weight gain. Post-hoc analyses of a clinical study vs. olanzapine illustrated higher incidence of developing metabolic syndrome (MetS) with olanzapine than with asenapine after 52 weeks of treatment. The aim of this study is to assess the cost-effectiveness of asenapine in the treatment of BD-I compared with the most widely used atypical antipsychotics with a focus on the long-term consequences of MetS which increases the risk of diabetes and cardiovascular diseases (CVD). **METHODS:** Perspective of National Pharmaceutical Reimbursement Authority was applied and life expectancy horizon was adopted. Risks of metabolic syndrome after 52 weeks of treatment were derived from randomized clinical studies of asenapine and indirect comparison of other atypical antipsychotics vs olanzapine. Risks of developing diabetes and CVD were based on published risk models. Treatment costs associated with metabolic consequences as well as cost of atypical antipsychotics were derived from local sources. Number of diabetes and CVD avoided is used as effectiveness measure in the model. **RESULTS:** Asenapine dominates (more effective and less expensive) all atypical antipsychotics in the treatment of BD-I. Compared to olanzapine, quetiapine, aripiprazole, risperidone and paliperidone (all genericized), asenapine was associated with incremental total costs of 2418 TL, 1786 TL, 804 TL and 877 TL; and associated with incremental total number of diabetes & CVD avoided of 0.054, 0.038, 0.010 and 0.037 respectively. **CONCLUSIONS:** The lower incidence of developing MetS associated with asenapine compared to olanzapine and other atypicals is associated with lower treatment costs and lower incidence of diabetes and CVD in Turkey.

PMH42

COST-UTILITY ANALYSIS OF LISDEXAMFETAMINE IN THE TREATMENT OF CHILDREN AND ADOLESCENTS WITH ATTENTION-DEFICIT/HYPERACTIVITY DISORDER IN THE UNITED KINGDOM

Zimovetz E[1], Beard SM[2], Hodgkins P[3], Bischof M[4], Mauskopf JA[5], Setyawan J[3]
[1]*RTI Health Solutions, Manchester, UK,* [2]*BresMed Health Solutions Ltd., Sheffield, UK,* [3]*Shire, Wayne, PA, USA,* [4]*Shire, Eysins, Switzerland,* [5]*RTI Health Solutions, Research Triangle Park, NC, USA*

OBJECTIVES: An economic analysis was conducted from the United Kingdom's (UK's) National Health Service (NHS) perspective to evaluate the cost-effectiveness of lisdexamfetamine (LDX) versus atomoxetine (ATX) in treating children and adolescents with attention-deficit/hyperactivity disorder (ADHD) who have had an inadequate response to methylphenidate (MPH). **METHODS:** A 1-year probabilistic decision-analytic model with a Markov structure of nested decision trees was constructed. Health states included "response", "non-response", and "unable to tolerate". Key model assumptions were adapted from a technology assessment for ADHD products by the National Institute for Health and Care Excellence. The analysis used clinical data from a head-to-head randomized controlled trial in inadequate responders to MPH. Response to treatment was defined as a score of 1 (much improved) or 2 (improved) on the Clinical Global Impression-Improvement scale. Tolerability was assessed by rates of discontinuation due to adverse events. Utility weights were identified via a systematic literature review. Health care resource use estimates for responders and non-responders were obtained via a survey of UK specialists. Unit costs from national sources were applied to estimate the corresponding health-state costs. Daily drug costs were based on mean doses reported in the trial. One-way and probabilistic sensitivity analyses were performed. **RESULTS:** The comparison of LDX and ATX, using head-to-head data, resulted in an incremental cost-effectiveness ratio (ICER) of £1,802 per quality-adjusted life year (QALY). At a willingness to pay of £20,000 per QALY, LDX had an 86% probability of being cost-effective compared with ATX. In 38% of sensitivity analysis runs, LDX was a dominant strategy over ATX. The model was slightly sensitive to changes in assumptions about drug costing and to lengthening the titration period for ATX. **CONCLUSIONS:** From the perspective of the UK NHS, LDX provides a cost-effective treatment option for children and adolescents with ADHD who are inadequate responders to MPH.

PMH43

COST-EFFECTIVENESS OF ASENAPINE IN THE TREATMENT OF BIPOLAR DISORDER I PATIENTS WITH MIXED EPISODES

Azorin JM[1], Sawyer L[2], Chang S[3], Rinciog C[3], Guiraud-Diawara A[4], Marre C[4], Hansen K[4]
[1]*Sainte-Marguerite Hospital, Marseilles, France,* [2]*Symmetron Limited, Elstree, UK,* [3]*Symmetron Limited, Borehamwood, UK,* [4]*Lundbeck SAS, Issy les Moulineaux, France*

OBJECTIVES: The cost-effectiveness of second-generation antipsychotic drugs is well established in the treatment of patients experiencing a manic episode associated with bipolar I disorder. However, no studies demonstrating the value of these drugs in patients with mixed episodes according to DSM-IV have so far been undertaken. The aim of this study was to assess the cost-effectiveness of asenapine versus olanzapine in the treatment of this costly subgroup of patients. **METHODS:** A 9-week acute phase model was developed, during which patients receive up to three lines of treatment: asenapine or olanzapine alone, then adjunctive valproate, and finally a switch to adjunctive lithium. Patients can respond during any 3-week period and non-responders move to the next treatment in the sequence. Efficacy of asenapine (46.3%) and olanzapine (37.5%) was informed by a post-hoc analysis of two short-term clinical trials, where response was measured as a composite YMRS and MADRS endpoint. Following initial treatment, patients entered a 5-year maintenance Markov model during which they faced probabilities of treatment discontinuation, recurrent manic, mixed and depressive symptoms and death. Direct costs (year 2012-13 values), including drug, monitoring costs and resource use related to bipolar disorder and selected adverse events, were assessed from a UK NHS perspective. Benefits were measured as quality-adjusted life years (QALYs). **RESULTS:** For patients with a mixed episode, asenapine was a more effective and less costly treatment strategy compared with olanzapine over a 5-year period. Greater health benefits and cost savings were driven by earlier response to asenapine treatment during the acute phase and were well maintained during longer-term follow-up. These results were robust to changes in key parameters including short and longer-term efficacy, unit cost and utility values. **CONCLUSIONS:** Compared with olanzapine, results of this analysis suggest that asenapine generates greater health benefits at lower cost in the treatment of patients experiencing mixed episodes associated with bipolar I disorder.

PMH44

C-QUALITY: A COST AND QUALITY OF LIFE PHARMACOECONOMIC ANALYSIS OF ANTIDEPRESSANTS IN MAJOR DEPRESSIVE DISORDER IN ITALY

Katz P, Heiman F, Ripellino C
CSD Medical Research S.r.l., Milan, Italy

OBJECTIVES: To assess the cost-effectiveness (€ per quality-adjusted life year [QALY]) of all Selective serotonin reuptake inhibitors (SSRIs) and all Serotonin-norepinephrine reuptake inhibitors (SNRIs) for the treatment of Major Depressive Disorder (MDD) in Italy. **METHODS:** A decision analytic model was adapted from the Swedish Dental and Pharmaceutical Benefits agency model to reflect current clinical practice in the treatment of MDD in the largest Italian regions. This adaptation was possible thanks to the collaboration of an expert panel of Italian psychiatrists and health economists. The model evaluated patients with a first diagnosis of MDD and initiating an SSRI or an SNRI for the first time. The time horizon was 12 months. Efficacy and utility data for the model were retrieved from the literature and validated by the expert panel. Local data were considered for resource utilization and for treatment costs based on each regional health service perspective. Population-weighted regional data were used to define a national model. Scenario simulations, one-way sensitivity analyses, and Monte Carlo simulations were performed to test the robustness of the model. **RESULTS:** The base case analysis showed that escitalopram was associated with a lower total cost (€1,562) and a larger health gain (QALYs) at one year (0.732) per patient, and dominated the other treatment strategies since more QALYs were achieved at a lower total cost. Sensitivity analyses support the robustness of the model. **CONCLUSIONS:** The results indicate that escitalopram is the most cost-effective pharmacological treatment strategy for the Italian health service compared with other SSRIs and all SNRIs used in the first-line treatment of MDD.

PMH45

COST EFFECTIVENESS OF PALIPERIDONE PALMITATE IN NATIONAL HEALTH SERVICE (NHS) WALES: A COST UTILITY ANALYSIS BASED ON THE NATIONAL INSTITUTE FOR HEALTH AND CARE EXCELLENCE (NICE) CORE MODEL FOR THE MANAGEMENT OF SCHIZOPHRENIA

Lee J[1], Jiang Y[2], Gauthier A[2], Curtis S[3], Musingarimi P[1], Price M[1]
[1]*Janssen-Cilag UK Ltd., High Wycombe, UK,* [2]*Amaris, London, UK,* [3]*Janssen-Cilag Pty Ltd., Sydney, Sydney, Australia*

OBJECTIVES: Paliperidone palmitate has demonstrated non-inferior efficacy to risperidone long acting injectable (LAI) for the treatment of schizophrenia in previous studies. The objective of this analysis was to assess the cost effectiveness of paliperidone palmitate relative to risperidone LAI, based on the cost-utility analysis described in the current NICE Guidelines for the Management of Schizophrenia. The analysis was undertaken from the perspective of NHS Wales and was submitted to the All Wales Medicines Strategy Group for evaluation. **METHODS:** A decision-analytic Markov model was developed to estimate the cost-utility of paliperidone palmitate relative to risperidone LAI. The model adopted an annual cycle length. Patients who entered the model initiated either paliperidone palmitate or risperidone LAI and could subsequently transition between five health states during each annual cycle. AEs associated with each intervention were derived from literature. Utility values were derived from a community-based study, using trade-off technique to elicit HRQoL for schizophrenia according to frequency of injections. Resource use data was sourced from the NICE core model/guidelines, Welsh clinical experts, and a UK Delphi panel. Unit costs were derived from the British National Formulary, NHS reference costs, and the Personal Social Services Research Unit reports. Costs and outcomes were evaluated over a 10-year horizon, and discounted at 3.5%. Results were presented as incremental costs/QALY. Uncertainty was addressed via deterministic and probabilistic sensitivity analyses. **RESULTS:** The base case analyses demonstrated that paliperidone palmitate would incur lower costs (-£3,773) and generate more quality adjusted life years (QALYs) (+0.13) than risperidone LAI. This indicated that paliperidone palmitate 'dominated' risperidone LAI. Extensive scenario/sensitivity analyses confirmed the robustness of the results **CONCLUSIONS:** Compared with risperidone LAI, paliperidone palmitate is a cost-effective therapy for the treatment of schizophrenia in adult patients in NHS Wales.

PMH46

COST-UTILITY ANALYSES OF COGNITIVE-BEHAVIORAL THERAPY FOR MAJOR DEPRESSIVE DISORDER – A SYSTEMATIC REVIEW

Brettschneider C, König HH
University Medical Center Hamburg, Hamburg, Germany

OBJECTIVES: Major depressive disorder (MDD) causes a massive health and economic burden for societies worldwide. Cognitive behavioural therapy (CBT) is an inherent part of the treatment of MDD and is recommended for children, adolescents and adults. Cost-Utility-Analysis (CUA) is an important instrument to support decision-making on resource allocation and health policy as it permits the comparison of interventions for different diseases. The objective of our study was to systematically review CUAs related to CBT in the treatment of patients suffering from MDD. **METHODS:** We conducted a systematic literature search in MEDLINE, EMBASE, PsycINFO and NHSEED. We included all original studies reporting CUA of CBT for patients suffering from MDD. Cost data were inflated to the year 2011 and converted into US-$ using purchasing power parities (US-$ PPP) to ensure comparability of the data. Quality assessment of the studies was performed by means of a standardised quality checklist. **RESULTS:** We identified 22 CUAs. The methodological quality was fair. Two studies considered a lifetime horizon. The mean time horizon of the remaining studies was 19.2 months (SD = 12.6). In most instances individual and group CBT as well as CBT for maintenance showed acceptable cost-utility ratios (ICER < 50.000 US-$-PPP / QALY). The results of CUAs of CBT provided for children and adolescents or by computer were inconsistent. In comparison to medication CBT tends to be more cost effective as stand-alone therapy and in combination with medication. **CONCLUSIONS:** Individual and group CBT is a cost effective treatment for MDD. Further research to determine the cost effectiveness of computerized CBT and of CBT for specific populations like children, adolescents or the elderly is required. Furthermore there is a need for long term evidence of cost effectiveness of CBT.

PMH47

COMPARISON OF HEALTH CARE RESOURCE UTILIZATION AND COSTS AMONG CHILDREN AND ADOLESCENTS WITH ATTENTION DEFICIT HYPERACTIVITY DISORDER IN GERMANY WHO INITIATED TREATMENT WITH ATOMOXETINE OR LONG-ACTING METHYLPHENIDATE

Curtice TG[1], Greven P[2], Yeaw J[3], Sikirica V[1], Chen YJ[3], Setyawan J[1], Makin C[3]
[1]*Shire, Wayne, PA, USA,* [2]*Institut fuer Kinder- und Jugendpsychiatrie, Berlin, Germany,* [3]*IMS Health, Alexandria, VA, USA*

OBJECTIVES: This study compared health care resource utilization (HRU) and costs among children/adolescents with attention deficit/hyperactivity disorder (ADHD) in Germany who initiated treatment with atomoxetine (ATX) or long-acting methylphenidate (LA-MPH). **METHODS:** A retrospective propensity score matched cohort analysis was conducted using the IMS electronic medical record database comprising >15 million patient records from ~3,000 German physicians. Included patients were aged 6-17 years, with a first (index) ATX or LA-MPH prescription in 2006-2010; ≥1 ADHD diagnoses 12-month before (pre-index) and after (post-index) index; and ≥1 index medication prescription post-index. Patients in the ATX and LA-MPH

cohorts were matched 1:1 using "nearest neighbor" greedy match propensity score method. HRU (inpatient, outpatient, and medications) and costs were compared between the two cohorts. Unit costs were identified from German Diagnosis-related Group for inpatient, Einheitlicher Bewertungsmassstab doctor fee scale for outpatient, and Rote Liste®for medication costs. Direct medical costs over the post-index period were reported in 2011 Euros. Chi-square for categorical variables and t-test or Wilcoxon-Mann-Whitney for continuous variables were used to test for differences between cohorts (alpha=0.05). Generalized linear models with negative binomial (for HRU) and gamma (for cost) distributions were used to address residual differences between matched cohorts. **RESULTS:** Of 4705 eligible patients, 737 with ATX (mean age=10.9 years, 20.8% female) were identified and matched 1:1 with LA-MPH patients (mean age=11.2 years, 18.6% female). Patients initiating ATX had higher HRU and spending per-patient than patients initiating LA-MPH over the post-index: 20.9 (SD=11.5) vs. 15.7 (SD=9.0) outpatient prescriptions, 10.1 (SD=6.3) vs. 8.3 (SD=5.3) outpatient visits, €1029 (SD=574) vs. €496 (SD=334) in retail pharmacy costs, and €1,258 (SD=739) vs. €684 (SD=515) in total all-cause costs (all $p=<.0001$). **CONCLUSIONS:** Among children/adolescents with ADHD in Germany, ATX initiators consumed significantly more health care resources and were associated with significantly higher direct medical costs compared with LA-MPH initiators.

MENTAL HEALTH – Patient-Reported Outcomes & Patient Preference Studies

FACTORS ASSOCIATED WITH POOR ADHERENCE IN PATIENTS INITIATING MEDICATION FOR MAJOR DEPRESSIVE DISORDER: INTERIM RESULTS FROM A PROSPECTIVE, LONGITUDINAL STUDY

Lenderking WR[1], Samp J[2], Hanlon J[1], Hsieh R[3], Akhras KS[2], Revicki DA[3]
[1]*Evidera, Lexington, MA, USA,* [2]*Takeda Pharmaceuticals International, Inc., Deerfield, IL, USA,* [3]*Evidera, Bethesda, MD, USA*

OBJECTIVES: To examine factors associated with low adherence in Major Depressive Disorder (MDD) patients initiating antidepressant medication (ADM) over a 12-week period. **METHODS:** MDD patients initiating an ADM (with no ADM claim in the 6 months prior) were identified from a large pharmacy benefits manager database. Patients completed paper or online assessments including demographics at baseline and patient-reported assessments at baseline, Week 4 and Week 12. Participants were classified as having low, medium, or high adherence based on the modified Morisky Adherence Scale, with the medium and high adherence groups combined for analysis. Logistic regression analyses were run to evaluate the association between adherence and age, gender, and patient-reported assessments of depression and sexual dysfunction (SD), weight gain, sleep problems, nausea, and anxiety. **RESULTS:** Of 2412 patients screened, 591 enrolled and completed baseline assessments. Mean age was 40.4 years (standard deviation=12.1), 82.4% were women, and 87.6% were white. There were 483 who completed Week 4 and 425 who completed Week 12 assessments. At Week 12, 39.6% were high adherers, 20.6% were medium adherers, and 39.8% were low adherers. Thirty-eight percent of low adherers had actually discontinued ADM. Among discontinuers, 40.6% discontinued due to ADM side effects. In logistic regression models, low adherence at Week 4 was significantly associated with weight change ≥5 pounds (OR=2.10, 95% CI: 1.32–3.35), anxiety (OR=1.73, 95% CI: 1.06-2.8) and nausea (OR=2.31, 95% CI: 1.06–5.02). Age, gender, depression severity, sexual dysfunction, and insomnia were not significant in the logistic model. No factors were significantly associated with adherence at Week 12. **CONCLUSIONS:** In this real-world study of patients with MDD, nearly 40% of patients were low adherers. Weight change, anxiety, and nausea were associated with low adherence at Week 4, but not at Week 12.

PMH49

ADHERENCE, SWITCHING, AND DISCONTINUATION DURING THE 12 WEEKS FOLLOWING ANTIDEPRESSANT INITIATION IN PATIENTS WITH DEPRESSIVE DISORDER: RESULTS OF A PROSPECTIVE, LONGITUDINAL STUDY

Lenderking WR[1], Samp J[2], Hanlon J[1], Hsieh R[3], Revicki DA[3], Akhras KS[2]
[1]*Evidera, Lexington, MA, USA,* [2]*Takeda Pharmaceuticals International, Inc., Deerfield, IL, USA,* [3]*Evidera, Bethesda, MD, USA*

OBJECTIVES: This study examined patterns of adherence, switching, and discontinuation, in major depressive disorder (MDD) patients initiating antidepressant medication (ADM) therapy. **METHODS:** Depressed patients recently initiating an ADM were identified from a large pharmacy benefits manager database. Eligible patients were invited to participate by phone or mail and enrolled patients completed. **RESULTS:** Of 2,412 patients screened, 591 were enrolled. Average age was 40.4 years (standard deviation=12.1), 82.4% of participants were women, and 87.6% were white. At Week 4 (n=483), 39.4% were classified as low adherers with 31 (6.4%) patients having discontinued ADM for reasons including side effects (n=14, 45.2%), feeling better (n=5, 16.1%), cost (n=5, 16.1%), and lack of efficacy (n=4, 12.9%). There were 27 (5.6%) patients who switched by Week 4. Of these, 12 (44.4%) switched due to side effects, 11 (40.7%) due to lack of efficacy, and 3 (11%) due to cost. By week 12 (n=425), 33 additional patients had discontinued ADM citing similar reasons as those at Week 4. Of 43 patients who reported switching at Week 4 or Week 12, 15 (34.9%) cited side effects, 16 (37.2%) cited lack of efficacy, and 4 (9.3%) cited cost. **CONCLUSIONS:** In this real-world, 12-week study of MDD patients initiating ADM, adherence to ADM was low. Switching and discontinuing ADM were common within the 12-weeks period and were primarily attributed to side effects and lack of efficacy.

PMH50

FUNCTIONAL OUTCOMES WITH ARIPIPRAZOLE ONCE-MONTHLY IN TWO DOUBLE-BLIND, PLACEBO- AND ACTIVE-CONTROLLED STUDIES (ASPIRE US 246 AND ASPIRE EU 247) FOR THE TREATMENT OF SCHIZOPHRENIA

Fleischhacker WW[1], Perry P[2], Sanchez R[2], Jin N[3], Peters-Strickland T[2], Johnson B[2], Baker R[2], Eramo A[4], McQuade RD[2], Carson WH[2], Kane JM[5]
[1]*Department of Psychiatry and Psychotherapy, Medical University, Innsbruck, Austria,* [2]*Otsuka Pharmaceutical Development & Commercialization, Inc., Princeton, NJ, USA,* [3]*Otsuka Pharmaceutical Development & Commercialization, Inc., Rockville, MD, USA,* [4]*H. Lundbeck A/S, Copenhagen, Denmark,* [5]*The Zucker Hillside Hospital and the Hofstra North Shore-LIJ School of Medicine, Hempstead, NY, USA*

OBJECTIVES: To evaluate functional outcomes of aripiprazole once-monthly (ARI-OM) 400 mg (ARI-OM-400) versus a sub-therapeutic dose of ARI-OM (50 mg; ARI-OM-50), oral aripiprazole (ARI), and placebo, in two trials of stable patients with schizophrenia. **METHODS:** Detailed study designs have been reported previously. Results are reported for the double-blind, randomized phase of each study. ARI-OM is an extended-release injectable suspension given at 400 mg in the gluteal muscle. Functional outcome was measured using the Personal and Social Performance scale (PSP) and statistically analyzed using analysis of covariance with last observation carried forward. **RESULTS:** A total of 403 patients were randomized to ARI-OM-400 (n=269) or placebo (n=134) in the first (246) trial. PSP scores at endpoint significantly worsened with placebo (-6.2) versus ARI-OM-400 (-1.7; p=0.0002). In the second study (247), 662 patients were randomized to: ARI-OM-400 (n=265); ARI (n=266); or ARI-OM-50 (n=131). PSP scores with sub-therapeutic ARI-OM-50 significantly worsened (-2.39) versus ARI-OM-400 (+0.45; p=0.03). Similar functional stability was observed with ARI (+0.08). **CONCLUSIONS:** Patient functioning, as assessed by PSP, was maintained with ARI-OM in both studies but deteriorated in patients randomized to either sub-therapeutic doses or placebo, confirming the benefits of adequately dosed antipsychotic therapy in preserving functional stability in long-term management of schizophrenia.

PMH51

THE DEVELOPMENT AND VALIDATION OF A QUALITY OF LIFE MEASURE FOR PEOPLE WITH MILD COGNITIVE IMPAIRMENT (THE MCQ)

Dean K[1], Walker Z[2], Churchman D[3], Wilcock G[4], Jenkinson C[4]
[1]*Royal Berkshire NHS Foundation Trust, London, UK,* [2]*University College London, London, UK,* [3]*Isis Outcomes, Oxford, UK,* [4]*University of Oxford, Oxford, UK*

OBJECTIVES: Mild cognitive impairment (MCI) is a state that lies between normal cognition and dementia, and the number of cases with the condition is rising as the population ages. However, to date, no validated patient reported outcome measure (PRO) exists specifically in MCI. We report on a study to develop a PRO for use in MCI. **METHODS:** Semi-structured in-depth interviews were carried out with people with MCI in order to determine the questionnaire items. These interviews were audio-recorded, transcribed and content analysed. The draft questionnaire was refined following feedback from a focus group of patients with a diagnosis of MCI. Questionnaires were posted to subjects recruited from memory clinics and research databases, the completed questionnaires were analysed using factor analytic techniques to produce the final measure; construct validity was assessed by correlation with a generic patient reported outcome measure, the SF-12. **RESULTS:** Interviews were carried out with 23 people with MCI. 280 questionnaires were sent to subjects, with a response rate of 56% i.e.146 were included in the analysis. Factor analysis produced a 13 item measure tapping two domains of patient reported quality of life ('Emotional Effects' and 'Practical Concerns'). Internal consistency reliability was high for both domains (alpha was 0.91 and 0.85 respectively). Both dimensions were found to be highly and significantly correlated with the Mental Component Summary score of the SF-12. **CONCLUSIONS:** The Mild Cognitive Impairment Questionnaire (MCQ) is a short 13 item measure developed specifically to measure patient reported outcomes in people with MCI. It was created on the basis of patient report, and has been shown to have good psychometric properties. It is likely to prove valuable in the evaluation of treatment regimes in this important and growing patient group.

PMH52

SCORING THE CENTER FOR EPIDEMIOLOGIC STUDIES – DEPRESSION SCALE: WHICH ITEMS GO WHERE?

Cole JC, Atkinson MJ, Nokela M
Covance Market Access Services, Inc., San Diego, CA, USA

OBJECTIVES: To guide researchers on the best way to score the Center for Epidemiologic Studies – Depression scale (CES-D) by comparing competing models in the literature. **METHODS:** Radloff (19777), the original CES-D author, first provided scoring for four uncorrelated factors of depression: negative affect (NA), positive affect (PA), interpersonal (I), and somatic (S). Sheehan et al. (1995) validated four correlated factors in the CES-D. However, Radloff and Sheehan results may have differed because Radloff ascribed items of *failure* and *fearful*to NA whereas Sheehan assigned a value of I. Following Sheehan's scoring, Cole et al. (2004) presumed a hierarchical factor of depressed mood that included all four previously identified factors and posited a 10-item short-form of the CES-D. These four models were compared using structural equation modeling for parametric models with Bollen-Stine bootstraps to control for multivariate nonnormality in 225 community-residing subjects, structural validity of the models were compared. **RESULTS:** Fit statistics for the four models were: Radloff comparative fit index (CFI) = .790 & root mean square error of approximation (RMEA) = .011; Sheehan CFI = .926 & RMSEA = .053, Cole hierarchical CFI = .927 & RMSEA = .052; Cole 10-item CFI = .979 & RMSEA = .041 **CONCLUSIONS:** The uncorrelated Radloff model was the poorest fit the day. Both Sheehan and Cole 20-item models were decently fit to the data and nearly identical to each other in fit. Finally, the 10-item Cole short-form of the CES-D was the best fit model to the data. Given the brevity of this form and strong fit with the theoretical structure postulated by Radloff, researchers may want to consider this form of the CES-D for research on depressed mood.

PMH53

PREVALENCE AND RISK FACTORS OF DEPRESSION IN PATIENTS WITH CHRONIC OBSTRUCTIVE PULMONARY DISEASE IN INDIA

Negi H[1], Raval A[2], Malay M[3]
[1]*Post Graduate Institute of Medical Education & Research, Chandigarh, India,* [2]*West Virginia University, Morgantown, WV, USA,* [3]*Indira Gandhi Medical College, Shimla HP, India*

OBJECTIVES: Although depression is a significant co-morbid condition in chronic illness, little is known about the prevalence or risk factors for depressive symp-

toms in chronic obstructive pulmonary disease (COPD) in India. A study was undertaken to investigate the prevalence and risk factors of depression in the Indian COPD patients. **METHODS:** COPD was classified according to GOLD stages based on forced expiratory volume in one second (FEV_1) in 126 stable patients. Depression was examined by administering the nine-item Hindi version of Patient Health Questionnaire-9 (PHQ-9). Linear regression model was used to examine association between predictor variables and risk of depression with adjustment of age and sex. Cronbach alpha was calculated to assess internal consistency of PHQ-9. **RESULTS:** Patients with stable COPD (n=126) were evaluated (73.8% male and 26.2% female). In the study population as whole, 33.3% patients showed moderate to severe depressive symptoms whereas 20.6% patients had major depressive disorder on PHQ-9 Scale. Educational and occupational status, body mass index, FEV_1, respiratory symptoms, physical impairment and dyspnea were found to be potential predictors of depression in COPD patients. **CONCLUSIONS:** One-fifth of the patients with COPD had severe symptoms of related to depression, which was especially higher with severity of COPD. Hence, the patients with COPD should focus on management of these two conditions. Further, future studies should be conducted to assess the role of depression management and timely treatment of it in the patients with COPD.

PMH54

PATIENT FUNCTIONING IN GENERALIZED ANXIETY DISORDER SUBJECTS WITH PARTIAL RESPONSE TO PRIOR SSRI TREATMENT: THE EFFECT OF ADJUNCTIVE THERAPY WITH PREGABALIN IN DAILY MEDICAL PRACTICE

Carrasco JL[1], Olivares JM[2], Alvarez E[3], Pérez M[4], López-Gómez V[4], Rejas J[5]
[1]*Department of Psychiatry, Hospital Clínico San Carlos, Madrid, Spain,* [2]*Hospital Meixoeiro, Complejo Hospitalario Universitario, Vigo, Spain,* [3]*Department of Psychiatry, Hospital de la Santa Creu i San Pau, Barcelona, Spain,* [4]*Pfizer S.L.U., Alcobendas, Madrid, Spain,* [5]*Pfizer S.L.U., Alcobendas/Madrid, Spain*

OBJECTIVES: To analyze the effect of adding pregabalin or usual care (UC) on patient functioning in GAD subjects with partial response (PR) to previous SSRI course in daily medical practice. **METHODS:** Post-hoc analysis of patients with PR to SSRI monotherapy enrolled in a prospective 6-month naturalistic study. PR was defined as a Clinical Global Impression scale score >3 and persistence of anxiety symptoms >16 in the Hamilton-Anxiety scale. Two groups (based on psychiatrist judgment) were analyzed: adjunctive therapy (AT) with pregabalin (150-600 mg/day) to existing therapy; or usual care (switching to a different SSRI or adding another anxiolytic different than pregabalin). Patient functioning was assessed by mean of the disability WHO-DAS-II scale [range 0 (no disability) to 100 (completely unable)]. Changes in domains scale scores were compared at end-of-trial visit by a general linear model with covariates. **RESULTS:** Four-hundred-eighty-six newly prescribed pregabalin and 239 UC patients [mean (SD) HAM-A 26.7 (6.9) and CGI 4.1 (0.5)] were analyzed. AT with pregabalin was associated with significantly higher mean (95% CI) reductions vs. UC in all the domains of the WHO-DAS-II scale. Differences between groups were statistically significant (effect sizes were moderate): understanding and communication [-6.9(-9.8;-4.0), p<0.001], getting around [-5.2(-8.0;-2.8), p<0.001], self-care [-3.6(-5.5;-1.8), p<0.001], getting along with others [-5.0(-8.6;-1.3), p=0.007], household [-5.3(-9.6;-1.0), p=0.015], work activities [-6.5(-11.2;-1.8), p=0.007], and participation in society [-6.3(-9.7;-2.9), p<0.001]. The overall disability score was significantly more reduced in pregabalin group vs. UC: -21.7(-23.3;-20.1) vs. -15.3(-17.5;-13.1), p<0.001. Gender effect was negligible (no interaction) in all the dimensions analyzed except household functioning (higher reduction in women). **CONCLUSIONS:** In medical practice, GAD patients with partial response to prior course of a SSRI experienced greater and meaningful functioning improvements with adjunctive therapy with pregabalin in comparison with usual care. The effect of pregabalin was independent of patient gender except for household functioning.

PMH55

WORK IMPAIRMENT BURDEN OF ANXIETY AND DEPRESSION IN GERMANY

Pisa G[1], DiBonaventura M[2]
[1]*Kantar Health GmbH, Munich, Germany,* [2]*Kantar Health, New York, NY, USA*

OBJECTIVES: The effect of mental disorders on absenteeism in Germany has steadily increased. They are now the third-most common reason for sick leave after musculoskeletal and respiratory conditions. The aim of this study was to provide current estimates of the effect of anxiety and depression on both absenteeism and presenteeism in Germany. **METHODS:** Data from the German respondents (N=15,001) of the 2011 National Health and Wellness Survey were used in the analysis. Outcome measures included the Short Form-12v2 (mental and physical component summary [MCS and PCS] and health utility scores) and the Work Productivity and Activity Impairment questionnaire. Respondents who reported a diagnosis of anxiety and, separately, a diagnosis of depression were compared with respective matched controls (matched on demographic and health history variables using propensity score matching). **RESULTS:** A total of 904 (6.0%) respondents reported a diagnosis of anxiety (62.6% female, mean age=44.6 years) and 1574 (10.5%) respondents reported a diagnosis of depression (60.2% female; mean age=44.9 years). Compared with matched controls, respondents with anxiety reported significantly greater absenteeism (17.9% vs. 8.1%) and presenteeism (36.3% vs. 19.4%) (all p<.05). Similar findings were observed for depression (absenteeism: 17%.3 vs. 7.6%; presenteeism: 36.1% vs. 17.1%; all p<.05). These findings translated to an incremental 60.7 and 61.1 days lost per year due to absenteeism alone for anxiety and depression, respectively. Respondents with anxiety and depression also reported significantly lower levels of health status compared with matched controls (anxiety: 33.0 vs. 45.7 and 43.5 vs. 46.6 for MCS and PCS, respectively, all p<.05; depression: 33.3 vs. 46.6 and 43.8 vs. 47.1 for MCS and PCS, respectively, all p<.05). **CONCLUSIONS:** Anxiety and depression were associated with significant work impairment along with reduced mental and physical health status in Germany. These results suggest greater awareness and early treatment could reduce the social and economic burden of these conditions.

PMH56

HEALTH-RELATED QUALITY OF LIFE OF PATIENTS ON OPIATE REPLACEMENT THERAPY

Adams R
National Centre for Pharmacoeconomics, Dublin, Ireland

OBJECTIVES: To evaluate health-related quality of life (HRQOL) and contributing factors in individuals receiving opiate replacement therapy. **METHODS:** This was a cross-sectional study of patients attending for methadone therapy in an inner city drug treatment centre. EQ-5D, SF-36, SF-6D, Hospital Anxiety Depression Scale (HADs) were assessed, along with substance abuse via the Treatment Outcomes Profile (TOPs). Mean values, ranges and standard deviations were calculated and utility scores were derived. Analysis was performed using Spearman's correlation and t-test to determine any significant correlations. **RESULTS:** A total of 115 patients were included, 72% were male and the mean age was 35 years. 63% were HCV-PCR positive and 49% admitted to using drugs in the past month. 57% of patients had high levels of anxiety with the mean score being 11.14 (anxious). 35% were depressed with the mean score being 8.40 (borderline depressed). The mean EQ-5D utility score was 0.56 with 7% having a utility score that was worse than death. The mean SF-36 utility score was 0.55. The mean SF-36 physical component score was 44.25 and the mean mental component score was 33.18. **CONCLUSIONS:** HRQOL was reduced in this opiate replacement therapy cohort. HCV, gender and injecting drug use did not affect HRQOL but anxiety, depression and use of crack cocaine had a significant impact.

PMH57

NATURALISTIC DISEASE MANAGEMENT STUDY OF PATIENTS WITH ALCOHOL DEPENDENCE IN THE PRIMARY CARE SETTING IN THE UNITED KINGDOM (STREAM)

Coste F[1], Chalem Y[1], François C[1], Wallace P[2]
[1]*Lundbeck S.A.S., Issy-les-Moulineaux, France,* [2]*NIHR, London, UK*

OBJECTIVES: Describe the management of alcohol dependence at general practitioner (GP) level. **METHODS:** STREAM is a non-interventional, 6-month prospective study of adult patients undergoing targeted alcohol screening during routine consultation by GPs throughout England and Scotland, for whom alcohol problems were either known or suspected on the basis of clinical signs or patient's report. Inclusion criteria were an AUDIT score >=8 and consent. At baseline, diagnosis of dependence was made using the DSM-IV criteria and data were collected on socio-demographic characteristics, co-morbidities, alcohol consumption with the timeline follow-back method, previous and current alcohol treatment, treatment goal (abstinence or reduction of alcohol consumption). The data were analyzed descriptively. **RESULTS:** A total of 218 patients screened positive and were included in 26 sites. A total of 79% of patients fulfilled the DSM-IV criteria for alcohol dependence; 74% were men, the mean age was 50 years and only 29% were working full or part-time. 40% of patients had a history of alcohol treatment (almost always counseling), 20% had a history of detoxification and 9% a history of pharmacological treatment. At inclusion, the proportion of patients with ongoing treatment for alcohol addiction was 28% and these patients were drinking in average 63 g/day compared to 89 g/d in untreated patients. Of those patients on treatment or about to initiate it, alcohol reduction was more frequently the treatment goal than abstinence (51% vs. 45%). **CONCLUSIONS:** Targeted screening is an effective way for GPs to identify patients with alcohol dependence opportunistically. Many such patients have a history of counseling but few have received pharmacological interventions. Only a minority of those with alcohol dependence have ever received any form of treatment. For the majority of those in treatment, alcohol reduction is the treatment goal of choice. Consumption levels in patients with dependence tend to be high, irrespective of treatment status.

PMH58

ARE PUBLIC SUBSIDIES EFFECTIVE TO REDUCE HOSPITALIZATIONS

Rapp T, Sirven N, Chauvin P
University of Paris Descartes, Paris, France

OBJECTIVES: Elderly people facing dependence are exposed to the financial risk of long lasting care expenditures. This risk is high for people facing cognitive, functional and behavioral problems. In the short-term, dependent elderly people face increased non-medical care expenditures. In the long-term, they face increase medical care expenditures, driven by extended hospital stays. In France, providing public financial assistance has been showed to improve dependent people's access to non-medical care services. However, the long-term impact of public financial assistance on care trajectories has not been explored yet. Our study aims at determining whether financial assistance on non-medical care provision decreases hospital stays rates. **METHODS:** We run Fixed Effects Poisson regression models using longitudinal data of 574 French patients diagnosed with Alzheimer's disease. We use instrumental variables to reduce the presence of a potential endogeneity bias. **RESULTS:** We find that beneficiaries of home care subsidies have a 34% lower rate of hospitalization than non-beneficiaries. **CONCLUSIONS:** Providing public financial assistance is effective to reduce hospitalizations in Alzheimer's disease.

PMH59

DEVELOPING AN INDIVIDUALIZED E-HEALTH DECISION SUPPORT SYSTEM FOR DEMENTIA TREATMENT AND CARE: THE FP7 EU-PROJECT E-HEALTH MONITOR (EHM)

Schaller SU, Kriza C, Niederländer C, Wahlster P, Kolominsky-Rabas PL
Centre for Health Technology Assessment (HTA) and Public Health (IZPH), University of Erlangen-Nuremberg, Erlangen, Germany

OBJECTIVES: The increasing prevalence of dementia worldwide highlights the need for effective and individualized support systems for dementia treatment and care. Facing the reality of increasing internet usage as well as the large availability of digitalized information, there is a high potential for ehealth interventions. Therefore one purpose of this project is to provide a 'Personal eHealth Knowledge Space' (PeKS)

for dementia patients, caregivers and medical professionals on the basis of a web-based platform. **METHODS:** Within the PeKS, involved endusers will be provided disease- as well as situation-specific information from existing, evidence-based digital information (links, PDFs, videos) but also from local and regional information sources. The overall aim is to enable increased knowledge and competence by providing situation-specific and on time information. On the other hand, the PeKS includes an interactive monitoring tool, thus enhancing (shared) medical decision support by connecting patients/caregivers and medical professionals. After the technical integration of the concept, a running prototype will be available. **RESULTS:** The developed prototype of the 'Personal eHealth Knowledge Space' is realized by integrating service-oriented architecture, knowledge engineering, multiagent systems, and wearable/portable device technologies. An interactive monitoring tool, based on information provided by caregivers will be realized by integrating the 'Nurses' Observation Scale for Geriatric Patients (NOSGER)'. Individualized information is going to be provided through push- and pull mechanisms. **CONCLUSIONS:** Health support systems addressing individual dementia patients/caregiver needs have a large potential, however they are scarce. eHealthMonitor's overall objective is to significantly increase the individualization of personal eHealth services and thereby the quality and patients' acceptance of electronic health care services for prevention, treatment and care. The research is funded by the European Commission, ICT FP7, project ID 287509.

PMH60

PSYCHOACTIVE DRUG USE, POLYPHARMACY AND CO-MORBIDITIES IN NEWLY DIAGNOSED PATIENTS WITH PERVASIVE DEVELOPMENT DISORDER IN THE PROVINCE OF QUEBEC

Croteau C[1], Dorais M[2], Tarride JE[3], Mottron L[4], Perreault S[1]
[1]*Université de Montréal, Montreal, QC, Canada,* [2]*StatSciences Inc., N.-D. de l Île-Perrot, QC, Canada,* [3]*McMaster University, Hamilton, ON, Canada,* [4]*Hôpital Rivière des Prairies, Montreal, QC, Canada*

OBJECTIVES: A number of medication surveys conducted in the U.S. have demonstrated a high level of psychotropic drug use in patients diagnosed with pervasive development disorder (PDD). Medication use is of interest as not many products are approved for treatment in autism. Describe drug use in subjects newly diagnosed with PDD in Quebec province. **METHODS:** A cohort study was built by using Quebec RAMQ and Med-Echo databases for subjects having a new PDD diagnosis (ICD-9 codes: 299.0-299.9) between January 1998 and December 2010. Cohort entry date was the date of a first diagnosis confirmed by the absence of PDD diagnosis in previous 2 years, and aged less than 26 years. Descriptive analyses of patient characteristics were done at cohort entry and drug use profiles were done the year prior to, and within the 3 years following diagnosis. **RESULTS:** A cohort of 4684 subjects was identified; 78% of patients were male and the age ranges were as follows: 41.9% (1-5 years), 31.2% (6-12 years), 12.3% (13-17 years), 14.7% (18-25 years). Prior to being diagnosed with PDD, 35% received at least 1 psychoactive drug. Methylphenidate was most common in 6-12 year olds (36%) whereas antipsychotics were most common in the 13-17 group (28.6%) and in the adult population (51.7%). Antipsychotic use was also present in younger children: 5.7% in 1-5 year olds and 23% in 6-12 year olds, 1 year after diagnosis. Antipsychotic, antidepressant and anticonvulsant usage increased in the 3 years following diagnosis, and also with age. **CONCLUSIONS:** Prior to PDD diagnosis, more than a third of the patients were on psychotropic medications, a practice that continued and increased after diagnosis. Psychoactive drug utilization is high and could be of concern if used to compensate for limited access to other treatment modalities such as educational and allied health therapies.

PMH61

IS ADJUNCTIVE GUANFACINE-EXTENDED RELEASE ASSOCIATED WITH CHANGES IN STIMULANT ADHERENCE AMONG CHILDREN AND ADOLESCENTS WITH ATTENTION DEFICIT/HYPERACTIVITY DISORDER IN A MANAGED CARE SETTING?

Gajria K[1], Candrilli SD[2], Meyers J[2], Fridman M[3], Farrand K[1], Hodgkins P[1], Sikirica V[1]
[1]*Shire, Wayne, PA, USA,* [2]*RTI Health Solutions, Research Triangle Park, NC, USA,* [3]*AMF Consulting, Los Angeles, CA, USA*

OBJECTIVES: To assess stimulant adherence among pediatric patients with attention-deficit/hyperactivity disorder (ADHD) after adding guanfacine extended-release (GXR) as adjunctive therapy to stimulants in a US managed care setting. **METHODS:** Data from the MarketScan Commercial Claims and Encounters insurance claims database (2009-2011) were used. Patient inclusion criteria were: 6-17 years old; ≥1 ADHD diagnosis (ICD-9-CM code 314.00 or 314.01); ≥1 long-acting (LA) and/or short-acting (SA) stimulant prescription; continued stimulant therapy for ≥30 days and ≥6 months of continuous insurance coverage pre- and post-GXR initiation; and nonadherent to stimulant treatment pre-GXR. Adherence was assessed using the medication possession ratio [MPR] (range=0.0-1.0), with MPR <0.80 considered nonadherent. Change in stimulant adherence pre- to post-GXR initiation was assessed using an OLS multivariable model, adjusting for patient age, sex, and geographic region; GXR dose (last observed), adherence, dose stabilization, and year of initiation; number of non-ADHD prescriptions pre-GXR; stimulant MPR pre-GXR; and stimulant received (LA, SA, SA+LA). **RESULTS:** A total of 238 patients nonadherent to stimulants prior to initiating GXR were analyzed; 38% were female, mean (SD) age was 10.3 (3.3) years, unadjusted pre- and post-GXR stimulant MPR was 0.51 (0.16) and 0.82 (0.25), respectively, and the change in MPR was 0.31 (0.28). Among LA patients (n=162), mean unadjusted pre-GXR stimulant MPR was 0.50, and 0.80 post-GXR; among SA and SA+LA patients (n=76), this was 0.53 (pre-GXR) and 0.88 (post-GXR). The mean adjusted (i.e., post-model estimation) change in MPR was 0.29 (95% CI: 0.27-0.32) for LA patients versus 0.34 (95% CI: 0.31-0.38) for combined SA and SA+LA patients (difference=0.05; P=0.013). **CONCLUSIONS:** Among patients nonadherent to stimulant treatment, prior to initiating adjunctive GXR, adding GXR was associated with positive changes in stimulant adherence, with statistically significant differences in the change in MPR observed for patients initiating GXR while on LA stimulants alone versus those on SA or SA+LA stimulants.

PMH62

PATIENTS' CHARACTERISTICS AND PATTERNS OF USE OF DEPOT ANTIPSYCHOTICS IN GERMAN PATIENTS WITH SCHIZOPHRENIA

Rouleau A[1], Depont F[2], Klora M[3], Messer T[4], Braun S[5], Zeidler J[3], Milea D[6]
[1]*Lundbeck SAS, Issy-les-Moulineaux, France,* [2]*SC Partners, Paris, France,* [3]*Leibniz University Hannover, Hannover, Germany,* [4]*Danuvius Klinik GmbH, Pfaffenhofen, Germany,* [5]*HERESCON GmbH, Hannover, Germany,* [6]*Lundbeck Singapore PTE LTD., Singapore, Singapore*

OBJECTIVES: To describe patients' characteristics and patterns of use of depot antipsychotics in patients with a diagnosis of schizophrenia in Germany. **METHODS:** Claims data were analysed from German patients covered by Elsevier Health Risk Research Database between 2009-2011 (approx 7.6 million insured persons). The study sample consisted of adult patients who initiated a given depot antipsychotic for schizophrenia (F20) or schizoaffective disorder (F25) in 2010. Baseline clinical characteristics of patients were searched over the year prior to depot initiation. Persistence (treatment duration) with depot treatment was assessed using a Kaplan-Meier survival analysis until discontinuation or end of the study period (31 December 2011). **RESULTS:** A total of 2,240 patients with a diagnosis of schizophrenia or schizoaffective disorder (mean age 50.7 years, 48.8% male) were included. At baseline, the main psychiatric comorbidities were major depressive disorder (38% of patients), substance use disorders (29%) and anxiety disorders (13%). Main somatic conditions were cardiovascular diseases (37%), neurological disorders (33%) and hyperlipidemia (27%). Depot antipsychotics prescribed were mainly risperidone long acting (32%), flupentixol (31%) and haloperidol decanoate (17%). Prescribers were psychiatrists/neurologists (58%), GPs (16%), other/unknown (26%). Median persistence to depot antipsychotic treatment was 156 days. **CONCLUSIONS:** To our knowledge, this is the first large database study conducted in Germany aiming at describing the patients' characteristics and treatment patterns of schizophrenic patients treated with depot antipsychotics. It is notable that the current sub-population of schizophrenic patients treated with depot showed substantial psychiatric and cardiovascular co-morbidities.

PMH63

VARIATION IN TREATMENT PATTERNS AND OUTCOMES IN CHILDREN AND ADOLESCENTS WITH ATTENTION-DEFICIT/HYPERACTIVITY DISORDER ACROSS EUROPEAN COUNTRIES

Setyawan J[1], Grebla R[1], Nam S[1], Fridman M[2], Supina D[1]
[1]*Shire, Wayne, PA, USA,* [2]*AMF Consulting, Los Angeles, CA, USA*

OBJECTIVES: To visualize heterogeneity in treatment pathways and outcomes among children and adolescents with ADHD in Europe. **METHODS:** Retrospective chart review of 779 ADHD patients (aged 6–17 years) diagnosed by 340 clinicians between 2004 and 2007 in six European countries. Receipt of ADHD medication and/or behavioural therapy (BT) was evaluated across the study period. Patient characteristics, treatment patterns, physician-reported satisfaction and symptom control were analysed in the total population and among patients with at least one switch in ADHD therapy during follow-up (switchers). Optimal treatment success (OTS) was defined as high satisfaction and complete symptom control at chart review. **RESULTS:** Most patients treated with ADHD medication (89.5%) received methylphenidate. Among 386 patients (49.6%) who remained on their initial treatment throughout the chart review period, the majority (86.3%) were treated with ADHD medication alone or in combination with BT. Switchers (n=393; 50.4%) did not differ significantly at baseline from non-switchers. Few patients (n=98; 12.6%) switched more than once. The most common types of switch (first and last treatments considered) were from one monotherapy to another (n=91; 23.2%) or change of medication co-administered with BT (n=54; 13.7%). The most common reasons for last switch were suboptimal response (40.2%), duration of action (18.1%) or both (14.5%). At review, among those who switched, 11.7% discontinued all ADHD treatment and 5.1% received only BT. Overall, OTS was 27.4% with no significant difference between switchers and non-switchers (29.1% vs 25.5%; p=0.281). **CONCLUSIONS:** About half the patients switched from their initial treatment during chart review, mostly due to suboptimal response, with many (16.8%) discontinuing ADHD medications. Furthermore, OTS remained low regardless of whether a patient switched ADHD therapies. Together, these observations suggest currently available ADHD treatments are inadequate for achieving OTS among children and adolescents in Europe.

PMH64

PATIENTS' CHARACTERISTICS AND PATTERNS OF USE OF DEPOT ANTIPSYCHOTICS IN SWEDISH PATIENTS WITH SCHIZOPHRENIA

Depont F[1], Rouleau A[2], Osby U[3], Sobocki P[4], Milea D[5]
[1]*SC Partners, Paris, France,* [2]*Lundbeck SAS, Issy-les-Moulineaux, France,* [3]*Karolinska Institutet, Stockholm, Sweden,* [4]*Pygargus AB, Stockholm, Sweden,* [5]*Lundbeck Singapore PTE LTD., Singapore, Singapore*

OBJECTIVES: To describe patients' characteristics and patterns of use of depot antipsychotics in patients with a diagnosis of schizophrenia in Sweden. **METHODS:** A retrospective analysis was conducted based on longitudinal and population-based data in the Swedish national health registries. The study sample consisted of adult patients who initiated a treatment with any depot antipsychotic for schizophrenia (F20) or schizoaffective disorder (F25) in 2009-2010. Baseline clinical characteristics of patients were searched over the year prior to depot initiation. Persistence (treatment duration) with depot treatment was assessed using a Kaplan-Meier survival analysis until discontinuation or end of the study period (31 December 2011). **RESULTS:** A total of 2,879 patients with a diagnosis of schizophrenia or schizoaffective disorder were included. Mean age was 50.0 years and 54.4% of the patients were male. At baseline, the main psychiatric comorbidities were other psychotic disorders (17% of patients), substance use disorders (11%) and major depressive disorders (3%). Somatic conditions were

infrequent (4% diabetes and 3% neurological disorders). The most common depot antipsychotics prescribed were zuclopentixol (32%), perphenazine (28%) and risperidone LAI (19%). These were prescribed primarily by psychiatrists (85%). Median persistence to depot treatment was 195 days. **CONCLUSIONS:** To our knowledge, this is the first large database study conducted in Sweden aiming at describing the patients' characteristics and treatment patterns of schizophrenic patients treated with depot antipsychotics. It is notable that the current sub-population of schizophrenic patients treated with depot does not show substantial psychiatric and somatic co-morbidities, possibly due to under-diagnosing of co-morbidities, especially somatic diseases, by psychiatrists.

PMH65

ASSESSING THE ECONOMIC BURDEN AND HEALTH CARE UTILIZATIONS OF THE UNITED STATES VETERAN PATIENTS DIAGNOSED WITH SCHIZOPHRENIA

Wang L[1], Xie L[2], Li L[1], Kariburyo MF[2], Baser O[3]
[1]*STATinMED Research, Dallas, TX, USA,* [2]*STATinMED Research, Ann Arbor, MI, USA,* [3]*STATinMED Research/The University of Michigan, Ann Arbor, MI, USA*

OBJECTIVES: To examine the economic burden and health care utilizations of schizophrenia in the U.S. veteran population. **METHODS:** A retrospective database analysis was performed using the Veterans Health Administration (VHA) Medical SAS datasets from October 1, 2008 to September 30, 2012. Patients diagnosed with schizophrenia were identified using International Classification of Disease 9thRevision Clinical Modification (ICD-9-CM) diagnosis codes 295.xx, and the first diagnosis date was designated as the index date. A group of patients without schizophrenia of the same age, region, gender and index year were identified and matched by baseline Charlson Comorbidity Index (CCI) as the comparison group. Patients in both groups were required to be at least 18 years old and have continuous medical and pharmacy benefits 1 year pre- and 1 year post-index date. One-to-one propensity score matching was used to compare health care costs and utilizations during the follow-up period between the schizophrenia and comparison group patients, adjusted for baseline demographic and clinical characteristics. **RESULTS:** A total of 171,086 eligible patients were identified for the schizophrenia and control cohorts. After 1:1 matching, a total of 70,045 patients were matched from each cohort with well-balanced baseline characteristics. Patients diagnosed with schizophrenia had significantly higher health care utilization in inpatient (18.12% vs. 2.30%, p<0.01), emergency room (19.67% vs. 6.46%, p<0.01), office (98.32% vs. 53.26%, p<0.01), and outpatient visits (98.53% vs. 54.16%, p<0.01). Higher health care utilizations translated into higher costs for schizophrenic patients including inpatient ($7,228 vs. $613, p<0.01), pharmacy ($1,012 vs. $343, p<0.01), outpatient ($3,998 vs. $1,302, p<0.01), and total costs ($12,238 vs. $2,260, p<0.01) relative to patients in the comparison group. **CONCLUSIONS:** Schizophrenic patients were associated with a substantial economic burden compared to their matched controls.

PMH66

DIFFERENCES IN HEALTH CARE RESOURCE UTILIZATION AND EXPENDITURES AMONG SCHIZOPHRENIC PATIENTS IN THE UNITED STATES BY HEALTH INSURANCE STATUS, 2007-2008

Rohwer R, de Moor C
Mapi Real World Evidence, Lexington, KY, USA

OBJECTIVES: To compare health care resource utilization (HRU) among schizophrenic patients in the United States by the type of health insurance and estimate the annual expenditures. **METHODS:** The 2007 National Health and Interview Survey (NHIS) data were used for this study (150 schizophrenia cases). Multivariate regression was conducted to compare HRU (hospitalizations, physician visits, ER visits) by type of health of insurance (any private, public only, and none). Additionally, 2008 Medical Expenditure Panel Survey (MEPS) data were linked with the NHIS data (29 of the NHIS cases). Means, SE and 95% confidence intervals of prescription and total health care annual expenditures were calculated for schizophrenic patients by insurance type. **RESULTS:** Multivariate analysis indicated a significant association between the number of hospitalizations, physician visits and ER visits over 12 months and any private insurance (β=-2.06, SE=0.84, p=0.01; -19.69, 8.92, 0.03; -22.35, 9.55, 0.02, respectively) compared to no insurance (referent). These same associations were not significant for the public only insurance (-0.30, 0.44, 0.16; -5.89, 3.91, 0.13; -7.72, 4.09, 0.06, respectively). Mean, SE [95% confidence interval] prescription expenditures for schizophrenic patients are similar between private insurance holders ($737, 215.3 [312.3-1161.6]) and those without insurance ($718, 237.0 [249.7-1186.3]), but were higher for public insurance holders ($3781, 897.2 [2008.1-5553.0]). Mean total health care expenditures for schizophrenic patients are similar between private insurance holders ($4000, 1382.4 [1273.9-6726.7]) and those without insurance ($4318, 2215.4 [0-8696.6]), but were higher for public insurance holders ($12,584, 2452.2 [7739.6-17,428.8]). **CONCLUSIONS:** Private insurance HRU for schizophrenic patients is lower than public only insurance holders, followed by those without insurance. Seemingly contradictory, a higher expenditure among public insurance holders was observed. This observation could be the result of the more severe schizophrenic cases having only public insurance. Caution should be employed in the use of the expenditure calculations due to the small numbers of patients.

PMH67

EXPLORING DEPENDENCE ON OTHERS IN ALZHEIMER'S DISEASE

Rapp T[1], Lacey L[2], Orgogozo JM[3], Vellas B[4]
[1]*University of Paris Descartes, Paris, France,* [2]*JANSSEN Alzheimer Immunotherapy, Dublin, Dublin, Ireland,* [3]*Université Bordeaux, Bordeaux, France,* [4]*Gérontopole Toulouse, Toulouse, France*

OBJECTIVES: The increasing economic importance of dependence on others in the elderly population is a major problem in Europe. This problem is very concerning for patients with Alzheimer's disease, who heavily rely on informal caregivers' assistance. Exploring the relationship between patients' dependence on others and care expenditures is very important when planning future resources for the elderly and for predicting the economic consequences of interventions which may delay dependence. Few studies have explored such a relationship in Continental Europe. **METHODS:** We use data from the DEP-FR study. We ran ordered logisitic and heckman regressions. **RESULTS:** We provide evidence: that there is a positive and significant correlation between cognitive, functional and behavioral declines and dependence on others, that an increase in dependence on others is associated with a decrease in informal care providers' satisfaction, that there is a linear relationship between dependence on others and informal and formal care use. **CONCLUSIONS:** Our results provide two main dependence policies perspectives. First, public interventions should try to reduce dependence through its three main dimensions of dependence on others (cognitive, behavioral and functional), and not only focus on the functional dimension of dependence. Second, specific measures should be implemented to the release of informal caregivers' burden, which increases with dependence on others.

PMH68

HOW WELL DO WE UNDERSTAND THE ECONOMIC BURDEN ASSOCIATED WITH DEMENTIA? A FOCUS ON TRENDS IN CARE HOME COSTS AND FUTURE PERSPECTIVES IN THE UNITED KINGDOM

Griffiths M, Hamerslag L, Wilson T, Kusel J
Costello Medical Consulting Ltd., Cambridge, UK

OBJECTIVES: The prevalence and economic burden of dementia is increasing, and in 2007 the UK government declared dementia a national priority. This research aims to evaluate trends in care home costs for dementia patients following this announcement, and to discuss the implications for the future economic burden of dementia. **METHODS:** PubMed was searched for terms related to 'cost', 'care homes' and 'dementia'. Horizon scanning was additionally performed for costs of care home data in the context of the wider economic burden of dementia. Only UK studies published after 2007 were considered, and information from a range of sources was assimilated to understand future implications for the economic burden of dementia. **RESULTS:** Four relevant PubMed articles and an additional twelve publications from horizon scanning were identified. It was reported that two-thirds of care home patients have dementia and that accommodation costs represent the major contributor to the cost of dementia (41%). The average annual cost of a care room had risen from £25,953 in 2011 to £27,404 in 2012 and this was accompanied by a 3.9% deficit in local authority payment increases for care home residents from 2010 to 2012. It is estimated that by 2043, more than double the current number of care home places will be required to match the increase in dementia prevalence, and the economic dependency ratio is expected to increase from 24% to 30% over the next 15 years. **CONCLUSIONS:** A considerable proportion of dementia patients are treated in care homes and, considering the disparity between the rising costs of care homes and funding increases, the burden borne by patients and their families is increasing. There is therefore an imminent need to develop cost-effective service provision for dementia patients; the new remit of NICE in social care may represent an important step towards this.

PMH69

EXAMINING THE EFFECTS OF A FUNCTIONAL RESTORATION AND PAIN MANAGEMENT PROGRAM AMONG CHRONIC PAIN PATIENTS IN THE TEXAS WORKERS COMPENSATION SYSTEM: PILOT STUDY – PART I

Nwokeji ED[1], Rascati KL[1], Nemeth WC[2], Jordan KD[2], Novak S[1], Adeyemi AO[1]
[1]*The University of Texas at Austin, Austin, TX, USA,* [2]*RestoreFX, Austin, TX, USA*

OBJECTIVES: Management of chronic nonmalignant pain (CNMP) is important in both primary care and rehabilitative medicine however, the relationships between CNMP and the diverse types of addiction and chemical dependency are often complex and clinically relevant. The objective of this pilot study was to examine the impact of the Functional Restoration and Pain Management (FRPM) Program on pain severity outcomes and controlled medication use among CNMP patients enrolled in the Texas Workers Compensation (TWC) benefit program. **METHODS:** A retrospective cohort analysis of administrative claims and medical records data was conducted among TWC chronic pain patients enrolled in the FRPM Program receiving buprenorphine therapy. Prescription utilization patterns and pain severity outcomes during a 12-month observation period were examined. Eligible patients were ≥18 years of age, continuously enrolled as TWC beneficiaries, had a history of utilization of chronic pain medications at enrollment, placed on buprenorphine therapy, and received services through the FRPM program within the observation period defined as date from patient entry into the program to 12 months post-enrollment. **RESULTS:** The mean age of eligible participants (N=18) enrolled in the pilot study was 49.6 years ±9.5. A majority of patients were male (61%), white (61%), had a chronic pain lumbar diagnosis (45%), depression comorbidity (78%), and a substance abuse disorder (39%). Overall, patients showed a significant reduction in pain scores (p=0.032) at month 12 compared to baseline. For controlled medication utilization, there was a significant difference in narcotic pain medication use reduction in Hispanics/Latinos (p=0.033) compared to other racial/ethnic groups (i.e., Whites and African-Americans) at month 12 compared to baseline. **CONCLUSIONS:** Though a pilot study, the results suggest that the FRPM program has the potential of improving health outcomes of patients with chronic pain, while reducing their use of controlled medications. A larger follow-up study is needed to validate and expand on these preliminary findings.

PMH70

IMPACT OF AUTISM SPECTRUM DISORDERS ON THE FAMILY – A NATIONAL PERSPECTIVE

Vohra R, Madhavan S, Sambamoorthi U
West Virginia University School of Pharmacy, Morgantown, WV, USA

OBJECTIVES: To examine caregiver reported impact of ASD on family as compared to impact of other developmental disabilities (DD) and mental health conditions (MHC) on family. **METHODS:** A cross-sectional study using 2009-2010 National Survey of Children with Special Health Care Needs on caregivers of children aged 3-17 years with either ASD, DD, MHC, or both DD and MHC diagnosis (N = 18,136)

was conducted. Family impact was assessed as: Financial burden, Employment Burden, and Time-related burden. Binary and multinomial logistic regressions were conducted to compare likelihood of adverse family impact across ASD, DD without ASD, MHC without ASD, and DD and MHC without ASD, after adjusting for socio-demographics, number of special children in the household, child's functional ability, and presence of a physical condition. **RESULTS:** Majority of the sample were older children (6-17 years), Whites, caregivers with ≥200% FPL income and greater than high school education. Sixteen percent (n=2,801) of the caregivers had a child with an ASD diagnosis. Caregivers of children with ASD were more likely to have financial burden than caregivers of children with DD (AOR=1.45, 95% CI=1.10-1.91) and MHC (AOR=1.59, 95% CI=1.33-1.91). There were no significant differences in financial burden reports between caregivers of children with ASD and those with both DD and MHC. Caregivers of children with ASD were also more likely to leave a job (employment), as compared to caregivers of children with DD (AOR=1.57, 95% CI=1.23-2.00), MHC (AOR=3.06, 95% CI=2.51-3.74), or both (AOR=1.73, 95% CI=1.36-2.20). Caregivers of children with ASD were more likely to report time-related burden as compared to caregivers of children with MHC (AOR=2.87, 95% CI=2.18-3.78) and DD and MHC (AOR=1.80, 95% CI=1.32-2.44). **CONCLUSIONS:** Caregivers of children with ASD are more likely to report an adverse family impact as compared to caregivers of children with DD, MHC, or both.

DEVELOPING A POPULATION-BASED DEMENTIA REGISTRY FOCUSING ON PATIENTS AND CARER NEEDS: METHODOLOGICAL CHALLENGES

Gobin J[1], Marinova-Schmidt V[1], Schaller SU[1], Luttenberger K[2], Richter-Schmidinger T[2], Maler JM[2], Gräßel E[2], Kolominsky-Rabas PL[1]

[1]*Centre for Health Technology Assessment (HTA) and Public Health (IZPH), University of Erlangen-Nuremberg, Erlangen, Germany,* [2]*University Hospital, Erlangen, Germany*

OBJECTIVES: With increasing prevalence of dementia worldwide the interest in the dementia burden and impact on the health care system is rising. Yet comprehensive information about long-term needs and patterns of care of dementia patients and informal caregivers is scarce. Dementia specific registries provide an opportunity to investigate these aspects by long-term-data analysis. However, so far no international standards exist for developing a dementia registry. **METHODS:** An interdisciplinary team (psychiatry, public health, psychology, medical sociology, health economics and gerontology) established a registry structure in 2012. In the conception phase, existing registries, studies of dementia and best practice scenarios were identified. Features were combined in our concept and inclusion criteria, time for follow-up, fields of particular relevance and instruments were determined. A questionnaire was built and tested in exemplar sites. **RESULTS:** The pilot study started with prospective interviews in January 2013 to evaluate the concept. The inclusion criterion is a dementia diagnosis according to ICD-10. Patients are recruited from the regional memory clinic during the process of diagnosis. Patient drop outs occur after initial inclusion because of other ensured diagnosis such as depression. Both patients and caregivers are interviewed separately with internationally approved valid instruments. The follow-up will take place after 6, 12 months and annually until death or loss to follow-up. **CONCLUSIONS:** Existing dementia registries are very rare and heterogeneous in their structure, with currently no standards on quality indicators and processes. However, the complexity of dementia requires a sophisticated organizational structure for covering all aspects of dementia. Despite the challenges, our dementia registry structure provides essential, comprehensive and long-term information about the dementia care setting. The research is funded by the European Commission, ICT FP7, project ID 287509.

EFFECT OF NURSE-LED MEDICATION REVIEWS IN PSYCHIATRIC PATIENTS – AN INTERVENTIONAL STUDY

Soerensen AL[1], Nielsen LP[2], Lisby M[3], Poulsen BK[2], Mainz J[4]

[1]*Aalborg University, Aalborg, Denmark,* [2]*Aarhus University Hospital, Aarhus, Denmark,* [3]*Aarhus University Hospital & Aarhus University, Aarhus, Denmark,* [4]*Aalborg Psychiatric University Hospital, Aalborg, Denmark*

OBJECTIVES: There is an increasing demand for medication reviews to improve the quality of prescribing for patients with chronic illness such as psychiatric patients. Traditionally, this has been undertaken by physicians. Pharmacists have also proven to be a resource in this field but registered nurses are the health professionals spending most time directly with the patient and very few studies investigate nurses' role and potential in improving the appropriateness of medication. Therefore, the objective of this study is to investigate the effect of educating nurses in general pharmacology and conducting systematic medication reviews using computer based screening. The effect is evaluated in a controlled interventional study. **METHODS:** An interventional study including 2 acute psychiatric wards. In one ward nurses' will receive pharmacological training and the other ward will function as a control. The nurses will perform approximately 250 medication reviews followed by medication reviews performed by pharmacologists. Primary outcomes are the respective frequencies, types and severity of potential inappropriate prescriptions identified by the nurses and pharmacologists and an estimation of the interratervariability between the two professions. **RESULTS:** The hypothesis is that nurse-led medication reviews will reduce potential inappropriate prescribing and that training will increase nurses' ability to identify and report potential inappropriate prescribing. It is assumed that this intervention, in addition to a more appropriate prescribing, will lead to a reduction in length of hospitalization for psychiatric patients. **CONCLUSIONS:** The perspective for this study is to add knowledge about frequency, types and potential severity of potential inappropriate prescribing for psychiatric patients. The study will contribute with information regarding the effect of pharmacological training of nurses and possibly improve medication safety for psychiatric patients. Results from this study could serve as evidence, when hospital management makes decisions on how to accede the need for medication reviews as part of an ongoing accreditation process.

MEDICATION USE PATTERNS AND ADHERENCE AFTER INITIATING ANTIPSYCHOTICS TREATMENT FOR PATIENTS WITH SCHIZOPHRENIA IN TIANJIN, CHINA

Yao X[1], Wu J[1], Liu LL[2], Ye WW[2], Xue HBH[2], Montgomery W[3]

[1]*Tianjin University, Tianjin, China,* [2]*Lilly Suzhou Pharmaceutical Co., Ltd. Shanghai Branch, Shanghai, China,* [3]*Eli Lilly Australia Pty Ltd., West Ryde, Australia*

OBJECTIVES: To describe medication use patterns and adherence rates for schizophrenia patients after initiating antipsychotic treatment in Tianjin, China. **METHODS:** Data were extracted from the Tianjin Urban Employee Basic Medical Insurance database (2008-2010). Adult patients with a schizophrenia diagnosis, newly initiating or restarting antipsychotics (no antipsychotics during previous 90 days) with 12-month continuous enrollment after their first observed antipsychotic prescription were included. Patients' medication prescribing patterns and antipsychotic adherence are described. **RESULTS:** A total of 1216 patients were identified, with a mean (SD) age of 51.43 (12.48) years, 54.11% female. 83.14% of patients initiated with one antipsychotic and 16.86% with ≥ 2 antipsychotics. 37.99% of patients were initiated on typical antipsychotics, 52.06% on atypicals, and 9.95% on both. A higher portion of typical initiators were co-prescribed antianxiety and anticholinergic medications than atypical starters (both p<0.001). During the following 12 months, the majority of patients remained on medications from their initial antipsychotic class (80.74% of typical initiators vs. 86.41% of atypical initiators) or the same medication (66.45% of typical initiators vs. 70.93% of atypical initiators). More typical initiators switched to, or augmented with, atypical antipsychotics than atypical initiators to/with typical antipsychotics (19.26% vs. 13.59%, P=0.011). During the following 3, 6 and 12 months, antipsychotic continuation rates (≤ 30 days gap) were 50.33%, 23.60%, and 8.88%, respectively. Medication Possession Ratios were low, with means (SD) of 0.58 (0.32), 0.44 (0.30), and 0.34 (0.27) for the 3, 6 and 12 months, respectively. **CONCLUSIONS:** More individuals with schizophrenia were treated with atypicals rather than typical antipsychotics. The majority of patients tended to stay with one antipsychotic drug class or the same medication. Patients' adherence to prescribed antipsychotics was low. This study highlights the importance of selecting an effective medication when starting antipsychotic therapy in China. However much could be done to improve treatment adherence.

MUSCULAR-SKELETAL DISORDERS – Clinical Outcomes Studies

THE IMPACT OF COMORBIDITIES ON UTILITY CHANGES IN LOWER-LIMB OSTEOARTHRITIS : KHOALA STUDY

Hosseini K[1], Gaujoux-Viala C[2], Baertschi A[3], Oudot J[3], Rat AC[1], Guillemin F[1]

[1]*CHU Nancy, Clinical Epidemiology and Evaluation; Université de Lorraine, Paris Descartes University, APEMAC, EA 4360, Nancy, France,* [2]*• Montpellier I University, Nîmes University Hospital, Rheumatology, France • EA 2415, Montpellier I University, Nîmes University Hospital, Rheumatology Department, France, Paris, France,* [3]*CHU Nancy, Clinical Epidemiology and Evaluation, Nancy, France*

OBJECTIVES: 1) To determine the minimal important change (MID) of indirect utility score for patients with osteoarthritis (OA) over 3-year follow up, and 2)Estimate the impact of comorbidity for patients reaching the MID. **METHODS:** A total of 878 patients with symptomatic knee or/and hip OA of KHOALA cohort were included. Comorbidity were assessed by Functional Comorbidity Index (FCI). Utility score was assessed using SF-6D, and limitation in activities by WOMAC function score (0-100,0 is better), at baseline and 3-year. The MID of utility was assessed using standard error of measurement (SEM). According to MID, patients were classified as negative/positive change or unchanged. Two separate multinomial logistic models were fitted to determine predictors of positive or negative change over the MID threshold. Both models included sociodemographic characteristics and the mean difference of WOMAC score between baseline and 3-year. **RESULTS:** A total of 650 OA patients completed the questionnaire at both times. The mean (SD) utility was 0.664 (±0.110) at baseline and 0.667 (±0.110) at 3-year. Patients have on average 2.5 (±1.94) comorbidities and a signifcant (p<.0001) decrease of the WOMAC function score at 3-year. The MID of SF-6D utility score was 0.067: 147 patients classified with negative and 156 with a positive change. In the first model including the number of comorbidities, patients with a decrease of the WOMAC function score had an increased utility (OR=0.95; p<.0001). In the second model, patients with pneumologic (OR=1.88; p=0.03) or neurologic (OR=2.73;p=0.047) disease were likely to have improved utility, while patients having a psychiatric disease were less likely to have an improvement (OR=0.54;p=0.029). **CONCLUSIONS:** According to MID, about half of patients had a positive or negative change in their utility score. Compared to functional severity of OA, comorbidities have a relatively marginal impact on indirect utility score. This suggests that clinically, considering the functional severity of OA remains a first priority.

PMS2

THE IMPACT OF COMMODITIES AND EXTRA-ARTICULAR MANIFESTATIONS IN RHEUMATOID ARTHRITIS PATIENTS

Doddapaneni S[1], Khera K[1], Prabhu VA[1], Nagappa AN[2], Rau NR[3]

[1]*Manipal College of Pharmaceutical Sciences, Manipal, India,* [2]*Manipal University, MCOPS, Manipal, India,* [3]*Kasturba Medical College & Hospital, Manipal, India*

OBJECTIVES: Rheumatoid arthritis (RA) is a chronic, systemic disease associated with comorbidities and extra-articular manifestations (EAM) . The main objective of the study was to estimate the frequency and impact of comorbidities and EAM in well-defined RA patients. **METHODS:** A prospective study was conducted at a tertiary care hospital between the years 2009 & 2012. Patients (age ≥ 18 years) with RA, fulfilling the revised criteria of the American college of rheumatology (1987 & 2010), were enrolled in the study. Standard clinical, laboratory and radiological measures of RA and details of comorbidities and EAM were recorded using patient hospital records. **RESULTS:** Of 602 RA patients, 481 (79.9%) females and 121 (20.1%) males were present. Mean age of 47.57±12.78 years, mean disease duration of 4.52±4.75

years and mean days of hospitalization 6.44±4.47 were observed. Disease duration of more than 2 years was observed in 336 (55.8%) patients. RA alone, RA with 1 comorbidity, RA with 2 comorbidities, RA with 3 comorbidities, RA with 4 comorbidities, RA with 5 comorbidities, were present in 227 (37.7%), 171 (28.4%), 118 (19.6%), 58 (9.6%), 19 (3.2%), 9 (1.5%) patients respectively. The most common comorbidities were diabetes mellitus 114 (18.94%), hypertension 104 (17.28%) and EAM was anemia 351 (58.30%). **CONCLUSIONS:** Comorbidities and EAM were present in substantial proportion of RA patients. Diabetes mellitus, hypertension and anemia were found to be most common in our setting. Early diagnosis and management are necessary to reduce their impact on therapeutic outcomes in RA.

PMS3

IMPACT OF COMORBIDITY BURDEN ON REAL-WORLD HEALTH CARE COSTS OF RHEUMATOID ARTHRITIS PATIENTS IN TURKEY

Baser O[1], Burkan A[2], Baser E[3], Koselerli R[2], Ertugay E[2], Altinbas A[4]
[1]*STATinMED Research/The University of Michigan, Ann Arbor, Michigan, MI, USA,* [2]*Social Security Institution, Ankara, Turkey,* [3]*STATinMED Research, Ankara, Turkey,* [4]*Diskapi Yildirim Beyazi Education and Research Hospital, Gastroenterology Clinic, and STATinMED Research, Ankara, Turkey*

OBJECTIVES: To determine the impact of comorbidity burden on real-world health care costs of rheumatoid arthritis (RA) patients in Turkey, using nationwide real-world data. **METHODS:** Study data was obtained from MEDULA (2009-2011). Using International Classification of Disease Tenth Revision Clinical Modification (ICD-10-CM) codes, adult RA patients (ages 18-99) were identified for the identification period (June 1, 2010 - December 31, 2010). Patients were required to have two RA diagnoses at least 60 days apart, and were grouped as prevalent and incident cases. The date of the first RA claim was identified for each patient and designated as the index date. Total health care costs were examined over the 12-month period following the index date. To control for clinical characteristics, a comorbidity index score for each patient during the baseline period was calculated using the Elixhauser method. This index is the sum of a comprehensive set of 30 present comorbid conditions, and is widely-used in the outcomes research field to determine patient health status. Individual comorbidities, such as diabetes, respiratory diseases, allergy and cardiovascular diseases, were identified using ICD-10 codes. **RESULTS:** A total of 2,613 patients met all inclusion criteria (693 incident; 1,920 prevalent patients). Prevalent patients had higher comorbidity index scores relative to incident patients. Nearly 35% of incident and 40% of prevalent patients had at least one cardiovascular, diabetic, respiratory, or allergy comorbid condition prior to the diagnosis. The mean Elixhauser Comorbidity Index score was calculated as 5.31 for incident and 5.7 for prevalent patients. Prevalent patients with respiratory and cardiovascular comorbid conditions incurred additional health care costs of €302 and €283 respectively. For incident patients, respiratory comorbid conditions increased the health care costs with €916. **CONCLUSIONS:** Respiratory comorbid conditions were associated with health care costs for both prevalent and incident RA patients in Turkey.

PMS4

EFFECTS OF CLAIMS-BASED RHEUMATOID ARTHRITIS SEVERITY ON BIOLOGIC THERAPY USE AND HEALTH CARE COSTS IN TURKEY

Baser O[1], Baser E[2], Altinbas A[3], Burkan A[4]
[1]*STATinMED Research/The University of Michigan, Ann Arbor, Michigan, MI, USA,* [2]*STATinMED Research, Ankara, Turkey,* [3]*Diskapi Yildirim Beyazi Education and Research Hospital, Gastroenterology Clinic, and STATinMED Research, Ankara, Turkey,* [4]*Social Security Institution, Ankara, Turkey*

OBJECTIVES: To apply a previously validated claims-based severity index for rheumatoid arthritis (SIFRA) to prevalent rheumatoid arthritis (RA) groups in Turkey and assess the effect of claims-based RA severity on health care costs and biologic use. **METHODS:** The Turkish national health insurance database MEDULA (01JUN2009-31DEC2011) was used for the study. Prevalent RA patients were required to be age 18-99 with two RA diagnoses ≥60 days apart and continuous enrollment 1 year pre- (baseline period) and post-index date (follow-up), which was the first RA claim during the identification period (01JUN2010-31DEC2010). SIFRA was calculated for the baseline period. For the follow-up period, total health care costs and biologic use were examined. To determine health care costs, generalized linear models were applied, and multivariate logistic regression determined the effect of SIFRA on outcome measures for biologic use. **RESULTS:** A total of 1,920 RA patients were identified. The mean SIFRA score was 14.21. There was a significant variation in scores across cities. Study results confirmed increased biologic use in more severe patients. After adjusting for differences in age, gender, region and comorbidity index, patients in the high SIFRA tercile were 5.16 times more likely to be prescribed biologics (p<0.001, confidence interval [CI]: 3.46-7.69), and incurred more annual health care costs in the amount of €2,091 (p<0.001, CI: €1,557-€2,625) than those in the low SIFRA tercile. **CONCLUSIONS:** This study showed that RA severity is a significant determinant of health care costs and biologic therapy use. Biologic use was positively correlated with the severity score. According to severity scores, the total medical costs of RA patients in Turkey ranged from €1,435 to €3,275. Since statistically omitting a variable from population models provides biased and inconsistent estimates, any comparative effectiveness studies on RA treatment should include severity scores in the analysis.

PMS5

THE IMPACT OF PERSISTENCE AND COMPLIANCE WITH ORAL BISPHOSPHONATES ON FRACTURE RATES ASSESSED USING THE CLINICAL PRACTICE RESEARCH DATALINK (CPRD) IN THE UNITED KINGDOM

Feudjo Tepie M[1], Taylor A[2], Roddam A[1], Critchlow C[3], Iqbal M[2], Ferguson S[1], Bayly J[4]
[1]*Amgen Ltd., Uxbridge, UK,* [2]*Amgen Ltd., Cambridge, UK,* [3]*Amgen Inc, Thousand Oaks, CA, USA,* [4]*University of Derby, Derby, UK*

OBJECTIVES: To assess the impact of persistence and compliance on fracture rates and health care resource use (HRU) in women treated with oral bisphosphonates (oBPs). **METHODS:** This analysis of the UK CPRD included women with first oBP prescription (index event) between January 2004–December 2007, ≥50 years of age, with no history of cancer and a minimum of 12 months' data before and 6 months' after the index event. Follow-up for any osteoporotic fracture was until December 2008. Persistence was defined as duration of continuous oBP use with no gaps >3 months; compliance was assessed using the medication possession ratio (MPR; proportion of time with treatment available). HRU was evaluated using total primary care contact (including prescriptions), and all specialist referrals and hospitalisations. Analyses were stratified by persistence and compliance. **RESULTS:** A total of 21,717 patients were included (mean age, 73.5 years). Between 2004–2007, fracture rates per patient–year were: 0.14 (95% CI: 0.12, 0.16; group with MPR <80%) and 0.11 (0.10, 0.12; MPR ≥80%) for patients with 12–24 months' persistence *vs* 0.09 (0.08, 0.10) and 0.07 (0.06, 0.08), respectively, for patients with ≥36 months' persistence. Hospitalisation rates were 0.38 (0.34, 0.42; MPR <80%) and 0.30 (0.29, 0.32; MPR ≥80%) for patients with 12–24 months' persistence *vs* 0.55 (0.52, 0.59) and 0.18 (0.17, 0.19), respectively, for patients with ≥36 months' persistence. Among patients who discontinued oBPs and had <12 months' persistence and MPR ≥80% before discontinuation, fracture rates were 0.02 (0.01, 0.03) and 0.09 (0.07, 0.12) in the first and second 6 months following discontinuation, respectively, and hospitalisation rates were 0.09 (0.07, 0.11) and 0.48 (0.42, 0.55), respectively. **CONCLUSIONS:** Outcomes associated with oBPs were improved with longer persistence and higher compliance. However, in patients with <12 months' persistence, protection against fractures and hospitalisation diminished 6 months after discontinuation of oBPs.

PMS6

INDIRECT COMPARISON OF JOINT DAMAGE PREVENTION WITH ADALIMUMAB V. ABATACEPT, EACH IN COMBINATION WITH METHOTREXATE, IN EARLY RHEUMATOID ARTHRITIS

Wu EQ[1], Cifaldi M[2], Diener M[3], Kaltenboeck A[3], Ganguli A[2], Bergman M[4]
[1]*Analysis Group, Inc., Boston, MA, USA,* [2]*AbbVie Inc., North Chicago, IL, USA,* [3]*Analysis Group, Inc., New York, NY, USA,* [4]*Taylor Hospital, Ridley Park, PA, USA*

OBJECTIVES: The AMPLE trial concluded comparable efficacy of adalimumab (ADA) and abatacept (ABA) after one-year methotrexate (MTX) combination treatment for rheumatoid arthritis (RA). This study compared effects of adalimumab v. abatacept, each in MTX combination, on progressive RA joint damage, adjusting for study population characteristics. **METHODS:** Two placebo-controlled trials in early RA, PREMIER (ADA+MTX v. MTX) and AGREE (ABA+MTX v. MTX) were selected based on design and comparability of enrollment criteria. Patient-level data from PREMIER were adjusted, using propensity score weighting, to match average baseline characteristics from AGREE, including RA duration and clinical measures. Radiographic progression (RP) was a change in total Sharp score (TSS) > 0 (modified TSS in PREMIER and Genant-modified TSS in AGREE). Joint space narrowing (JSN) and joint erosion (JE) scores in PREMIER were scaled to proportion with AGREE measures. After re-weighting, one-year incremental effects were compared for ADA+MTX vs. ABA+MTX, including RP rates, mean JSN and JE score changes from baseline, disease activity score (DAS28) remission rates, and American College of Rheumatology 50% improvement (ACR50). **RESULTS:** Compared to AGREE patients, PREMIER patients were slightly older, more likely to be Caucasian, had longer RA duration, higher C-reactive protein levels, more severe joint damage, and lower functional impairment at baseline. After re-weighting, more ADA+MTX patients had no RP after one year compared to ABA+MTX patients (27.0% v. 8.3%; p=0.02). Mean improvements in JSN (-1.41 v. -0.04) and JE (-1.54 v. -0.39) scores from baseline were numerically greater with ADA+MTX; statistical significance could not be assessed as standard errors were not published for AGREE. No statistically significant differences were observed in DAS28 remission rates (p=0.47) and ACR50 responses (p=0.72). **CONCLUSIONS:** Although both combination therapies yielded similar disease activity measures at one year in early RA patients, ADA+MTX offered greater protection against radiographically-confirmed joint damage than ABA+MTX.

PMS7

META-ANALYSIS OF EFFICACY OF ETANERCEPT FOR TREATMENT OF PSORIATIC ARTHRITIS

Aggarwal S, Topaloglu H
Novel Health Strategies, Bethesda, MD, USA

OBJECTIVES: Psoriatic arthritis (PA) is an inflammatory disease affecting joints and connective tissues. The anti-tumor necrosis factor (TNF) biologics are increasingly being used in patients who have failed traditional disease-modifying antirheumatic drugs. Etanercept has shown efficacy in treatment of PA. The objective of this study was to conduct meta-analysis and present total evidence for etanercept in treatment of PA. **METHODS:** For this meta-analysis we included randomized controlled trials (RCTs)evaluating etanercept for the treatment of PS. RCTs studying adult populations with active and progressive PA with an inadequate response to previous DMARD therapy were eligible. Trials conducted among PA populations with prior experience with anti-TNF agents, including an inadequate response, were excluded. A systematic literature search for Etanercept trials was undertaken for the databases Pubmed, Embase, Biosis, Google Scholar, and Cochrane. Data was collected for the study size, interventions, year, and the three outcomes HAQ, PASI and PsARC. For meta-analysis, random effects and fixed effects models were used to obtain cumulative statistics. **RESULTS:** Two RCTs with a total of 131 patients were identified. The pooled response rates for Etanercept for PsARC were 75% (95% CI 60%-90%), for HAQ were 59% (95% CI 46%-72%), and for PASI were 24% (95% CI 13%-34%). The pooled response rates for placebo for PsARC were 30% (95% CI 26%-35%), for HAQ were 5% (95% CI 1%-9%), and for PASI were 3% (95% CI 0%-7%). For PsARC the cumulative relative risk with Etanercept versus placebo was 0.40 (95% CI 33%-48%). For HAQ, the cumulative relative risk with placebo versus Etanercept was 0.08 (95% CI 5%-12%). For PASI, the cumulative relative risk with placebo versus Etanercept was 0.14 (95% CI 8%-20%). **CONCLUSIONS:** Meta-analysis shows Etanercept offers patients with psoriatic arthritis an effective therapeutic option for control of their disease.

PMS8

EQ-5D UTILITY WEIGHTS ASSOCIATED WITH RESPONSE TO TREATMENT WITH MATRIX APPLIED AUTOLOGOUS CULTURED CHONDROCYTES (MACI) IMPLANT AND MICROFRACTURE FOR CARTILAGE DEFECTS OF THE KNEE

Saris D[1], Brittberg M[2], Mehin N[3], Dehle F[4], Dowton D[4], Kili S[5], Price A[6]
[1]*University Medical Center Utrecht, Utrecht, The Netherlands,* [2]*Region Halland Orthopaedics, Kungsbacka, Sweden,* [3]*Sanofi Biosurgery, Paris, France,* [4]*OptumInsight, Sydney, Australia,* [5]*Sanofi Biosurgery, Oxford, UK,* [6]*Nuffield Department of Orthopaedics, Rheumatology and Musculoskeletal Sciences (NDORMS), Oxford, UK*

OBJECTIVES: SUMMIT, a 2-year, multicenter, randomised trial, demonstrated significant improvements in pain and function with matrix applied autologous cultured chondrocytes (MACI) implant versus microfracture in patients with symptomatic knee cartilage defects (NCT00719576). We present post-hoc results of the impact of treatment response on EQ-5D utility scores, and the overall incremental impact of treatment with MACI compared with microfracture over 2 years. **METHODS:** Patients (aged 18-55) with Outerbridge Grade III/IV focal cartilage defect ≥3.0cm^{2}were randomised to receive MACI implant (n=72) or microfracture (n=72). Response to treatment was defined as ≥10-point improvement from baseline in both the Knee Injury and Osteoarthritis Outcome (KOOS) pain and function scores at year 2. EQ-5D was evaluated at baseline, and years 1 and 2. Patients' EQ-5D responses were scored using UK-tariffs. Utility values associated with responders and non-responders were estimated based on results from both treatment arms combined. Incremental quality-adjusted life year (QALY) gains were derived by multiplying the difference in response rates between the treatments with the difference in utility between responders and non-responders. **RESULTS:** The mean utility score for all patients (n=142) at baseline was 0.481±0.296. Responders (n=111) had an improvement in mean utility score from baseline of 0.352 (0.833-0.481) compared with 0.033 for non-responders (n=29; 0.514-0.481) at year 2. Significantly more patients treated with MACI responded to treatment than with microfracture (87.5% vs. 68.1%, respectively; p=0.016), resulting in an incremental QALY gain of 0.11 for MACI compared with microfracture over 2 years. **CONCLUSIONS:** At baseline, patients with chondral defects experienced a substantially reduced HRQoL. Significantly more patients responded to treatment with MACI versus microfracture, and this response was associated with substantial improvements in HRQoL. In this population, the higher response rate for MACI resulted in an incremental QALY gain of 0.11 compared with microfracture over 2 years.

PMS9

EARLY RESPONSE TO CERTOLIZUMAB PEGOL IN RHEUMATOID ARTHRITIS PREDICTS OUTCOME AT ONE YEAR

Berenbaum F[1], Pham T[2], Fautrel B[3], Joubert JM[4], De Chalus T[4], Riou França L[5], Claudepierre P[6]
[1]*CHU Saint-Antoine, Paris, France,* [2]*CHU Sainte-Marguerite, Marseille, France,* [3]*CHU Pitié-Salpétrière, Paris, France,* [4]*UCB Pharma, Colombes, France,* [5]*Phisquare Institute, Paris, France,* [6]*Groupe Hospitalier Henri Mondor, Créteil, France*

OBJECTIVES: Treat-to-target strategies for the treatment of rheumatoid arthritis (RA), as recommended in current treatment guidelines, require the use of reliable early markers of treatment response in order to adapt therapy in a timely way in patients with insufficient response. The objective of this study was to evaluate and compare the performance of different clinical indicators in predicting clinical response at one year. **METHODS:** This was a *post-hoc*analysis of data from the RAPID1 randomised, placebo-controlled Phase III study. A total of 382 severe RA patients treated with certolizumab pegol 200mg and no prior TNF inhibitor were assessed by Week 12 (bW12) and at Week 52 (W52). "Insufficient response" was defined using the ACR response criteria, compared to baseline, DAS28 score (Δ<1.2), HAQ score (Δ<0.22) and CDAI (score<22). The ability of insufficient response to these markers bW12 to predict failure to achieve ACR50 at W52, was compared in terms of positive predictive value (PPV), specificity and sensitivity. **RESULTS:** At W52, 149 (38.1%) patients met the ACR50 response criterion. For all bW12 outcome indicators, the specificity and the PPV was >80%. The higher PPVs were observed for bW12 ACR20 non response (1.00 [95%CI: 0.93-1.00]), bW12 reduction in DAS28 (0.95 [95%CI: 0.82-0.99]) and bW12 CDAI score (0.93 [95%CI: 0.85-0.97]). For bW12 ACR20 non response, bW12 reduction in DAS28 and bW12 CDAI score, specificities were respectively 1.00 (95%CI: 0.97-1.00), 0.99 (95%CI: 0.94-1.00) and 0.95 (95%CI: 0.90-0.98). The highest sensitivity was observed for the bW12 ACR50 (0.70 [95%CI: 0.63-0.76]). **CONCLUSIONS:** All these early response markers have high PPV and high specificity but low-to-moderate sensitivity: 80% to 100% of patients identified as "insufficient-responders" by W12 would fail to fulfil the ACR50 response at W52. Such predictability data for certolizumab pegol should help physicians to make early decisions about the potential discontinuation of the treatment.

PMS10

THE 3D O-ARM SURGICAL IMAGING SYSTEM WITH NAVIGATION EFFECTIVELY AND ECONOMICALLY ADDRESSES THE CHALLENGES OF SPINAL STABILIZATION PROCEDURES

Annoni E[1], Joedicke H[1], Barnett GS[2]
[1]*Medtronic International, Tolochenaz, Switzerland,* [2]*Gillian Barnett & Associates Ltd., Dunfanaghy, County Donegal, Ireland*

BACKGROUND: Inaccurate pedicle screw placement and neurological or vascular injury during spinal instrumentation procedures is both costly and preventable. **OBJECTIVES:** To determine the comparative efficacy or effectiveness and value for money of the 3D O-arm Surgical Imaging System with Navigation during spinal stabilization surgery compared with standard practice. **METHODS:** A search of Medical and Health Economic electronic databases (Embase, PubMed, HEED, NHS EED, Cochrane) and conference abstracts up to Nov. 2012 was conducted to identify studies evaluating the effectiveness, efficacy and economics of 3D surgical imaging with navigation. No time or language restrictions were applied. **RESULTS:** Compared with current practice options, the 3D O-arm surgical imaging with navigation was shown to significantly increase the accuracy of instrument placement, reduce surgeons' and patients' exposure to radiation, and offer the opportunity for intraoperative revision for malplaced screws during the index procedure. Results of 10 case series and a European registry show rates of pedicle screw placement accuracy (0 mm to ≤2 mm) between 95% and 100% with 3D O-arm surgical imaging with navigation compared to 84% - 95% reported for various current practice options from multiple meta-analyses. In addition, accuracy rates of between 72% and 92% have been reported for 2D C-arm without navigation. Economic studies demonstrated 3D O-arm surgical imaging with navigation has the potential to reduce the cost of fusion procedures in Europe and the USA by negating the need for pre-operative and post-operative imaging associated with current standard-of-care, reducing the need for reoperations for screw revision, shortening length of procedures and OR time. It has been estimated that it could reduce the cost of hospitalization for spinal surgery by at least 3.8%. **CONCLUSIONS:** Current evidence shows 3D O-arm surgical imaging with navigation substantially reduces the human and financial burden of patients during spinal stabilization surgery compared with standard practice.

PMS11

EVALUATING THE EFFICACY OF BIOSIMILAR INFLIXIMAB WITH THE ACR50 RESPONSE IN PATIENTS WITH RHEUMATOID ARTHRITIS; A META-ANALYSIS IN BAYESIAN FRAMEWORK

Brodszky V, Gulacsi L, Balogh O, V Hevér N, Baji P, Péntek M
Corvinus University of Budapest, Budapest, Hungary

OBJECTIVES: To identify all relevant literature on clinical efficacy and safety evidence for biosimilar infliximab (CT-P13) and comparator biological medications in rheumatoid arthritis and to conduct an up-to-date meta-analysis. **METHODS:** The following comparators were considered for this analysis: abatacept, adalimumab, certolizumab, etanercept, golimumab, infliximab, rituximab and tocilizumab. A MEDLINE search was conducted until March 2013. The Cochrane Highly Sensitive Search Strategy was applied to identify randomized controlled publications and was combined with 'arthritis, rheumatoid' MeSH terms and drug names. Randomized, controlled, clinical trials with adults with moderate-to-severe RA and reporting endpoints for 6 months where the full paper can be obtained were included. Direct and indirect evidences were combined in a mixed treatment comparisons in a Bayesian framework. Efficacy measured by ACR50 endpoint and frequency of serious adverse events at 24-30 weeks were analysed. **RESULTS:** Altogether 41 trials were included into current meta-analysis. The relative odds ratios (and 95% credible intervals) for ACR50 of biosimilar infliximab treatments compared to abatacept, adalimumab, certolizumab, etanercept, golimumab, rituximab, tocilizumab and infliximab were 1.0 (0.3-3.8), 0.9 (0.2-3.4), 0.3 (0.1-1.4), 1.0 (0.2-4.2), 1.2 (0.3-5.1), 0.9 (0.2-3.6), 0.5 (0.1-2.2), 1.0 (0.3-3.2), respectively. Similarly, relative odds ratios for serious adverse events were 1.9 (0.8-4.8), 2.0 (0.6-5.8), 0.7 (0.2-2.1), 2.0 (0.8-5.7), 1.5 (0.5-4.2), 1.1 (0.7-2.0), 1.3 (0.8-2.2), 1.3 (0.8-2.1), respectively. **CONCLUSIONS:** The results showed that efficacy and safety of biosimilar infliximab is not significantly different from innovator infliximab and from other biologics.

PMS12

SYSTEMATIC REVIEW COMPARING THE EFFICACY AND SAFETY OF COLLAGENASE CLOSTRIDIUM HISTOLYTICUM (XIAFLEX®) INJECTION WITH SURGICAL FASCIECTOMY FOR THE TREATMENT OF DUPUYTREN'S CONTRACTURE

Sugden P[1], Cottrell S[1], Tilden D[1], Ballmer A[2]
[1]*THEMA Consulting Pty. Limited, Pyrmont, Australia,* [2]*Actelion Pharmaceuticals Australia, Belrose, Australia*

OBJECTIVES: To compare the efficacy and safety of collagenase clostridium histolyticum (CCH, Xiaflex®) injection with surgical fasciectomy for the treatment of Dupuytren's contracture (DC). **METHODS:** Systematic review and qualitative synthesis of comparative and non-comparative studies reporting efficacy (clinical success, recurrence of contracture) and safety (complication) outcomes for patients undergoing fasciectomy for DC. Informal non-statistical comparison with outcomes from 3 pivotal placebo controlled trials and a long term follow-up study of DC patients treated with CCH. **RESULTS:** Sixty-eight studies of fasciectomy were identified for inclusion in the review: 61 case series (52 retrospective; 9 prospective); 3 randomised controlled trials (RCTs), none of which permitted either a direct comparison with CCH or an indirect comparison via a common comparator; 1 RCT follow-up study; 2 prospective uncontrolled studies; 1 postal survey. Studies varied in terms of fasciectomy technique employed. Follow-up ranged from only immediately post-operatively up to 35 years post-operatively. Definitions of surgical success and recurrence varied, and were frequently ill-defined or less stringent than the robust definitions used in the CCH trials. In studies of fasciectomy where definitions were judged as reasonably comparable to those used in the CCH trials (clinical success: 14 studies; recurrence: 40 studies), clinical success and recurrence rates for CCH and fasciectomy were comparable (clinical success: 63% vs 69% respectively, recurrence: 28% vs 21% at 4 years, respectively). Complication rates were greater for fasciectomy than for CCH. These included digital nerve or artery injury (3.3% vs 0%), complex regional pain syndrome (3.6% vs 0.04%), joint stiffening (8.9% vs 0%), wound infection (6.2% vs 0%), and paraesthesia (4.3% vs 0%). Tendon ruptures were reported with CCH, but were infrequent (0.07%). **CONCLUSIONS:** CCH and surgical fasciectomy can be reasonably considered as comparable in terms of efficacy for the treatment of DC and superior in terms of safety.

PMS13

COMPARATIVE EFFECTIVENESS OF ACTIVE VERSUS SHAM ACUPUNCTURE VERSUS USUAL CARE IN THE MANAGEMENT OF CHRONIC, NON-CANCER PAIN IN PRIMARY CARE

Saramago P[1], Weatherly H[1], Manca A[2], Sculpher MJ[1], MacPherson H[1]
[1]*University of York, York, UK,* [2]*University of York, Heslington, UK*

OBJECTIVES: To examine the effectiveness of acupuncture net of sham effect and usual care, measured using EQ-5D, in the management of chronic, non-cancer pain in primary care. Systematic reviews of acupuncture for the conditions osteoarthritis

of the knee, musculoskeletal pain and headache have been published however no reviews have incorporated the latest trial evidence from the recent large scale high quality RCTs to generate EQ-5D scores. **METHODS:** An individual patient level data (IPD) based Mixed Treatment Comparison (MTC) was undertaken using a database of 28 recent, high quality RCTs containing observations for over 18,000 patients. The analysis evaluated the effectiveness of acupuncture in terms of continuous outcomes, for each of the three conditions over a three month time horizon, mapping generic and disease-specific measures to generate EQ-5D scores and using published mapping algorithms unless none were available. **RESULTS:** Acupuncture, net of sham, is more effective in that it generates greater EQ-5D scores compared to usual care in the management of chronic, non-cancer pain in primary care. Using a random effects IPD MTC, the change in EQ-5D scores from baseline to 3 months was mean 0.0419 (95% credibility interval 0.0066 to 0.0765) for acupuncture net of sham and 0.0573 (95% credibility interval 0.0139 to 0.1006) for acupuncture vs usual care. **CONCLUSIONS:** Based on EQ-5D scores, this analysis suggests that acupuncture, is the most effective option. The analyses synthesise effectiveness evidence using MTC of IPD whilst controlling for sham effect. This analysis is an intermediate step to inform a full cost-effectiveness analysis to support decision-making in the UK.

PMS14

APPLICATION OF A DATA VISUALIZATION TOOL: TREATMENT PATTERNS OF VETERAN PATIENTS WITH ANKYLOSING SPONDYLITIS

Baser O[1], Wang L[2], Li L[2], Huang A[2], Xie L[3]
[1]*STATinMED Research/The University of Michigan, Ann Arbor, MI, USA,* [2]*STATinMED Research, Dallas, TX, USA,* [3]*STATinMED Research, Ann Arbor, MI, USA*

OBJECTIVES: As outcomes research methodologies advance, they should increasingly allow access by different disciplines as clinicians, epidemiologists, economists, and statisticians interact frequently. A data visualization tool can present complex patterns effectively to a diverse audience. The objective of this study was to present treatment patterns among Veterans Health Administration (VHA) patients diagnosed with ankylosing spondylitis (AS) using advanced data visualization techniques. **METHODS:** Using the VHA Medical SAS® dataset, adult patients with at least one AS diagnosis (ICD-9-CM: 720.0) were selected. Prescriptions for anti-tumor necrosis factor (anti-TNF) and non-TNF agents were identified. For 2 years after the date of the first prescription (initiation date), drug switches and discontinuation were examined. Using a processing language, a data visualization tool was developed to demonstrate changes in treatment patterns after the first and second treatment switches. **RESULTS:** A total of 1,021 AS patients initiated therapy with TNF, of which 13.52% switched to another TNF, 0.20% switched to a non-TNF, 49.56% discontinued therapy and 36.73% continued their initial therapy. Among patients who switched to another TNF, 60.87% remained on the switched therapy, while 31.16% discontinued therapy, 7.97% switched to another TNF, and no patients switched to a non-TNF. 81.82% of patients who made a second switch to a TNF medication remained on this TNF, while 9.09% discontinued treatment. A total of 84 AS patients initiated therapy with a non-TNF. 4.76% of these patients switched to a TNF, 1.19% switched to another non-TNF, 93.61% discontinued therapy and no patients continued treatment. Of those patients whose first switch was to a TNF, 50% continued therapy while the remaining 50% discontinued. There were no second switches. **CONCLUSIONS:** When analyzing several years of data including treatment (dis)continuation and switches, treatment patterns can be difficult to capture. Data visualization tools help present complicated flows effectively for a diverse research audience.

PMS15

IMPROVEMENT IN DISEASE ACTIVITY SCORES ASSOCIATED WITH EARLY VERSUS LATE INITIATION OF BIOLOGIC THERAPY IN PATIENTS WITH RHEUMATOID ARTHRITIS: RESULTS OF A EUROPEAN CHART REVIEW STUDY

Emery P[1], Solem CT[2], Macahilig CP[3], Majer IM[4], Stephens JM[2], Cappelleri JC[5], Tarallo M[6]
[1]*University of Leeds School of Medicine, Leeds, UK,* [2]*Pharmerit International, Bethesda, MD, USA,* [3]*Medical Data Analytics, Parsippany, NJ, USA,* [4]*Pharmerit International, Rotterdam, The Netherlands,* [5]*Pfizer Inc., New York, NY, USA,* [6]*Pfizer Italia, Rome, Italy*

OBJECTIVES: Recent research has suggested that patients may have a "window of opportunity" to reverse immune dysregulation associated with RA onset through aggressive early treatment. This study aimed to evaluate the outcomes associated with early versus late biologic treatment in RA. **METHODS:** Adults (≥18 years) with confirmed RA diagnosis between January 2008 and December 2010, who received biologic therapy for ≥3 months and had ≥12 months follow-up were included in this retrospective, observational medical chart review study in Spain, Germany, and United Kingdom. Physicians abstracted outcomes including 28-joint disease activity scores (DAS28) alongside treatment received. Patients were classified as receiving early biologic treatment if started within 1 year of RA diagnosis. Outcomes included DAS28 reduction of ≥1.2 from scores at biologic start and remission (DAS28<2.6). Time to reaching these outcomes was evaluated using Kaplan-Meier survival curves and log rank tests. **RESULTS:** Of 328 patients included, 310 (178 early; 132 late) had DAS28 measurements and were demographically similar between early vs. late treatment (overall: mean age 47.9 at diagnosis, 71.0% female, 96.1% white). Overall, 73.5% of patients had a DAS28 decrease ≥1.2 points and 44.5% achieved remission. More early versus late biologic treated patients had a DAS28 decrease ≥1.2 (79.2% vs 65.9%, p=0.009) but there was no significant difference in the time to this decrease. More early vs. late biologic treated patients achieved remission (51.1% vs. 35.6%, p=0.009), with a significant difference in survival curves when indexing on time since RA diagnosis (p<0.001) and biologic start (p=0.024). There were no significant differences outcomes across countries. **CONCLUSIONS:** This chart review contributes to the growing literature surrounding outcomes associated with early biologic treatment. Within this study, RA patients who were treated early were more likely to achieve clinically significant improvement and to reach remission earlier in their RA disease trajectory than those treated later.

PMS16

UPTAKE OF DENOSUMAB IN THE TREATMENT OF OSTEOPOROSIS IN THE CZECH REPUBLIC

Fuksa L, Vytrisalova M
Charles University, Faculty of Pharmacy, Hradec Kralove, Czech Republic

OBJECTIVES: The objective was to analyze current trends in consumption as well as prescription practice pattern of the new anti-RANKL monoclonal antibody denosumab in the treatment of osteoporosis since its introduction onto the market in the Czech Republic in 2011. **METHODS:** The prescription-based database of the General Health Insurance Company (VZP) of the CR that covers approximately 62% of the Czech population was used as the data source. An insured person with a recorded prescription for denosumab in the period of interest was defined as a patient. The obtained epidemiological and costing data were also confronted with the prediction in the budget impact analysis in the public reimbursement dossier accessible in the State Institute for Drug Control files. **RESULTS:** A total of 3119 (158) patients (men) treated with denosumab were identified in the first year, i.e. between August 2011 and July 2012. The median age of patients was 73 years. Of the patients prescribed denosumab in the first half-year, 84% received the second dose within the observed period of one year, of which 85% within the authorized period of 6 months (+-1 month). This new drug was most often prescribed by physicians trained in internal medicine (47%) and rheumatology (30%). The cumulative costs for VZP of the drug were CZK 27.3 mil (EUR 1.1. mil) in the first year. **CONCLUSIONS:** The uptake of denosumab has been rapid and agrees with the predictions presented by the manufacturer before the launch of the drug. This preliminary data also suggest that both the prescribing doctors and the patients filling the prescriptions follow the dosing schedule.

PMS17

THE USE OF BIOLOGIC DRUGS FOR THE TREATMENT OF RHEUMATOID ARTHRITIS IN ITALY

Heiman F[1], Katz P[1], Pegoraro V[1], Di Virgilio R[2]
[1]*CSD Medical Research S.r.l., Milan, Italy,* [2]*Pfizer Pharmaceuticals, Rome, Italy*

OBJECTIVES: To describe the clinical profile of patients with rheumatoid arthritis (RA) treated with biologic agents within the former Italian centers "Antares" where autoimmune diseases are treated. **METHODS:** This study analyzed data from patient diaries (PDS), which involved 70 rheumatologists that are regular prescribers of biological treatments for rheumatoid arthritis and were recruited by telephone. The patient diaries were completed via web. **RESULTS:** Study population consisted of 206 (45.9%) patients with RA, 160 (35.6%) with psoriatic arthritis, 61 (13.6%) with ankylosing spondylitis, 14 (3.1%) with Juvenile idiopathic arthritis and 8 (1.8%) with early RA. Female gender prevailed, while the most numerous age group was the one that ranged from 50 to 60 years. The disease was mostly diagnosed before 50 years old and, despite in the group of patients treated with biologic drugs for more than 3 months the percentage of subjects with a value of HAQ less than 1 is higher when compared with those of patients whose treatment has begun more recently, the proportion of patients with a value of HAQ between 2 and 3 is still 40.0%. The same, half of the subjects treated for more than 3 months still have a moderate or high disease activity (DAS28 ≥3.2). **CONCLUSIONS:** The study sample was in line with the literature concluding that it is representative of the Italian context. The fact that there is a proportion of patients treated with biological therapy for more than three months, as well as an important number of patients who have been treated with more than one biologic drugs, and that have a perception of quality of life rather low and / or a disease activity state rather active, leads to conclude that there is still a type of patient for which new therapeutic options should be evaluated.

PMS18

ESTIMATED OSTEOPOROTIC POPULATION AND THE RELATED MEDICATION CONSUMPTION IN MUNICIPALITY LEVEL – DISCREPANCIES OBSERVED THROUGH DATA VISUALIZATION APPROACH

Säävuori N[1], Tyrväinen V[2], Purmonen T[3]
[1]*Oy Medfiles Ltd., Vantaa, Finland,* [2]*Proper Ltd., Joensuu, Finland,* [3]*Oy Medfiles Ltd., Kuopio, Finland*

OBJECTIVES: Osteoporosis is a common health problem among elderly population. Patients with osteoporosis are exposed to low-energy fractures. The prevalence of the disease varies significantly throughout the country due to the strong correlation with demographic factors. National guidelines recommend secondary prevention for all osteoporosis patients suffering from low-energy fractures. The aim of treatment is to prevent further fractures. In order to effectively allocate the resources needed for osteoporosis treatment, it is essential to know the number of patients and treatment practices in local level. **METHODS:** Local registry data was used to estimate the total population with low-energy fractures, as well as to recognize the differences in treatment of osteoporosis in each hospital district (n=21) and municipality (n=320). Data on hip fractures from year 2009 was extrapolated to year 2012 using demographic data. The overall prevalence of low-energy fractures was estimated trough a distribution of different fracture types available from literature. A map-based application was built (Tableau 8) to visualize the differences in the prevalence and treatment of osteoporosis across Finland. The model enables comparison between municipalities or hospital districts. **RESULTS:** The estimated number of osteoporotic fractures was 1733, in a hospital district with 250,000 inhabitants (Northern-Savo). The estimated prevalence rates in different municipalities within the hospital district varied between 0.52–1.7/100 inhabitants. Simultaneously, basic reimbursement for medical treatment (ATC:M05B) was paid for 1.2/100 inhabitants - the range among elderly population (>65y) was 3.21–6.56/100 inhabitants. **CONCLUSIONS:** There are significant local differences in the prevalence of osteoporosis as well as in its treatment. The population demographics do not explain the observed differences in the consumption of osteoporosis medication between different municipalities. The developed map-based application gives multiple possibilities to analyze these issues through data visualization. With this approach the interventions may be targeted to areas needing it the most.

PMS19
COMPARISONS OF THE RISK FOR VENOUS THROMBOEMBOLISM BETWEEN HIP AND KNEE ARTHROPLASTY USING KOREA NATIONAL HEALTH INSURANCE CLAIMS DATABASE
Kim YJ[1], Ahn JH[1], Jang EJ[1], Jung YJ[1], Yoo JJ[2], Yoon PW[2], Lee SH[2]
[1]National Evidence-based Healthcare Collaborating Agency (NECA), Seoul, South Korea, [2]Seoul National University College of Medicine, Seoul, South Korea
OBJECTIVES: Venous thromboembolism (VTE) including deep vein thrombosis (DVT) and pulmonary embolism (PE) occurs most often in patients undergoing major joint arthroplasty and major surgical procedures (such as hip arthroplasty, HA or knee arthroplasty, KA). The prevalence of clinically relevant VTE, DVT and PE after hip and knee arthroplasty in nationwide database of Korea were 1.7%, 1.1% and 0.5%, respectively. The aim of this study was to compare the risk for VTE (including DVT and PE) between hip and knee arthroplasty in the Korean population. **METHODS:** A retrospective cohort study was conducted using nationwide claim registry obtained from the Korean Health Insurance Review and Assessment Service (HIRA), which includes medical claims records for 97.0% of South Koreans. We retrospectively identified patients who underwent HA or KA between January 1 and December 31 in 2010. VTE after arthroplasty were identified by diagnostic code (ICD-10: PE - I26, I26.99, DVT - I80, I82, I82.2) within 90days after surgery. Patients' characteristics including sex, age and preoperative comobidities were defined using the HIRA database from 2007 to 2010. We compare the risk for VTE between hip and knee arthroplasty using logistic regression model in patients without VTE history and VTE chemoprophylaxis use . **RESULTS:** A total of 38,024 patients had HA or KA arthroplasty in Korea in 2010 (HA 11,908 patients, KA 26,116 patients). KA was associated with an increased risk of DVT [aOR=1.3; 95% CI=(1-1.7), p-value=0.048], but KA was associated with a decreased risk of PE compared with HA [aOR=0.5; 95% CI=(0.3-0.7), p-value<0.001]. **CONCLUSIONS:** This study suggest that the risk of PE was high in HA rather than KA, but the risk of DVT was high in KA rather than HA. These results were due to differences in pathogenesis of DVT or PE.

PMS20
CORRELATION BETWEEN PROGNOSTIC FACTORS AND NON PROSTHETIC FURTHER FRACTURE RELATED TREATMENT AFTER FEMORAL NECK FRACTURE UNDERWENT INTERNAL FIXATION IN ELDERLY
Sebestyén A[1], Gajdácsi J[2], Molics B[3], Vámhidy L[3], Patczai B[3], Kovács LA[3], Boncz I[3]
[1]National Health Insurance Fund Administration, Pécs, Hungary, [2]National Health Insurance Fund Administration, Budapest, Hungary, [3]University of Pécs, Pécs, Hungary
OBJECTIVES: To investigate the correlation between prognostic factors and non prosthetic fracture related treatments following internal fixation of femoral neck fractures in elderly patients. **METHODS:** This retrospective observational cohort study data were collected from the Hungarian National Health Insurance Fund Administration and from the health care provider institutes based on S7200 ICD-10 codes. The patients with femoral neck fractures following internal fixation aged 60 years or older were provided in 2000. The secondary non prosthetic fracture related treatments during the 8 year follow-up period were registered. Of the prognostic factors, age, gender, type of fracture and surgical intervention, season and day of the primary surgery, surgical delay and the accompanying diseases were evaluated. Statistical analyses were performed using multivariate Cox regression models and Kaplan Meier survival methods. **RESULTS:** A total of 3306 patients met the criteria. The mean of age was 78.04 years (SD:8.59). The non-prosthetic fracture related treatment was performed in 307 patients (9.3%). With Cox regression analysis, significant correlation was revealed between the incidence of non prosthetic treatment and younger age (year, HR=0.978), surgical delay (12-24h vs 0-6h, HR=1.730; 24h+ vs 0-6h, HR=1.578), season of primary osteosynthesis (winter vs summer, HR=0.707; fall vs summer, HR=0.638), type of primary surgical intervention (screw vs DHS fixation, HR=2.096; femoral neck nailing vs DHS fixation, HR=3.223; Ender nailing vs DHS fixation, HR=4.515) and type of femoral neck fracture (intracapsular displaced vs intracapsular undisplaced, HR=1.360; extracapsular vs intracapsular undisplaced, HR=1.634). There was no significant effect of the day of primary surgery, the gender and the presence of comorbidities on the incidence of further surgical interventions. **CONCLUSIONS:** We have demonstrated that summertime primary surgical intervention, delay of surgery longer than 12 hours, type of femoral neck fracture and method of fixation are independent predictors of non prosthetic further treatment of femoral neck fractures.

MUSCULAR-SKELETAL DISORDERS – Cost Studies

BUDGET IMPACT ANALYSIS OF BIOSIMILAR INFLIXIMAB TREATMENT FOR RHEUMATOID ARTHRITIS IN SIX CENTRAL EUROPEAN COUNTRIES
Brodszky V[1], Péntek M[2], Baji P[1], Balogh O[1], V Hevér N[1], Gulacsi L[1]
[1]Corvinus University of Budapest, Budapest, Hungary, [2]Corvinus University, Budapest, Hungary
OBJECTIVES: To analyse the budget impact of introducing biosimilar infliximab for the treatment of rheumatoid arthritis in six central European countries' – Bulgaria, Czech Republic, Hungary, Poland, Romania and Slovakia - health care systems. **METHODS:** This budget impact model estimates the potential impact of the biosimilar infliximab on the health care budget over a three year time frame. The model considers third-party payer perspective. A spreadsheet-based country specific dynamic population model was developed. The model functioned in quarter year time units according to the three months long evaluation period. The model tracked the movement of the RA population between main states: 1) on synthetic DMARD; 2) on infliximab; 3) on biosimilar infliximab; 4) TNF inhibitors other than infliximab; and 5) biologics other than TNF inhibitor. Switching between biologics and biosimilar infliximab was taken into consideration too. Scenario analyses were conducted, different rate of interchanging and switching were considered. A -25% percentage price difference was assumed for biosimilar infliximab compared to originator infliximab. The budget impact was calculated as the difference in the total cost of the scenarios with and without biosimilar infliximab in each year of the model. **RESULTS:** Over the entire 3-year period with gradually interchanging 80% of infliximab patients to biosimilar infliximab is expected to leading to a net benefit of 29,810,000 euros compared to the scenario in which biosimilar infliximab would not be available. In the scenario in which interchangeabilty was disallowed the budget savings was 18,765,000 euros. If budget savings were spent on reimbursement of additional biosimilar treatments, approximately 1,615 or 1,025 more patients could be treated in the six countries, respectively. **CONCLUSIONS:** This budget impact analysis indicates that introducing biosimilar infliximab might result significant budget savings or increasing of the number of patient access to biological therapy. Interchanging by prescribing physicians could substantially increase budget savings.

PMS22
INTRODUCTION OF AN INFLIXIMAB BIOSIMILAR (CT-P13): A FIVE-YEAR BUDGET IMPACT ANALYSIS FOR THE TREATMENT OF RHEUMATOID ARTHRITIS IN IRELAND
McCarthy G[1], Ebel Bitoun C[2], Guy H[3]
[1]Mater Misericordiae University Hospital, Dublin, Ireland, [2]Hospira, Meudon La Foret, France, [3]WG Consulting Healthcare Limited, High Wycombe, UK
OBJECTIVES: Biosimilars have similar efficacy and safety profiles to the originator biologics such that their introduction into Ireland is expected to increase competition, lower prices and improve the affordability of costly therapies. The objective of this study sought to estimate the budget impact of introducing an infliximab biosimilar (CT-P13) as a treatment option for rheumatoid arthritis (RA) patients in Ireland. **METHODS:** An Excel-based budget impact model was developed over a five-year time horizon. The annual population in Ireland receiving treatment with a biologic was based on national population statistics and published literature including: prevalence and incidence of RA; proportion of patients eligible for treatment with a biologic; and proportion of patients receiving treatment with a biologic. After the first year, an annual population growth rate of 1.1% was assumed. Maximum conversion of all existing and new infliximab patients to the infliximab biosimilar was assumed for years one to five. The total cost/patient was based on published literature and included drug acquisition, administration, and monitoring costs. Outcomes are reported as the annual and cumulative budget impact over five years. **RESULTS:** In year one, 3,776 prevalent and 119 incident patients entered the model. Of these, 13% received the infliximab biosimilar with the total cost/patient calculated as €15,754 in the first year of treatment and €12,789 in subsequent years. The drug acquisition cost for the infliximab biosimilar was assumed to discount infliximab by 20%. Annual budget saving estimations following introduction of the infliximab biosimilar were €579,631, €1,165,400, €1,177,553, €1,189,463 and €1,201,137 for years one to five, with a cumulative budget saving of €5,313,184. **CONCLUSIONS:** Introducing an infliximab biosimilar as a treatment option for RA patients in Ireland represents a cost saving of up to €5,313,184 over five years; equivalent to treating an extra 337 new patients with a biosimilar for one year.

PMS23
DEMINERALISED BONE MATRIX (DBM) VERSUS ILIAC CREST BONE GRAFT (ICBG) FOR LUMBAR SPINAL FUSION PROCEDURES IN THE UNITED KINGDOM; A BUDGET-IMPACT ANALYSIS
Carlqvist P[1], Dawson S[2], Jeppsson K[3], Borgman B[4]
[1]Heron AB, Stockholm, Sweden, [2]HERON Evidence Development AB, Stockholm, Sweden, [3]HERON Evidence Development Ltd., London, UK, [4]Medtronic Trading Sàrl., Tolochenaz, Switzerland
OBJECTIVES: Iliac Crest Bone Graft (ICBG) is a commonly used bone graft material in lumbar spinal fusion procedures. Demineralised Bone Matrix (DBM) added to supplement Local Bone (LB) provides an alternative graft material that does not require a secondary surgery site to harvest iliac crest bone. The objective of this study was to investigate the economic impact associated with the use of DBM in lumbar spinal fusion procedures in the UK. **METHODS:** A decision tree model was developed to evaluate the two-year budget impact associated with adding DBM as an alternative bone graft material in the lumbar spinal fusion surgical procedure. The model structure was based on previously published economic models, identified via a structured literature search, and compares surgical treatment with either ICBG or DBM added to the LB procedure. The model includes the costs of the surgical procedures, for adverse events and for treatment failure (reoperations). Further, the model was validated by UK clinical experts to ensure its adherence to UK clinical practice. The model population included UK-based patients with lumbar degenerative disc disease (LDDD) considered eligible for lumbar spinal fusion with either LB or ICBG. In the model's base-case analysis, ICBG was compared with DBM added to LB. **RESULTS:** The model predicts cost-savings of £44 467 over two years when adding DBM to LB compared with using ICBG alone for the lumbar spinal fusion procedure in a hypothetical population of 100 patients. The cost-savings are realised through reduced surgical time and fewer adverse events associated with surgery. **CONCLUSIONS:** In a defined population of spinal fusion patients in the UK that would otherwise be treated with ICBG, the addition of DBM to LB presents an economically viable and potentially cost-saving clinically appropriate treatment option.

PMS24
POTENTIAL ECONOMIC IMPACT OF USING SUGAMMADEX FOR THE ROUTINE REVERSAL OF NEUROMUSCULAR BLOCKADE IN RUSSIAN HEALTH CARE SETTING
Derkach EV[1], Avxentyeva MV[2], Omelyanovsky VV[2]
[1]Autonomous Non-profit Organization "National Centre for Health Technology Assessment", Moscow, Russia, [2]The Russian Presidential Academy of National Economy and Public Administration, Moscow, Russia
OBJECTIVES: To evaluate the potential economic impact of sugammadex used for reversal of rocuronium-induced neuromuscular blockade (NMB) in comparison with neostigmine and spontaneous reversion of NMB in Russian health care setting. **METHODS:** We constructed the model to compare two scenarios of general anesthesia with rocuronium-induced NMB: 1) routine practice (70% spontaneous

reversal from NMB, 30% use of neostigmine), and 2) sugammadex used in all cases. We estimated costs associated with NMB and time when operation rooms are occupied. Calculations were made for a typical Russian hospital providing 5000 surgeries per year, 160 of them performed with rocuronium-induced NMB. The model inputs included current practice patterns derived from the survey of experts, data on the recovery time from NMB and rates of residual NMB and its complications were taken from published sources. Costs were estimated on the basis of data on governmental tenders and reimbursement rates for services in the compulsory medical insurance system. **RESULTS:** Introduction of sugammadex can decrease number of residual NMB cases by 93,6% and save 70 hours in operation room due to shorter period till extubation in comparison with base case scenario. The overall spending related to general anesthesia increased by EURO 20,510. In case of rational hospital management saved operating time could be used for providing extra surgeries that will generate additional revenue of EURO 14,395 – 48,041 for a hospital, depending on the type of surgery provided in a saved time. **CONCLUSIONS:** The reduction of recovery time with sugammadex may generate additional revenue for the hospital and improve access to health care for public. Still optimization of workflow processes is necessary.

PMS25

BUDGET IMPACT ANALYSIS OF BIOLOGIC DRUGS FOR TREATMENT OF POLIARTICULAR JUVENILE RHEUMATOID ARTHRITIS IN RUSSIA

Ignatyeva V[1], Goryaynov S[2], Avxentyeva M[1]
[1]*The Russian Presidential Academy of National Economy and Public Administration, Moscow, Russia,* [2]*Autonomous non-profit organization "National Centre for Health Technology Assessment", Moscow, Russia*

OBJECTIVES: To assess impact on the 3-year health care budget of 3 biologic drugs (BD) – abatacept, adalimumab and etanercept – provided for all eligible children with poliarticular juvenile rheumatoid arthritis (JRA) not responding to the standard therapy **METHODS:** The indirect comparison of the results of randomized controlled trials (RCT) demonstrated that compared BD have approximately the same effect on the rate of disease flares in children with poliarticular JRA. We developed four scenarios assessing direct costs (drugs, medical services and sick leave payments for parents caring for children) bared by the government during 3-years period in base case and in cases of provision of one of compared BD for all children with poliarticular JRA. The hypothesis was that introduction of BD decreases the rate of disease flares and thus reduces related costs. The potential reduction of costs related to disability was not assessed due to the lack of data. The model inputs were derived from Russian cost of illness analysis of JRA and RCTs on the efficacy of BD. The costs estimation was based on the average wholesale price of BD and reimbursement rates in the compulsory medical insurance system. **RESULTS:** The lowest costs are expected in the scenario with abatacept – EURO 63 mln in comparison with EURO 81.62 mln for etanercept and EURO 134.18 mln for adalimumab. Adoption of BD would reduce the costs of hospital treatment and sick leave payments for the caring parents by 14-17%. Overall the increase of budget spending during 3 year period per 1 patient receiving BD varies from EURO 10,328 (abatacept) to EURO 23,255 (adalimumab). **CONCLUSIONS:** Supplying with BD all eligible children with JRA requires high additional spending of the health care budget, the least burden is imposed by the adoption of abatacept in comparison with etanercept and adalimumab.

PMS26

STRATAFIX™ KNOTLESS TISSUE CONTROL DEVICE: A BUDGET IMPACT ANALYSIS FROM ITALIAN HEALTH SERVICE PERSPECTIVE

Perrone F[1], Muehlendyck C[2], Velleca M[1]
[1]*Johnson & Johnson Medical, Pomezia (RM), Italy,* [2]*Johnson & Johnson Medical Gmbh, Norderstedt, Germany*

OBJECTIVES: STRATAFIX™ Knotless Tissue Control Device is a new medical device. With significantly more points of fixation than traditional sutures, STRATAFIX™ gives surgeons more consistent tension control over every pass, and combine the strength and security of interrupted closure with more efficiency than continuous closure. A Budget impact analysis was developed to estimate the cost saving associated with use of new technology from the Italian Health Service perspective over a 1 year time horizon. **METHODS:** A literature review was conducted to evaluate the time savings in different procedures: hysterectomy and myomectomy (Gynecology), breast reconstruction and abdominoplasty (Plastic Surgery), prostatectomy and nephrectomy (Urology), hip and knee replacement (Orthopedics). Moreover, a survey with clinicians was conducted to estimate the number of sutures used for the different procedures. The means and 95% confidence interval (95%-CI) for the budget impact were estimated using bootstrap methods (10.000 simulations) assuming lognormal distribution for costs and time data, and beta distribution for percentage data. **RESULTS:** Cost savings per procedure with STRATAFIX™ would be 217 € and 227 € for hysterectomy and myomectomy respectively, 274 € and 60 € for breast reconstruction and abdominoplasty, 56 € and 230 € for prostatectomy and nephrectomy, 48 € and 50 € for hip and knee replacement. Considering the evolution of annual procedures performed with the introduction of STRATAFIX™, the cost saving associated will be about 1.340.129 € (95%-CI: 218.530- 3.089.771 €): 30% for myomectomy, 26% for breast reconstruction and 22% for hysterectomy. **CONCLUSIONS:** The additional costs for this new medical device permits to generate appropriateness and to reallocate staff and operation rooms for other activities. STRATAFIX™ technology appears cost-saving for the reduction of procedure time. The results were consistent according to the developed probabilistic sensitivity analysis, STRATAFIX™ leads to cost savings in 99% of the simulation.

PMS27

GLOBAL VARIATIONS IN BIOLOGICS ACCESS AND RHEUMATOID ARTHRITIS TREATMENT COSTS

Miles G[1], Bell JH[1], Wilson TJ[2], Hamerslag L[2], Kusel J[2]
[1]*Costello Medical Consulting, Cambridge, UK,* [2]*Costello Medical Consulting Ltd., Cambridge, UK*

OBJECTIVES: Biological therapy is effective at slowing disease progression in Rheumatoid Arthritis (RA), particularly in severe RA. Recent clinical trials also demonstrated efficacy of biologics for moderate RA. However, access to biologics varies substantially by country, in part due to differing eligibility criteria of reimbursement policies. Here we investigated the proportion of patients who receive biologics, and whether eligibility criteria were correlated with total costs per RA patient across a range of countries. **METHODS:** PubMed searches were performed to establish which countries reimburse biologics for RA treatment. Eligibility requirements, percentage of patients who received biologics and cost per patient were extracted from a variety of sources. Simple regression analysis was used to compare total cost of RA treatment per patient and severity of RA (DAS score) required for biologic access. **RESULTS:** Regarding eligibility criteria, 16 out of 21 countries restricted biologics to patients with severe RA (DAS score >5.1) and/or who failed 2 previous DMARDs. Eligibility was linked to reimbursement policy for 14 countries. New Zealand had the most stringent reimbursement criteria, with only 1 biologic reimbursed and limiting eligibility to severe, active erosive RA >6 months, 4 failed DMARDs including MTX, and DAS score >5.1. Taking into account the relative prevalence of RA, 20% of RA patients received biologics in Norway and Belgium, 10% in the UK, 9% in Australia, 5% in Germany and Italy and only 3% in New Zealand and Austria. Out of 14 countries, there was poor correlation between total cost of RA treatment per patient and the severity of RA required for biologics access (R Square: 0.09, p=0.29). **CONCLUSIONS:** Reimbursement policies for biologics in RA vary substantially between countries, as does the proportion of RA patients who receive biologics. No significant correlation was found between cost per patient and DAS score required for biologics treatment.

PMS28

ASSESMENT OF THE COST OF BIOLOGICAL THERAPY IN RHEUMATIC DISEASES: ECONOMIC IMPACT OF DOSAGE MODIFICATION IN CLINICAL PRACTICE

Manrique-Arija S, Ureña I, Jimenez- Nuñez FG, Ordóñez- Cañizares MC, Romero- Barco CM, Rodriguez- García V, Nieves L, Cano L, Irigoyen MV, Fernandez-Nebro A
HRU CARLOS HAYA. UNIVERSITY OF MALAGA. IBIMA, Malaga, Spain

OBJECTIVES: To evaluate the real annual cost of biological therapies (BT) in rheumatic diseases in a tertiary hospital in 2012 and to compare the real annual spending, in daily clinical practice, with theoretical costs with conventional doses. To analysis the reduction of costs after creating BT outpatient clinic. **METHODS:** Cost minimization analysis based on an observational, cross-sectional study. Patients with different rheumatic diseases in follow-up by Rheumatology service in Hospital Carlos Haya(Spain) who have been treated with BT under conventional and modified doses were included. *Outcome 1º*: Annual average cost (in Euros) of BT in patients with rheumatic diseases in clinical practice compared with theoretical cost.*Secondary Variables*: cost reduction in Euros after implantation of a specialized outpatient clinic of BT. *Dose reduction protocol*: After 6 months with label dose activity disease is assessed, if DAS28<2,6 or BASDAI<4, we reduce the standard dose and we reevaluate every 6 month. We performed a descriptive analysis of the sample. Cost minimization analysis to evaluate annual costs were carried out. **RESULTS:** A total of 478 patients were treated with BT in our service in 2012. Most of them were Reumatoid arthritis(265,55.4%). Theoretical annual cost in 2012, it would be of 5,647,969.35 Euros (11,791.17 Euros patient-year). However, during 2012 32 patients reduced doses of their biological therapy in clinical practice. This represented a saving of 146,129.67 Euros in 2012. From December 2012 until June 2013 in our outpatient clinic of BT, 76 patients went into remission or low disease activity and the biological drug dose was reduced. This dose modification resulted in a reduction of the total cost of 159, 004 Euros in 6 months associated with adequate disease control **CONCLUSIONS:** It is possible to reduce doses and associated costs of BT. The follow-up of patients in a specialized outpatient clinic leads to a better patient management and a cost reduction

PMS29

BURDEN OF INFUSION-RELATED COSTS AND STAFF TIME FOR RHEUMATOID ARTHRITIS IN THE HOSPITAL SETTING

Ogden K[1], Cifaldi M[2], Quock T[1], Ganguli A[3]
[1]*ICON plc, San Francisco, CA, USA,* [2]*AbbVie Inc., North Chicago, IL, USA,* [3]*AbbVie, North Chicago, IL, USA*

OBJECTIVES: Rheumatoid arthritis (RA) is a chronic autoimmune disease affecting 0.6% of the population in the US. Current RA infusion therapy incurs substantial cost and time to the hospital and patient. The purpose of this study was to model the infusion and related staff costs within a hospital center to better understand the economic and time burden of RA infusion therapy. **METHODS:** We developed an Excel model to estimate the annual time and cost burden associated with RA infusion services in a hypothetical hospital center. We assumed patients received abatacept, tocilizumab, or rituximab monotherapy. Product package inserts informed the number of annual maintenance infusions (13 infusions for abatacept [30 minutes each] and tocilizumab [60 minutes each]; 4 infusions for rituximab [195 minutes each]) per patient. The model projected annual direct costs and total value of staff time for infusion drug administration, infusion-related services, facility-related services, laboratory tests, and patient/caregiver costs. Costs were derived from the literature and adjusted to 2012 USD; 29.5% allocated overhead was applied to laboratory, facility and infusion service costs. Time estimates were obtained from the literature and survey data, converted to annual wages using BLS data, and adjusted to 2012 USD. **RESULTS:** The baseline model estimated total infusion drug and service-related costs to be $24,645 for abatacept, $27,840 for rituximab, and $31,339 for tocilizumab. Roughly 54%, 62% and 58% of these annual costs are associated with hospital labor, respectively. Patient/caregiver costs, comprising of lost wages and indirect medical costs, were estimated to be $788 for abatacept, $793 for rituximab, and $1,063 for tocilizumab. **CONCLUSIONS:** Our findings show that direct and infusion-related contribute to a substantial economic and time burden to both the hospital and patient. These findings can help decison makers assess the relative benefits and cost implications of administering infusion drugs to RA patients.

PMS30
COST ANALYSIS OF THE USE OF AN OPERATING ROOM WITH FULL-ROTATION 3-D INTRAOPERATIVE IMAGING AND NAVIGATION IN DIFFERENT SPINE SURGERIES
Rodríguez D, Gonzalez P
Medtronic Iberica S.A., Madrid, Spain
OBJECTIVES: The use of navigation and intraoperative imaging permits to perform a large number of procedures more accurately and safely. The aim of this study was to estimate the cost savings achieved by an integrated operating room with full rotation 3-D intraoperative imaging and navigation (NT) compared with a standard operating room in three types of surgery: balloon kyphoplasty, lumbar fusion, and fusion cervical. **METHODS:** We developed a cost analysis through a published literature review of full rotation 3-D intraoperative imaging and navigation studies, taking into account a hospital perspective. We identified the studies with data related to hospital resource savings when compared with a standard operating room (imaging test outside the operating room). Subsequently, potential savings per patient were estimated for each surgery and were updated to euros 2013. Cost data were taken from e-Salud database and Spanish regional tariffs. **RESULTS:** The use of full rotation 3-D intraoperative imaging and NT versus a standard operating room increases surgical process efficiency due to: avoid post surgery computer tomographies to confirm the success of the procedure, increase the accuracy of surgical interventions, avoid complications and reduce the need for re-interventions, reduce the operating room time, faster patient recovery and reduce hospital length of stay. Potential savings by type of surgery were € 615, € 3,242, and € 4,458 for balloon kyphoplasty, posterior cervical fusion, lumbar fusion, respectively. **CONCLUSIONS:** The use of full rotation 3-D intraoperative imaging and NT leads to improved clinical outcomes and increased hospital efficiency in surgeries carried out with it. A 3-D intraoperative imaging system is a cost-saving strategy for balloon kyphoplasty, lumbar fusion, and cervical fusion surgeries from a hospital perspective.

PMS31
HEALTH CARE UTILIZATION AND EXPENDITURES OF OSTEOPOROSIS PATIENTS TREATED WITH ORAL BISPHOSPHONATE IN TIANJIN, CHINA
Yu Q[1], Wu J[1], Ma F[1], Liu J[2], Jin L[3], Lin M[4], Chang J[4]
[1]*Tianjin University, Tianjin, China,* [2]*Tianjin Medical Insurance Research Association, Tianjin, China,* [3]*Bureau of Human Resource and Social Security, Tianjin, China,* [4]*Beijing Novartis Pharma Co., Ltd., Beijing, China*
OBJECTIVES: To estimate the health care utilization and expenditures for osteoporosis patients treated with oral bisphosphonate in Tianjin, China and examine factors associated with health care expenditures. **METHODS:** Data were obtained from Tianjin Urban Employee Basic Medical Insurance database (2008-2010) with 30% random sample of enrollees. The index date was the first pharmacy claim date of oral bisphosphonate in 2009. Patients of 40 years of age or older, continuously enrolled for 12 months prior to and following the index date, were included if osteoporosis was diagnosed and oral bisphosphonate (alendronate and etidronate) was claimed accordingly. All-cause cost, osteoporosis-related cost, drug cost, and related health care utilization were estimated at 2009 dollars. Logistic regression analysis was applied to identify factors associated with expenditures. **RESULTS:** Of 853 patients identified, 64.6% were for women. The mean age was 64.6 (±10.4) years. Of $2039.2 (±2782.6) all-cause cost per person per year, out-of-pocket cost accounted for 2.1%; drug cost accounted for 61.1%; osteoporosis-related cost accounted for 37.9%. Of $1026.5 (±1108.8) all-cause outpatient cost per person per year, drug cost accounted for 82.3%; osteoporosis-related cost accounted for 14.6%. Of $1012.7 (±2586.2) all-cause inpatient cost per person per year, drug cost accounted for 39.6%; osteoporosis-related cost accounted for 61.5%. An average of 7.0 (±3.7) outpatient visits and 0.4 (±0.8) hospitalization admissions were found. Regression results demonstrated that patients with diabetes mellitus and nephropathy had higher all-cause cost; female patients and patients with pre-fracture had higher osteoporosis-related cost. **CONCLUSIONS:** The economic burden of osteoporosis is high for osteoporosis patients and is expected to increase considering the increment of life expectancy and the increasing number of elderly population. Greater emphasis and policy guidance should be given to the impact of osteoporosis prevention and treatment in elderly population.

PMS32
THE COST OF OSTEOPOROTIC FRACTURES IN THE ROMANIAN POSTMENOPAUSAL WOMEN POPULATION
Mihalache M[1], Berghea F[2], Botez I[3], Dumitru C[4], Grigorie D[5], Ionescu R[6], Lupescu O[7], Opris D[6], Poiana C[5], Stanciu S[8], Psachoulia E[9], Intorcia M[9]
[1]*Amgen Romania SRL, Bucharest, Romania,* [2]*Carol Davila University Of Medicine and Pharmacy, Bucharest, Romania,* [3]*Spitalul Clinic de Recuperare Iasi, Iasi, Romania,* [4]*Spitalul Municipal Ploiesti, Ploiesti, Romania,* [5]*Institutul National de Endocrinologie "C.I. Parhon", Bucharest, Romania,* [6]*Spitalul Sf. Maria, Bucharest, Romania,* [7]*Spitalul Clinic de Urgenta Floreasca, Bucharest, Romania,* [8]*Spitalul Judetean de Urgenta Ploiesti, Ploiesti, Romania,* [9]*Amgen (Europe) GmbH, Zug, Switzerland*
OBJECTIVES: Little data are available regarding the economic burden of osteoporosis on the Romanian (public payer) health care system. This retrospective chart review estimated the direct costs of osteoporotic fractures in postmenopausal women in Romania. **METHODS:** Women aged >65 years diagnosed with osteoporosis, who sustained an osteoporotic hip, wrist or vertebral fracture between December 1, 2007 and November 1, 2011 (and 1-5 years prior to study enrolment), admitted as inpatients to a sample of Romanian general and specialist hospitals were eligible; patients with multiple fractures or fractures resulting from co-morbidities were excluded. The duration of post-fracture follow-up was one year. The cost perspective included direct costs incurred by the Romanian national health insurance agency and the patients' own budgets. Health care utilization was recorded from hospital and primary care resources, and then multiplied with national tariffs to obtain total costs. Bootstrapping was conducted to generate bias corrected and accelerated confidence intervals. **RESULTS:** Five general hospitals and two specialist hospitals in three Romanian cities participated. A total of 140 patients were included: 60 (42.8%) with hip, 68 (48.6%) with vertebral and 12 (8.6%) with wrist osteoporotic fractures. The mean [95% CI] total cost of osteoporotic fracture management was €1,155 [€1,044 - €1,304] per patient. Medications (mean [95% CI], €544 [€477 - €624]) and hospital care (€447 [€393 - €512]) were the major cost drivers, accounting for 47.1% and 42.8% of the average total cost respectively. Hip fractures were more costly than vertebral and wrist fractures (mean [95% CI]: €1,384 [€1,186 - €1,643]; €991 [€852 - €1,172]; and €934 [€659 - €1,177], respectively). **CONCLUSIONS:** This study provides the first estimates of the direct cost of osteoporotic fractures in the Romanian health care system. The results suggest that osteoporotic fractures pose a significant burden on both drug and hospital budgets. Effective treatment strategy to avoid such fractures may reduce this burden.

PMS33
MEDICAL COSTS OF PATIENTS WITH RHEUMATOID ARTHRITIS AND ASSOCIATION WITH GLOBAL DISEASE ACTIVITY IN TURKEY
Hamuryudan V[1], Direskeneli H[2], Ertenli I[3], Inanc M[4], Karaaslan Y[5], Oksel F[6], Ozbek S[7], Pay S[8], Terzioglu E[9], Durguner B[10], Baser O[11], Akkoç N[12]
[1]*Istanbul University Cerrahpasa Faculty of Medicine, Istanbul, Turkey,* [2]*Marmara University Faculty of Medicine, Istanbul, Turkey,* [3]*Hacettepe University Faculty of Medicine, Ankara, Turkey,* [4]*Istanbul University Istanbul Faculty of Medicine, Istanbul, Turkey,* [5]*Ankara Numune Training and Research Hospital, Ankara, Turkey,* [6]*Ege University, Izmir, Turkey,* [7]*Cukurova University Faculty of Medicine, Adana, Adana, Turkey,* [8]*Gulhane Military Medical Academy, Ankara, Turkey,* [9]*Akdeniz University, Antalya, Turkey,* [10]*Pfizer Pharmaceuticals, Istanbul, Turkey,* [11]*The University of Michigan, Ann Arbor, Michigan, MI, USA,* [12]*Dokuz Eylül University, Izmir, Turkey*
OBJECTIVES: To identify factors associated with the cost of RA care and calculated risk-adjusted costs associated with RA in Turkey. The relationships between costs of RA treatment and disease activity was also examined. **METHODS:** This cross-sectional study was performed in 10 tertiary rheumatology centers. Eligible patients were ≥18 years of age diagnosed as having RA for at least 12 months according to the American College of Rheumatology (ACR) 1987 criteria. Overall costs were categorized as inpatient, outpatient and pharmacy costs. Generalized linear models were used to calculate risk-adjusted direct costs. **RESULTS:** A total of 698 patients were studied. Patients' visual analog scale (VAS), patient's global disease activity (GDA) and routine assessment of patient index data 3 (RAPID-3) scores were on average 44.15, 5.19 and 5.10 respectively. Most patients were prescribed immunosuppressive medications and glucorticoids (87.8% and 61.2%, respectively). After adjusting all variables, total annual medical cost was €2,671. The most significant portion of overall expenditures was due to pharmaceutical costs €1,987, while outpatient costs were €303, inpatient costs were €360 and co-payments were €21. 14% of patients experienced work loss due to RA. On average, annual costs due to workday loss were €480. 5.4% of patients also had other RA-related consultations, which were not covered by insurance, bringing the average annual burden to €1,600 for these patients. 6.5% of RA patients had additional costs related to their condition such as the need for a new car, apartment or special equipment, spending an additional €1,640 in 1 year. 13.7% of patients required caregivers. The average annual out-of-pocket amount paid to caregivers was €624. **CONCLUSIONS:** The annual medical cost of RA in Turkey, although significantly lower compared to European estimates, causes considerable economic burden. Drug costs constitute the major part of annual cost for RA followed by indirect costs.

PMS34
PATIENTS AS A SOURCE FOR COST OF RHEUMATOID ARTHRITIS STUDY
Marinov L[1], Petrova G[2]
[1]*Medical University, Faculty of Pharmacy, Sofia, Bulgaria,* [2]*Medical University of Sofia, Sofia, Bulgaria*
OBJECTIVES: To perform the cost of rheumatoid arthritis analysis based on inquiry study with patients. **METHODS:** It is a micro costing study which was conducted between August and December 2012. The information was gathered with the support of the Association of patients with rheumatoid arthritis. The questionnaire was made and distributed to patients waiting in front the physicians' offices. Clarification in case of missing data was made by phone. The questions aimed to gather basic information about the characteristics of the patients, their pharmacotherapy, frequency of physicians' visits, hospitalizations, and their health status self- evaluation. The direct health costs were calculated based on patients' answers and insurance fund tariff. **RESULTS:** A total of 119 patients participated in the study, and nineteen were excluded due to insufficient information. Twenty-two patients were male and 78 were female aged 54.78 years on average. Almost half of the patients (42 patients) were employed. Thirty-four of patients had duration of the RA less than 5 years, 19 had duration between 5-7 years, another 14 patients had duration of between 7-10 years and 33 patients had duration more than 10 years. The total cost for the treatment of the patients for one month was 82 523 BGN (per patient, per month on average 825 BGN). To one quarter of the patients a biological treatment was prescribed with a total cost of 74 026 BGN per year. Ninety-two of the patients answered that they are strictly taking their medicines. Our study shows that most of the patients doesn't knows what medicines they are taking or even doesn't knows their dossing regime. **CONCLUSIONS:** The percentage of the patients that are not following the doctor's prescription is very high and their reliability as a source of cost studies is not sufficient that impose the need of patient education.

PMS35
WORK PRODUCTIVITY LOSS DUE TO RHEUMATOID ARTHRITIS IN POLAND. RESULTS OF CROSS-SECTIONAL STUDY OF OUTPATIENTS WITH CHRONIC INFLAMMATORY DISEASES AND COMPARISON WITH SELECTED STUDIES
Wladysiuk M, Bebrysz M, Rutkowski J, Haldas M, Fedyna M
Central and Eastern European Society of Technology Assessment in Health Care, Krakow, Poland
OBJECTIVES: To measure productivity loss of RA patients in Poland compared to results of selected studies. **METHODS:** In this study consecutive patients in

productive age (18-60 for women and 18-65 for men) were recruited at regionally stratified sample of rheumatology outpatient centers around the country and were offered a questionnaire including Work Productivity and Activity Impairment (WPAI) instrument (a standardized tool for loss of work productivity estimation). The survey was complemented by disease activity assessment questionnaire filled out by specialists who were also responsible for patients recruitment during the routine visits. Employed patients were estimating i.a. the absenteeism and presenteeism rates (% of work time missed due to health and % of impairment while working). Subsequently, systematic review of Medline database was conducted. Two studies using WPAI questionnaire were found (Bansbrack 2012, Zhang 2010). **RESULTS:** In the study, mean age of RA patients was 49 (mean age at RA onset was about 39), mean DAS28 result 3,77 (moderate disease). 40% of the group had first symptoms for less than 5 years (mean duration since symptoms onset was 90 months). Meanwhile, in Bansbrack 2012 mean age at RA onset was 48 and mean duration since onset of symptoms was 48.6 months. Mean age of patients described in Zhang 2010 was 51, 45.8% had disease duration of less than 5 years. The participants had a low function disability level and moderate arthritis. In the study absenteeism rate was 18%, while presenteeism rate reached 27%. The corresponding values in Bansbrack 2012 were 8.7% and 24%. In Zhang 2010 only presenteeism rate was analyzed and equaled 17.8%. **CONCLUSIONS:** RA reduces work ability and lower work productivity in people in productive age both in Poland and in other countries. Differences in patients characteristics are probably the cause of results variation between studies.

PMS36

HEALTH CARE RESOURCE USAGE, TREATMENT AND COSTS AMONG PATIENTS WITH HIP FRACTURE IN THE UNITED KINGDOM

Lambrelli D[1], Burge R[2], Raluy M[1], Karlsdotter K[1], Chen SY[3], Wu N[3], Schoenfeld M[2]
[1]*Evidera, London, UK,* [2]*Eli Lilly and Company, Indianapolis, IN, USA,* [3]*Evidera, Lexington, MA, USA*

OBJECTIVES: Available data on economic impact of hip fractures in the U.K. are mostly derived from clinical trials or published before the year 2000; recent estimates are lacking. This study examined health care resource usage, treatment and costs among patients with hip fracture in the U.K. **METHODS:** The study used data from the Clinical Practice Research Datalink (CPRD) linked to the Hospital Episode Statistics (HES). Adult patients hospitalised for hip fracture (ICD-10: S72 or M84.4; admission date as index date between January 1, 2006—March 31, 2011) and no previous hip fracture 7 days to 1 year pre- index, and computerised data available 1 year pre and 1 year post-index were identified in HES. Hip fracture-related inpatient and outpatient visits and pharmaceutical treatments were estimated for pre- and post-index periods. Associated costs were calculated by multiplying resource units by official publicly available costs from the NHS perspective. **RESULTS:** A total of 8,028 hip fracture patients were identified (mean age 79; 27% age 85+; 75.8% female; mean Charlson comorbidity index score 2.1). The most common comorbidities were osteoarthritis (42%), pulmonary disease (25%), and renal disease (23%). Pre-index, average resource use per patient included 1 inpatient stay (mean 5.7 days), 7.4 General surgery visits, 4.4 blood tests, and 0.76 General Practice phone consults. Average overall costs pre-index were £3122. For the index hospitalisation, mean length-of-stay and costs were 19.5 days and £14223, respectively; 18% were discharged to another hospital; and 39% and 5% had partial or total hip arthroplasty procedures performed. Post-index frequent medications included acetaminophen (56%), opioids (46%), and bisphosphonates (46%); 51% had hospital stays; and 5.7% had subsequent hip fractures. Average post-index overall costs were £7359. **CONCLUSIONS:** Our study provides recent estimates of resource usage, treatment and costs among U.K. hip fracture patients. This information can be useful in burden of illness and economic analyses.

PMS37

RESOURCE UTILISATION AND COSTS OF TOTAL HIP ARTHROPLASTY IN THE UNITED KINGDOM: A DESCRIPTIVE ANALYSIS

Raluy M[1], Burge R[2], Lambrelli D[3], MacLachlan S[1], Wu N[4], Chen SY[4], Schoenfeld M[2]
[1]*Evidera, London, UK,* [2]*Eli Lilly and Company, Indianapolis, IN, USA,* [3]*Evidera, UK,* [4]*Evidera, Lexington, MA, USA*

OBJECTIVES: Total hip arthroplasty (THA) is a commonly performed surgical procedure in the elderly, projected to increase substantially due to the aging population. Newer resource use and cost estimates are needed to understand the potential THA burden. The study objective was to estimate health care resource use and costs in THA patients in the U.K. **METHODS:** The Clinical Practice Research Datalink (CPRD) linked to the Hospital Episode Statistics (HES) was used to estimate resource use in THA patients. Inclusion criteria were: first inpatient stay for THA (OPCS procedure code W37-W39, W46-W48, W93-W95) (index event between 1/1/2006--3/31/2011); no THA diagnosis/procedure 7 days to one year pre-index date; 1-year pre and 1-year post-index of computerised data available; age 18+. Inpatient, outpatient and pharmacy THA-related costs were calculated by multiplying resource units by official publicly available costs (British Pound Sterling, 2012) from the NHS perspective. **RESULTS:** THA patients identified (n=15,288) were mostly female (66%), elderly (mean age 72; 45%>75), and 84% had osteoarthritis. Pre-index, the most common medications were opioids (53%), NSAIDs (41%), and acetaminophen (35%); 95% had General surgery visits; 64% had inpatient stays; 36% had x-ray; and overall costs (std. dev) were £4,556 (7850). The index hospital event average length-of-stay (LOS) was 9 days and mean costs were £11,321. Post-index medication usage for opioids, NSAIDs, and acetaminophen was 49%, 29%, and 45%, respectively. The most frequent resources were General surgery visits (94%), hospital stays (39%), and General Practice phone consults (35%). For patients with utilisation, means per patient were 7.4 for General surgery visits, 5.4 days for hospitalisations. Mean (std. dev) overall post-index costs were £3,567 (9612), comprised mostly of inpatient costs (85%). **CONCLUSIONS:** This study described resource utilisation, pain medications usage and associated costs for THA patients. These estimates may offer a better understanding of the economic burden.

PMS38

OUTPATIENT MEDICAL COSTS, INDIRECT COSTS, AND FAMILY BURDEN OF OSTEOPOROSIS FRACTURE IN CHINA

Yang Y[1], Du F[2], Lu T[3], Xie Z[4], Xu W[5], Huang Q[4], Ye WW[6], Burge R[7]

OBJECTIVES: The prevalence of osteoporosis fractures is anticipated to increase rapidly due to China's aging population. However, representative data on the economic burden of osteoporosis fractures are lacking. The aims of this study were to estimate direct outpatient medical costs, indirect costs and family burden associated with patients with osteoporosis fractures in China. **METHODS:** One hundred and fifty osteoporosis fracture patients and/or care-givers were interviewed within 149 days [median] post-fracture in three tertiary hospitals in Beijing, Wuhan and Chongqing representing eastern, middle and western China. Fracture patients were discharged from hospital between January 2011 and January 2013. The survey collected data on demographics; ambulatory status; outpatient services and costs (emergency room, drugs, other outpatient); indirect medical services and supplies and costs (nursing, transportation, rehabilitation, devices, etc.); and lost work time from caregivers. **RESULTS:** Of the 123 valid respondents (female: 64.2%; mean age: 71.3 years), 62.6% were hip fractures, followed by vertebral fracture (34.1%), non-vertebral/non-hip fracture (2.4%), and multiple fracture (0.8%). All patients received surgical treatment, 8.9% had historical fractures, 80.5% had comorbidities and 82.9% of patients had post-discharge outpatient visits. The most frequent comorbidities were hypertension (61.0%), rheumatoid arthritis (41.5%), high cholesterol (35.0%) and cardiovascular disease (34.2%). Reported disability (walk w/aid or could not walk) increased from 13% pre-fracture to 36% post-fracture. Average post-acute outpatient care costs and indirect medical costs were 2084 RMB and 3526 RMB, respectively. Care-givers reported an average of 33.2 days lost from work. Using median income from the three regions, the estimated average lost income for caregivers was 5910 RMB (weighted by share of responders per region). **CONCLUSIONS:** The study suggests the economic burden of osteoporosis fractures is considerable in terms of outpatient medical costs, indirect medical costs and family burden. Osteoporosis-related fractures may pose a significant burden to China due to the aging population.

PMS39

ANNUAL EXPENDITURE ON ANTI-TNF TREATMENT OF RHEUMATOID ARTHRITIS FOR THE PUBLIC HEALTH SYSTEM IN BRAZIL

Nobre MRC[1], Costa FM[1], Taino B[1], Kiyomoto HD[2], Rosa GF[2]
[1]*INCOR -HCFMUSP, sao Paulo, Brazil,* [2]*Cognos - Health Education, sao Paulo, Brazil*

OBJECTIVES: Provide clinically relevant evidence and drug expenditure information for brazilian public health system management. **METHODS:** We performed a systematic review on the use of anti-TNF biological agents, infliximab, adalimumab and etanercept in the treatment of patients with rheumatoid arthritis, using the precepts of evidence-based medicine, ensuring methodological quality of clinical studies, prioritizing clinical outcomes. Clinical evidence was retrieved in PubMed, Central Cochrane, EMBASE and medicine purchase costs in July 2010. **RESULTS:** Twenty-three randomized trials met the eligibility criteria, six on infliximab, nine on adalimumab and eight on etanercept. Adalimumab and etanercept showed no benefits when not associated with methotrexate. The ACR50 response to infliximab (NNT = 6) and adalimumab (NNT = 5) were similar while the results for etanercept were considered heterogeneous. The annual cost of infliximab to treat six patients and get ACR50 response in a single patient was US$ 125,997.00 while for adalimumab to treat five was US$ 186,990.00. The ACR70 response was similar between etanercept (NNT = 9) and adalimumab (NNT = 10), being lower in the recommended dose of infliximab (NNT = 12). The most favorable annual cost of acquisition was observed with adalimumab which US$ 311,651.00 is needed to treat 10 patients and get ACR70 response in a single one, compared to expense of US$ 365,107.00 with etanercept (NNT = 9). The unusual infliximab dose of 10mg/kg showed similar results (NNT = 9), however with the most unfavorable spent of US$ 680,385.00. **CONCLUSIONS:** Adalimumab was the agent who showed the most favorable annual expenditure for medicine purchase from the perspective of the public health system in Brazil, considering the most clinically relevant response.

PMS40

BIOLOGICAL TREATMENT PATTERNS AND ASSOCIATED COSTS FOR PATIENTS WITH RHEUMATOID ARTHRITIS IN TAIWAN

Wu CH, Chuang PY, Tang CH
Taipei Medical University, Taipei, Taiwan

OBJECTIVES: To examine the pattern of biological treatment and the medical costs for patients with rheumatoid arthritis (RA). **METHODS:** A longitudinal dataset that includes the claims of service used by a cohort of RA patients from the Bureau of National Health Insurance was used for this study. The inclusion criteria for the study cases were patients who: 1) were holding the Catastrophic Illness Card with RA; 2) had the 1st line TNF-α antagonist treatments for at least 6 months; 3) were aged over 17. Treatment patterns were defined based on their TNF-α Antagonist within 12 months after the initial 6-month treatment period. Wilcoxon signed rank tests were performed to compare differences in service costs and service uses between the pre- and post-biological treatment periods. **RESULTS:** In total, 2425 patients were eligible for analysis. In the first year after TNF-α initial 6-month treatment, 94% remained using the same TNF-α antagonist, 3% had switched from one to another TNF-α antagonist, and 3% discontinued use of TNF-α antagonist. RA patients treated with TNF-α antagonist were significantly associated with reductions in emergency room visits ($p < 0.001$), hospital days ($p < 0.01$) and total medication costs (excluding biologics) ($p < 0.01$). However, total RA-related outpatient visits and overall medication costs went up significantly ($p < 0.001$). Reduction in services use was not

significantly observed among patients who switched during their TNF-α antagonist treatment. **CONCLUSIONS:** RA with biological treatment was associated with reductions of service uses; however, overall service costs were compromised by costs incurred from increased utilization of outpatient service and TNF-α antagonist medication costs under the context of health care in Taiwan.

PMS41

REDUCTION IN NSAIDS CONSUMPTION AFTER VISCOSUPPLEMENTATION WITH HA: IS IT COSTS SAVING?

Migliore A[1], Massafra U[1], Bizzi E[1], Tormenta S[1], Giordan N[2]
[1]*S. Pietro Fatebenefratelli Hospital, Rome, Italy,* [2]*Fidia Farmaceutici S.p.A, Abano Terme (PD), Italy*

OBJECTIVES: Multicentric, open, retrospective study to determine whether NSAID consumption may be reduced by the use of US-guided Intra-articular injection (USGIAI) of hyaluronic acid (HA), in hip joint in patients affected by symptomatic hip OA. **METHODS:** Patients affected by mono or bilateral hip OA entered the study and were administered with a single HA (HyalOne-Hyalubrix 60) injection every six months. As primary endpoint, consumption of NSAIDs was evaluated by recording the number of days a month the patient used NSAID during the month previous to the visit, reported at each visit during the 24 months follow-up period, while secondary endpoints was represented by the percentage of patients assuming NSAIDs at baseline and at each control visit. **RESULTS:** A total of 755 patients entered the study from 2008 to 2013. Consumption of NSAIDs was reduced from a consumption rate mean of 21,3 to a mean of 5,08 at the third month; this reduction further improved at 12th and 24th month with a reduction respectively to 4,14 and 3,79. Percentage of patients not taking NSAIDs at baseline was 45%; this percentage raised to 57% at 12 months and remained stable (58%) at 24 months. We performed an evaluation of costs of therapies for hip OA for two hypothetic populations of 1000 patients each, the first one undergoing to HA USGIAI every six months for a total of 4 injections in 2 years, and the second one of 1000 patients undergoing to chronic daily NSAIDs therapy, both for two years. Our results confirmed in the USGIAI population a cost savings in comparison with the NSAIDs population. **CONCLUSIONS:** HA USGIAI, administered every 6 months, reduce the assumption of NSAIDs in patients affected by hip OA, reflecting its efficacy on pain relief and cost saving.

PMS42

PHARMACOTHERAPEUTIC MONITORING OF PATIENTS USING IMMUNOBIOLOGICAL IN A HEALTH INSURANCE COMPANY IN BRAZIL: TO KNOW TO BETTER MANAGE

Reis HPLC[1], Vieira JB[2], Fonseca DB[2], Magalhães DDP[2], Sartori DP[2], Viana ADJR[2], Barsi UD[2], Alencar JLL[2], Maciel JAP[2], Filho AEAM[2], Alcantara ACDC[2]
[1]*UFC, Fortaleza, Brazil,* [2]*Unimed Fortaleza, Fortaleza, Brazil*

OBJECTIVES: To determine the clinical and pharmacoeconomic indicators from pharmacotherapeutic monitoring of patients using immunobiological (IMB) in a Health Insurance Company in Fortaleza - Brazil. **METHODS:** Cross-sectional study in two hospitals accredited Insurance, from March/2012 to May 2013 (n = 96 patients). Data were recorded by medical (rheumatologist) in computerized management system (Sabius ®) performed after the query. Later, these were entered into Microsoft Excell 2007 and analyzed by clinical pharmacists auditors. The cost was calculated from the unit value in the book Brasíndice 765, using the Consumer Price Maximum and average weight of 70 kg in standard doses. **RESULTS:** Most patients were women (66, 68.75%), averaging 67 kg, aged between 30-59 years (62.50%) and higher incidence of rheumatoid arthritis among the diseases treated (45; 46.88%). The higher costs per capita were checked with Infliximab (R$ 62,459.40) and abatacept (R$ 41,989.55), while Adalimumab (R$ 16,614.60) and golimumab (R$ 10,385.05) represented the lowest cost per capita. There was a significant difference between the average cost per capita of IMB intravenous (91, R$ 48,975.27) and subcutaneous (11, R$ 10,695.49). The average cost for treatment / dose first line was R$ 6,068.91 and the second line was R $ 9,590.06, resulting in an incremental cost / dose of R $ 3,521.16 (36.72%). **CONCLUSIONS:** The pharmacotherapeutic monitoring becomes important for planning strategies aimed at streamlining and optimization of these drugs and pharmacoeconomic clinical management.

PMS43

DELAY OF TOTAL HIP REPLACEMENT (THR) USING HA VISCOSUPPLEMENTATION: IS COST EFFECTIVE?

Migliore A[1], Massafra U[1], Bizzi E[1], Tormenta S[1], Giordan N[2], Belisari A[3]
[1]*S. Pietro Fatebenefratelli Hospital, Rome, Italy,* [2]*Fidia Farmaceutici S.p.A, Abano Terme (PD), Italy,* [3]*Fondazione CHARTA, Milan, Italy*

OBJECTIVES: Retrospective study to determine whether THR may be delayed by the use of US-guided Intra-articular injection (USGIAI) of hyaluronic acid (HA), in hip joint in patients affected by hip OA. **METHODS:** We evaluate the delaying in the THR considering 176 patients suffering from hip OA and treated with HA USGIAI, candidates for THR according to the judgment of six orthopaedics. Then, we imaging two hypothetic populations of 1000 patients each candidates to THR, the first undergoing to 1 injection of HA (HyalOne-Hyalubrix 60) USGIAI and the second one undergoing to THR for a follow-up period of one year and four years. We performed the cost evaluation on hip surgery, eventual revision of the prosthesis, post-operative complications and mortality, rehabilitation, lost working days. **RESULTS:** At 24 months, 159 out of 76 (90 %) patients did not undergo to THR. At 48 months, 82 % (N = 144) of the study population treated with HA USGIAI avoided THR. In the group of 93 patients candidates for THR (that is, in which 4, 5, or 6 orthopaedic surgeons agreed that the patient was a suitable candidate for THR), only 17 had undergone THR, with survival results of 82 % at 24 months. At 48 months, this percentage reduced to 66 % in this group. Results show that the treatment with HA USGIAI is the most favorable option, from a clinical and economic perspective, and also considering the social impact (higher value of quality-adjusted life-years (QALYs)). Analyzing hospital perspective, there are even higher benefits, estimated to be between approximately 940,000 euros in one year and 580,000 euros after 4 years. **CONCLUSIONS:** Data simulation comparing HA USGIAI vs THR in patients eligible for surgery, shows that HA viscosupplementation has the most favorable outcome, both from a clinical and economic point of view.

PMS44

COST-EFFECTIVENESS MODELLING OF A 3-MONTH TIGHT CONTROL PATIENT MANAGEMENT OF RHEUMATOID ARTHRITIS WITH CERTOLIZUMAB PEGOL IN FRANCE

Fagnani F[1], Pham T[2], Claudepierre P[3], Berenbaum F[4], De Chalus T[5], Saadoun C[5], Joubert JM[5], Fautrel B[6]
[1]*Cemka-Eval, Bourg la Reine, France,* [2]*CHU Sainte-Marguerite, Marseille, France,* [3]*Groupe Hospitalier Henri Mondor, Créteil, France,* [4]*CHU Saint-Antoine, Paris, France,* [5]*UCB Pharma, Colombes, France,* [6]*CHU Pitié-Salpétrière, Paris, France*

OBJECTIVES: European registries of Rheumatoid Arthritis (RA) patients treated by biological agents suggest that 70-80% are maintained in first line at 1 year despite potential insufficient efficacy. Post hoc analyses of certolizumab pegol (CZP) studies indicate that a 3 month clinical response had a high predictive value of the 1 year outcome. The objective was to examine the efficiency of a strategy consisting of early switching from CZP to a second line TNF inhibitor in case of insufficient clinical response at 3 months (3M) in the French setting versus current clinical practices. **METHODS:** A decision-tree model was built to estimate the clinical outcomes (ACR50 cumulated time) and the direct costs of different cohorts of RA patients over a 2 year period. ACR50 was considered as an RA satisfying clinical outcome. The "3M tight control" strategy consisted of stopping CZP at 3 months in patients not achieving the ACR50 criterion and switching them to other biologics. Three reference cohorts treated with first line CZP, etanercept or adalimumab, respectively, according to current clinical practices were considered as comparators (reference). All TNF inhibitors were assumed to have equal efficacy in first line. Costs were estimated at 2013 French public prices. **RESULTS:** The proportion of patients achieving ACR50 after a 2 year follow-up was 58% in all reference cohorts and 75% in the "3M tight control" CZP strategy cohort. The costs per patient-year in ACR50 were €19,326 with the "3M tight control" strategy cohort and €23,588, €26,774 and €30,285 for the CZP, etanercept and adalimumab reference cohorts, respectively. The strategy "3M tight control" had an incremental cost-effectiveness ratio of €5,605/patient-year in ACR50 versus CZP reference, and was dominant versus etanercept or adalimumab reference. **CONCLUSIONS:** A 3-month tight control management of RA patients with CZP as first line treatment is cost-effective compared to alternatives.

PMS45

COST-PER-RESPONDER ANALYSIS OF BIOLOGICAL AGENTS FOR THE TREATMENT OF ACTIVE ANKYLOSING SPONDYLITIS IN GERMANY

Betts KA[1], Joshi AD[2], Yan SY[1], Zhou Z[1], Rao S[2], Wolff M[3], Cifaldi M[2]
[1]*Analysis Group, Inc., Boston, MA, USA,* [2]*AbbVie Inc., North Chicago, IL, USA,* [3]*AbbVie Deutschland GmbH & Co. KG, Ludwigshafen, Germany*

OBJECTIVES: To conduct a cost-per-responder analysis of biologic treatments (adalimumab, etanercept, golimumab, and infliximab) for the treatment of active ankylosing spondylitis (AS) from the German Statutory Health Insurants (SHI) perspective. **METHODS:** A systematic literature review was conducted to identify randomized clinical trials for biologic treatments for active AS. The clinical efficacy of biologic therapies and standard of care was evaluated using Assessment of SpondyloArthritis international Society (ASAS) 20 response, which is defined as at least 20% improvement from baseline using ASAS criteria. The relative probability of achieving ASAS 20 at Week 12 with each biologic therapy was estimated via network meta-analysis. Evaluation was conducted in terms of cost-per-incremental ASAS 20 responder. Twelve-week costs were assessed in terms of 2012 euros, and included drug acquisition, administration, laboratory tests, and clinic visits based on German treatment guidelines. Weight-based dosing for infliximab assumed an average weight of 78.6 kg. **RESULTS:** Thirteen randomized controlled trials of active AS with a minimal duration of 12 weeks were identified; 10 reported ASAS 20 at Week 12. The estimated rates of ASAS 20 response at Week 12 were not statistically different between infliximab (70.8%), adalimumab (62.9%), golimumab (61.2%), and etanercept (60.5%). However, all 4 biologic therapies were significantly better than the standard of care (27.1%). In the base case, adalimumab had the lowest cost-per-incremental ASAS 20 responder compared with standard of care (€13,282 per incremental ASAS 20 responder), followed by golimumab (€13,947), etanercept (€14,221), and infliximab (€22,838). These rankings were unchanged in sensitivity analyses based on ASAS 40 response rates (estimated from 6 trials). **CONCLUSIONS:** All 4 biologic treatments were more efficacious in terms of ASAS 20 response than the standard of care. Among biologics, adalimumab showed the lowest cost per incremental ASAS 20 responder at Week 12 for active AS from the German SHI perspective.

PMS46

COST-EFFECTIVENESS ANALYSIS OF BIOLOGICAL DISEASE-MODIFYING ANTIRHEUMATIC DRUGS IN THE TREATMENT OF RUSSIAN PATIENTS WITH RHEUMATOID ARTHRITIS WHO FAILED PREVIOUS ANTI-TNF-ALFA THERAPY

Ryazhenov VV, Emchenko IV
I.M. Sechenov First Moscow State Medical University, Moscow, Russia

OBJECTIVES: To assess the cost-effectiveness of rituximab and anti-TNF-alfa agents in the treatment of Russian patients with rheumatoid arthritis (RA) who failed previous anti-TNF-alfa therapy. **METHODS:** The pharmacoeconomic model was developed based on the data from multicentre prospective 3-year observational MIRAR-study (J. Gomez-Reino et al., 2012). A one-year time horizon was adopted in the model. The cost analysis included costs of medicines and expenses for the day care services. The efficacy of therapies was defined as a reduction of disease activity score in 28 joints (DAS28) and proportion of patients achieved EULAR good or moderate response after 6, 9 and 12 months since biological therapy was started. To assess the robustness of the results, one-way sensitivity analysis (SA) was carried out. **RESULTS:** Treatment with rituximab was associated

with the lowest total costs (437,620.24 RUB per one patient). The costs further increased in the row: etanercept (554,912.15 RUB), adalimumab (977,470.00 RUB), and infliximab (1,039,363.68 RUB). It should be noted that in the infliximab group the bulk of the costs (more than 60% of total) incurred within first six month of therapy. This may potentially increase the financial losses associated with inadequate response to infliximab. The estimated cost-effectiveness ratios (CERs) were 241,779.14 RUB, 334,284.43 RUB, 630,625.81 RUB, and 670,557.21 RUB per unit of DAS28-reduction in the rituximab, etanercept, adalimumab and infliximab groups, respectively. The similar results were observed for the CERs estimated per one patient with EULAR good or moderate response (533,683.22 RUB, 730,147.57 RUB, 1,286,144.74 RUB, and 1,367,583.79, respectively). SA demonstrated that results are robust. **CONCLUSIONS:** The present study has demonstrated that administration of rituximab is economically effective strategy in the treatment of Russian patients with rheumatoid arthritis who failed previous anti-TNF-alfa therapy. Furthermore, treatment with rituximab is associated with considerably lower costs as compared to etanercept, adalimumab and infliximab.

PMS47

COST-EFFECTIVENESS ANALYSIS OF TOCILIZUMAB IN RHEUMATOID ARTHRITIS, IN COLOMBIA

Gamboa O[1], Bárbosa D[2], Parada L[3], Latorre M[4]
[1]*IECAS, Bogotá, Colombia,* [2]*F. Hoffmann-La Roche, Bogotá D.C, Colombia,* [3]*Roche Colombia, Bogotá, D.C, Colombia,* [4]*Productos Roche Colombia, Bogota, Colombia*

OBJECTIVES: Assess the cost-effectiveness of first-line tocilizumab biological treatment as monotherapy or in combination with methotrexate, in patients with rheumatoid arthritis (RA) refractory to treatment with non-biological DMARDs. **METHODS:** A markov model was used of the natural history of RA to assess: tocilizumab, tocilizumab+methotrexate, adalimumab, adalimimab+methotrexate, etanercept, etanercept + methotrexate and infliximab+methotrexate. The systematic review of literature don't show results for infliximab in monotherapy. The strategies were evaluated in combination with methotrexate in the first or second line, for a total of 11 strategies evaluated. Outcomes were measured as quality adjusted life years (QALYs). Analysis from the payer perspective, only direct costs were considered, COP 2012. Ratios were calculated cost-effectiveness and incremental cost-effectiveness, and sensitivity analyzes deterministic and probabilistic were conducted. For the RA chronicity, was used time horizon until life expectancy used discount rate of 3% for both costs and health outcomes. **RESULTS:** Tocilizumab was one of the least expensive strategy in first and second-line treatment. For life expectancy horizon monotherapy with tocilizumab followed by infliximab in second line are efficient frontier with an ICER per QALY gained of COP $165,918,610.58. The ICER is sensible to price of medicaments, with a inferiority limit, the results change to COP $106.160.64. The probabilistic analysis indicates that a threshold to willingness to pay of COP $ 150 million higher than monotherapy with tocilizumab, be cost-effective in Colombia. **CONCLUSIONS:** The use of tocilizumab in first and second line like monotherapy and in combination strategy remains lower costs per benefit gained; in that sense, can be considered as an efficient therapy in the Colombian context.

PMS48

A MODEL TO EVALUATE THE IMMUNOGENICITY COSTS OF TUMOUR NECROSIS FACTOR-ALPHA INHIBITORS IN PATIENTS WITH RHEUMATOID ARTHRITIS

Heeg B[1], Majer I[1], Stephens JM[2], Tarallo M[3]
[1]*Pharmerit International, Rotterdam, The Netherlands,* [2]*Pharmerit International, Bethesda, MD, USA,* [3]*Pfizer Italia, Rome, Italy*

OBJECTIVES: The prognosis of rheumatoid arthritis (RA) has improved dramatically with the development of tumour necrosis factor-alpha (TNFα) inhibitors. However, some patients develop immunogenicity to TNFα inhibitors that can result in treatment failure and higher costs. In addition, immunogenicity to one TNFα inhibitor may create cross-resistance to others. Previous studies have shown the TNFα inhibitor etanercept (ETN) is less immunogenic than adalimumab (ADA) and infliximab (INF). The objective of this study was to determine the costs incurred due to the immunogenicity of ETN, ADA, and INF. **METHODS:** A Markov model was created using data from previously published studies (i.e. the proportions of patients developing antibodies against ADA and INF; the size of increase of dose or drug administration frequency in patients receiving ADA and INF if treatment failed; and the rate of effective dose escalation in patients with and without immunogenicity) and from expert opinion (i.e. physician visit intervals). It was assumed that patients receiving ETN did not develop immunogenicity. Patients initially started ETN, ADA, or INF were allowed to switch treatment to a second or third TNFα inhibitor if treatment failed. Costs due to immunogenicity were calculated from: drug usage after treatment failure, dose or frequency increase after treatment failures, and additional visits due to lack of response. **RESULTS:** Initiating treatment with ETN resulted in the highest proportion of patients still receiving first-line therapy after 5 years, compared with ADA or INF. Assuming 15,000 patients (1% prevalence of RA in The Netherlands) treated for 5 years, the immunogenicity costs incurred with different sequential treatment strategies were: ETN-ADA-INF €4,937,176, ETN-INF-ADA €5,409,593, ADA-ETN-INF €10,140,206, INF-ETN-ADA €11,160,699, ADA-INF-ETN €14,735,996, and INF-ADA-ETN €15,980,783. **CONCLUSIONS:** The 5-year results of our model showed initiating treatment with ETN rather than ADA or INF resulted in higher adherence to first-line therapy and lower immunogenicity costs.

PMS49

COST-EFFECTIVENESS ANALYSIS OF DIAGNOSTIC TESTS IN THE WORK-UP OF PATIENTS WITH INTERMEDIATE RISK OF DEVELOPING RHEUMATOID ARTHRITIS

Buisman LR[1], Luime JJ[2], Oppe M[1], Hazes JM[2], Rutten-van Mölken MPMH[1]
[1]*Erasmus University Rotterdam, Rotterdam, The Netherlands,* [2]*Erasmus MC, Rotterdam, The Netherlands*

OBJECTIVES: Several technologies are currently being developed for better stratifying individuals at risk of developing Rheumatoid Arthritis (RA) to patient-tailored treatment. We assessed the potential cost-effectiveness of four technologies (MRI, il6-serum test, RNA B-cell signature, genetic assay) applied to patients with intermediate risk for RA (3-5 points on ACR/EULAR) using an one-year horizon. **METHODS:** The cost-effectiveness was simulated with a decision model using data from the Rotterdam Early Arthritis Cohort (prevalence of RA: 55%). The comparator was 2010 ACR/EULAR classification criteria. Test properties (sensitivity (se), specificity (sp) and costs) were based on literature and expert opinion. Patients were classified true positive (TP) if they score >=6 points on the criteria or were test positive and used MTX at 12 months. True negative (TN) patients were those who that scored <6 points or were test negative and did not use MTX at 12 months. Utility changes within one year were assigned to TP (+0.1), TN (+0.1), false positive (+0.05), and false negative (-0.05). **RESULTS:** RNA B-cell signature (se: 0.60; sp: 0.90; costs: €150) has the largest net benefit (ΔTP-ΔFP) (45%) and is most cost-effective with an incremental cost effectiveness ratio (ICER) of €13,939. The il-6 serum test (se 0.70; sp: 0.53; costs: €100) has an ICER of €17,343. The MRI and genetic assay have ICERs of €38,541 and €70,347 due to the higher incremental costs of these strategies. To stay below a willingness to pay (WTP) threshold of €20,000/QALY gained (given current utility assumptions), the extra test costs of the new test strategy can maximally be €230. **CONCLUSIONS:** The RNA B-cell signature or il6-serum tests have most potential to be cost-effective in patients with intermediate risk of developing RA.

PMS50

INVESTIGATING THE VALUE OF ABATACEPT IV IN THE TREATMENT OF RHEUMATOID ARTHRITIS: A SYSTEMATIC REVIEW OF COST-EFFECTIVENESS STUDIES

Athanasakis K, Petrakis I, Kyriopoulos J
National School of Public Health, Athens, Greece

OBJECTIVES: Rheumatoid arthritis is a progressive inflammatory disease that affects greatly patients' quality of life and demands for aggressive management early on during the course of the disease. The emergence of biologics has equipped rheumatologists with evolutionary treatment tools but it has also influenced the costs of the disease, thus highlighting the necessity of cost-effectiveness data. In this light, the purpose of this study was to conduct a systematic review of cost-effectiveness data for abatacept i.v. in the treatment of moderate to severe rheumatoid arthritis. **METHODS:** Pubmed, the International Society for Pharmacoeconomics and Outcomes Research Outcomes Research Digest, the National Health System Economic Evaluation Database, and the Database of Abstracts of Reviews of Effects were searched for papers published in the last decade (2002-2012). An initial search using the keywords "abatacept, cost effectiveness, and rheumatoid arthritis" was followed by a search of related citations. The quality of independent economic evaluation studies was evaluated in accordance to the Centre for Reviews and Dissemination set of guidelines. **RESULTS:** In total 301 studies were identified and 42 met the inclusion criteria. The majority of rejected studies were due to lack of cost data, failure to include abatacept as a comparator to other biologic agents, and failure to include RA as a treatment indication. Half of the selected studies evaluated abatacept in the treatment of rheumatoid arthritis, after failure of or intolerance to tumor necrosis factor alpha inhibitors. Of those, 82% were in favor of abatacept as a cost-effective or dominant strategy versus varying alternatives, whereas 18% favored other treatments. **CONCLUSIONS:** The majority of evidence from the published literature supports that abatacept IV can be a cost-effective alternative in the treatment of moderate to severe rheumatoid arthritis.

PMS51

PHARMACOECONOMIC ASPECTS OF THE FIRST-LINE BIOLOGIC THERAPIES IN RUSSIAN PATIENTS WITH RHEUMATOID ARTHRITIS

Ryazhenov VV, Gorokhova SG, Emchenko IV
I.M. Sechenov First Moscow State Medical University, Moscow, Russia

OBJECTIVES: To assess the cost-effectiveness of tocilizumab and TNF-alfa inhibitors in the treatment of Russian patients with rheumatoid arthritis (RA) and intolerance or inadequate response to disease-modifying antirheumatic drugs (DMARDs) or for whom continuation of DMARDs was deemed inappropriate. **METHODS:** Based on the data from ADACTA-trial and the results of indirect comparison of tocilizumab and anti-TNF-alfa agents (G. Bergman et al., 2010) two pharmacoeconomic models were developed. A six-month time horizon was adopted in the models. Cost-effectiveness of tocilizumab and adalimumab was estimated in the first model. In the second model, cost-effectiveness of tocilizumab was compared to the cost-effectiveness of antirheumatic therapy in the mixed treatment group, which included patients who received infliximab, etanercept and adalimumab in proportion 1:1:1. The cost analysis included costs of medicines and expenses for the day care services. The efficacy of the treatment was defined as a DAS28-reduction, proportion of patients achieved a low or moderate DAS28, EULAR good or moderate response (was considered only in the first model) and ACR20, ACR50, ACR70 responses. Sensitivity analysis (SA) was performed by changing costs of medicines and relative proportions of patients received infliximab, etanercept and adalimumab in the mixed treatment group. **RESULTS:** Despite the higher cost of treatment with tocilizumab (591,112.92 RUB as compared to 488,735.00 RUB for adalimumab), it had the better cost-effectiveness ratios (CERs): 179,125.04 RUB vs 271,519.44 RUB per unit of DAS28-reduction, respectively. The similar results were observed for the CERs estimated per one patient with clinical response. Compared to the mixed treatment group, tocilizumab also had better CERs. SA confirmed the robustness of the model. **CONCLUSIONS:** The study has demonstrated that tocilizumab is an economically effective strategy in the treatment of Russian patients with RA and intolerance or inadequate response to DMARDs or for whom continuation of DMARDs was deemed inappropriate.

PMS52
ASSESSMENT OF THE ECONOMIC IMPACT OF BELIMUMAB FOR THE TREATMENT OF SYSTEMIC LUPUS ERITHEMATOSUS IN THE ITALIAN SETTING: A COST-EFFECTIVENESS ANALYSIS
Turchetti G[1], Pierotti F[1], Palla I[1], Stragliotto E[2], Porcasi R[2], Pippo L[2]
[1]Scuola Superiore Sant'Anna, Pisa, Italy, [2]GlaxoSmithKline, Verona, Italy
OBJECTIVES: Systemic Lupus Erythematosus (SLE) is a chronic non-organ specific autoimmune disease and is characterized by a dysregulation of the immune system that involves many organs and systems. It affects about 28,500 people in Italy, especially women of childbearing age (female-male ratio 9:1) that may have a compromised functional state and a decreased quality of life. The purpose of this analysis is to determine the cost-effectiveness of belimumab, a new biological treatment specifically developed for the treatment of SLE, in the Italian setting. **METHODS:** A cost-effectiveness micro simulation model with a lifetime horizon was adapted to the Italian setting. The analysis compares the standard of care (SoC) alone vs belimumab plus SoC from the perspective of the National Healthcare System. Clinical-economic consequences of the therapy and of the development of organ damage were calculated. When available, Italian data were used, otherwise UK costs were transformed into euros using the purchasing-power parity approach. The utility values were based on the EQ-5D of belimumab clinical trials (BLISS 52 and 76). The results were discounted by 3% for both costs and effects. It was considered a duration of treatment with belimumab of 6 years and it was assumed that the drug is used with wastage. **RESULTS:** The results of the cost-effective analysis in terms of cost per life year gained (ICER) and cost per QALY (ICUR) were € 22,990 and € 32,859 respectively. These values drop to € 20,119 and € 28,754 respectively when indirect costs are included. **CONCLUSIONS:** In this analysis, the results of ICER and ICUR show that belimumab is cost-effective in the Italian setting, according to the guidelines of the Italian Association of Health Economics (€ 25-40,000/QALY).

TOCILIZUMAB IN POLYARTICULAR JUVENILE IDIOPATHIC ARTHRITIS – A COST-UTILITY MODEL FOR THE UNITED KINGDOM
Chang S[1], Sawyer L[1], Dejonckheere F[2], van Suijlekom-Smit LW[3], Anink J[3], Diamantopoulos A[1]
[1]Symmetron Limited, Elstree, UK, [2]F. Hoffmann-La Roche Ltd., Basel, Switzerland, [3]Erasmus MC Sophia Childrens Hospital, Rotterdam, The Netherlands
OBJECTIVES: To evaluate the cost-effectiveness of tocilizumab (TCZ) in the treatment of polyarticular juvenile idiopathic arthritis (pJIA) in the United Kingdom (UK). **METHODS:** An individual sampling model was developed to reflect the health care system and treatment pathway in the UK. Benefits were measured in terms of Quality Adjusted Life years (QALYs) and were derived from HUI3 data collected by the Dutch Arthritis and Biologicals in Children (ABC) Register [Prince et al., 2011]. Costs were calculated from a National Health Service and Personal Social Services perspective. The analysis calculated incremental costs and benefits associated with the addition of first line TCZ to the standard care pathway involving etanercept (ETN), adalimumab (ADA), and abatacept (ABA). The economic model used efficacy inputs derived from an indirect comparison of TCZ and ADA [Sawyer et al., 2013]. Due to fundamental differences in the clinical trial populations and trial design, it was not possible to compare the response rates of TCZ with ETN and ABA. Therefore in the absence comparative data, the economic analysis assumed response rates for ETN and ABA were similar to ADA. Longer-term treatment discontinuation was linked to level of response and assumed to be independent of treatment. **RESULTS:** Base case results estimated incremental costs of approximately £1,750 and incremental QALYs of 0.1011. The incremental cost-effectiveness ratio (ICER) was £17,000 per QALY gained. **CONCLUSIONS:** The results of this analysis suggest that TCZ represents an efficacious and cost-effective addition to the current standard of care for treating pJIA patients in the UK.

PMS54
COST-MINIMIZATION ANALYSIS OF SUBCUTANEOUS ABATACEPT IN THE TREATMENT OF RHEUMATOID ARTHRITIS IN SPAIN
Ariza-Ariza R[1], van Walsem A[2], Canal Fontcuberta C[3], Roldán Acevedo C[4], Betegón Nicolás L[3], Oyagüez Martín I[4], Janssen K[2]
[1]Hospital Universitario Virgen Macarena, Sevilla, Spain, [2]Mapi, Houten, Spain, [3]Bristol-Myers Squibb, Madrid, Spain, [4]Pharmacoeconomics & Outcomes Research Iberia, Madrid, Spain
OBJECTIVES: To compare the cost of using subcutaneous abatacept (SC ABA) versus other first-line biological disease-modifying antirheumatic drugs (DMARDs) available in Spain, in the treatment of patients with rheumatoid arthritis (RA) who have failed an initial treatment with methotrexate (MTX). **METHODS:** With regards to efficacy and safety outcomes, SC ABA was considered non-inferior vs intravenous ABA (IV ABA), adalimumab (ADA), certolizumab pegol (CZP), etanercept (ETN), golimumab (GLM), infliximab (IFX) and tocilizumab (TCZ), based on results of an indirect comparison using mixed treatment analysis. Therefore a cost- minimization analysis for a 3 year time horizon was developed. The perspective was that of the Spanish National Health System (NHS). Pharmaceutical and administration costs (€, 2013) of all biological DMARDs which are available in Spain as first-line treatment after MTX were considered. Drug costs were included in terms of ex-factory price with mandatory rebate. Administration costs were obtained from local published data. The analysis was developed for an average patient weight of 70 kg. A 3% annual discount rate was applied. Deterministic and probabilistic sensitivity analyses were performed. **RESULTS:** SC ABA treatment was associated with a yearly cost of €11,521.36 per patient during the first year of treatment and €11,002.23 in subsequent years. The total 3-year cost of SC ABA was €32,138.43 per patient, proving to be cost saving versus most of the other biological DMARDs. In all cases, pharmaceutical costs lead to more than 85% of total disease management costs. Sensitivity analyses proved the model to be robust. **CONCLUSIONS:** According to these results, SC ABA would lead to cost-savings versus IV ABA, ADA, CZP, ETN, GLM and TZC in the management of RA patients initiating treatment with biological DMARDs.

PMS55
THREE TNF-A-INHIBITORS FOR TREATMENT OF RHEUMATOID ARTHRITIS, ANKYLOSING SPONDYLITIS AND PSORIATIC ARTHRITIS
Ivakhnenko O[1], Rebrova O[2], Avxentyeva M[3], Khachatryan G[1]
[1]Autonomous non-profit organization "National Centre for Health Technology Assessment", Moscow, Russia, [2]Pirogov Russian National Research Medical University, Moscow, Russia, [3]The Russian Presidential Academy of National Economy and Public Administration, Moscow, Russia
OBJECTIVES: To perform pharmacoeconomic analysis of golimumab (GOL) vs adalimumab (ADA) and infiliximab (INF) for rheumatoid arthritis (RA), ankylosing spondylitis (AS) and psoriatic arthritis (PA) in Russia **METHODS:** Indirect comparison demonstrated that compared drugs have similar efficacy and safety. Cost-minimization analysis was performed to compare the cost for 1-year treatment with GOL, ADA and INF in doses according to the approved recommendations. Expected cost for treating all eligible patients with RA, AS and PA with TNF-α-inhibitors in Russia were calculated in a model, assuming that INF is used in the 1st line therapy during one year and ADA or GOL in the 2d line therapy during the 2d year. Number of patients to be treated with TNF-α-inhibitors was calculated based on state statistical data and data on the percentage of patients who do not respond to therapy with synthetic disease-modifying antirheumatic drugs (DMARDs) and first-line biologic DMARDs from clinical trials. **RESULTS:** INF dosing regimen is different for RA and other rheumatic diseases, 1 year treatment with INF costs €16,212 for RA and €24,319 for AS and PA. GOL and ADA have the same dosing regimen for all rheumatic diseases and costs €16,544 and €24,243 per year correspondingly. If all eligible patients with rheumatic diseases in Russia receive biologic DMARDs when necessary, treatment with GOL in the 2d line is less expensive than ADA, difference in costs is €89,062,427 (for all eligible patients per year). It allows treating additional 4959 patients RA, 278 AS patients and 147 PA patients per year. **CONCLUSIONS:** GOL is cost-saving vs ADA for the 2d line therapy of rheumatic diseases in Russia. 1-year treatment with GOL is less expensive that INF for AS and PA and may be considered as the 1st line option.

PMS56
PHARMACOECONOMIC ANALYSIS OF ABATACEPT FOR TREATMENT OF ADULTS WITH RHEUMATOID ARTHRITIS IN RUSSIA
Gerasimova K[1], Avxentyeva M[2], Goryaynov S[3], Rebrova O[4]
[1]The First Moscow State Medical University named after I.M. Sechenov, Moscow, Russia, [2]The Russian Presidential Academy of National Economy and Public Administration, Moscow, Russia, [3]Autonomous non-profit organization "National Centre for Health Technology Assessment", Moscow, Russia, [4]Pirogov Russian National Research Medical University, Moscow, Russia
OBJECTIVES: to conduct a pharmacoeconomic analysis of abatacept vs etanercept, tocilizumab and adalimumab for rheumatoid arthritis (RA) in adult patients, resistant to methotrexate therapy, in Russia. **METHODS:** Indirect comparison of clinical efficacy of abatacept, etanercept, tocilizumab and adalimumab was performed. Data on safety from clinical studies and meta-analysis was analyzed. The differences in the direct medical costs for compared biological drugs (BD) in adult patients with RA were calculated using the cost-minimisation analysis. The cost of abatacept vs etanercept and tocilizumab were calculated on the basis of the registered manufacture's prices for vital and essential drugs (VED) in 2012. The costs of abatacept vs adalimumab were calculated based on the price of tender purchases in 2011 (adalimumab is not included into the VED List, and its price is not registered). The costs of day care for patients during the BD administration were calculated based on the cost norms per volume of medical care approved by the Program of State Guarantees for the provision of free medical care to Russian citizens in 2012. The calculations were performed over the BD application period for 2 years. **RESULTS:** Indirect comparison showed no statistically significant differences in the efficacy of compared BD. There was no data about clinically meaningful differences in safety. The use of abatacept is less costly than etanercept and tocilizumab when registered manufacture's prices are used for cost estimation. The difference in costs (in favor of abatacept) amounted to 1431.34 EUR and 16058.34 EUR per patient per 2 years respectively. Abatacept is less costly than adalimumab (the costs are calculated based on prices of tender purchases in 2011): the difference in costs amounted to 1502.07 EUR per patient per 2 years in favor of abatacept. **CONCLUSIONS:** Abatacept is a cost-saving option compared with etanercept, tocilizumab and adalimumab.

PMS57
CURRENT AND FUTURE STRATEGY FOR OSTEOPOROSIS SCREENING AND DIAGNOSTICS: COST-EFFECTIVENESS OF FRAX WITH OR WITHOUT PULSE-ECHO ULTRASOUND MEASUREMENT OF BONE MINERAL DENSITY AND DXA ON DEMAND
Asseburg C[1], Riekkinen O[2], Karjalainen JK[2], Kröger H[3], Soini EJ[1]
[1]ESiOR Oy, Kuopio, Finland, [2]Bone Index Finland, Kuopio, Finland, [3]Kuopio University Hospital, Kuopio, Finland
OBJECTIVES: Over 75% of osteoporotic patients are not diagnosed with osteoporosis and do not receive treatment because effective on-site diagnostics is lacking in primary care facilities. We compare the cost-effectiveness of two pathways of osteoporosis diagnosis: 1) Fracture Risk Assessment Tool (FRAX) followed by pocket size pulse-echo ultrasound device (Bindex®) followed by Dual-energy X-ray absorptiometry (DXA) when needed ("proposed"), and 2) FRAX followed by DXA when needed ("guideline"). **METHODS:** A new Markov model of preventive osteoporosis treatment (assumptions: generic alendronate treatment; efficacy based on published meta-analysis and modified by compliance/persistence; wrist, vertebral, hip and other fractures included; Finnish health care payer perspective with 10-year timeframe and 3% discounting per annum) was extended to include the proposed pathway and osteoporosis screening/diagnosis in terms of sensitivity/specificity. FRAX with body mass index and age dependent National Osteoporosis Guideline Group thresholds was the initial screening tool common to both pathways. Bindex® was calibrated to 90% sensitivity and specificity thresholds (International Society for Clinical Densitometry). In the proposed pathway, only the patients with Bindex result between these calibration

thresholds (32,6% of the patients) required a DXA measurement to verify the diagnosis of osteoporosis. Cost-effectiveness was assessed in five patient cohorts: women (BMI 24 kg/m^2) aged 65 years with previous fracture and 75 or 85 years with and without previous fracture. **RESULTS:** Among the cohorts modeled, the average screening cost saved with Bindex® including proposed pathway in comparison to current guideline pathway were around €230/patient. At a cost of €50/screen, the probability that the pathway including Bindex® was cost-effective compared to the current pathway was 100% in all patient cohorts. Bindex® including pathway appeared to be cost-effective at prices as high as €100/screen. **CONCLUSIONS:** Bindex® including pathway appears to be cost-saving strategy compared to the current and recommended Finnish osteoporosis diagnosis and care pathway.

PMS58

A MODEL OF THE COST EFFECTIVENESS OF INFLIXIMAB FOR THE TREATMENT OF SEVERELY ACTIVE ULCERATIVE COLITIS, IN CHILDREN AND ADOLESCENTS AGED 6 TO 17 YEARS, WHO HAVE HAD AN INADEQUATE RESPONSE TO CONVENTIONAL THERAPY

Farrell J[1], Jiang Y[2], Chaudhary MA[3], Sheppard O[1], Gathany T[4], Fan T[5]
[1]*MSD, Hoddesdon, UK,* [2]*Amaris, London, UK,* [3]*Merck Research Laboratories, North Wales, PA, USA,* [4]*Johnson & Johnson Pharmaceutical Services, LLC, Malvern, PA, USA,* [5]*Merck & Co., Inc., Whitehouse Station, NJ, USA*

OBJECTIVES: To evaluate the cost-effectiveness of Infliximab (IFX) treatment in severe, active paediatric ulcerative colitis (pUC). **METHODS:** A Markov model was constructed based upon the literature, to model the progression of a cohort of pUC patients treated with IFX and ciclosporin (CIC) used off-label in the rescue therapy setting. The transition probabilities were estimated from the IFX phase III trials (T72, ACT1 and ACT2). The comparative efficacy was incorporated by using the odds ratio for IFX *vs.* CIC from a head to head trial in adults (Laharie *et al*). Utility weights from observational studies (SOLUTION and Arseneau *et al*) were assigned to the health states within the Markov process. Incremental cost-effectiveness ratios (ICERs) were estimated with a one year time horizon. Uncertainty around key variables was explored through deterministic sensitivity analysis. **RESULTS:** Compared to CIC in the rescue therapy setting, IFX was a dominant treatment option (produced more QALYs at a lower cost). The results were sensitive to the number of days patients were hospitalised for each treatment, the comparative rates of adverse events and altering the odds ratio for comparative effectiveness. **CONCLUSIONS:** IFX is a highly effective and well-tolerated therapy for the treatment of paediatric patients with severely active ulcerative colitis. IFX is the only biologic treatment licensed for this population, and is cost-effective when compared to the commonly used off-licence treatment CIC.

PMS59

COST-UTILITY OF RHEUMATOID ARTHRITIS MONOTHERAPY WITH TOCILIZUMAB IN SPAIN

Benito Ruiz P[1], Navarro Sarabia F[2], Gomez Reino J[3], Poveda J[4], Alvaro Gracia J[5], Rubio-Rodríguez D[6], Ruiz-Beato E[7]
[1]*Hospital del Mar, Barcelona, Spain,* [2]*Hospital Virgen de la Macarena, Sevilla, Spain,* [3]*Complejo Hospitalario Universitario de Santiago, Santiago de Compostela, Spain,* [4]*Hospital Universitario La Fe, Valencia, Spain,* [5]*Hospital Universitario de La Princesa, Madrid, Spain,* [6]*Health Value, Madrid, Spain,* [7]*Roche Farma, S.A., Madrid, Spain*

OBJECTIVES: Analyze Tocilizumab (TCZ) monotherapy cost-utility for moderate/severe rheumatoid arthritis in patients who are intolerant/contraindicated to MTX, compared with two standard treatment sequences: comparison 1: Etanercept-Adalimumab-Certolizumab-Support treatment vs. Tocilizumab-Etanercept-Adalimumab-Support treatment, and comparison 2: Adalimumab-Etanercept-Certolizumab- Support treatment vs. Tocilizumab-Adalimumab-Etanercept-Support treatment. **METHODS:** A life time micro-simulation model with 6 months cycles was performed in order to calculate the incremental cost-effectiveness ratio of the TCZ treatment sequences vs. standards sequences, which were determined by an expert panel of Spanish rheumatologists. Demographic data on age, HAQ score and sex were obtained from the ADACTA trial, while body weight data was obtained from the PRAXIS study. The efficacy data (ACR clinical response) were obtained from the pivotal clinical trial of each drug. Utilities were calculated from the relationship between ACR response, HAQ score and EQ5D instrument, according to the VACAR study, conducted in the Spanish population. The analysis was done from National Health System (NHS) perspective. Unit costs (€; 2012) were obtained from Spanish sources. Annual discount rate was 3.5% for costs and outcomes. Probabilistic sensitivity analyses were performed. **RESULTS:** TCZ sequences generated more costs per patient than the standard sequence (€ 7,107 in comparison 1; € 6,087 in comparison 2). However, the TCZ sequence generated more QALYs than the standard sequence (0.330 in comparison 1 and 0.297 in comparison 2). The cost of gaining a QALY with TCZ sequences versus the standard sequence was € 21,529 (comparison 1) and € 20,496 (comparison 2). According to probabilistic sensitivity analyses, the probability that the TCZ sequences are cost effective is 86.8% for the comparison 1 and 86.1% for the comparison 2. **CONCLUSIONS:** In both comparisons, the analysis results indicate that the inclusion of TCZ monotherapy as first-line represents an effective and cost-effective alternative in Spain versus the current sequences used for the treatment of patients with rheumatoid arthritis and MTX intolerance/contraindication.

PMS60

COST-UTILITY ANALYSIS OF TOCILIZUMAB MONOTHERAPY VERSUS STANDARD OF CARE FOR THE TREATMENT OF RHEUMATOID ARTHRITIS IN GREECE

Athanasakis K[1], Konstantopoulou T[2], Tarantilis F[1], Tsalapati K[1], Vritzali E[2], Kyriopoulos J[1]
[1]*National School of Public Health, Athens, Greece,* [2]*Roche (Hellas), Athens, Greece*

OBJECTIVES: Rheumatoid Arthritis (RA) is a chronic, inflammatory disease affecting 0.68% of the adult population in Greece. RA is associated with a lowered quality of life and a serious economic burden. This study aims to evaluate the cost-effectiveness of adding tocilizumab to a treatment sequence for patients with active RA, who had an inadequate response to one or more traditional disease-modifying antirheumatic drugs (tDMARDs) and are intolerant or contraindicated to methotrexate (MTX). **METHODS:** A patient-level simulation model was applied to project lifetime costs and outcomes for 10.000 patients from a payer's perspective. The analysis compared a standard treatment pathway (STP) (adalimumab, etanercept and palliative care) with a similar pathway initialized with tocilizumab (TCZ). Disease severity was reflected by Health Assessment Questionnaire (HAQ) scores. As primary efficacy outcomes, American College of Rheumatology (ACR) response rates were used. Patient characteristics (age, gender and baseline HAQ score) and TCZ efficacy data were derived from the ADACTA trial, whereas efficacy data for the remaining DMARDs were derived from a network meta-analysis of each medication's trial outcomes. A mapping model transformed HAQ scores into QALYs. Clinical practice standards were defined by an expert panel of Greek Rheumatologists. Costs for pharmaceuticals and resource unit costs were obtained from official (Social Insurance) price lists. A discount rate of 3% was used for both costs and QALYs. **RESULTS:** Results indicate that a treatment sequence starting with TCZ yields 1.17 more QALYs (9.38 vs. 8.21) for an additional cost of €33,145 (€125,409 vs. €92,264) compared to the STP. The Incremental Cost – Effectiveness Ratio (ICER) was 28,325.5€/QALY gained. Sensitivity Analysis confirms robustness of findings below a threshold of €45.000. **CONCLUSIONS:** The results of the analysis suggest that TCZ as a first-line biologic drug can be a cost-effective treatment option for the management of active RA in patients intolerant or contraindicated to MTX.

PMS61

HEALTH ECONOMIC MODELLING OF SEQUENTIAL THERAPIES FOR RHEUMATOID ARTHRITIS: A SYSTEMATIC REVIEW

Tosh J, Stevenson M, Akehurst R
University of Sheffield, Sheffield, UK

OBJECTIVES: A systematic review was conducted to: 1) Identify economic evaluations of therapies for rheumatoid arthritis (RA), and 2) assess and critique how sequential therapies were modelled and evaluated. **METHODS:** Systematic searches of ten databases were undertaken to identify published economic evaluations of disease modifying therapies for RA. Searches were undertaken in February 2013, with no date restriction. Studies were included if they reported a full comparative economic evaluation. Identified studies were appraised using the Drummond economic evaluation checklist. Data extracted included economic evaluation data, along with data relating to sequential treatments. Data on the modelling methods used were also extracted, to identify how data sources were synthesised. The systematic review was conducted to the PRISMA standards. **RESULTS:** Fifty-seven studies were identified. 43 (75%) were cost-utility analyses. 11 (19%) had a UK perspective, and 11 (19%) had a US perspective. The remainder were mainly undertaken within Europe (26 (46%) studies). There was a distinction between studies in recent-onset RA (14 (25%)), and those in established RA (42 (74%)). One study (1%) was unclear. The review identified approximately 30 RA treatments. Using individual level modelling was associated with improved quality of the evaluation and the ability to evaluate sequences. Reporting about the impact of future treatments on costs and health benefits was poor. When downstream treatments were modelled, the evidence used was often poorly reported. No study considered identifying the optimal sequence of treatments given a set of alternative treatments. Where models have been developed that consider a lifelong time horizon and downstream treatment sequences, evidence gaps were identified. **CONCLUSIONS:** The review has identified that methods have not been consistently applied, which has led to varied estimates of cost-effectiveness. Sequences of treatments have not been appropriately considered and modelled, potentially biasing estimates of cost-effectiveness.

PMS62

COST-UTILITY ANALYSIS OF TOCILIZUMAB IN COMBINATION WITH METHOTREXATE VERSUS STANDARD OF CARE FOR THE TREATMENT OF RHEUMATOID ARTHRITIS IN GREECE

Athanasakis K[1], Konstantopoulou T[2], Tarantilis F[1], Tsalapati K[1], Vritzali E[3], Kyriopoulos J[1]
[1]*National School of Public Health, Athens, Greece,* [2]*Roche (Hellas), Greece, Athens, Greece,* [3]*Roche (Hellas), Athens, Greece*

OBJECTIVES: Rheumatoid Arthritis (RA) is a chronic, inflammatory disease affecting 0.68% of the adult population in Greece. RA is associated with a lowered quality of life and a serious economic burden. This study aims to evaluate the cost-effectiveness of adding tocilizumab to a treatment sequence on a background of methotrexate (MTX) for patients with active RA, who had an inadequate response to one or more traditional disease-modifying antirheumatic drugs (tDMARDs). **METHODS:** A patient-level simulation model was applied to project lifetime costs and outcomes for 10.000 patients from a payer's perspective. The analysis compared a standard treatment pathway (STP) (Adalimumab, Etanercept, Abatacept and Palliative care along with MTX) with a similar pathway initialized with Tocilizumab (TCZ). Disease severity was reflected by Health Assessment Questionnaire (HAQ) scores. As primary efficacy outcomes American College of Rheumatology (ACR) response rates were used . Patient characteristics (age, gender and baseline HAQ score) and drug efficacy for TCZ were obtained by an analysis of pooled data from three phase-III clinical trials. Efficacy data for comparators were derived from indirect comparisons. A mapping model transformed HAQ scores into QALYs. Standards regarding clinical practice were defined by an expert panel of Greek Rheumatologists. Costs for pharmaceuticals and resource unit costs were derived from official (Social Insurance) price lists. A discount rate of 3% was used for costs and QALYs. **RESULTS:** Results indicate that a treatment sequence starting with TCZ yields 0.79 more QALYs (11.68 vs. 10.89) for an additional cost of €21,174 (€168,963 vs. €147,788) compared to STP. The Incremental Cost – Effectiveness Ratio was 26,686€/QALY gained. Sensitivity Analysis confirms robustness of findings below a threshold of €45.000. **CONCLUSIONS:** The results of the analysis suggest that TCZ, combined with MTX, as a first-line biologic drug can be a cost-effective treatment option for the management of active RA compared to STP.

PMS63
COST-UTILITY OF FIRST-LINE ADALIMUMAB AND TOCILIZUMAB MONOTHERAPIES IN RHEUMATOID ARTHRITIS BASED ON HEAD-TO-HEAD DATA
Soini EJ[1], Hallinen T[1], Vihervaara V[2], Kauppi MJ[3]
[1]ESiOR Oy, Kuopio, Finland, [2]Roche Oy, Espoo, Finland, [3]Päijät-Häme Central Hospital, Lahti, Finland
OBJECTIVES: Until recently, large-scale head-to-head randomized clinical trials (RCT) involving biologic drugs in the treatment of rheumatoid arthritis (RA) have been lacking. In addition, most evidence of biologic RA treatments has relied on combination treatment with methotrexate. The RCT ADACTA compared adalimumab vs. tocilizumab monotherapies as the 1st biologic treatments for severe RA, and demonstrated tozilizumab's clinical superiority over adalimumab. Based on this evidence, we assess the cost-utility of adalimumab and tocilizumab monotherapy in RA after the failure of traditional disease modifying antirheumatic drug(s) (tDMARD). **METHODS:** Two sequences, namely adalimumab or tocilizumab followed by etanercept followed by best supportive care (BSC) including tDMARDs, were implemented in a probabilistic, individual sampling (microsimulation model) setting in order to compare the results among 1,230 Finnish RA patients in a lifetime scenario (based on the Finnish social insurance institution reimbursement data, 1,230 [42.6%] of anti-TNF users purchased anti-TNF without tDMARD in 2012). Clinical outcomes (no ACR20, ACR20, ACR50 and ACR70 responses, and their impact on Health Assessment Questionnaire, HAQ) were obtained from ADACTA and drug survivals from literature. HAQ-scores were linked non-linearly to EQ-5D scores based on the tocilizumab trials, and to hospitalizations and lost production days through literature data. All resources were valued with Finnish unit costs (drugs 4/2013, other costs 2012 real value). Analyses were performed from the Finnish payer perspective (excluding productivity loss) and societal perspective including 3% annual discount rate. **RESULTS:** A QALY gained with the tocilizumab sequence costs €14,294 (€9,111) compared with the adalimumab sequence from the payer (societal) perspective. The respective expected value of perfect information (EVPI) for the payer was €996/patient. Population EVPI was €121,770 with €20,000/QALY gained. According to cost-effectiveness acceptability frontier, the tocilizumab sequence had 89% probability for cost-effectiveness at €20,000/QALY gained. **CONCLUSIONS:** After tDMARD(s) failure, tocilizumab monotherapy was cost-effective in comparison to adalimumab monotherapy.

PMS64
LONG TERM COSTS AND OUTCOMES IN PSORIATIC ARTHRITIS PATIENTS NOT RESPONDING TO CONVENTIONAL THERAPY TREATED WITH TUMOR NECROSIS FACTOR INHIBITORS: THE EXTENSION OF PSORIATIC ARTHRITIS COST EVALUATION (PACE) STUDY
Cortesi PA[1], Olivieri I[2], de Portu S[3], Salvarani C[4], Cauli A[5], Lubrano E[6], Spadaro A[7], Cantini F[8], Cutro M[2], Mathieu A[5], Matucci-Cerinic M[9], Pappone N[10], Punzi L[11], Scarpa R[12], Mantovani LG[13]
[1]University of Milano - Bicocca, Monza, Italy, [2]San Carlo Hospital of Potenza and Madonna delle Grazie Hospital, Potenza and Matera, Italy, [3]Medtronic International Sàrl, Tolochenaz, Switzerland, [4]Arcispedale S. Maria Nuova, Reggio Emilia, Italy, [5]University of Cagliari, Monserrato, Italy, [6]University of Molise, Campobasso, Italy, [7]Università di Roma "La Sapienza", Rome, Italy, [8]Prato Hospital, Prato, Italy, [9]University of Florence, Florence, Italy, [10]Fondazione Maugeri IRCCS, Telese Terme, Italy, [11]University of Padova, Padova, Italy, [12]University Federico II of Naples, Naples, Italy, [13]Federico II University of Naples, Naples, Italy
OBJECTIVES: Poor information on long term outcomes and costs on Tumor Necrosis Factor-α (TNF-α) inhibitors in Psoriatic Arthritis (PsA) are available. Our aim was to evaluate long-term costs, benefits and cost-effectiveness of TNF-α inhibitors in PsA patients with inadequate response to conventional treatment with traditional disease-modifying antirheumatic drugs (DMARDs). **METHODS:** A total of 55 of the 107 enrolled patients included in the study at one year, completed the 5 years follow up period (2005-2010). Patients aged older than 18 years, with different forms of PsA and failure or intolerance to DMARDs therapy were treated with anti-TNF agents. Information on resource use, quality of life, disease activity, function and laboratory values were collected at baseline and through the 5 years of therapy. Costs (expressed in Euro 2011) and utility (measured by EQ-5D instrument) before and after TNF-α inhibitorstherapy were compared in order to estimate the incremental cost per quality adjusted life year (QALY) gained. The cost-effectiveness acceptability-curve was also calculated. **RESULTS:** Thirty-four patients were males (61.8%), aged mean(SD)= 48.94(11.09) years. The majority of patients (83.6%) had a predominant or exclusive peripheral arthritis. At the end of the 5 years, there was a significant increase in direct costs due to an increase of drug cost caused by TNF-αinhibitors that was partially offset by the decrease in indirect costs. The incremental cost estimated and the utility gained of 0.22 gave an incremental cost-effectiveness ratio of 39,678.6 € per QALY gained for the society. The acceptability curve showed there would be a 90% likelihood that anti-TNF therapy would be considered cost-effective at willingness-to-pay threshold of €60,000 per QALY gained. **CONCLUSIONS:** Cost-effectiveness ratios are within the commonly accepted Italian willingness-to-pay threshold. These results show how TNF-α inhibitors could be long-term cost-effectiveness treatment. Our results need to be confirmed in larger samples of patients.

PMS65
HIGH ECONOMIC BURDEN OF MODERATE TO SEVERE PSORIATIC ARTHRITIS ON PAID WORK AND HOUSEHOLD PRODUCTIVITY: BASELINE RESULTS FROM THE RAPID-PSA STUDY
Kavanaugh A[1], Mease PJ[2], Purcaru O[3], van der Heijde D[4]
[1]UCSD, San Diego, CA, USA, [2]Swedish Medical Center and University of Washington, Seattle, WA, USA, [3]UCB Pharma, Brussels, Belgium, [4]Leiden University Medical Centre, Leiden, The Netherlands
OBJECTIVES: To estimate the economic burden of moderate to severe psoriatic arthritis (PsA) on workplace and household productivity using data from RAPID-PsA. **METHODS:** The ongoing Phase 3 RAPID-PsA trial (NCT01087788) recruited patients (pts) with active PsA. Impact of PsA on workplace and household productivity and daily activities was assessed at study baseline, using the validated arthritis-specific Work Productivity Survey (WPS). **RESULTS:** At baseline, pts had a mean age of 48 years and 55% were female; 61.6% had psoriasis skin involvement ≥3% body surface area. 59.5% of pts were employed, 14.0% work disabled due to PsA, and 13.5% retired. Overall, a high burden of PsA on workplace and household productivity and on social activities was reported, with on average >1 week (wk) of paid work affected and >2 wks of household duties or social activities affected per month. Household productivity losses were on average, up to 2 to 3 times higher in non-employed or disease work disabled pts vs employed pts: on average household duties were affected 18 days or 26 days vs 10 days/month, respectively. Employed pts with manual jobs reported higher productivity losses at work and within the home vs those with non-manual jobs. Overall, 41.8% of pts required regular assistance from relatives, friends or paid caregivers in their usual activities because of PsA. These pts reported on average 2 to 3 times higher workplace and household productivity losses vs pts who did not require help. **CONCLUSIONS:** PsA is associated with a high burden of disease on workplace and household productivity that could lead to large financial burden for pts and society. Effective PsA treatments are needed to prevent disability and work losses, and reduce economic burden of the disease.

PMS66
ECONOMIC BURDEN OF AXIAL SPONDYLOARTHRITIS RELATED TO PAID WORK AND HOUSEHOLD PRODUCTIVITY AT BASELINE IN THE RAPID-AXSPA STUDY: DIFFERENCES AND SIMILARITIES BETWEEN ANKYLOSING SPONDYLITIS AND NON-RADIOGRAPHIC AXIAL SPONDYLOARTHRITIS
van der Heijde D[1], Purcaru O[2], Kavanaugh A[3]
[1]Leiden University Medical Centre, Leiden, The Netherlands, [2]UCB Pharma, Brussels, Belgium, [3]UCSD, San Diego, CA, USA
OBJECTIVES: To estimate the economic burden of axial spondyloarthritis (axSpA) and directly compare ankylosing spondylitis (AS) and axSpA with no definitive sacroiliitis on X-ray (non-radiographic axSpA, nr-axSpA) in terms of workplace and household productivity losses. **METHODS:** The ongoing Phase 3 RAPID-axSpA trial (NCT01087762) recruited patients (pts) with adult-onset active axSpA according to ASAS criteria, and included AS and nr-axSpA pts. The impact of axSpA on workplace and household productivity was assessed at study baseline (BL), using the arthritis-specific Work Productivity Survey (WPS). **RESULTS:** At BL, 69.2% of axSpA, 67.4% AS and 71.4% nr-axSpA pts were employed outside the home. A high burden of axSpA on workplace and household productivity and on social activities was reported, with slightly higher burden in nr-axSpA vs AS pts. More AS vs nr-axSpA pts were unable to work (15.7% vs 8.2%). On average, axSpA pts reported >1 wk of paid work and >2 wks of household duties or social activities affected/month. Household productivity losses were up to 2–3 times higher in non-employed and disease work disabled vs employed pts. Employed pts with manual jobs reported higher losses at paid work and within household vs pts with non-manual jobs. 39.1% of axSpA pts required regular assistance in their usual activities (42.1% in AS vs. 35.4% in nr-axSpA) and reported higher workplace and household productivity losses vs those who did not require help. Similar patterns were observed in AS and nr-axSpA. **CONCLUSIONS:** A similarly high burden of disease on workplace and household productivity was seen in AS and nr-axSpA pts that could lead to large financial burden for pts and society. Effective axSpA treatments are needed to prevent disability and work losses and to reduce the economic burden of axSpA.

PMS67
LOSS OF PRODUCTIVITY IN POLISH PATIENTS WITH RHEUMATOID ARTHRITIS
Szafraniec-Burylo SI[1], Orlewska E[2], Rupinski R[3], Filipowicz-Sosnowska A[3]
[1]National Institute of Public Health - National Institute of Hygiene, Warsaw, Poland, [2]Centre for Pharmacoeconomics, Warsaw, Poland, [3]Institute of Rheumatology, Warsaw, Poland
OBJECTIVES: To assess loss of paid productivity in Polish rheumatoid arthritis (RA) patients according to disease activity and disability. **METHODS:** We conducted a prospective one-center observational study with 6-month time horizon. The sample consisted of 109 RA patients of working age (women:<60 years; men:< 65 years), stratified according to Disease Activity Score (DAS28-CRP) and disability index of the Health Assessment Questionnaire (HAQ-DI). Productivity loss was expressed by absenteeism and employment status changes: reduced work hours (part-time), unemployed and/or early retirement due to RA. Spearman rang correlation coefficient test was used to investigate the relationship of productivity loss with disease activity and disability. **RESULTS:** Patients were on average 48.5 years of age, had a mean disease duration of 8.5 years, and 85% were female. DAS28-CRP was ≤5.1 in 52 patients (group A) and >5.1 in 57 patients (group B). HAQ-DI was >2 in 22 patients (group I), >1 and ≤2 in 54 patients (group II), ≤1 in 33 patients (group III). Number of patients who lost productivity was 94 (86%) (79% in A vs. 93% in B, 100%, 94% and 63.6% in I, II and III, respectively). Of them 63 (58%) patients received disability pension due to RA (48% in A vs. 67% in B, 77%, 76% and 15% in I, II and III, respectively). Mean number of working days lost was 120.7 (97.2 in A vs. 142.9 in B; 157.3, 143.1 and 59.8 in I, II and III, respectively). Proportion of patients with productivity loss and number of working days lost were correlated with disease activity ($p<0.01$ and $p<0.001$, respectively) and disability index (both $p<0.001$). **CONCLUSIONS:** This study indicates high impact of disease activity and disability on productivity loss in RA patients. Treatment aiming at reducing disease activity decreases disability progress and may enhance productivity in Polish patients with RA.

PMS68
RESOURCE USE DUE TO DISABILITY IN POLISH RHEUMATOID ARTHRITIS PATIENTS: SIGNIFICANT INCREASE OF TRANSPORTATION NEEDS AND HOME VISITS
Szafraniec-Burylo SI[1], Orlewska E[2], Rupinski R[3], Filipowicz-Sosnowska A[3]
[1]National Institute of Public Health - National Institute of Hygiene, Warsaw, Poland, [2]Centre for Pharmacoeconomics, Warsaw, Poland, [3]Institute of Rheumatology, Warsaw, Poland
OBJECTIVES: To assess transportation needs and number of home visits in relation to disease activity (DAS-28CRP) and disability index of the Health Assessment Questionnaire (HAQ-DI) in Polish patients with rheumatoid arthritis (RA) **METHODS:**

Prospective data on distance covered due to RA (paid and non-paid, self and caregiver's transport) and about number of medical home visits were gathered during 6 months observation after discharge of non-selected RA patients from one tertiary academic hospital. Patients were stratified according to their DAS28-CRP and HAQ-DI. Spearman rang correlation coefficient test was used for statistical analysis. **RESULTS:** A total of 205 consecutive RA patients included into the study were stratified in 5 groups: A: DAS-28CRP ≤5.1 (89 patients), B: DAS28-CRP >5.1 (116 patients), I: HAQ-DI ≤1 (51 patients), II: HAQ-DI ≤2 and >1 (88 patients) and III: HAQ-DI > 2 (66 patients). In the whole study group 157 (77%) patients used transport for a mean distance of 461 kilometers in 6 months. Corresponding values for group A, B, I, II and III were as follows: 67% for 329 km, 84% for 563 km in B, 55% for 159 km in I, 81% for 528 km in II and 88% for 605 km in III. 7 patients used home visits (3% for a mean number of 0.1 visits - 2% for 0.2, 4% for 0.2, 0% for 0, 1% for 0.3 and 9% for 0.3 in A, B, I, II and III, respectively). There was significant positive correlation between disability and both proportion of patients using transport and distance covered (both p<0.0001), between disability and home visits and between disease activity and transport (both p<0.01). **CONCLUSIONS:** Problems with moving around and need for travelling due to the disease result in significant resource use in RA patients. Comprehensive services meeting these needs may diminish the burden of disease in Poland.

PMS69

BURDEN OF INFORMAL CARE IN RELATION TO DISEASE ACTIVITY AND DISABILITY IN POLISH PATIENTS WITH RHEUMATOID ARTHRITIS

Szafraniec-Burylo SI[1], Orlewska E[2], Rupinski R[3], Filipowicz-Sosnowska A[3]
[1]*National Institute of Public Health - National Institute of Hygiene, Warsaw, Poland,* [2]*Centre for Pharmacoeconomics, Warsaw, Poland,* [3]*Institute of Rheumatology, Warsaw, Poland*

OBJECTIVES: To assess informal care use in relation to disease activity (DAS-28CRP) and disability index of the Health Assessment Questionnaire (HAQ-DI) in Polish patients with rheumatoid arthritis (RA). **METHODS:** Data on amount of time consumed for informal care (unpaid assistance of family member or other caregiver) was collected during a prospective one center cohort observational study of non-selected RA patients discharged from tertiary academic hospital. At enrollment patients were divided according to DAS28-CRP and HAQ-DI. Observational period was 6 months. Spearman rang correlation coefficient test was used to investigate the relationship between informal care and disability. **RESULTS:** A total of 205 patients were included in the analysis: 89 with DAS-28CRP ≤5.1 (group A), 116 with DAS28-CRP >5.1 (group B), 51 with HAQ-DI ≤1 (group I), 88 - with HAQ-DI ≤2 and >1 (group II) and 66 patients with HAQ-DI > 2 (group III). 164 (80%) patients have been looked after by informal caregivers (64% and 92% in A and B, respectively, and 47%, 89% and 94% in I, II and III, respectively). Mean number of hours of informal care per patient during 6 months was 467 (336, 567, 153, 412 and 783 hours in A, B, I, II and III, respectively). There were significant (p<0.0001) positive correlations between both disease activity and disability index and both number of patients being looked after by informal caregivers and number of hours of informal care. **CONCLUSIONS:** Informal care involves substantial time inputs depending on disease activity and functional status of the care receiving RA patients. On one side, improving access to formal caregiving might be a good solution to improve quality of life and enhance productivity of present informal caregivers in Poland. On the other side slowing down the disease process might reduce the need of informal care for RA patients.

PMS70

THE USE OF DEXA SCANS IN POSTMENOPAUSAL OSTEOPOROSIS IS ASSOCIATED WITH REDUCED LONG TERM FRACTURE RISK

Burke TP, de Courcy J, Milligan G
Adelphi Real World, Bollington, UK

OBJECTIVES: Postmenopausal osteoporosis (PMO) leads to an increased risk of fractures, which in turn is associated with high resource utilisation. DEXA scans measure the patient's bone mineral density and are an important tool in assessing fracture risk. We aim to determine if the monitoring of PMO patients using DEXA scans is associated with lower incidence of fracture. **METHODS:** Analysis was undertaken using data from the 2012 Adelphi Osteoporosis Disease Specific Programme (DSP), a cross-sectional survey of patients with osteoporosis across the EU5 and the US. Physicians completed a detailed patient record form (PRF) for the next 10 consulting osteoporosis patients. The PRF captured patient information which included age, BMI and physician-perceived severity of the patient's osteoporosis as well information on fracture history, DEXA scans received and date of diagnosis. Bootstrapped survival time regression using an exponential distribution on time to fracture was used to determine the hazard ratio (relative fracture risk) for those that had received a DEXA scan, compared with those that had not. Other covariates in the model were age, BMI, severity, and the possibility that the likelihood of a DEXA scan increases with duration of time since diagnosis. **RESULTS:** Of the 2508 PMO patients with complete information required for the analysis, 1107 had received a DEXA scan (and had associated treatment intervention) and 1401 had received no DEXA scan. Patients who had received a DEXA scan had 59% (0.594, p=0.006) of the fracture risk of those who had received no DEXA scan, adjusted by possible confounders (ceteris paribus). **CONCLUSIONS:** Patients tested with DEXA scans were associated with a significantly lower risk of fracture than those patients who were not. Over time increased use of DEXA testing could lead to a reduction in fractures and subsequently lower resource use and disease burden.

COMPLIANCE PROTECTS AGAINST FRACTURE IN WOMEN WITH POSTMENOPAUSAL OSTEOPOROSIS IN HUNGARY

Lakatos P[1], Tóth E[2], Cina Z[2], Lang Z[2], Psachoulia E[3], Intorcia M[3]
[1]*Semmelweis University, Budapest, Hungary,* [2]*Healthware Consulting Ltd., Budapest, Hungary,* [3]*Amgen (Europe) GmbH, Zug, Switzerland*

OBJECTIVES: Compliance to osteoporosis drugs is frequently very low, leading to an increased fracture risk. We investigated the factors associated with fracture risk in women with postmenopausal osteoporosis (PMO) in Hungary, with a focus on compliance. **METHODS:** This retrospective analysis of data from the National Health Insurance Fund Administration included women aged ≥50 years with a diagnosis of osteoporosis (ICD-10 codes, M80 or 81), who started an osteoporosis drug prescription between Jan 2004–Dec 2012 (index event) and had a 13-month non-treatment period prior to this prescription. The relationship between all factors (covariates) and fracture risk was assessed using a dynamic Cox regression model and Andersen-Gill analysis, estimating 95% confidence intervals. Compliance was measured using the medication possession ratio (MPR); MPR≥80% at 1 year was considered compliant. **RESULTS:** A total of 181,239 patients matched the inclusion criteria; 40.4% of patients were > 70 years old and 12.2% had prior fractures in the 36-month period before each index date. Compliant patients had a 35% (RR=0.65, CI=0.59-0.72) fracture risk reduction versus non-compliant patients. Patients aged 70-79 years, and > 80 years, had an increased fracture risk of 71% (RR=1.71, CI=1.54-1.90) and 118% (RR=2.18, CI=1.94-2.46), respectively, compared to patients aged 50-60 years. Prior fractures were associated with a 32% increased risk of one new fracture (RR=1.32, CI=1.18-1.49), and with a 90% increased fracture risk (RR=1.90, CI=1.64-2.19) in patients with 2+ prior fractures, respectively, compared to patients with no prior fractures. There was also a relationship between any co-medication and fracture risk, with a 12% (RR=1.12, CI=1.03-1.22) increase with one co-medication and an 11% (RR=1.11, CI=1.01-1.21) increase with 2+ co-medications compared to none. **CONCLUSIONS:** Compliance was associated with protection against fracture (reduction of relative fracture risk). However, age, any co-medication and prior fractures were associated with an increased relative risk of fracture.

PMS72

TREATMENT PERSISTENCE IN SWEDISH WOMEN INITIATING DENOSUMAB TREATMENT FOR POSTMENOPAUSAL OSTEOPOROSIS

Karlsson L[1], Lundkvist J[2], Intorcia M[3], Psachoulia E[3], Ström O[1]
[1]*Quantify Research, Stockholm, Sweden,* [2]*Amgen AB, Solna, Sweden,* [3]*Amgen (Europe) GmbH, Zug, Switzerland*

OBJECTIVES: Persistence to orally and/or frequently administered osteoporosis treatments is poor. Indeed, previous retrospective research has shown that approximately 50% of patients discontinue oral treatments within one year. Denosumab is administrated as a treatment for postmenopausal osteoporosis (PMO) via a subcutaneous injection once every 6 months, and better persistence with denosumab has been shown in randomized trials. The current study estimated treatment persistence among women initiating denosumab for PMO in Sweden. **METHODS:** The study included post-menopausal women who initiated denosumab between May 2010 and July 2012 in the Swedish National Prescription Register. One injection of denosumab was defined as 6 months of persistence. Patients were considered persistent for an additional 6 months if they filled their next denosumab prescription within 6 months + 56 days (permissible gap). Subgroup analyses included comparisons of pre-treated vs. treatment-naïve patients to other osteoporosis treatments, and of patients initiating denosumab treatment in 2010/2011 vs. 2012. **RESULTS:** The study identified 2,315 incident users of denosumab. Mean (SD) age was 73.7 (9.0) years and 60.7% were pre-treated. 83% (CI_{95}:81-84) of patients were persistent at 12 months, 69% (CI_{95}:67-71) at 18 months and 62% (CI_{95}:60-65) at 24 months. Increasing the permissible gap to 90 or 180 days resulted in 12-month-persistence of 85% and 91%, respectively. Pre-treated patients were more persistent than treatment-naïve patients after 18 (71% vs. 67%) and 24 months (65% vs. 58%), but not at 12 months. No difference was observed between patients starting their treatment during 2010/2011 and 2012. **CONCLUSIONS:** Among Swedish women with PMO, persistence to denosumab treatment is high, and pre-treated patients are more persistent than treatment-naïve patients. Given the poor persistence to oral osteoporosis treatments, denosumab treatment could, in these patients, be considered a relevant alternative to increases persistence and hence optimizes outcomes in PMO.

PMS73

PERSISTENCE & COMPLIANCE TO TREATMENT FOR OSTEOPOROSIS IN POSTMENOPAUSAL WOMEN IN HUNGARY: A RETROSPECTIVE COHORT STUDY

Lakatos P[1], Tóth E[2], Cina Z[2], Lang Z[2], Psachoulia E[3], Intorcia M[3]
[1]*Semmelweis University, Budapest, Hungary,* [2]*Healthware Consulting Ltd., Budapest, Hungary,* [3]*Amgen (Europe) GmbH, Zug, Switzerland*

OBJECTIVES: Persistence and compliance with prescribed medication are important factors in treatment success. This study calculated persistence and compliance to treatment among postmenopausal women with osteoporosis in Hungary. **METHODS:** This retrospective analysis of data from the National Health Insurance Fund Administration included women aged ≥50 years with a diagnosis of osteoporosis (ICD-10 codes, M80 or 81), who started an osteoporosis prescription (including bisphosphonates, strontium ranelate, hormone replacement therapy, parathormone and denosumab) between January 2004 to December 2012. We estimated 12- and 24-month persistence per active substance and administration type, with an 8-week grace period; and measured compliance using the medication possession ratio (MPR; MPR≥80% at 12-months considered compliant). **RESULTS:** A total of 288,194 patients matched the inclusion criteria;43.8% were aged >70 years and 6.6% had prior fractures at first index date; 84.4% and 3.1% were receiving oral and intravenous bisphosphonates, respectively, and 12.5% other osteoporosis therapies. 12-month persistence to oral and injectable drugs was 31% and 76%, respectively. 12-month persistence was lowest for daily (23%) and monthly (27%) versus quarterly (58%) and half-yearly (84%) administration (100% persistence and compliance assumed for yearly administration), declining at 24 months to 10%, 10%, 36% and 44% for daily, monthly, quarterly and yearly drugs, respectively (24-month persistence to half-yearly drugs not available). Only 46% of patients were compliant with treatment, with compliance higher for injectable (daily, quarterly,

half-yearly or yearly) (78%) versus oral (daily, weekly, or monthly) drugs (35%). The lowest compliance was observed with daily (24%) and monthly (34%) drugs. Less frequently administered drugs (except yearly) had the highest compliance with quarterly drugs having 63% and half-yearly drugs 70%. **CONCLUSIONS:** This analysis shows that persistence and compliance to osteoporosis treatment is very low in postmenopausal women in Hungary. However, higher persistence and better compliance was observed for injectable, less frequently administered drugs, which may lead to better outcomes.

PMS74

VALIDATION OF THE FRENCH TRANSLATED VERSION OF THE OSTEOPOROSIS SPECIFIC MORISKY MEDICATION ADHERENCE SCALE (OS-MMAS) IN FRANCE

Feudjo Tepie M[1], Kempf C[2], Letierce A[3], Ferreira I[4], Kalouche-Khalil L[5], Roddam A[1], Guillemin F[6]

[1]*Amgen Ltd., Uxbridge, UK,* [2]*Cegedim Strategic Data, Boulogne-Billancourt, Île-de-France, France,* [3]*Cegedim strategic Data, Boulogne-Billancourt, France,* [4]*Amgen, Cambridge, Cambridge, UK,* [5]*Amgen, ZUG, Switzerland,* [6]*University of Lorraine, Nancy, France*

OBJECTIVES: The OS-MMAS is a disease-specific 8 item self-reported measure of adherence for osteoporosis patients. This study evaluated the measurement properties of its French translated version. **METHODS:** A cohort of women aged 55 or older, with post-menopausal osteoporosis (PMO) residing in France and treated with daily or weekly oral bisphosphonates (OBPs) were selected based on their historical data from the French Longitudinal Patient Database; following their visit to one of the participating practices. Eligible patients were given an OS-MMAS questionnaire for completion at home. Internal consistency was evaluated using the Cronbach's coefficient and construct validity using confirmatory one factor analysis (CFA). Convergence validity was assessed using agreement between patients' medication procession ratio (MPR) and their total score from OS-MMAS. To assess reproducibility, a subset of respondents received a second questionnaire approximately 3 months later. Reproducibility was tested using the intra-class correlation (ICC). **RESULTS:** From a network of 1200 French general practices, 117 participated; 687 eligible women visited these practices during the period 20-Jul-2012 to 31-Dec-2012. Of these women, 218 (mean 73.2 years; SD= 8.1) completed ≥1 OS-MMAS. The 6 and 12 month MPR was less than 80% for 25.7% patients and 59.1% patients, respectively. Cronbach's alpha coefficient was 0.76 and varied between 0.71 and 0.79 with the deletion of one item. The Chi-Square test of association between MPR (<80%, >80%) and OS-MMAS scores (<6; 6-8; 8+) was statistically significant at 6 months (p= 0.025), but not at 12 months (p-value= 0.059). CFA reported a standardized root mean square residual of 0.06. The ICC on 70 patients was 0.24 with 95% confidence interval [0.01-0.45]. **CONCLUSIONS:** This study demonstrated acceptable agreement between classification of patient's adherence to OBPs assessed using French translated OS-MMAS and that using historical 6 months MPR; but also indicated that the construct of the OS-MMAS could be improved.

PMS75

CHANGE OF BURDEN OF DISEASE IN GERMAN RHEUMATOID ARTHRITIS PATIENTS SINCE THE UPTAKE OF TNF-INHIBITORS: A LITERATURE REVIEW OF GERMAN REAL LIFE DATA

Wolff M[1], Kleine H[2], Wittig B[2], Mentrup S[2]

[1]*AbbVie Deutschland GmbH & Co. KG, Ludwigshafen, Germany,* [2]*AbbVie Deutschland GmbH & Co. KG, Wiesbaden, Germany*

OBJECTIVES: To obtain a comprehensive overview of the impact of TNF-inhibitors on the components of the burden of Rheumatoid Arthritis (RA) in Germany. **METHODS:** A systematic literature research in EMBASE, Medline, grey literature including rheumatology congress abstracts (ACR, EULAR, DGRh), German RA registry homepages, and the Information System of the Federal Health Monitoring (2002-2012) was performed. Published data on the effect of TNF-inhibitors on mortality, morbidity, and health care resource utilization (HCRU) was included. **RESULTS:** Overall, 15 partially overlapping full-text articles (0 mortality, 12 morbidity, 5 HCRU), 6 additional unique abstracts excluding encore publications (1 mortality, 4 morbidity, 1 HCRU) and two other sources (1 morbidity, 1 HCRU) were included in the final review. Reviewed literature reported an association of TNF-inhibitor use with a 35% lower mortality rate (HR=0.65; p=0.0004) compared to synthetic disease modifying antirheumatic drugs (DMARDs). Disease severity based on symptoms decreased over time in Germany: the chances of reaching DAS28 remission (OR=1.97; 95%-CI: [1.20-3.21]) and functional remission (OR=2.21; 95%-CI: [1.06-4.63]) were doubled, the odds of functional independence were quadrupled (OR=4.09; 95%-CI: [1.80-9.29]) with TNF-inhibitor treatment. All SF-36 domains and fatigue scores increased significantly after treatment initiation. TNF-inhibitor treatment is associated with fewer limitations in daily activities (OR=0.77; 95%-CI: [0.65-0.90] and less perseverant limitations (OR=0.82; 95%-CI: [0.68-0.98]. Standardized disability pension ratios in patients with biologics use decreased over time from 12.5 (2001–2003) to 3.4 (2010-2011). Frequency and average duration of hospitalization have fallen from 2001 (19% of patients hospitalized with average duration of 19 days) to 2011 (12%, 12 days). No HRCU data was available for the outpatient sector or surgery. **CONCLUSIONS:** Based on available German data, treatment with TNF-inhibitors is associated with lower mortality, increasing likelihood to reach clinical remission, better symptom control, functional status, work ability and quality of life.

PMS76

PREDICTING EQ-5D UTILITY SCORES FROM SF-36 SCORES IN PATIENTS WITH RHEUMATOID ARTHRITIS IN JAPAN

Moriwaki K[1], Ito S[2], Kobayashi D[2], Noto S[1], Yanagisawa S[3], Toujou T[1], Murasawa A[2]

[1]*Niigata University of Health and Welfare, Niigata, Japan,* [2]*Niigata Rheumatic Center, Shibata, Japan,* [3]*Faculty of Pharmaceutical Sciences, Himeji Dokkyo University, Himeji, Japan*

OBJECTIVES: To develop a mapping model for estimating EuroQol 5D (EQ-5D) utility values from Short Form 36 (SF-36) scores in Japanese patients with rheumatoid arthritis (RA), with or without clinical characteristics. **METHODS:** Linear regression models were applied to a cross-sectional data set of 112 patients with RA collected from a regional hospital in Niigata prefecture, Japan. Four model specifications were estimated, where EQ-5D was regressed on 1) eight SF-36 scores; 2) as per 1) plus squared and pair-wise interaction terms, 3) as per 1) plus clinical characteristics; and 4) as per 3) plus squared and pair-wise interaction terms, respectively. Model 2 and 4 were developed by using stepwise regression analyses. Model goodness of fit was examined by using Akaike information criterion (AIC), R2, and adjusted R2. Predictive performance was evaluated by using root mean square error (RMSE). **RESULTS:** Model 1 with eight SF-36 scores explained more than 59% of the variation in EQ-5D utility values. The best-performing model based on goodness of fit and predictive performance was model 4 (AIC=□-200.4, R^2=0.767, adjusted R^2=0.709, RMSE=0.090). The model included four SF-36 scores (GH, MH, PF, and RP), five squared terms, twelve pair-wise interaction terms, and log transformed simplified disease activity index (SDAI). Also model 2, which included no clinical characteristics, had similar predictive ability (AIC=□-195.0, R^2=0.764, adjusted R^2=0.699, RMSE=0.093). **CONCLUSIONS:** EQ-5D utility values can be predicted from SF-36 scores and SDAI with Japanese patients with RA. The mapping model can be applied to SF-36 datasets to produce utility scores for economic evaluation of RA treatments from the perspective of Japan health care system.

PMS77

HEALTH-STATE UTILITIES IN MEASURING HEALTH-RELATED QUALITY OF LIFE AMONG PATIENTS WITH RHEUMATOID ARTHRITIS IN TAIWAN

Tang CH[1], Hsu PN[2], Hsu JY[1], Fang CH[3]

[1]*Taipei Medical University, Taipei, Taiwan,* [2]*National Taiwan University, Taipei, Taiwan,* [3]*Pfizer, New Taipei City, Taiwan*

OBJECTIVES: Rheumatoid arthritis is (RA) associated with numerous comorbidities that have major impacts on patients' quality of life. The purpose of this study is of twofold, first, to measure the health related utilities on patients with RA using time trade-off (TTO) and EQ-5D and to examine how these different measures were related to a disease specific measure, Health Assessment Questionnaire (HAQ) and disability level of RA. Second, to investigate absenteeism and presenteeism using Work Productivity and Activity Impairment Questionnaire for Patients with RA (WPAI-RA). **METHODS:** Face-to-face patient interviews on patients with mild RA (DAS <3.2), moderate RA (3.2<=DAS<5.1) and severe RA (DAS>=5.1) have been carried out since June 2013 at rheumatology outpatient clinics at four hospitals located in northern, central and southern Taiwan, and will be continued until the desired sample size of 120 is attained. Health state utilities were elicited using time trade-off (TTO), visual analogue scale (VAS) and EQ-5D. Productivity losses and activity limitation were measured by WPAI-RA. The mean value of the total HAQ score is the mean of the scores for the eight categories: dressing, rising, eating, walking, hygiene, reach, grip and usual activities. **RESULTS:** Based upon the preliminary sample collected, the mean age was 54.5 years, mean history of disease was 8.16 years, and 77% were female in the study patients. The mean health utility was 0.87 (EQ-5D), 0.72 (VAS) and 0.75 (TTO). The mean value of the total HAQ score is 0.83. Employed patients reported 10% reduced work productivity in the previous week, as well as 21.0% reduced productivity in daily activities (all patients). **CONCLUSIONS:** EQ-5D and VAS are consistent measures for HAQ and have high potentials for use in assessing the well-being of the patients with RA in Taiwan. Productivity losses associated with absenteeism and presenteeism are substantial.

PMS78

PATIENT PREFERENCE FOR ORAL VERSUS INJECTABLE AND INTRAVENOUS METHODS OF TREATMENT FOR RHEUMATOID ARTHRITIS

Barclay N[1], Tarallo M[2], Hendrikx T[3], Marett S[1]

[1]*The Research Partnership Ltd., London, UK,* [2]*Pfizer Italia, Rome, Italy,* [3]*Pfizer bv, Capelle aan den IJssel, The Netherlands*

OBJECTIVES: For patients with rheumatoid arthritis (RA), convenience, frequency of dosing, and invasiveness vary greatly across different administration routes and may influence their everyday lives. The objective of this study was to investigate the impact of administration method on patients' quality of life, understand their resulting unmet needs, and establish an overall preference for method of administration for RA treatment. **METHODS:** Patients from France, UK, Germany, Italy, Spain, Belgium, Sweden, and The Netherlands diagnosed with RA by a physician and taking prescription medication – disease-modifying anti-rheumatic drug (DMARD) monotherapy, biologic monotherapy, or DMARD and biologic combination therapy – completed a 20-minute online survey. Patients were asked about: 1) benefits and drawbacks of their current treatment administration method; 2) their preference for twice-daily oral therapy versus injection or intravenous (IV) infusion therapy if it met their safety and efficacy expectations; 3) if told by their doctor that they needed to change their current RA therapy, would they switch to twice-daily oral tablets, injections, or IV infusion if efficacy and safety requirements were met. **RESULTS:** 1400 patients were included: n=250 patients in each of France, UK, Germany, Italy, and Spain and n=50 in each of Sweden, Belgium, and The Netherlands. Oral DMARDs were seen as having more benefits and fewer drawbacks than DMARD injections, biologic injections, and IV therapy. The majority of patients (79%) would prefer a twice-daily oral tablet than an injection or IV infusion (21%) if it met efficacy and safety expectations. If told by their doctor that they needed to change their current RA therapy, 83% of all patients would prefer switching to twice-daily oral tablets over injection (13%) or IV infusion (4%). **CONCLUSIONS:** Oral therapy can meet some of the key practical and emotional unmet needs RA patients face with injectable or IV infusion therapy, providing efficacy and safety requirements are met.

ARE PATIENTS' PREFERENCES FOR OSTEOPOROSIS DRUG TREATMENT TRANSFERABLE BETWEEN COUNTRIES? RESULTS FROM A DISCRETE-CHOICE EXPERIMENT CONDUCTED IN TWO EUROPEAN COUNTRIES

Hiligsmann M[1], Dellaert B[2], Dirksen C[1], Van der Weijden T[1], Goemaere S[3], McGowan B[4], Reginster JY[5], Watson V[6], Boonen A[1]

[1]*Maastricht University, Maastricht, The Netherlands,* [2]*Erasmus University Rotterdam, Rotterdam, The Netherlands,* [3]*Ghent University Hospital, Ghent, Belgium,* [4]*Trinity Centre for Health Sciences, Dublin, Ireland,* [5]*University of Liège, Liège, Belgium,* [6]*University of Aberdeen, Aberdeen, UK*

OBJECTIVES: To evaluate the preferences of osteoporotic patients for medication attributes in Belgium and Ireland, and to assess whether preferences are transferable across these jurisdictions. **METHODS:** A discrete-choice experiment was designed in which patients were asked to choose between two unlabelled drug alternatives (and an opt-out option), which vary in five attributes: efficacy in reducing the risk of fracture, type of potential common side-effects, mode and frequency of administration and out-of-pocket costs. An efficient experimental design was used to construct the sets of treatment options and a mixed logit panel data model was employed to estimate patients' preferences. To assess the significance of the differences between countries, a joint model was estimated using interaction terms. **RESULTS:** A total of 257 Belgian and 200 Irish osteoporotic patients completed the experiment. In both countries, patients preferred a drug treatment with a higher risk reduction and a lower cost. They disliked more being at risk of gastro-intestinal disorders than at risk of skin reactions and flu-like symptoms and preferred 6-month subcutaneous injection compared with weekly oral tablets. In Belgium, patients also preferred oral monthly tablet over weekly tablets, while Irish patients preferred yearly intravenous over weekly tablets. Some differences between countries were significant. Irish patients attached higher value to being at risk for skin reactions or flu-like symptoms, and the parameter of yearly intravenous was higher (and significant) in Ireland. In addition, higher costs are more acceptable for Irish patients. These differences were generally robust in subgroups analyses including patients over 65 years, with prior fracture, high income or high education. **CONCLUSIONS:** In this study, the preferences of osteoporosis patients for drug therapy did not substantially differ between two European countries. Only for levels of some attributes significant differences were observed, which could not only be related to health and socio-demographic factors.

LONG-TERM MAINTENANCE OF IMPROVEMENTS IN PATIENT-REPORTED OUTCOMES WITH CERTOLIZUMAB PEGOL IN PATIENTS WITH AXIAL SPONDYLOARTHRITIS, INCLUDING ANKYLOSING SPONDYLITIS AND NON-RADIOGRAPHIC AXIAL SPONDYLOARTHRITIS: 48-WEEK RESULTS OF THE RAPID-AXSPA STUDY

Sieper J[1], Kivitz A[2], van Tubergen A[3], Deodhar A[4], Coteur G[5], Singh P[6], Landewé R[7]
[1]*University Hospital Charité, Berlin, Germany,* [2]*Altoona Center for Clinical Research, Duncansville, PA, USA,* [3]*Maastricht University Medical Center, Maastricht, The Netherlands,* [4]*Oregon Health and Science University, Portland, OR, USA,* [5]*UCB Pharma, Brussels, Belgium,* [6]*UCB Pharma, Monheim, Germany,* [7]*Amsterdam and Atrium Medical Center, Heerlen, The Netherlands*

OBJECTIVES: To report the effect of certolizumab pegol (CZP), a PEGylated Fc-free anti-TNF, on patient-reported outcomes (PROs) in axial spondyloarthritis (axSpA), including ankylosing spondylitis (AS) and non-radiographic axSpA (nr-axSpA), over 48 weeks (wks) in the RAPID-axSpA trial. **METHODS:** The ongoing RAPID-axSpA trial (NCT01087762) is double-blind and placebo (PBO)-controlled to Wk24 and dose-blind to Wk48. Patient (pts) fulfilled ASAS criteria and had active axSpA. Pts originally randomized to CZP (200mg Q2W or 400mg Q4W, following 400mg loading dose at Wks 0, 2, 4) continued on their assigned dose in dose-blind phase; PBO pts entering dose-blind phase were re-randomized to CZP loading dose followed by CZP 200mg Q2W or 400mg Q4W. We report efficacy data for the full analysis set (FAS) originally randomized to CZP. PRO endpoints included physical function (BASFI), total spinal pain, fatigue (from BASDAI), ASQoL, Sleep Problems Index II domain of MOS Sleep scale, and SF-36. Missing data were imputed by LOCF. **RESULTS:** Of 111 and 107 pts randomized to CZP 200mg Q2W and 400mg Q4W, 105(94.6%) and 98(91.6%) completed the double-blind period, and 98(88.3%) and 93(86.9%) completed the dose-blind period. Rapid improvements from baseline to Wk24 were maintained to Wk48, for both CZP 200mg Q2W and 400mg Q2W, in total spinal pain (Wk24: -3.3 and -3.2; Wk48: -3.6 and -3.5), fatigue (Wk24: -2.6 and -2.8; Wk48: -2.8 and -2.9), BASFI (Wk24: -2.4 and -2.3; Wk48: -2.6 and -2.4), ASQoL (Wk24: -5.1 and -5.1; Wk48: -6.0 and -5.6) and sleep (Wk24: -12.7 and -12.9; Wk48: -14.7 and -14.2). CZP-treated pts also maintained improvements in SF-36 components and domains. Similar outcomes were seen in AS and nr-axSpA populations. **CONCLUSIONS:** Improvements in PROs observed with both CZP dosing regimens were maintained over 48 wks, including those in pain, fatigue, physical function and HRQoL. Maintenance was observed in both AS and nr-axSpA pts.

PMS81

LONG-TERM MAINTENANCE OF IMPROVEMENTS IN MULTIPLE FACETS OF PSORIATIC ARTHRITIS WITH CERTOLIZUMAB PEGOL: 48-WEEK PATIENT-REPORTED OUTCOME RESULTS OF THE RAPID-PSA STUDY

Gladman D[1], Fleischmann R[2], Coteur G[3], Peterson L[4], Mease PJ[5]
[1]*University of Toronto, Toronto, Ontario, ON, Canada,* [2]*Metroplex Clinical Research Center, Dallas, TX, USA,* [3]*UCB Pharma, Brussels, Belgium,* [4]*UCB Pharma, Raleigh, NC, USA,* [5]*Swedish Medical Center and University of Washington, Seattle, WA, USA*

OBJECTIVES: To report the effect of certolizumab pegol (CZP), a PEGylated Fc-free anti-TNF, on patient-reported outcomes (PROs) in psoriatic arthritis (PsA) over 48 weeks (wks) in the RAPID-PsA trial. **METHODS:** The ongoing RAPID-PsA trial (NCT01087788) is double-blind and placebo-controlled to Wk24 and dose-blind to Wk48. Patients (pts) had active PsA and had failed ≥1 DMARD. Pts originally randomized to CZP (200mg Q2W or 400mg Q4W, following 400mg loading dose at Wks 0, 2, 4) continued on their assigned dose in dose-blind phase; placebo pts entering dose-blind phase were re-randomized to CZP loading dose followed by CZP 200mg Q2W or 400mg Q4W. We report efficacy data for the randomised set (RS) of pts originally randomized to CZP. Mean changes from baseline in patient assessment of pain (VAS), fatigue assessment scale (NRS), HAQ-DI, SF-36, PsAQoL and Dermatology Life Quality Index (DLQI) were assessed with LOCF imputation. **RESULTS:** Of 138 and 135 pts randomized to CZP 200mg Q2W and 400mg Q4W, 128 (92.8%) and 120 (88.9%) completed the double-blind period, and 123 (89.1%) and 114 (84.4%) completed the dose-blind period, respectively. Rapid improvements from baseline to Wk24 observed in double-blind period were maintained to Wk48 for pain (Wk24: -28.6 and -28.4; Wk48: -31.6 and -29.5), fatigue (Wk24: -2.2 and -1.9; Wk48: -2.4 and -2.0), HAQ-DI (Wk24: -0.52 and -0.43; Wk48: -0.56 and -0.49), SF-36 physical component summary (Wk24: 8.4 and 7.6; Wk48: 8.6 and 8.4) and mental component summary (Wk24: 5.5 and 3.5; Wk48: 4.8 and 3.2), PsAQoL (Wk24: -4.4 and -3.3; Wk48: -4.8 and -3.5), and DLQI (Wk24: -6.3 and -5.2; Wk48: -6.2 and -5.6) for CZP 200mg Q2W and 400mg Q4W patients, respectively. **CONCLUSIONS:** Improvements in generic and disease-specific PROs observed over 24 wks were sustained over 48 wks in CZP-treated PsA pts. Improvements were observed regardless of CZP dose regimen.

PMS82

EXPANDING THE MEASUREMENT OF TREATMENT BENEFIT IN RHEUMATOID ARTHRITIS: THE ROLE OF THE PATIENT-REPORTED OUTCOME CONSORTIUM'S RA WORKING GROUP

Naegeli AN[1], Nikaï E[2], Burke LB[3], Coons SJ[4], Strand V[5], Simon LS[6], Piault E[7], Hayes RP[1]
[1]*Eli Lilly and Company, Indianapolis, IN, USA,* [2]*UCB Pharma S.A., Brussels, Belgium,* [3]*CDER FDA, Silver Spring, MD, USA,* [4]*Critical Path Institute, Tucson, AZ, USA,* [5]*Stanford University, Palo Alto, CA, USA,* [6]*SDG LLC, Cambridge, MA, USA,* [7]*Genentech, San Francisco, CA, USA*

OBJECTIVES: To develop a patient-reported outcome (PRO) instrument that can be qualified by the Food and Drug Administration (FDA) for use in rheumatoid arthritis (RA) randomized controlled trials (RCTs) to support treatment benefit claims. **METHODS:** On August 28, 2012, a consensus development workshop was held by the RA Working Group (WG) within the Critical Path Institute's PRO Consortium to identify RA-related PRO concepts to determine their potential role in the documentation of treatment benefit in RA RCTs. Key stakeholders participated in this one-day meeting, including RA patients, representatives from the FDA (Division of Pulmonary, Allergy, and Rheumatology Products [DPARP] and Study Endpoints and Labeling Development [SEALD]), experts from the American College of Rheumatology (ACR), European League Against Rheumatism (EULAR), Outcome Measures in Rheumatology (OMERACT), National Institutes of Health (NIH, NIAMS) and the pharmaceutical industry (RA WG members). **RESULTS:** Over the course of the workshop, a consensus emerged that there are several outcomes important to RA patients not explicitly assessed by the ACR response criteria (i.e., fatigue, stiffness, and social participation). Finally, consensus amongst the various stakeholders was reached that any new measure needs to provide information over and above what is currently captured by the traditional primary composite endpoints and the priority would be to focus on FDA qualification of a PRO measure evaluating RA-related fatigue. **CONCLUSIONS:** The RA WG is initiating a collaboration with clinical experts through OMERACT to provide an operational definition of fatigue and to develop a conceptual framework to support its measurement in clinical trials. Following this preliminary step, qualitative and quantitative steps will be launched to develop the fatigue measure.

SHORT RUN DYNAMICS OF INADEQUATE PAIN RELIEF (IPR): EVIDENCE FROM A EUROPEAN MULTINATIONAL SURVEY OF REAL WORLD THERAPIES (SORT)

Mavros P[1], Black CM[1], Peloso PM[1], Stokes L[2], Philips C[3], Moore A[4], Conaghan P[5], Rannou F[6], Arden N[7], van de Laar M[8], Taylor SD[1]
[1]*Merck Sharp & Dohme Corp., a subsidiary of Merck & Co., Inc., Whitehouse Station, NJ, USA,* [2]*Merck & Co., Inc., Whitehouse Station, NJ, USA,* [3]*Swansea University, Wales, UK,* [4]*University of Oxford, Oxford, UK,* [5]*University of Leeds, Leeds, UK,* [6]*University of Paris, Paris, France,* [7]*University of Southampton, Southampton, UK, UK,* [8]*University of Twente, Enschede, The Netherlands*

Osteoarthritis (OA) is the most prevalent musculoskeletal disorder and has been associated with poorer quality of life for patients who experience heightened pain and decreased functionality. Despite the importance of OA management in clinical practice settings, there has been limited evidence confirming the adequacy of pain relief in patients with knee OA who take analgesics to manage their symptoms. **OBJECTIVES:** To assess changes in pain relief states in the short run (30 days) and evaluate associated changes in outcome measures: SF-12, Brief Pain Inventory (BPI) and WOMAC in participants with knee OA. **METHODS:** The Survey of Real World Therapies (SORT), a 12-month prospective study across 6 EU countries (N=1,254), enrolled participants > 50 years old with knee OA who were prescribed analgesics. Patient-reported outcomes measures were collected at baseline and one month post baseline: BPI, SF-12 and WOMAC. Inadequate pain relief (IPR) was defined as BPI pain score of "moderate or greater pain" (>4). **RESULTS:** A total of 1153 participants were included: 67.3% women; mean age 68 years (SD=9.4); mean OA duration 5.9 years (SD=6.2). 54% of participants reported experiencing IPR. After 30 days, 28% of participants reported changes in pain relief, which was equally distributed (14% each) between the two baseline pain-relief states. Changes in IPR states were significantly associated with changes in SF-12 composite summary scores and WOMAC subscales. Patients who reported improvements in pain scores showed statistically significant improvements in average pain (2.7 points) and both QOL composite measures ($p<0.01$): WOMAC subscales improvement ranged from 8-11 points and the Physical and Mental Component Summaries scores decreased 1.83 and 1.79 points, respectively. Those who experienced worsening pain had an increase in average pain of 2.7 points on the BPI. These participants showed statistically significant decreases in QOL - WOMAC scores decreased between 4-9 points and PCS and MCS scores increased 2.10 and 2.27 points, respectively. **CONCLUSIONS:** Changes in pain states were significantly associated with overall quality of life and physical function.

PMS84

HEALTH OUTCOMES AND ECONOMIC BURDEN OF POST-KNEE REPLACEMENT SURGERY IN OSTEOARTHRITIS PATIENTS: COMPARISON WITH MATCHED CONTROLS

Pignot M[1], DiBonaventura M[2]
[1]*Kantar Health, München, Germany,* [2]*Kantar Health, New York, NY, USA*

OBJECTIVES: Osteoarthritis (OA), a degenerative condition of the articular cartilage, primarily affects the knee joint and surgery is often required for late-stage patients. The number of total knee arthroplasties (TKAs) is expected to grow to 3.48 million procedures by 2030 in the US alone. However, the devices lack an ideal safety profile. The objective of this study was to examine real-world outcomes among OA patients post-knee replacement. **METHODS:** Data from the 2012 U.S. National Health and

Wellness Survey, an Internet health survey administered to a representative sample of adults, were used. Respondents who reported experiencing OA, with the knee being the only joint affected, and who reported having had joint surgery in the past year were considered to have had a knee replacement. A matched control group was identified as a comparator to the knee replacement group by using a propensity score matching method (matching variables include demographics and health history). Knee replacement respondents and matched controls were compared with respect to the Short Form-36v2, activity impairment (from the Work Productivity and Activity Impairment questionnaire), and health care resource utilization using ANOVA tests. **RESULTS:** A total of 102 respondents were identified as part of the knee replacement group (52.0% male, 57.9 years). Compared with matched controls (n=102), those in the knee replacement group reported significantly worse physical health status (42.5 vs. 47.6, p<.05) though equivalent mental health status (49.7 vs. 49.0, p=.67). Levels of activity impairment (38.0% vs. 27.0% impairment, p<.05) and health care resource utilization (physician visits: 7.3 vs. 4.5, p<.05; emergency room visits: 0.6 vs. 0.2, p<.05; and hospitalizations: 0.6 vs. 0.2, p<.05) were all significantly higher among the knee replacement group relative to matched controls. **CONCLUSIONS:** These results suggest a significant burden among knee replacement respondents across both health status and economic outcomes. Improved management of these patients may have significant societal benefits.

PMS85

COMPARING HEALTH-RELATED QUALITY OF LIFE ACROSS RHEUMATOID ARTHRITIS, PSORIATIC ARTHRITIS AND AXIAL SPONDYLOARTHRITIS: ANALYSES FROM CERTOLIZUMAB PEGOL CLINICAL TRIAL BASELINE DATA

Mease PJ[1], van Tubergen A[2], Deodhar A[3], Coteur G[4], Nurminen T[5], van der Heijde D[6]
[1]*Swedish Medical Center and University of Washington, Seattle, WA, USA,* [2]*Maastricht University Medical Center, Maastricht, The Netherlands,* [3]*Oregon Health and Science University, Portland, OR, USA,* [4]*UCB Pharma, Brussels, Belgium,* [5]*UCB Pharma, Monheim, Germany,* [6]*Leiden University Medical Centre, Leiden, The Netherlands*

OBJECTIVES: Inflammatory diseases such as rheumatoid arthritis (RA), psoriatic arthritis (PsA) and axial spondyloarthritis (axSpA) are associated with significant burden on patients' (pts) health-related quality of life (HRQoL). The objective was to compare HRQoL across RA, PsA and axSpA populations. **METHODS:** Baseline data used from: RA pooled RAPID1 (NCT00152386) and RAPID2 (NCT00160602), RAPID-PsA (NCT01087788) and RAPID-axSpA (NCT01087762). Differences between SF-36 HRQoL scores and US general population age/gender-matched population norms were calculated and descriptively compared between the overall RA, PsA and axSpA populations, PsA subpopulations with skin involvement (≥3% body surface area) and without, and axSpA subpopulations of ankylosing spondylitis (AS) and non-radiographic axSpA (nr-axSpA). Physical function was assessed using HAQ-DI in RA and PsA, and was also compared between PsA subpopulations. **RESULTS:** Comparison of SF-36 score decrement vs population norms (mean±SD) revealed axSpA pts (N=317) experienced a higher burden on overall physical HRQoL (-19.3±7.5) compared to RA (N=1535; -17.4±7.0) and PsA (N=403; -16.6±8.0) pts, while RA pts reported a higher psychological burden (-11.3±11.2) compared to axSpA (-9.3±12.3) and PsA (-8.6±12.2) pts. Comparison of HAQ-DI scores revealed RA pts experienced greater difficulties in all physical function aspects assessed, compared to PsA pts. For axSpA pts, the burden of disease (SF-36 scores) was similar between AS and nr-axSpA subgroups. For PsA pts, comparison of HRQoL scores confirmed that skin involvement does not significantly add to the physical health burden of disease but adds to some of the psycho-social aspects (eg. social function). **CONCLUSIONS:** Trends suggested axSpA had the highest burden on overall physical HRQoL followed by RA and PsA, while the burden on overall mental HRQoL was highest in RA followed by axSpA and PsA. HRQoL burden in axSpA did not appear different between subpopulations, however the presence of skin involvement in PsA was associated with a higher burden on social function.

PMS86

LONG-TERM BENEFITS OVER MORE THAN 4 YEARS OF CERTOLIZUMAB PEGOL COMBINATION THERAPY ON WORKPLACE AND HOUSEHOLD PRODUCTIVITY, AND PARTICIPATION IN SOCIAL ACTIVITIES IN RHEUMATOID ARTHRITIS: RESULTS FROM THE OPEN-LABEL EXTENSION STUDY OF RAPID1

Kavanaugh A[1], Smolen JS[2], Emery P[3], Keystone E[4], Strand V[5], Purcaru O[6], van Vollenhoven R[7]
[1]*UCSD, San Diego, CA, USA,* [2]*Medical University of Vienna and Hietzing Hospital, Vienna, Austria,* [3]*University of Leeds School of Medicine, Leeds, UK,* [4]*University of Toronto, Toronto, ON, Canada,* [5]*Stanford University, Palo Alto, CA, USA,* [6]*UCB Pharma, Brussels, Belgium,* [7]*Karolinska Institute, Stockholm, Sweden*

OBJECTIVES: In the RAPID1 randomized controlled trial (RCT; NCT00152386), certolizumab pegol (CZP) every 2 weeks (Q2W) plus MTX provided rapid improvements in clinical measures, and workplace and household productivity over 52 weeks (wks) in patients (pts) with active rheumatoid arthritis (RA). We report the long-term effect of CZP+MTX Q2W on workplace and household productivity and social participation in RA pts from the RAPID1 open-label extension (OLE; NCT00175877). **METHODS:** RAPID1 52-wk Completers and Wk16 Withdrawers were eligible for treatment in OLE with CZP 400mg Q2W +MTX, reduced per study protocol to 200mg Q2W +MTX after ≥6 months in OLE. Workplace and household productivity were assessed through the validated RA-specific Work Productivity Survey (WPS-RA). WPS-RA responses (observed cases) are summarized for CZP RCT Completers who enrolled in OLE and completed WPS-RA at OLE completion/withdrawal visit (C/W). **RESULTS:** Of CZP Completers who enrolled in OLE (N=508), 388 remained at Wk208 (4yrs) and a subset of 290 completed WPS-RA at OLE C/W (after minimum 4.3 and maximum 6.2 years CZP treatment from RCT baseline [BL]). Of these pts at RCT BL (N=267), 49% were employed outside the home, 21% were RA work-disabled, 14% were homemakers and 13% were retired. Employed pts reported long-term reductions in absenteeism [mean BL:3.7 (N=131), C/W:0.1 (N=129)], number of days with decreased productivity (presenteeism) (mean BL:7.8, C/W:0.4) and level of RA interference with work productivity (mean BL:5.0, C/W:1.3, on 0–10 scale) per month. Similar decreases were reported in the number of household work days missed (mean BL:8.1, C/W:1.0), days with ≥50% decreased household productivity (mean BL:10.5, C/W:1.2), RA interference with household productivity (mean BL:6.2, C/W:2.0) and days missed per month of family/social/leisure activity (mean BL:5.8, C/W:0.7). **CONCLUSIONS:** In the RAPID1 OLE, CZP Q2W plus MTX maintained improvements in workplace and household productivity and increased social activity participation over >4yrs.

PMS87

CONTINUED IMPROVEMENTS IN WORKPLACE AND HOUSEHOLD PRODUCTIVITY WITH CERTOLIZUMAB PEGOL TREATMENT IN AXIAL SPONDYLOARTHRITIS, INCLUDING ANKYLOSING SPONDYLITIS AND NON-RADIOGRAPHIC AXIAL SPONDYLOARTHRITIS: 48-WEEK RESULTS FROM THE RAPID-AXSPA STUDY

van der Heijde D[1], Braun J[2], Rudwaleit M[3], Purcaru O[4], Kavanaugh A[5]
[1]*Leiden University Medical Centre, Leiden, The Netherlands,* [2]*Rheumazentrum Ruhrgebiet, Herne, Germany,* [3]*Endokrinologikum Berlin, Berlin, Germany,* [4]*UCB Pharma, Brussels, Belgium,* [5]*UCSD, San Diego, CA, USA*

OBJECTIVES: Investigate certolizumab pegol (CZP) effect on workplace and household productivity up to 48 weeks (wks) in patients (pts) with axial spondyloarthritis (axSpA), including ankylosing spondylitis (AS, meeting modified New York criteria) and non-radiographic axSpA (nr-axSpA). **METHODS:** The ongoing RAPID-axSpA trial (NCT01087762) is double-blind and placebo-controlled to Wk24 and dose-blind to Wk48. Pts had active axSpA, according to ASAS criteria, including AS and nr-axSpA. Pts originally randomized to CZP (200mg Q2W or 400mg Q4W, following 400mg loading dose at Wks 0, 2, 4) continued on their assigned dose in dose-blind phase; placebo pts entering dose-blind phase were re-randomized to CZP loading dose, followed by CZP 200mg Q2W or 400mg Q4W. The validated arthritis-specific Work Productivity Survey (WPS; administered Q4W) assessed the impact of axSpA on workplace and household productivity. WPS responses (LOCF imputation) in pts originally randomized to CZP in the full analysis set (FAS) are summarized descriptively over 48 wks. **RESULTS:** A total of 325 pts were randomized, of which 218 were assigned to CZP 200mg Q2W or CZP 400mg Q4W. 69.4% and 74.9% of pts were employed at baseline (BL) in the CZP 200mg Q2W and CZP 400mg Q4W groups, respectively. By Wk48, employed CZP pts reported reduced workplace absenteeism (Wk48: mean 0.4 and 0.1 days missed/month for CZP 200 mg Q2W and 400 mg Q4W, respectively vs BL: mean 2.3 and 1.4 days/month) and presenteeism (Wk48: mean 1.0 and 1.6 days with reduced productivity/month vs BL: mean 5.8 and 4.7 days/month). Continued improvements in both CZP groups to Wk48 were also observed in household productivity and participation in social/leisure activities. Similar improvements were seen in AS and nr-axSpA populations. **CONCLUSIONS:** The initial improvements with CZP in workplace and household productivity and increased participation in social/leisure activities observed over 24 wks were continued to Wk48 in axSpA, AS and nr-axSpA pts.

PMS88

SUSTAINED IMPROVEMENTS IN PRODUCTIVITY AT PAID WORK AND WITHIN HOUSEHOLD, AND INCREASED PARTICIPATION IN DAILY ACTIVITIES OVER TIME WITH CERTOLIZUMAB PEGOL IN PATIENTS WITH PSORIATIC ARTHRITIS: 48-WEEK RESULTS FROM THE RAPID-PSA STUDY

Kavanaugh A[1], Gladman D[2], van der Heijde D[3], Purcaru O[4], Mease PJ[5]
[1]*UCSD, San Diego, CA, USA,* [2]*University of Toronto, Toronto, ON, Canada,* [3]*Leiden University Medical Centre, Leiden, The Netherlands,* [4]*UCB Pharma, Brussels, Belgium,* [5]*Swedish Medical Center and University of Washington, Seattle, WA, USA*

OBJECTIVES: To examine the effect of certolizumab pegol (CZP) on workplace and household productivity up to 48 weeks (wks), in patients (pts) with active psoriatic arthritis (PsA). **METHODS:** The ongoing RAPID-PsA trial (NCT01087788) is double-blind and placebo-controlled to Wk24 and dose-blind to Wk48. Pts had active PsA and had failed ≥1 DMARD. Pts originally randomized to CZP (200mg Q2W or 400mg Q4W, following 400mg loading dose at Wks 0, 2, 4) continued on their assigned dose in dose-blind phase; placebo pts entering dose-blind phase were re-randomized to CZP loading dose, followed by CZP 200mg Q2W or CZP 400mg Q4W. This publication reports data for pts in the randomised set (RS) originally randomized to CZP. The validated arthritis-specific Work Productivity Survey (WPS), administered Q4W from baseline (BL), assessed the impact of PsA on workplace and household productivity. WPS responses (LOCF imputation) in both CZP groups are summarized descriptively over 48 wks. **RESULTS:** 409 pts were randomized, of which 273 were assigned to CZP 200mg Q2W or CZP 400mg Q4W. 87% of patients randomized to CZP completed to Wk48. 60.1% and 61.5% were employed at BL in the CZP 200mg Q2W and CZP 400mg Q4W groups, respectively. By Wk48, employed CZP pts reported reduced workplace absenteeism (Wk48: mean 0.1 and 0.6 days missed/month for CZP 200mg Q2W and 400mg Q4W, respectively vs BL: mean 2.0 and 1.6 days/month) and presenteeism (Wk48: mean 0.8 and 1.9 days with reduced productivity/month vs BL: mean 5.2 and 5.1 days/month). CZP groups also reported improvements in household productivity and increased participation in social/leisure activities up to Wk48. **CONCLUSIONS:** The initial improvements with CZP in workplace and household productivity, and participation in social/leisure activities observed over 24 wks were maintained over 48 wks in PsA pts.

PMS89

FACTORS ASSOCIATED WITH ABSENTEEISM IN RHEUMATOID ARTHRITIS PATIENTS IN EMPLOYMENT: RESULTS OF A SURVEY AMONG FRENCH PATIENTS

Fagnani F[1], Duburcq A[1], Woronoff AS[2], Chauvin P[3], Cukierman G[4], Tropé-Chirol S[2], Joubert JM[4], Bertin P[5]
[1]*Cemka-Eval, Bourg la Reine, France,* [2]*ANDAR, Paris, France,* [3]*INSERM, Paris, France,* [4]*UCB Pharma, Colombes, France,* [5]*CHU Dupuytren, Limoges, France*

OBJECTIVES: To investigate the contribution of different socio-economic and clinical factors to absenteeism in the workplace in a population of Rheumatoid Arthritis (RA) patients currently in employment. **METHODS:** A national retrospective survey was conducted in French RA patients (age <60, either employed or unemployed) recruited by rheumatologists or who were members of a patients' association (ANDAR). Patient-reported outcomes, socio-economic characteristics and various measures of productivity loss were collected using structured telephone interviews. Multivariate

regression analyses were performed to identify the contributing factors to absenteeism. **RESULTS:** A sample of 503 patients agreed to participate, of which 488 were evaluable. 364 patients (74.6%) were in employment, 31 (6.4%) were unemployed and 93 (19.1%) were out of the labor market. Among the 364 patients currently in employment, 102 (28.0%), 138 (37.9%) and 124 (34.1%) were in ACR functional class of I, II and III/IV, respectively. The mean HAQ scores were 0.6, 1.4 and 1.5 (p<0.0001), and 2.9%, 16.7% and 29.0% (p<0.0001), respectively, had an occupational disability status. An overall proportion of 48.3% patients declared an RA associated work absence over the last year. This proportion increased from 28.4% in ACR I to 62% in ACR III/IV group, and from 7.8% to 31.4% (p<0.0001), respectively, for absence >1 month. Despite a high uptake of biologic agents (60.4%) among these patients, RA was active for a significant period of time; mean 2.2 (±3.2) months in ACR I group and 4.8 (±4.2) months in ACR III/IV group. Regression analyses suggested that ACR functional class and frequencies and duration of flares were the major factors contributing to absenteeism, far ahead of any other socio-economic characteristics. **CONCLUSIONS:** Loss of productivity due to RA could be further reduced through better control of disease activity.

MUSCULAR-SKELETAL DISORDERS – Health Care Use & Policy Studies

A REVIEW OF COST-EFFECTIVENESS EVALUATIONS AS PART OF NATIONAL HTA ASSESSMENTS OF BIOLOGIC DMARDS IN THE TREATMENT OF RHEUMATOID ARTHRITIS

Iannazzo S[1], De Francesco M[2], Gomez-Ulloa D[3], Benucci M[4]
[1]*IMS Health, Milano, Italy,* [2]*IMS Health, Milan, Italy,* [3]*IMS Health, Barcelona, Spain,* [4]*Hospital S. Giovanni di Dio, Florence, Italy*

OBJECTIVES: Rheumatoid arthritis is an autoimmune chronic disease which is associated with an increasing disability of patients and high socioeconomic burden. Given the large number of economic evaluations considered by national HTAs, this review attempts to clarify whether biologic DMARDs cost-effectiveness and cost-utility results form the basis for official recommendation by national HTA agencies. **METHODS:** Both older biologic anti-TNFα drugs (etanercept, infliximab and adalimumab) and novel bDMARDs (abatacept, tocilizumab, certolizumab, golimumab and rituximab) were considered. All main HTA agencies were searched for published economic evaluations up to 2012. Documents were selected if they included cost-effectiveness or cost-utility as outcome, if they referred to at least one of the drugs of interest, if they were published in English and if they were not superseded by other analysis. PICO statements were used to define exclusion criteria. **RESULTS:** Of the 65 documents initially identified through the search strategy, 20 documents were selected. The associated HTA agencies were PBAC (Australia), CADTH (Canada), SMC (Scotland) and NICE (England). In relation to older anti-TNFα, documents published by NICE were found to be the only explicitly recommending the drugs on the basis of obtained cost-utility results. Economic evaluations of novel bDMARDs published by SMC and NICE appeared to inform HTA decisions not to recommend abatacept and to list all other drugs conditional on price facilitation and following failure of rituximab. By contrast, cost-utility analysis published by PBAC and CADTH did not appear to influence official recommendations on novel biologic DMARDs. **CONCLUSIONS:** Cost-effectiveness and cost-utility evidence was not equally perceived by decison makers and did not have equal weight in defining the official listing of biologic DMARDs for the treatment of RA. Further research should therefore address methods for a greater integration between health economic analysis and final decisions taken by National HTA agencies.

PMS91
COST-EFFECTIVENESS ANALYSIS OF ALENDRONATE THERAPY FOR SECONDARY PREVENTION OF OSTEOPOROTIC FRACTURES

Moriwaki K[1], Komaba H[2], Noto S[1], Yanagisawa S[3], Takiguchi T[1], Toujo T[1], Inoue H[1], Fukagawa M[2], Takahashi HE[1]
[1]*Niigata University of Health and Welfare, Niigata, Japan,* [2]*Tokai University School of Medicine, Isehara, Japan,* [3]*Faculty of Pharmaceutical Sciences, Himeji Dokkyo University, Himeji, Japan*

OBJECTIVES: Although osteoporotic fractures impose a heavy financial burden on society as a whole, only 20% of patients with osteoporosis and in risk of fracture are being treated. The purpose of this study was to estimate the cost-effectiveness of alendronate therapy for secondary prevention of osteoporotic fractures in Japan. **METHODS:** A patient-level simulation model with nine health states was developed to predict lifetime costs and quality-adjusted life years (QALYs) of five years of alendronate therapy versus no preventive treatment for Japanese women with osteoporosis, who have a history of hip fracture. Fracture risk associated with age and bone mineral density (BMD) was derived from epidemiologic studies in Japan. We ran the model with different combinations of age (50, 60, and 70), BMD (T-score of −2.5 and −2.0), and BMD-independent fracture risk factors. **RESULTS:** For patients with T-score of -2.0 having no additional risk factors, the incremental cost-effectiveness ratio (ICER) of alendronate was $3,023 and $7,389 per QALY gained for those aged 60 and 70 years, respectively. In all other situations, alendronate was dominant over no preventive treatment, with lifetime cost savings ranging from $30,849 to $1,498,961. These results were fairly robust to variations in model parameters. **CONCLUSIONS:** Alendronate therapy for secondary fracture prevention in Japanese women with osteoporosis provided good value for money.

PMS92
COMPARISON OF CLINICAL CHARACTERISTICS OF PATIENTS WITH RHEUMATOID ARTHRITIS RECEIVING THEIR FIRST BIOLOGIC AND BIOLOGIC-NAÏVE PATIENTS CONSIDERED BIOLOGIC-SUITABLE IN THE UNITED STATES

Narayanan S[1], Baskett A[2], Lu Y[2], Hutchings R[2]
[1]*Ipsos Healthcare, Gaithersburg, MD, USA,* [2]*Ipsos Healthcare, London, UK*

OBJECTIVES: To assess clinical characteristics of RA patients considered suitable for biologic therapy (by their physicians) in comparison to those currently treated with 1st line biologics in the US. **METHODS:** A medical chart-review study of RA patients was conducted among physicians (primarily rheumatologists) in hospitals/private practices to collect de-identified data on patient diagnosis, treatment patterns/dynamics and patient symptomatology/disease status. Physicians from the US were screened for duration of practice and patient volume and recruited from a large panel to be geographically representative. Eligible patient charts (>6 biologic patients, > 2 biologic-suitable (and yet biologic-naïve) patients per physician judgment) were randomly selected from a sample of prospective patients visiting each center/practice during the screening period. **RESULTS:** Ninety-seven physicians abstracted 726 eligible RA patient charts; 378(52%) patients were on their first biologic and 175(24%) patients have never experienced biologic but were considered suitable for one. Mean age was: 1st line-52.8yrs, biologic-suitable-51.5yrs; Female: 1st line-73%, biologic-suitable-76%. Disease severity at diagnosis and current disease severity (both per physician judgment) (mild:moderate:severe) were: 1st line – 6%:74%:14% and 67%:29%:3%, biologic-suitable – 11%,74%, 10% and 25%:66%:9% respectively. Current drug class usage differed between the two groups (1st line/biologic-suitable): non-biological-DMARD (57%/88%), steroids (19%/36%), NSAIDs-COX2-inhibitors (6%/10%), NSAIDs- non-COX2-inhibitors (14%/22%), and analgesics (11%/12%). Key lab measures were (1st line/biologic-suitable): ESR(24.2/40.0 mm/h) and CRP(2.5mg/5.6 dl). Current ACR-scores were (1st line/biologic-suitable): no response(2%/19%), ACR20(12%/36%), ACR50(18%/15%), ACR70(20%/5%), ACR90(26%/1%). Among patients with available data, current HAQ (1st line-0.7, biological-suitable-1.1), DAS28 (1st line-2.5, biological-suitable-4.1), 100mmVAS (1st line-2.3, biological-suitable-4.6), Swollen Joint Count (1st line-2.0, biological-suitable-5.9) and Tender Joint Count (1st line-2.8, biological-suitable-7.0) differed between the patient groups. **CONCLUSIONS:** Compared to the patients currently treated with 1st line biologic, RA biologic-naïve but suitable patients (per physician judgment) had relatively higher disease burden. Reasons for non-initiation of biologic treatment among 'biologic-suitable' patients warrant further investigation to alleviate disease burden.

PMS93
COMPARISON OF DISEASE STATUS, TREATMENTS AND OUTCOMES OF PATIENTS WITH PSORIATIC ARTHRITIS RECEIVING THEIR FIRST BIOLOGIC IN THE EUROPEAN UNION AND UNITED STATES

Narayanan S[1], Baskett A[2], Lu Y[2], Hutchings R[2]
[1]*Ipsos Healthcare, Gaithersburg, MD, USA,* [2]*Ipsos Healthcare, London, UK*

OBJECTIVES: To compare the disease status and outcomes of patients with PsA receiving their first biologic in UK, Germany, France, Italy and Spain (5EU) with the US. **METHODS:** A multi-country multi-center medical chart-review study of PsA patients was conducted among physicians (majority: rheumatologists) in hospitals/private practices to collect de-identified data on patients who were recently treated with a biologic as part of usual care. Physicians were screened for duration of practice and patient volume and recruited from a large panel to be geographically representative in each country. Eligible PsA patient charts (>3) were randomly selected from a sample of prospective patients visiting each center/practice during the screening period. Physicians abstracted patient diagnosis, treatment patterns/dynamics and patient symptomatology/disease status/outcomes. **RESULTS:** In 4Q2012, 434 physicians (5EU:337, US:97) abstracted 790 eligible PsA patient charts (5EU:606, US:184); 674 (85%) (5EU:527, US:147) patients were on their first biologic (mean-age: 5EU:47.4yrs, US:47.6yrs; female: 5EU:48.6%, US:44.9%). Time-to-1st biologic from diagnosis (5EU:41.0months, US:27.2months) and time-on-current biologic (5EU:23.2months, US:36.7months) differed between regions. Top-2 biologic treatments observed were adalimumab (5EU:47%, US:47%) and etanercept (5EU:36%, US:32%). Among the top-4 reasons for biologic treatment initiation, 'mechanism of action', 'improve signs/symptoms', 'positive personal experience' and 'prevention of structural damage' were observed in both the 5EU and US. Key lab measures documented were: ESR (5EU:20.6mm/h, US:23.7mm/h) and CRP (5EU:9.4mg/dl, US:2.8mg/dl). Current disease severity per physician-judgment (mild:moderate:severe) was: 5EU-61%:33%:5%, US-73%:26%:1%. Among patients with available data, current HAQ (5EU:1.3, US:0.6), VAS provider score (5EU:3.1, US:2.6), VAS patient score (5EU:3.4, US:2.7) and Swollen Joint Count (5EU:2.0, US:1.7) differed across regions. **CONCLUSIONS:** Among PsA patients receiving their first biologic, disease severity and outcomes differed between 5EU and US, with patients in 5EU with relatively higher burden and poorer outcomes.

PMS94
PATTERNS OF DISEASE REMISSION AMONG PATIENTS WITH RHEUMATOID ARTHRITIS RECEIVING THEIR FIRST BIOLOGIC IN EUROPEAN UNION

Narayanan S[1], Baskett A[2], Lu Y[2], Hutchings R[2]
[1]*Ipsos Healthcare, Gaithersburg, MD, USA,* [2]*Ipsos Healthcare, London, UK*

OBJECTIVES: To assess the patterns of disease remission among RA patients receiving their first biologic in 5-EU countries, namely, UK, Germany(DE), France(FR), Italy(IT) & Spain(SP). **METHODS:** A multi-country multi-center medical chart-review study of RA patients was conducted among physicians (majority: rheumatologists) in hospitals/private practices to collect de-identified data on patients who were recently treated with a biologic as part of usual care. Physicians were screened for practice-duration and patient-volume and recruited from a large panel to be geographically representative in each country. Patient charts (>=5) were randomly selected within each center/practice. Physicians abstracted patient diagnosis, treatment patterns/dynamics and patient symptomatology/disease status (incl. assessment of 'disease remission', per physician clinical judgment). **RESULTS:** In 4Q2011, 370 physicians abstracted 2208 eligible RA patient charts (UK:410, FR:499, DE:404, IT:415, SP:480); patient mean-age:51yrs, female:71%; 75% and 20% were on 1st line and 2nd line biologic respectively. Overall, 53% of patients were in remission (UK:54%, FR:56%, DE:61%, IT:41%, SP:53%). Remission-rates differed by biologic lines: 1st-line:53%, 2nd-line:53%, 3rd-line:46%, 4th-line:42%, 5th-line:38%. Among those with lab measures, results differed between those in remission vs. those who were not: mean ESR(mm/h): 17.0vs.32.1, mean CRP(mg/dl): 7.0vs.15.6, mean MMP3(ng/ml): 2.8-vs-4.7, Rheumatoid Factor (% positive): 83%-vs-86% and Anti-CCP (% positive): 75%-vs-79%. Among those with data, recent (mean) disease severity scores

differed between those in remission vs. those who were not: Tender Joint Count: 2.3-vs-6.1, Swollen Joint Count: 1.2-vs-4.2, 100mm VAS score: 18.6-vs-42.8, HAQ: 0.7-vs-1.6 and DAS28: 2.6-vs-4.4. **CONCLUSIONS:** More than half of the patients were not in remission in this diverse cohort of RA patients in 5-EU and they experienced disproportionate level of disease burden. As the line of treatment increased, proportion of individuals achieving remission decreased. These observed patterns warrant further scrutiny to determine the best practices and improve remission rates, thereby alleviating patient burden.

PMS95

COMPARISON OF CLINICAL CHARACTERISTICS OF PATIENTS WITH RHEUMATOID ARTHRITIS RECEIVING THEIR FIRST BIOLOGIC IN EUROPE UNION AND THE UNITED STATES

Narayanan S[1], Baskett A[2], Lu Y[2], Hutchings R[2]
[1]*Ipsos Healthcare, Gaithersburg, MD, USA,* [2]*Ipsos Healthcare, London, UK*

OBJECTIVES: To assess the clinical characteristics of patients with RA receiving their first biologic in EU and the US. **METHODS:** A multi-country medical chart-review study of RA patients was conducted among physicians (majority: rheumatologists) in hospitals and private practices to collect de-identified data on patients who were recently treated with a biologic as part of usual care. Physicians from UK, Germany, France, Italy and Spain (5EU) and the US were screened for duration of practice and patient volume and recruited from a large panel to be geographically representative in each country. Eligible RA patient charts (>5) were randomly selected from a sample of prospective patients visiting each center/practice during the screening period. Physicians abstracted patient diagnosis, treatment patterns/dynamics and patient symptomatology/disease status. **RESULTS:** In 4Q2012, 434 physicians (5EU:337; US:97) abstracted 2085 (5EU:1534; US:551) eligible RA patient charts; current biologic patterns (5EU/US) were: 1st line (78%/69%), 2nd line (16%/21%) & 3rd+ line (6%/11%). 1577 (5EU:1199; US: 378) patients were on their first biologic. Mean age – 5EU:50.8yrs, US:52.8yrs; female – 5EU:73%; US:73%. Mean time-to-1st biologic (5EU/US) from diagnosis was 40/28 months; mean time on current 1st biologic (5EU/US) was 24/34 months. Top-3 biologic treatments observed were – etanercept (5EU/US:37%/42%), adalimumab (5EU/US:34%/32%), and infliximab (5EU/US:8%/10%). The top-5 reasons for biologic treatment initiation were the same across 5EU/US ('mechanism of action', 'improve signs/symptoms', 'prevent structural damage', 'positive personal experience', 'inhibits disease progression'). Key lab measures documented were (5EU/US): ESR (22.7/24.2mm/h) and CRP (10.9/2.5mg/dl). Current disease severity per physician judgment (mild:moderate:severe) were: 5EU-57%:37%:6%, US-67%:29%:3%. Among patients with available data, current HAQ (5EU:1.2/US:0.7), DAS28 (5EU:3.4/US:2.5), 100mmVAS (5EU:3.5/US:2.3), Swollen Joint Count (SWC) (5EU:2.6/US:2.0) and Tender Joint Count (TJC) (5EU:3.9/US:2.8) differed within between 5EU and US. **CONCLUSIONS:** Among RA patients receiving their first biologic, disease severity differed between 5EU and US, with patients in 5EU with relatively higher burden.

PMS96

PATIENT ELIGIBILITY AND USE OF BIOLOGICS IN RHEUMATOID ARTHRITIS, ANKYLOSING SPONDYLITIS AND PSORIATIC ARTHRITIS IN THE UNITED STATES

Narayanan S[1], Baskett A[2], Lu Y[2], Hutchings R[2]
[1]*Ipsos Healthcare, Gaithersburg, MD, USA,* [2]*Ipsos Healthcare, London, UK*

OBJECTIVES: To evaluate physician assessment of patient eligibility and eventual use of biologics in RA, AS, and PsA in the US. **METHODS:** A multi-country cross-sectional survey of physicians (primarily rheumatologists) was conducted in the US. Physicians were screened for biologic patient volume (>2RA biologic patients/week, >5AS biologic patients/month, >5PsA biologic patients/month) and recruited from a large physician-panel to be geographically representative. Practice characteristics, patient-volume, physician perceptions and practice patterns were assessed; physicians' target patient population was grouped into 2 categories, based on physician input: Group1 – patients perceived to be eligible for biologics, Group2 – patients who ended up receiving biologics within Group1. Summary statistics across the US are reported. **RESULTS:** In 4Q2012, 97 physicians participated in the study. Mean age: 47.6yrs; female: 30%. Main practice: private office (non-hospital):46%. Patient volume per physician was: total-1904, RA-419, AS-82, PsA-145. Average frequency of patient encounters were (RA/AS/PsA; weeks): 11/12/11. Physician judgment of patient disease severity were (average across their patients): RA – mild:28%/moderate:47%/severe:25%, AS – mild:31%/moderate:43%/severe:26% and PsA – mild:30%/moderate:44%/severe:27%. Physician assessment of patient eligibility and use of biologics were: within RA-mild-patients – Group1:21%/Group2:14%, within RA-moderate-patients – Group1:63%/Group2:51%, within RA-severe-patients – Group1:81%/Group2:70%; within AS-mild-patients – Group1:32%/Group2:24%, within AS-moderate-patients – Group1:66%/Group2:55%, within AS-severe-patients – Group1:79%/Group2:69%; within PsA-mild-patients – Group1:30%/Group2:23%, within PsA-moderate-patients – Group1:66%/Group2:55%, within PsA-severe-patients – Group1:81%/Group2:71%. Among the top-3 biologic treatments used, etanercept, adalimumab, and infliximab were observed throughout RA, AS and PsA. **CONCLUSIONS:** Across the markets, between 30-45% of biologic eligible patients (per physician perception) within moderate/severe disease severity groups did not end up receiving a biologic therapy across RA/AS/PsA cohorts. Reasons behind these patterns and the impact on subsequent patient outcomes warrant further scrutiny.

PMS97

DISEASE BURDEN AMONG PATIENTS WITH PSORIATIC ARTHRITIS WHO HAVE EXPERIENCED FIRST LINE TUMOR NECROSIS FACTOR INHIBITOR REGIMEN FAILURE IN THE EUROPEAN UNION

Narayanan S[1], Lu Y[2], Hutchings R[2], Baskett A[2]
[1]*Ipsos Healthcare, Gaithersburg, MD, USA,* [2]*Ipsos Healthcare, London, UK*

OBJECTIVES: To assess treatment patterns and disease burden among PsA patients on 2nd-line biologics after 1st-line anti-TNF failure. **METHODS:** A multi-country chart-review study of PsA patients was conducted among physicians in hospitals/private practices to collect de-identified data on patients recently treated with a biologic as part of usual care. Physicians from UK/Germany/France/Italy/Spain (5EU) were screened for practice-duration and patient-volume and recruited from a large panel to be geographically representative in each country. Eligible patient charts (>2) were randomly selected from a sample of prospective patients visiting each center/practice during the screening period. Physicians abstracted patient diagnosis, treatment patterns/dynamics and patient symptomatology/disease status. **RESULTS:** Between Jan2011-Dec2012, 454 PsA patients (mean age:48.8yrs;female:49.6%) on 2nd-line biologic after 1st-line anti-TNF failure were identified. Mean time-to-1st-line anti-TNF from diagnosis was 51.6months; mean time on 1st-line anti-TNF was 18.3months (patients <6/7-12/13-24/>24months:33%/21%/19%/27%). Top-3 1st line anti-TNFs observed were: etanercept(38%), adalimumab(32%), and infliximab(27%). The top-5 reasons for 1st-line anti-TNF discontinuation were 'long-term efficacy failure', 'disease worsened', 'side-effects not tolerated', 'insufficient-improvement', and 'initial failure of efficacy'. Mean time on current 2nd-line biologic was 18.5months (patients <6/7-12/13-24/>24months:28%/21%/25%/27%). Current 2nd-line biologics (top-5) included: adalimumab(39%)/etanercept(31%)/infliximab(14%)/golimumab(11%)/abatacept(2%). Top-5 reasons for choice of 2nd-line biologic were 'mechanism of action', 'prevention of structural damage', 'improve signs/symptoms', 'disease worsened', 'positive personal experience'. Key lab measures documented were: ESR-21.7mm/h and CRP-8.3mg/dl. Among patients with available data, current HAQ was 1.1, Swollen Joint Count was 1.9 and Tender Joint Count was 3.4. Current disease severity per physician judgment (mild:moderate:severe) were: 48%:47%:5%. Current disease severity (mild:moderate:severe) by time on 1st line anti-TNF biologic (<6/7-12/13-24/>24months) were 47%:48%:5% / 55%:42%:3% / 49%:48%:4% / 44%:49%:7% respectively. **CONCLUSIONS:** Among PsA pts on their 2nd biologic who experienced anti-TNF failure, 54% discontinued their 1st line anti-TNF regimen within 12months of initiation and continue to have considerable disease burden despite current 2nd line biologic.

PMS98

ECONOMIC IMPACT ASSOCIATED WITH A BIOLOGICAL THERAPY PRIORITIZATION PROTOCOL IN RHEUMATOID ARTHRITIS PATIENTS IN THE HOSPITAL OF SAGUNTO

Borrás-Blasco J[1], Gracia-Pérez A[1], Castera DE[1], Rosique JD[1], Abad FJ[1], González Álvarez A[2]
[1]*Hospital de Sagunto, Sagunto, Spain,* [2]*Hospital Obispo Polanco, Teruel, Spain*

OBJECTIVES: Until 2010 the cost of biological treatments in Rheumatoid Arthritis (RA) was increased annually by 15% in our hospital. In 1st January 2011, a Hospital Commission and Protocol of Biological Therapies were created to improve the cost-effectiveness usage of biological drugs in RA. To evaluate the economic impact associated with a biological therapy prioritization Protocol for RA patients in the Hospital of Sagunto. **METHODS:** Observational, ambispective study comparing the associated cost of biotreated RA patients pre-protocol (2009-2010) versus post-protocol periods (2011-2012). Inclusion criteria: RA patients treated with Abatacept (ABA) Adalimumab (ADA), Etanercept (ETN) or Infliximab (IFX) for at least 6 months during the study period (2009-2012). ETN was selected as 1st line therapy because our successful experience of ETN 25 mg/weekly in certain RA patients, its subcutaneous administration and lowest theoretical cost per patient in Spain. Cost savings and economic impact were calculated using Spanish official prices. **RESULTS:** In the pre-protocol period (2009-2010), total expenses were increased by 110,000€, up to 1,761,000€ in 2010 (11,362€ pat/year). After protocol implementation, total expenses decreased by 53,676€ on the 2010-2011 period, and 149,200€ on the 2011-2012 period. On the 2010-2011 period the cost of biological therapy per patient-year decreased 355€ (11,007€ pat/year) and additional 653€ (up to 10,354€ pat/year) by 2012, with a cumulative effect of the protocol implementation of 1,008€ per patient-year. In the pre-protocol period, the annual cost/patient was 10.812€ with ETN, 10.942€ with IFX, 12.961€ with ADA and 12.739€ with ABA. By 1st Jan 2013, the annual cost per patient was 9,469€ with ETN, 10,579€ with IFX, 11,117€ with ADA and 13,540€ with ABA. **CONCLUSIONS:** The creation of our Commission of Biological Therapies is key to rational management of RA patients and optimization of resources, allowing us to save 200,000€ after 2-year efficiency protocol implementation.

PMS99

REAL WORLD UTILIZATION OF BIOLOGICAL AGENTS IN RHEUMATOID ARTHRITIS PATIENTS: A FRENCH NATIONAL CLAIMS DATABASE ANALYSIS OVER THE PERIOD 2009-2011

Fautrel B[1], Laurendeau C[2], Joubert JM[3], Cukierman G[3], Gourmelen J[4], Fagnani F[2]
[1]*CHU Pitié-Salpétrière, Paris, France,* [2]*Cemka-Eval, Bourg la Reine, France,* [3]*UCB Pharma, Colombes, France,* [4]*INSERM, Villejuif, France*

OBJECTIVES: To describe the current medical management of Rheumatoid Arthritis (RA) patients in routine practice in a national representative sample of patients, focusing on biological agents (BA) uptake. **METHODS:** The EGB database is a 1/97 representative sample of the national claims database covering the whole French population. RA patients were identified as adults (age >18) benefiting from full coverage ("ALD" eligibility criteria) for RA (ICD-10 codes M05-06) on January 1, 2009. Patients treated by BA were defined as RA patients with at least one claim for at least one BA over the period. BA-naïve treated patients were identified by the absence of a BA claim during the first 3 months of the study period, followed by at least one BA claim. **RESULTS:** Over the 3-year period, 236 patients had a BA reimbursed and 5,336 deliveries by pharmacists were observed. The proportion of BA users, either alone or in combination, was 14.0% in 2009, and 70 patients (32.7%) used a BA in combination with methotrexate. Among patients treated by BA, 85.2% used at least one TNF inhibitor during the study period. Etanercept had the highest delivery record (58.1%), followed by adalimumab (28.8%) and infliximab (15.3%). Among the whole group of patients treated by BA, 13.6% were delivered rituximab at least once. Over the period, a proportion of 73.3% of patients had one BA agent only, 19.1% experienced one switch and 7.6% had two or more switches.

At 18 months, drug survival rate of the mix of first-line biologics was 71.8% [95% CI: 60.1% - 80.6%]. **CONCLUSIONS:** Claims database is a useful tool to describe the medical management of RA patients. These observations suggest that BA clinical use in RA disease management in France is similar to other existing European registries data.

PMS100

ETANERCEPT 25 MG ONCE WEEKLY COULD BE A COST-EFFECTIVE OPTION FOR RHEUMATOLOGY PATIENTS IN SUSTAINED CLINICAL REMISSION

Borrás-Blasco J[1], Gracia-Pérez A[1], Casterá DE[1], Abad FJ[1], Rosique-Robles JD[1], González Álvarez A[2], Gimeno-Mallench L[1]

[1]*Hospital de Sagunto, Sagunto, Spain,* [2]*Hospital Obispo Polanco, Teruel, Spain*

OBJECTIVES: Etanercept 50mg/week (ETN50) has demonstrated efficacy in rheumatoid arthritis (RA), psoriatic arthropathy (PA) and ankylosing spondylitis (AS) patients. In certain patients in sustained clinical remission, a dose reduction to etanercept 25 mg/week (ETN25) could be done. Determine the economic impact of ETN25 in RA, PA and AS patients in sustained clinical remission. **METHODS:** Observational, retrospective cohort of patients treated with ETN50 that achieve and maintain clinical remission (DAS28<2.6 or BASDAI<2) during 1 year and slow worsening of structural changes, enrolled in an off-label program (January 2006-June 2013) to switch ETN50 to ETN25. Economical impact was assessed using Enbrel® Spanish official prices. **RESULTS:** From January 2006 to June 1, 2013, 98 RA, 40 PA, 47 AS patients were treated with ETN50; 39 (24%) patients (18 women; age 53±7 years; 24 RA, 7 PA, 8 AS) received ETN25 for at least 0.5 years (2.6±2.0 years; range 0.5-7.3 years). At June 1, 2013, 29 (74%) patients continued on ETN25. RA patients: 17 continued on ETN25, 5 patients discontinued due to reactivation of RA (4 switched to ETN50 and 1 switched to adalimumab, all regained clinical remission) and 2 patients due to adverse reactions. PA patients: 4 continued on ETN25, 2 patients discontinued due to reactivation of PA (switched to ETN50 regaining clinical remission) and 1 patient due to adverse reaction. All AS patients continued on ETN25. Total associated savings with ETN 25 throughout the 7-year observation period were 622.073€, leading to treat 52 additional patients with ETN50 for a year without increasing ETN total costs. **CONCLUSIONS:** ETN25 produces cost savings when used in patients in clinical remission for at least 1 year with ETN50. At a time when therapy cost is an unavoidable component of health care treatment decisions, ETN25 could be a cost-effective option for selected RA, PA and AS patients.

PMS101

BURDEN OF DOSE ESCALATION WITH BIOLOGICS IN RHEUMATOID ARTHRITIS: A REVIEW OF FREQUENCY AND COSTS

Moots R[1], Mays R[2], Li C[2], Stephens J[2], Tarallo M[3]

[1]*University of Liverpool Academic Rheumatology Unit, Liverpool, UK,* [2]*Pharmerit International, Bethesda, MD, USA,* [3]*Pfizer Italia, Rome, Italy*

OBJECTIVES: Switching or dose escalation of TNF inhibitors is an option for rheumatoid arthritis (RA) patients unresponsive or with a partial response to first-line treatment. Drug costs increase with higher dosing but the frequency and impact of dose escalation on other costs is not well known. A literature review of biologic dose escalation in RA was conducted to assess how often it occurs and the economic impact to payers. **METHODS:** A search of PubMed, EMBASE, Cochrane, and Centre of Disseminated Reviews was conducted for TNF inhibitors in inflammatory arthritis diseases. Searches were focused on dose escalation and economic terms in RA. Limits were Human, English and time frame (2003 to 2013). A weighted proportion of dose escalators in RA was calculated for each drug as an alternative to reporting ranges. **RESULTS:** Forty-one publications were identified with 36 reporting values for dose escalation in RA. The proportion of dose escalators varied widely: adalimumab 7.5 to 36%, etanercept 0 to 22%, and infliximab 0 to 80%. Various definitions of dose escalation led to the wide range. The weighted proportion of dose escalators for each drug was adalimumab 14.9%, etanercept 4.9%, and infliximab 41.7%. Six studies reported economic data comparing dose escalators to non-dose escalators. Adalimumab drug costs increased 27 to 43% with total costs increasing 28 to 34%; infliximab drugs costs increased 6 to 75%, RA-related costs increased 25 to 54%, and total costs increased 15% to 35%. Lowest costs were reported with etanercept: drug costs increased 3.2 to 19%, RA-related costs increased 4.5%, and total costs increased 2.2 to 15%. **CONCLUSIONS:** Pooled results demonstrated dose escalation in RA occurred most frequently with infliximab and least frequently with etanercept. Not only were biologic costs increased, but also RA-related and total costs. Etanercept was associated with the lowest cost increases.

PMS102

RATIONALE FOR INITIATING AND SWITCHING BIOLOGIC THERAPY IN PATIENTS WITH RHEUMATOID ARTHRITIS: RESULTS OF A EUROPEAN CHART REVIEW STUDY

Emery P[1], Solem CT[2], Macahilig CP[3], Corman S[2], Majer IM[4], McGuire M[3], Cappelleri JC[5], Tarallo M[6]

[1]*University of Leeds School of Medicine, Leeds, UK,* [2]*Pharmerit North America, LLC, Bethesda, MD, USA,* [3]*Medical Data Analytics, Parsippany, NJ, USA,* [4]*Pharmerit International, Rotterdam, The Netherlands,* [5]*Pfizer, Inc., Groton, CT, USA,* [6]*Pfizer Italia, Rome, Italy*

OBJECTIVES: This study aimed to describe the rationale for selection of initial biologic therapy and changes in biologic therapy among patients with RA in Germany, Spain, and the United Kingdom (UK). **METHODS:** This retrospective, observational medical chart review captured patient data via 118 Spanish, German, and British rheumatologists. Patients(≥18 years) had a confirmed diagnosis of RA between January 2008 and December 2010, and received a biologic therapy for ≥3 months and had ≥12 months of follow-up. Physicians recorded all RA regimens and rationale for drug selection. **RESULTS:** The 656 patients (n=328; Germany: n=111, Spain: n=106, UK: n=111) were 71.3% female, had a mean (standard deviation) age of 48.3 (12.6) years at diagnosis and mean 28-joint Disease Activity Score of 5.1±1.2 at biologic initiation. Patients most frequently initiated biologic therapy with adalimumab (41%) or etanercept (38%). The most common reason for initial biologic treatment was inadequate response from traditional disease-modifying anti-rheumatic drugs (DMARDs) alone (54.9%), followed by symptom control (13.4%). Among the remaining responses, clinical data (e.g., results from clinical trials) was cited most frequently in the UK (17.1%) compared to Germany/Spain (9.0%/4.7%), while personal experience was cited most in Germany (15.3%) vs. UK/Spain (2.7%/0.9%). Inadequate response to DMARDs was most frequently reported for adalimumab (61.5%) vs. etanercept (46.9%) or other biologics (40.2%); inadequate DMARD symptom control was more cited for etanercept (18.8%) vs. adalimumab (11.1%) or other biologics (9.8%). Among the 23 patients who switched to a second biologic agent, 72.7% were switched due to inadequate response to the first biologic agent. **CONCLUSIONS:** Across the three study countries, prescribers most frequently initiated biologic therapy due to inadequate response or lack of symptom control on traditional DMARDs. Other reasons varied by country, however differences across biologic agents prescribed were minimal.

PMS103

BURDEN OF DISEASE OF CERVICAL DYSTONIA IN THE UNITED KINGDOM

Raluy M[1], Kurth H[2], Wang M[1], Dinet J[2], MacLachlan S[1], Gabriel S[2], Wasiak R[1]

[1]*Evidera, London, UK,* [2]*IPSEN Pharma, Boulogne Billancourt, France*

OBJECTIVES: Cervical Dystonia (CD), the most common adult-onset dystonia, is characterised by involuntary contractions of the cervical muscles that result in abnormal, sustained, and painful postures of the head, neck and shoulders. Annual prevalence rate of CD in Europe is approximately 117 per million. To date, very few studies assessed the burden of the disease, and those published focused on costs of specific treatments. The objective of this study was to describe health care resource utilisation of patients with CD during the first year after diagnosis in the UK. **METHODS:** In this retrospective cohort study, adult patients with a first ever diagnosis of primary or secondary CD (Read code: F138200 Spasmodic torticollis) between January 2007 and December 2011 were selected from The Health Improvement Network (THIN), a large UK Primary Care database. Patients were required to have a follow-up time of at least 24 months after diagnosis. Analyses performed described demographic and clinical characteristics at diagnosis and all-cause utilization of CD-related health care resources including treatment during follow up. **RESULTS:** This study included 4,497 patients, 65.40% were female, median age at diagnosis was 41 years old and 8.05% were diagnosed with depression. During that first year, patients had on average 6 visits to the GP (SD: 5.45) and were newly referred most frequently to the orthopaedist (5.09%); less than 2% of patients had an all-cause hospitalisation and less than 1% underwent neurosurgery; 80.23% were managed with pharmacological treatment for CD, and the most commonly prescribed drugs were analgesics (69.85%) and benzodiazepines (41.23%); 14.65% received physical therapy. **CONCLUSIONS:** This study provides first-time estimates of the health care resource utilisation related to management of patients with CD in UK during the first year. To describe the complete burden of CD further research will have to investigate secondary care data and longer time horizon.

PMS104

THE COST SAVING POTENTIAL OF UTILIZING BIOSIMILAR MEDICINES IN BIOLOGIC NAIVE SEVERE RHEUMATOID ARTHRITIS PATIENTS

Whitehouse J[1], Walsh K[2], Papandrikopoulou A[2], Hoad R[1]

[1]*GfK Bridgehead, Melton Mowbray, UK,* [2]*Sandoz Biopharmaceuticals, Holzkirchen, Germany*

OBJECTIVES: To analyze the potential cost savings associated with utilization of a quota for biosimilar RA medicines in a biologic naïve but potentially biologic eligible population (those defined as severe). **METHODS:** High patient numbers in rheumatoid arthritis (RA) and biologic therapy costs place significant pressures on health care budgets. Currently biologic therapies are underutilized in severe RA (DAS Score ≥3.7) patient populations that may be eligible for treatment. Biosimilar treatments are expected to reach the market (for the top 3 molecules adalimumab, etanercept and infliximab) by 2017 and may provide an avenue to reduce treatment costs and increase patient access to these agents. Biologic naïve RA populations were estimated for France, Germany and the UK as severe RA patients are assumed to be eligible for biologic therapy. Total cost of applying biologic treatment to a 50% quota of the estimated eligible patient population was compared to a situation of initiating patients on a biosimilar equivalent with a price point 30% lower than the originator. Reinvestment potential was calculated, defining how many more patients could be treated with yearly savings. **RESULTS:** By 2017, when all 3 biosimilars are expected to be available, the assumed 50% quota resulted in yearly savings of €98 million for the UK, €351 million for Germany and €26 million for France compared to the budget impact of using the originator. If these savings were reinvested potentially 40%, 36% and 39% of the remaining biologic naïve patients could be initiated on biosimilar treatment in the UK, Germany and France respectively. **CONCLUSIONS:** The cost savings from biosimilar adoption in naive severe RA patients presented potentially increase access by removing budgetary pressures from health care systems. Proactive payer encouragement for biosimilar utilization is necessary through the use of guidelines and prescription quotas so that health care systems can realize significant savings.

PMS105

THE RESOURCE USE RELATED TO HIP FRACTURES BASED ON DATA FROM ICUROS

Wintzell V[1], Ivergård M[1], Tankó LB[2], Barghout V[2], Svedbom A[1], Alekna V[3], Bianchi ML[4], Clark P[5], Díaz Curiel M[6], Dimai HP[7], Jürisson M[8], Lesnyak O[9], McCloskey E[10], Sanders KM[11], Thomas T[12], Borgström F[13], Kanis JA[14]

Metabolism, Metabolic Bone Centre, University of Sheffield, Sheffield, UK, [11]Department of Medicine, NorthWest Academic Centre, The University of Melbourne, Melbourne, Australia, [12]INSERM U1059, CHU-St-Etienne, Saint Etienne, France, [13]LIME/MMC, Karolinska Institutet, Stockholm, Sweden, [14]WHO Collaborating Centre for Metabolic Bone Diseases, University of Sheffield, Sheffield, UK

OBJECTIVES: The International Costs and Utilities Related to Osteoporotic fractures Study (ICUROS) is an ongoing 18 months prospective observational study with the objective of estimating resource use and health related quality of life related to osteoporotic fractures. This study aims to describe the resource utilization for hip fractures (sustained during 2007-2012) pooled from 10 countries: Australia, Austria, Estonia, France, Italy, Lithuania, Mexico, Russia, Spain, and the UK. **METHODS:** Patients studied were ≥ 50 years and lived at home prior to fracture. Data were collected through patient interviews and review of medical records: at baseline and 4, 12, and 18 months after fracture. Only resource use related to the fracture event was collected. **RESULTS:** There were 1,795, 1,435, 1,256 patients available for analysis at 4, 12 and 18 months follow-up, respectively. The mean age (±SD) at fracture was 77±10 years and 79% were women. 96% of patients were hospitalized. Mean hospital length of stay (LoS) (±SD) was 17.2±20.4 days during months 0-4 and 1.2±6.8 during months 5-18. Mean LoS varied from 9.3 days to 26.5 days during months 0-4 across countries. The mean number of physician visits (±SD) was 2.8±3.1 during months 0-4 and 2.5±5.6 between months 5-18. The mean number of nurse visits (±SD) was 2.4±9.6 and 3.8±31.9 during corresponding periods, respectively. During months 0-4, 65% of patients used analgesics, 41% calcium/vitamin D, and 27% pharmacological interventions for osteoporosis. The respective uptakes for months 5-18 were 47%, 46% and 25%. **CONCLUSIONS:** Almost all patients were hospitalized after fracture and the mean number of inpatient days is high, although there is a large variation. The vast majority of health care consumption in relation to fracture occurs during the first 4 months but substantial consumption persists up to 18 months after fracture.

PMS106

METHODOLOGY OF AN OBSERVATIONAL STUDY TO EVALUATE THE CARE MAP OF WOMEN WITH POSTMENOPAUSAL OSTEOPOROSIS (PMO) IN SWITZERLAND

Lippuner K[1], Pendl G[2], Biteeva I[2], Murigande C[2], Schwenkglenks M[3]
[1]*Policlinic for Osteoporosis, Bern, Switzerland,* [2]*Amgen Switzerland Ag, Zug, Switzerland,* [3]*Institute of Pharmaceutical Medicine/ European Center of Pharmaceutical Medicine, University of Basel, Basel, Switzerland*

OBJECTIVES: The diagnosis and management of PMO involves multiple specialists and referrals. To better understand patient management, an ongoing observational study will evaluate the care map of women with PMO treated in routine clinical practice in Switzerland, and estimate the 2-year treatment cost of parenterally administered medications (denosumab, ibandronate, zoledronate). Here, we describe the study design and methodology. **METHODS:** Of 52 specialist centers across Switzerland operating a DXA machine, 22 agreed to participate in the study. Women diagnosed with PMO and initiated on parenteral antiresorptive treatment were enrolled in the study between June 18, 2012 and May 31, 2013. To minimize selection bias, treatment initiation must have occurred within 6 months before study initiation visit at the participating center. The planned follow-up period is 24 months. Patients may be followed by the specialist or referred back to the general practitioner. Where available, the following data will be collected: demographics and patient history, co-morbidities and co-medications, DXA T-scores, osteoporosis risk factors, PMO treatment and rationale, bone turnover markers, vitamin D level, and costs related to PMO diagnosis and treatment. These parameters will be recorded at baseline and at any visit in the 24-month observation period as available from routine practice. Continuous outcomes will be summarized by descriptive statistics. For categorical outcomes, the number and percentage of patients in each category will be presented. Baseline covariates (demographic, patient characteristics and site characteristics) will be described overall and by treatment received. **RESULTS:** As of May 31, 2013 at least 280 eligible women were enrolled into the study. Full study results will be reported at a later date. **CONCLUSIONS:** The recruited number of patients confirms the feasibility of the planned methodology. Data from this study will provide valuable information regarding the care map of women with PMO in routine clinical practice in Switzerland.

PMS107

AGE AND GENDER DISTRIBUTION OF OUTPATIENT CARE PHYSIOTHERAPY SERVICES FOR DORSOPATHIA DISEASES IN HUNGARY

Molics B[1], Hanzel A[1], Kránicz J[1], Schmidt B[2], Horváth Z[3], Boncz I[1]
[1]*University of Pécs, Pécs, Hungary,* [2]*University of Pécs, Zalaegerszeg, Hungary,* [3]*National Institute for Quality- and Organizational Development in Healthcare and Medicines (GYEMSZI), Pécs, Hungary*

OBJECTIVES: To assess the utilization of out-patient care physiotherapy services related to dorsopathia diseases of the musculoskeletal and connective tissue diseases according to age and gender. **METHODS:** The data come from the financial data base of the National Health Insurance Fund Administration (in Hungarian: OEP) involving the year of 2009. The activity list was provided by the rulebook on the application of the activity code list in out-patient care. The dorsopathia diseases of musculoskeletal and connective tissue diseases (M00-M99) are listed in the International Classification of Diseases (ICD) with code of M40–M54. The number of cases in physiotherapy activities were determined per 10,000 persons by age and gender in outpatient care. **RESULTS:** The total number of the provided 151 different types WHO-classified physiotherapy services was 32.318.413 in the year of 2009; 19.095.614 (59,09%) of them with the musculoskeletal and connective tissue diseases. The prevalence of the dorsopathia diseases were 51,17% in the group of the muskuloskeletal and connective tissue diseases. The average number of cases of physiotherapy activities per 10,000 persons accounted for 12.015 cases in 2009. The average number of cases per 10,000 persons for males and females were 15.589 cases for males and 8.061 cases for females. The number of cases increase from the 20. age groups in the men and women patients. The highest number of physiotherapy treatment is provided for both gender in the age group 50 to 59 followed by age groups of 60 to 74. **CONCLUSIONS:** The physiotherapy services occurred with the highest incidence in cases of the 'diseases of the musculoskeletal system and connective tissue' ICD group. The dorsopathia diseases at the ICD groups show the highest prevalence, indicating the importance of prevention.

PMS108

AGE AND GENDER DISTRIBUTION OF OUTPATIENT CARE PHYSIOTHERAPY SERVICES FOR HIP AND THIGH INJURIES IN HUNGARY IN 2009

Molics B[1], Sebestyén A[2], Kránicz J[1], Schmidt B[3], Nőt L[1], Zemplényi A[1], Boncz I[1]
[1]*University of Pécs, Pécs, Hungary,* [2]*National Health Insurance Fund Administration, Pécs, Hungary,* [3]*University of Pécs, Zalaegerszeg, Hungary*

OBJECTIVES: The medical aspects of injuries of the lower extremity is well known, however, limited information is available on physiotherapy treatment of these diseases. The aim of our study is to assess amount and frequency of the physiotherapy services in hip and thigh injuries based on age and gender distribution. **METHODS:** Data were derived from the countrywide database of Hungarian Health Insurance Administration (HHIA), based on official reports of outpatient care institutes in 2009. The total numbers of different physiotherapy services were determined by selecting the reported specific diagnoses codes and counting the number treatments provided for that specific diagnosis code. The different types of treatment codes are listed in the chapter of the Guidelines of HHIA for 'Physiotherapists, massagetherapists, conductors and other physiotherapy practices'. The number of cases in physiotherapy activities related to for hip and thigh injuries (BNO S70-79) were determined per 10,000 persons by age and gender in outpatient care. **RESULTS:** The total number of the 151 different physiotherapy services was 353.260 cases at the hip and thigh injuries in the year of 2009 at the. In 2009 the average number of cases of physiotherapy activities per 10,000 persons accounted for 351.91 cases. The average number of cases per 10,000 persons for males and females were 443.7 cases for males and 249.75 cases for females. The number of cases of the hip and thigh injuries were higher in the 15-49 age group in males, and in the age group of elderly females. **CONCLUSIONS:** In case of the hip and thigh injuries, the highest demand of the outpatient care physiotherapy services occurred older injured patients. The differences in young males vary with the physical activity and the type of recreation activities, and with the condition of osteoporosis in elderly females.

PMS109

BONE EVALUATION STUDY (BEST): PREVALENCE AND TREATMENT RATES OF MALE PATIENTS WITH OSTEOPOROSIS (OP) IN GERMANY

Hadji P[1], Steinle T[2], Eisen C[2], Linder R[3], Klein S[4], Schmid T[2]
[1]*Universityhospital of Giessen and Marburg GmbH, Marburg, Germany,* [2]*Amgen (Europe) GmbH, Munich, Germany,* [3]*WINEG | Wissenschaftliches Institut der TK, Hamburg, Germany,* [4]*IGES Institut GmbH, Berlin, Germany*

OBJECTIVES: With an aging population, prevalence of OP and OP-attributable fractures (OAF) is expected to rise dramatically. We evaluated prevalence and treatment rates for male OP (MOP) in Germany. **METHODS:** BEST, a retrospective analysis of de-identified claims data from a German sickness fund, included male and female OP patients, aged ≥50 years and insured ≥ 1 day between 01/2006–12/2009. Two populations were defined. Inclusion criteria for population B were: 1) OP diagnosis (M80.x, M81.x), and/or 2) prescription for OP-related medication (OPM), and 3) exclusion of diagnoses M88.x, E83.5x, and M90.7x (ICD-10). Population A included population B plus patients solely experiencing OAF. **RESULTS:** Population A included 104,938 men. In 2009, prevalence of MOP was 6%. While 67% of men experienced ≥1 OAF during observation period, with the highest rate in those aged 50-54 years (78%), only 15% received OPM. Population B included 47,694 men. In 2009 prevalence of MOP was 4.8%. 27.2% of those diagnosed experienced ≥1 OAF, with the highest rate in men aged ≥ 75 years (2006-2009). Only 41.8% of men with ≥ 1 OAF received OPM during the observation period. **CONCLUSIONS:** While prevalence of MOP is lower than that of postmenopausal OP (6% vs. 24% in 2009), high fracture rates in OP-patients represent a significant burden to the German health care system. The low treatment rates reported may lead to suboptimal outcomes, and must be optimized to reduce risk of follow-up fractures in MOP.

THE BENEFIT-HARM FRONTIER OF DIFFERENT PRIMARY SCREENING STRATEGIES FOR CERVICAL CANCER IN GERMANY

Sroczynski G[1], Esteban E[1], Engel J[2], Hillemanns P[3], Petry K-U[4], Krämer A[5], Schnell-Inderst P[1], Mühlberger N[1], Siebert U[6]
[1]*UMIT - University for Health Sciences, Medical Informatics and Technology/ ONCOTYROL - Center for Personalized Cancer Medicine, Hall in Tyrol/ Innsbruck, Austria,* [2]*Munich Cancer Registry of the Munich Cancer Centre, Clinic Grosshadern, Ludwig-Maximilians-University, Munich, Germany,* [3]*Hannover Medical School, Hanover, Germany,* [4]*Department of Obstetrics and Gynecology, Hanover Medical School, Hanover, Germany,* [5]*School of Public Health, University of Bielefeld, Bielefeld, Germany,* [6]*UMIT – University for Health Sciences, Medical Informatics and Technology / ONCOTYROL / Harvard University, Hall i. T./ Innsbruck / Boston, Austria*

OBJECTIVES: Using a benefit-harm frontier (BHF) approach, we systematically compared benefits and harms of different HPV- and cytology-based primary cervical cancer screening strategies in Germany. **METHODS:** A previously validated and published Markov modelwas used to analyze the trade-off between benefits and harms of different screening strategies differing by length of screening interval and test algorithms, including cytology alone, HPV testing alone, in combination with cytology or with cytological triage of HPV-positives. We used published German clinical, epidemiological and international test accuracy data from meta-analyses. Predicted outcomes included reduction in cervical cancer incidence and unnecessary treatment (defined as conizations of lesions <CIN3). **RESULTS:** Overall, comparing identical screening

intervals HPV-based screening was more effective than cytology alone, with a relative reduction in cervical cancer incidence of 49%-90% compared to 33%-80% with cytology alone (depending on screening intervals). In HPV- compared to cytology screening the incremental gain in effectiveness was higher with extended screening intervals and the increase in harms lower. Based on the BHF, 12 of 17 screening strategies were dominated, including annual cytology, the current recommended standard in Germany. Biennial HPV-screening was similarly effective as annual cytology and reduced unnecessary treatment. Moving from biennial HPV- with cytological triage to annual HPV-screening alone results in an incremental harm-benefit ratio of 15-533 unnecessary treatments per additional prevented cervical cancer case (depending on screening adherence rate). **CONCLUSIONS:** The benefit-harm frontier is a useful tool to demonstrate the trade-off between expected gains and risks of different screening strategies. Based on our analyses, HPV-based cervical cancer screening is more effective than cytology alone, but has a higher risk of overtreatment when used in annual screening. In the German health care context, depending on screening adherence rates biennial or triennial HPV-screening for women ≥30 years is similarly effective as annual cytology with significantly reduced unnecessary treatments.

PRM2

EVALUATING WHETHER INCONSISTENCIES ARE PRESENT IN A MIXED TREATMENT COMPARISON OF TROUGH FORCED EXPIRATORY VOLUME IN 1 SECOND AT 12 WEEKS

Buckley F[1], Baldwin M[2], Keininger D[3], Jansen J[1], Cope S[4]
[1]*Mapi, Boston, MA, USA,* [2]*Novartis Pharmaceuticals UK Limited, Horsham, West Sussex, UK,* [3]*Novartis Pharma AG, Basel, Switzerland,* [4]*Mapi, Toronto, ON, Canada*

OBJECTIVES: To evaluate whether there are inconsistencies in the network of randomized controlled trials (RCTs) used for a network meta-analysis (NMA) comparing alternative long-acting bronchodilators among patients with moderate to severe chronic obstructive pulmonary disease (COPD) in terms of trough forced expiratory volume in 1 second (FEV1) at 12 weeks. **METHODS:** The change from baseline (CFB) in FEV as observed with placebo, tiotropium 18µg/5µg once daily (OD), salmeterol 50µg twice daily (BID), formoterol 12µg BID, aclidinium 400µg BID, glycopyrronium 50µg OD, indacaterol 75/150/300µg OD, formoterol 12µg+ tiotroipum 18µg BID/OD, indacaterol 150µg+ tiotropium 18µg OD, and indacaterol 110µg+ glycopyrronium 50µg OD in RCTs identified with a systematic literature review were synthesized with a NMA. Where possible, treatment estimates from fixed effect (FE) and random effects (RE) NMA models (assuming consistency between direct and indirect evidence) and independent means (IM) models (pooled direct evidence) were compared to assess whether any inconsistencies in the network were present. **RESULTS:** Thirty-two RCTs identified through a systematic literature review were included in the analysis. Direct evidence was available for the monotherapies versus placebo, the combination therapies versus tiotropium, for indacaterol+ glycopyrronium versus placebo, and for tiotropium versus salmeterol. The largest differences between the estimated treatment effect estimates from the NMA and the IM models were observed for the comparisons between indacaterol 150µg versus tiotropium (FE difference=0.025 [95% Credible Intervals (95%CrI): 0.002, 0.047]; RE difference=0.027 [95%CrI: -0.007, 0.61]), indacaterol+ glycopyrronium versus placebo (FE difference=-0.022 [95%CrI: -0.053, 0.008]; RE difference=-0.018 [95%CrI: -0.059, 0.022]), and indacaterol+ glycopyrronium versus tiotropium (FE difference=0.011 [95%CrI: -0.014, 0.036]; RE difference=0.015 [95%CrI: -0.024, 0.053]). **CONCLUSIONS:** Based on a comparison of the findings of a NMA and IM models, some minor inconsistencies in treatment effects for trough FEV1 at 12 weeks were identified that will be explored through additional sensitivity analyses.

PRM3

TESTING THE EUNETHTA INTERNAL VALIDITY OF RANDOMIZED CONTROLLED TRIALS GUIDELINE AND TOOL IN HUNGARY

Huszti Z, Juhasz J
National Institute for Quality- and Organizational Development in Healthcare and Medicines, Budapest, Hungary

OBJECTIVES: The reliability of the results of a randomized trial depends on the extent to which potential sources of bias have been avoided. We tested the EUnetHTA Internal Validity guideline so that to harmonize our risk of bias assessments with the European standard and finally to improve the reliability of relative efficacy and cost effectiveness assessments for decision makers in Hungary. **METHODS:** We translated the risk of bias standardized assessment questions of the EUnetHTA Internal Validity (of randomized controlled trials) into Hungarian. We first chose ten studies for internal validity testing from the ones that were submitted for reimbursement at the beginning of 2012, and their results were used for health economy assessment. **RESULTS:** We found adequate randomization sequence generation in seven studies and we marked it unclear in three trials (e.g.: lack of information, age related sequence generation). The allocation concealment was labeled suitable in six studies (e.g.: IVRS, IWRS) and unclear in four trials. All studies could be classified according the the type of blinding. We found selective reporting in one trial where the non-inferiority results in the per-protocol population were not published. We rated the risk of bias low for eight trials and high for two trials due to unclear sequence generation and publication bias. We also evaluated 77 endpoints and we labelled 22 endpoints with high risk of bias. The most common reasons for high risk ratings were the not appropriately implemented ITT principle and selective reporting. **CONCLUSIONS:** The EUnetHTA guideline gives an opportunity to estimate the risk of bias of randomized controlled trials in a structured and harmonized way without leaving out any important considerations. The results of the internal validity evaluation can lead the focus of interest to those endpoints where the sensitivity analysis is requisite in the health economic models.

PRM4

CLINICAL OUTCOMES ASSESSMENTS IN SCHIZOPHRENIA: A SYSTEMATIC LITERATURE REVIEW

Cooke C[1], Heatley R[2], Galani Berardo C[3], Johnson KI[2], Kasper S[4]
[1]*Complete Clarity, Macclesfield, UK,* [2]*Complete Clarity, Macclesfield, Cheshire, UK,* [3]*F. Hoffman La Roche, Basel, Switzerland,* [4]*Medical University of Vienna, Vienna, Austria*

OBJECTIVES: There is a growing interest from health technology assessment agencies in determining the clinical outcomes assessments and endpoint strategies that can establish treatment benefits. We describe a systematic literature review of endpoints and outcomes used in schizophrenia trials to determine treatment benefit. **METHODS:** The therapies selected in the search strategy included pharmacological interventions, cognitive-behavioural therapies, family intervention, and music therapy. These were chosen to reflect the range of interventions in current use, and to allow comparison between outcomes reported for different therapies. The search terms were designed to include all outcomes for each therapy area, and were used to search four electronic databases for published English language studies. Randomised controlled trials (RCTs) were retrieved if they included patients with schizophrenia treated with the chosen therapies, and clinical outcomes from a predefined list (e.g. symptom improvement, functionality, quality of life, remission rates, response rates, and recovery). **RESULTS:** Of 2,221 RCTs identified, 271 progressed to data extraction; 225 assessed pharmacological interventions and 46 non-pharmacological interventions. Approximately 76 outcomes were measured across the trials. The most common scale used in pharmacological trials was the Positive and Negative Syndrome Scale (PANSS) total score (76.9%), and the PANSS positive subscale in non-pharmacological trials (50%). However, even within the common outcomes, the specified level of reduction to define a relevant response varied; among trials reporting PANSS total, five different levels of reduction were defined (≥20%, ≥25%, ≥30%, ≥40%, ≥50%). Common outcomes were also measured differently in terms of improvement from baseline and proportion achieving response/remission, with little consensus on clinical meaningfulness. **CONCLUSIONS:** The RCTs included in this review reported a broad range of outcomes, making comparison of different therapies a complex task. The disparity in outcomes between pharmacological and non-pharmacological outcomes scales highlights the challenges in designing trials to demonstrate clinical benefit.

MULTI-DIMENSIONAL CAPTURE OF PATIENT-RELEVANT ENDPOINTS IN REGULATORY TRIALS AND HEALTH TECHNOLOGY ASSESSMENTS IN ONCOLOGY TWO YEARS AFTER INTRODUCTION OF THE GERMAN AMNOG HEALTH CARE REFORM

Dintsios CM[1], Knoerzer D[2], Duenne AA[2], Schwartz FW[3], Ruof J[2]
[1]*German Association of Research-based Pharmaceutical Companies (vfa), Berlin, Germany,* [2]*Roche Pharma, Grenzach-Wyhlen, Germany,* [3]*Hannover Medical School, Hannover, Germany*

OBJECTIVES: With the introduction of AMNOG in January 2011, an early benefit assessment (EBA) was required for new medicines in Germany. EBAs are based on the additional therapeutic benefit of a drug on patient-relevant endpoints (PREs). We compared the acceptance of PREs for oncology in regulatory trials, and in EBAs conducted by German health technology assessment (HTA) bodies. **METHODS:** EBAs on oncology drugs and the respective regulatory trials were reviewed. The Federal Joint Committee (G-BA) website was used to obtain manufacturers' value dossiers, Institute for Quality and Efficiency in Health Care (IQWiG) assessments, and G-BA resolutions. Acceptance of endpoints in the dimensions of mortality, morbidity and quality of life (QoL) by HTA bodies, IQWiG and G-BA, were compared to those accepted for regulatory trials. Data on endpoints used in regulatory trials were obtained from the manufacturers' value dossiers. **RESULTS:** Overall survival (OS) and measures of disease morbidity, such as progression-free survival (PFS), were generally accepted in regulatory trials. OS was accepted by IQWiG and G-BA as a mortality endpoint for evaluating additional benefit. Widely accepted morbidity endpoints such as PFS were not deemed patient-relevant by IQWiG and G-BA. In general, QoL questionnaires used in regulatory trials were accepted by the HTA bodies, although minor variability between questionnaires led to some exclusions from the HTA evaluations and the obtained QoL data revealed a number of missing values. **CONCLUSIONS:** HTA and regulatory bodies largely agree on the acceptance of mortality and QoL endpoints typically evaluated in oncology. Considerable variability was observed in the acceptance of PREs in morbidity. Evaluating additional benefit based only on mortality and QoL endpoints underestimate the potential value of new drugs. Multiple endpoints, which capture all three dimensions, should be evaluated in regulatory trials and accepted by IQWiG and G-BA to confirm patient-relevant additional benefit.

PRM6

THRESHOLD SELECTION IN BIOMARKERS USING COX REGRESSION. AN APPLICATION TO NON-SMALL-CELL LUNG CANCER

Luaces P[1], Sánchez L[1], Ballesteros J[2], García B[1], Rodríguez PC[1], Viada C[1], Popa X[1], Crombet T[1], Lage A[1]
[1]*Center of Molecular Immunology, Havana, Cuba,* [2]*University of the Basque Country UPV/EHU, Leioa, Spain*

OBJECTIVES: To select thresholds for predictive biomarkers using Cox regression. **METHODS:** We used data from a Cuban trial designed to assess the efficacy of immunotherapy against the epidermal growth factor (EGF) to test our approach. The trial included 122 patients diagnosed with non-small-cell lung cancer (NSCLC) who had basal EGF concentration available. The EGF concentration was analysed as a predictor of immunotherapy success over the range of all possible values of the biomarker (w [a,b]). For each w_i, patients with $w > w_{i0}$ were selected and a Cox model adjusted to assess survival. We then identified the w_{0s} with significant treatment results to find (a) the lowest biomarker threshold where the effect of treatment was significant and also to find (b) the biomarker threshold that reflected the highest difference between treatments. **RESULTS:** For NSCLC we observed that EGF concentration thresholds range from 870 pg/ml to 2000 pg/ml were significant. At the lowest threshold (870 pg/ml) the immunotherapy group showed a 6-month difference for the median survival ($p = 0.022$) whereas at the threshold that showed the maximum difference between treatments (EGF = 1750 pg/ml) the immunotherapy group presented a 10-month difference for the median survival ($p = 0.004$). **CONCLUSIONS:** The evaluation of p-values of the effect of treatment for each w_0 [a,b] allows the selection of the thresholds where the treatment result is significant. Whereas the

lowest threshold where the effect of treatment is significant allows the selection of patients that could be mostly benefited with the treatment, the selection of the threshold with the minimum p-value will reflect the higher difference between treatments.

PRM7

SYSTEMATIC LITERATURE REVIEW AND VALIDITY EVALUATION OF THE EXPANDED DISABILITY STATUS SCALE (EDSS) AND THE MULTIPLE SCLEROSIS FUNCTIONAL COMPOSITE (MSFC) IN PATIENTS WITH MULTIPLE SCLEROSIS

Meyer-Moock S[1], Feng YYS[1], Dippel FW[2], Kohlmann T[1]
[1]*University Medicine Greifswald, Greifswald, Germany,* [2]*Sanofi, Berlin, Germany*

OBJECTIVES: There are a number of instruments to describe severity and progression of multiple sclerosis, which are increasingly used as endpoints to assess the effectiveness of therapeutic interventions. We examined to what extent the psychometric properties of the two accepted instruments - EDSS and MSFC – meet the methodological standards and what value they have in clinical trials. **METHODS:** We conducted a systematic literature search in relevant databases [MEDLINE (PubMed), ISI Web of Science, EMBASE, PsycINFO & PSYNDEX, CINAHL] yielding 3,860 results. The identification of relevant full-text publications was conducted using abstract and then full-text reviews. **RESULTS:** For evaluation of psychometric properties (validity, reliability, sensitivity of change) of EDSS and MSFC, 120 relevant full-text publications were identified, 54 of them assessed the EDSS, 26 the MSFC and 40 included both instruments. The EDSS has some documented weaknesses in reliability and sensitivity to change. For the MSFC, the main limitations are the learning effects and the z-scores method used to calculate the total score. However, the methodological criterion of validity applies sufficiently for both instruments. For use in clinical studies, we found that the EDSS has been preferred as a primary and secondary outcome measure in recent studies (50 EDSS, 9 MSFC). **CONCLUSIONS:** Recognizing their strengths and weaknesses, both EDSS and MSFC are suitable to detect the effectiveness of clinical interventions and to monitor the disease progress. Almost all publications identify the EDSS as the most widely used tool to measure disease outcomes in clinical trials. Despite some limitations, both instruments are accepted to generate "hard endpoints". In no publication, EDSS or MSFC are discussed as surrogate parameters. A great advantage of the EDSS is the international acceptance (e.g. by EMA) as a primary endpoint in clinical trials and its broad use in trials, enabling cross-study comparisons.

PRM8

IMPACT OF MEDICATION ADHERENCE ON HEALTH CARE COST IN ASTHMA

Nagy B[1], Tóth E[2], Komáromi T[2], Lang Z[2], Molnár D[3], Kalmár J[3], Marusakova E[4], Helbich M[5]
[1]*Healthware Ltd., Budapest, Hungary,* [2]*Healthware Consulting Ltd., Budapest, Hungary,* [3]*GSK Hungary, Budapest, Hungary,* [4]*GlaxoSmithKline Slovakia, Bratislava, Slovak Republic,* [5]*Caldera s.r.o., Slovakia, Banská Štiavnica, Slovak Republic*

OBJECTIVES: To evaluate the impact of medication adherence on health care utilization and costs of the patients with asthma in Hungary. **METHODS:** The authors conducted a retrospective observation of the patients continuously enrolled in medical and prescription benefit plans from July 2007 to June 2012. The study is based on patient attendance data of Hungarian National Health Insurance Fund -NHIFA. The accessible resource uniquely contains the detailed provision data (medicine, out- and inpatient services) about the whole 10 millions Hungarian populations. Inclusion criterion for the patients was at least one diagnosis of asthma in inpatient or outpatient care (ICD code J45) and at least one relevant asthma therapy prescription in a twelve months period, and at least one relevant asthma therapy prescription during the following twelve months period. Disease-related and all-cause related medical costs, drug costs, and hospitalization risk were measured. These measures were modeled at varying levels of medication adherence using regression analysis. Adherence (Sokol, 2005) was defined as the percentage of days during the analysis period that patients had a supply of 1 or more maintenance medications for the condition. The days of supply are calculated based on WHO DDD's. This measurement strategy reduces the risk of overestimating adherence. For prescriptions extending beyond the end of the analysis period, days' supply is truncated at the end of the period. Patients in each study sample are stratified into 5 categories based on their adherence score: 1–19%, 20–39%, 40–59%, 60–79%, or 80–100 %. **RESULTS:** High level of medication adherence was associated with lower hospitalization and exacerbation rates. **CONCLUSIONS:** Increased drug utilization can provide a net economic return when it is driven by improved adherence.

PRM9

IMPACT OF MEDICATION ADHERENCE ON HEALTH CARE COST IN COPD

Nagy B[1], Tóth E[2], Komáromi T[2], Lang Z[2], Molnár D[3], Kalmár J[3], Helbich M[4], Marusakova E[5]
[1]*Healthware Ltd., Budapest, Hungary,* [2]*Healthware Consulting Ltd., Budapest, Hungary,* [3]*GSK Hungary, Budapest, Hungary,* [4]*Caldera s.r.o., Slovakia, Banská Štiavnica, Slovak Republic,* [5]*GlaxoSmithKline Slovakia, Bratislava, Slovak Republic*

OBJECTIVES: To evaluate the impact of medication adherence on health care utilization and costs of the patients with COPD in Hungary. **METHODS:** The authors conducted a retrospective observation of the patients continuously enrolled in medical and prescription benefit plans from July 2007 to June 2012. The study is based on patient attendance data of Hungarian National Health Insurance Fund - NHIFA. The accessible resource uniquely contains the detailed provision data (medicine, out- and inpatient services) about the whole 10 millions Hungarian populations. Inclusion criterion for the patients was at least one diagnosis of COPD in inpatient or outpatient care (ICD code J44) and at least one relevant COPD therapy prescription in a twelve months period, and at least one relevant COPD therapy prescription during the following twelve months period. Disease-related and all-cause related medical costs, drug costs, and hospitalization risk were measured. These measures were modeled at varying levels of medication adherence using regression analysis. Adherence (Sokol, 2005) was defined as the percentage of days during the analysis period that patients had a supply of 1 or more maintenance medications for the condition. The days of supply are calculated based on WHO DDD's. This measurement strategy reduces the risk of overestimating adherence. For prescriptions extending beyond the end of the analysis period, days' supply is truncated at the end of the period. Patients in each study sample are stratified into 5 categories based on their adherence score: 1–19%, 20–39%, 40–59%, 60–79%, or 80–100 %. **RESULTS:** High level of medication adherence was associated with lower hospitalization and exacerbation rates. **CONCLUSIONS:** Increased drug utilization can provide a net economic return when it is driven by improved adherence.

PRM10

USING SATURN PLOTS TO DESCRIBE CO-MORBIDITY PATTERNS WITHIN COHORTS

Juneau P
Truven Health Analytics, Boyds, MD, USA

OBJECTIVES: It is a common practice in outcomes research studies to examine several co-morbidities over two or more cohorts to develop some intuition about the health status of each group. It is also a common practice in claims data to record the co-morbid condition as a binary variable (i.e., absence or presence of the co-morbidity). If an investigator is interested in studying the absence or presence of 10 co-morbidities, he or she will have to consider 2^{10}= 1024 possible co-morbidity patterns, a seemingly daunting task. The common current practice is to construct summary tables and examine them to understand cohort co-morbidity patterns. Even with this summarization, it is difficult to deduce what the composition is for the cohort over all co-morbidities simultaneously. Once again, this can be a daunting task. The objective of this research is to develop a means of summarizing these rich and somewhat complex data to enhance clinical decision making. **METHODS:** Graphical approaches for the summarization of data enable geometry, scaling, shading, and or color to describe such "high dimensional" data. The author will introduce a novel means of plotting the co-morbid conditions that will afford investigators the ability to study patterns of co-morbidities simultaneously and understand the relative frequencies of their occurrence in one display. **RESULTS:** The use of a novel graphical procedure (a Saturn plot) allows an investigator to examine co-morbidity patterns readily when the number of binary co-morbidities is 10 without having to resort to poring over several tables or one large table partitioned into smaller ones based on co-morbidities. **CONCLUSIONS:** A newly developed graphical data summary called a Saturn plot allows investigators to indentify the relative frequency of various subgroups (as defined by their co-morbidity pattern) within a cohort without the need to study large sets of tables.

PRM11

DESIGN OF A RANDOMIZED CONTROLLED TRIAL (RCT) EVALUATING OUTCOME AND COST-EFFECTIVENESS OF A LOCAL CASE MANAGEMENT INTERVENTION OF PATIENTS SUFFERING FROM CHRONIC OBSTRUCTIVE PULMONARY DISEASE (COPD)

Sørensen SS[1], Pedersen KM[2], Ehlers L[1]
[1]*Aalborg University, Aalborg, Denmark,* [2]*University of Southern Denmark, Odense M, Denmark*

OBJECTIVES: In December 2011 the Danish Government issued a new plan of action for chronic disease management in the Danish counties and DKK 100 million were granted to set up new positions as case managers to help vulnerable elderly patients. No precise job description was provided, however, and the Danish counties request evidence for the effect of case management (CM). The aim of this study was to 1) design a job description for a case manager, and 2) design a RCT evaluating consequences and costs of providing local CM to patients with COPD. **METHODS:** By use of the UK Medical Research Councils (MRC) framework for development of complex interventions, the design of the case manager job description and the RCT was determined through a systematic literature review, interviews with key persons and discussions in a specialist-comprised steering group. **RESULTS:** CM was designed to encompass coordination of care, facilitation of relevant health- and social services and promotion of patient self-care through advocacy and education. The RCT was powered to detect the effect of CM on hospital admissions. Secondary measures include mortality, quality of life, self-care and cost-effectiveness of CM versus usual care. 150 COPD patients are randomized into two groups after referral to pulmonary rehabilitation at the local rehabilitation center in Aalborg County, Denmark. The control group will receive usual care, whereas the interventional group will receive CM besides their usual care. Each patient is followed for 12 months. The questionnaires SF-12, EQ-5D, Sct. George-Respiratory-Questionnaire (SG-RQ) and The Patient-Activation-Measure (PAM-13) are completed at baseline and 12 months. Prospectively collected data from national population-based medical registries are used to estimate events and resource usage. **CONCLUSIONS:** The study is expected to provide further insight to the future organization of CM, and if being cost-effective, the intervention could be applied to comparable health care settings.

PRM12

REVIEW OF META-ANALYSIS METHODS FOR MULTINOMIAL DATA

Bennison C[1], van Beurden-Tan C[2], Buyukkaramikli C[2], Heeg B[2]
[1]*Pharmerit Ltd., York, UK,* [2]*Pharmerit International, Rotterdam, The Netherlands*

OBJECTIVES: Indirect comparisons are often based on binary outcomes (e.g. relapse / remission) or continuous outcomes. In these cases logistic or linear models are applied to make the indirect comparisons. However, sometimes datasets contain multinomial outcomes, such as 'complete', 'partial' and 'no' response in oncology, that need to be indirectly compared. With multinomial data, different indirect comparisons methods may be required to answer different research questions. Our goal was to identify and qualitatively compare the different techniques that have been used to model multinomial data in an indirect comparison framework. **METHODS:** A systematic review of the PubMed database was conducted to identify different methods for handling multinomial data in a meta-analysis. Key words included 'meta-analysis', 'ordinal', 'ordered', 'multinomial' and 'proportional odds', in various combinations. Models were qualitatively compared according to their assumptions, flexibility and complexity. **RESULTS:** The systematic review identified three methods: a proportional odds model, an ordered logistic model, and a multinomial model. The proportional

odds model has a natural interpretation of the treatment effect, is flexible in terms of handling data with different numbers of categories, but relies on the proportional odds assumption. The ordered logistic model also has a natural interpretation of the treatment effect, but increases in complexity when handling data with a large number of categories. The multinomial model's interpretation for the treatment effect is difficult, but it can model a large number of categories and can handle unordered competing risks and time dependent data. **CONCLUSIONS:** There are three methods for incorporating multinomial data in a meta-analysis framework with various advantages and disadvantages. Selection of the appropriate model appears to be most dependent on the characteristics of the dataset. We determine that there is sufficient cause for future research focusing on a quantitative comparison of these different methods.

PRM13

EASING DECISION-MAKING BY EXPANDING METHODS OF MULTIPLE TREATMENT COMPARISON META-ANALYSIS – INCORPORATING NON-COMPARATIVE STUDIES VIA INFORMATIVE PRIORS

Thorlund K[1], Kanters S[2], Mills E[3]
[1]*McMaster University, Hamilton, ON, Canada,* [2]*University of British Columbia, Vancouver, BC, Canada,* [3]*Stanford University, Palo Alto, CA, USA*

OBJECTIVES: While multiple treatment comparisons (MTC) generally provide strong evidence, many are accompanied with uncertainty that makes life challenging for decison makers. Seeking reduction in uncertainty from non-comparative trial can ease decision-making, but the validity of this approach must be tested. Using an example of treatments for cryptococcal meningitis (CM), our objective was to assess the value and validity of incorporating non-comparative trial evidence via prior distributions in the Bayesian MTC framework. **METHODS:** We conducted a Bayesian MTC meta-analysis with and without informative priors and reported odds ratios (OR) with 95% credible intervals (CrI). Non-comparative data were incorporated in a two-stage approach. First meta-analysis for proportions was used to pool all relevant non-comparative outcomes for each treatment. Second, these results were used to construct informative priors for the comparative treatment effect parameters (the log odds ratios) in the Bayesian MTC. Treatments considered were amphotericin (AmB)-based therapy coupled with either flucytosine (5FC) or fluconazole (Azole). **RESULTS:** Twenty-seven studies (N=1,938), 15 head-to-head drug comparison trials and 12 studies evaluating a single drug, described early mortality. Twenty-nine studies, 17 head-to-head and 12 single-arm studies, described late mortality. Incorporating non-comparative trials via informative priors improved the precision of several comparisons. For early mortality for example, the OR for AmB+Azole vs AmB+5FC was 0.26 (95%CrI 0.04-1.26) with a conventional MTC, and 0.24 (0.04-0.98) with informative priors. Use of informative priors reduced the DIC by 38% and the heterogeneity by 28%, indicating a better model fit. Moreover, evidence from the non-comparative studies was coherent with the randomized evidence, adding to the validity of the approach. **CONCLUSIONS:** Incorporating non-comparative studies as informative priors in Bayesian MTCs appears a viable approach for reducing the uncertainty in MTCs, and thus easing decision making.

PRM14

DEVELOPMENT OF THE SCHIZOPHRENIA CAREGIVER QUESTIONNAIRE: MODIFICATION OF THE ZARIT BURDEN INTERVIEW INFORMED BY QUALITATIVE INSIGHTS

Gater A[1], Rofail D[2], Tolley C[1], Marshall C[1], Abetz-Webb L[1], Zarit SH[3], Galani Berardo C[4]
[1]*Adelphi Values, Bollington, UK,* [2]*Roche Products Ltd., Welwyn Garden City, UK,* [3]*Pennsylvania State University, University Park, PA, USA,* [4]*F. Hoffmann-La Roche LTD., Basel, Switzerland*

OBJECTIVES: Understanding the impact of caring for a person with schizophrenia on caregivers' lives and emotional and physical well-being is of increasing interest for health care decison makers. The Zarit Burden Interview (ZBI) is an established measure of caregiver impact for Alzheimer's disease. Face and content validity of the ZBI have not yet been established in schizophrenia and were explored in this study based on qualitative insights from caregivers of people with schizophrenia. **METHODS:** A targeted literature review and consideration of best practice guidelines for development of self-report questionnaires informed initial ZBI modifications. Face and content validity of the newly labelled Schizophrenia Caregiver Questionnaire (SCQ) were assessed via comprehensive semi-structured interviews with a diverse range of 19 US caregivers of people with schizophrenia. Interviews were initially open-ended and explored caregivers' experience of caring for a person with schizophrenia (concept elicitation). Cognitive debriefing of the draft SCQ then assessed relevance and understanding. **RESULTS:** Initial review of the ZBI informed changes to item wording, recall period, and response scales to improve face validity. The qualitative literature review and concept elicitation interviews informed ten additional items assessing concepts important to caregivers, not included in the ZBI: tiredness, stress, disturbed sleep, sadness, medication administration issues, worries about future episodes, worsening symptoms, frustration, emotional highs and lows, and impact on work. Following cognitive debriefing interviews, five items were modified to improve relevance and understanding; otherwise, caregiver feedback supported the content validity and comprehensiveness of the resulting SCQ. **CONCLUSIONS:** SCQ demonstrated good face and content validity for the assessment of caregiver impact in schizophrenia and is a promising tool for communication of caregiver outcomes to health care decision makers. Tiredness, disturbed sleep and sadness are included in depression scales hence there may be overlap if depression is assessed). Further work determining final SCQ content/scoring and psychometric properties is ongoing.

USING AN EXCEL CALCULATOR TO ESTIMATE ANKYLOSING SPONDYLITIS COSTS IN TURKEY

Baser O[1], Burkan A[2], Baser E[3], Koselerli R[2], Ertugay E[2], Altinbas A[4]
[1]*STATinMED Research/The University of Michigan, Ann Arbor, Michigan, MI, USA,* [2]*Social Security Institution, Ankara, Turkey,* [3]*STATinMED Research, Ankara, Turkey,* [4]*Diskapi Yildirim Beyazi Education and Research Hospital, Gastroenterology Clinic, and STATinMED Research, Ankara, Turkey*

OBJECTIVES: To build an Excel calculator, including demographic and clinical characteristics of Ankylosing Spondylitis (AS) patients, and estimate annual health care costs of AS patients in Turkey. **METHODS:** The study data was obtained from the Turkish national health insurance database, MEDULA (2009-2011). Adult AS patients (ages 18-99) were identified for the identification period (June 1, 2010 - December 31, 2010) through the use of International Classification of Disease Tenth Revision Clinical Modification (ICD-10-CM) codes. Patients were required to have two AS diagnoses at least 60 days apart, with at least 1 year of continuous health plan enrollment for the baseline and follow-up years. Patients were grouped as prevalent and incident cases, and generalized linear models (GLMs) were used to estimate risk-adjusted total annual costs for prevalent and incident cases. The expected annual cost value was based on patient demographic and clinical characteristics. Coefficients of patients' demographic and clinical characteristics were built in the Excel calculator. Using the calculation, a marginal effects table was created after GLM estimation. **RESULTS:** A total of 2986 patients met all inclusion criteria (603 incident; 2383 prevalent patients). Demographic and clinical characteristics of the patients were entered into the Excel calculator. Risk-adjusted annual total costs were calculated as €3307 for prevalent cases and €2000 for incident cases. Prior biologic use significantly contributed to total medical costs for both prevalent and incident AS patients ($p<0.001$). For incidence cases, the cost of care was lower for the 18-39 age group when controlling for other factors. For prevalent cases, there were no differences in health care costs in terms of region, gender, age, comorbidities, or prior non-steroidal anti-inflammatory drug (NSAID) or disease-modifying anti-rheumatic drug (DMARD) use. **CONCLUSIONS:** An Excel calculator is an important tool to estimate and compare AS-related health care costs in outcomes research.

PRM16

DERIVATION OF SEVERITY INDEX FOR RHEUMATOID ARTHRITIS

Baser O[1], Baser E[2], Altinbas A[3], Burkan A[4]
[1]*STATinMED Research/The University of Michigan, Ann Arbor, Michigan, MI, USA,* [2]*STATinMED Research, Ankara, Turkey,* [3]*Diskapi Yildirim Beyazi Education and Research Hospital, Gastroenterology Clinic, and STATinMED Research, Ankara, Turkey,* [4]*Social Security Institution, Ankara, Turkey*

OBJECTIVES: To derive a claims-based severity index for rheumatoid arthritis (SIFRA) and examine its impact on prevalent rheumatoid arthritis (RA) patients in Turkey. **METHODS:** Using the Turkish national health insurance database MEDULA (01JUN2009-31DEC2011), prevalent RA patients were identified. Patients were required to be age 18-99, have two RA diagnoses $\geq$60 days apart and be continuously enrolled 1 year pre- (baseline period) and post-index date (follow-up), which was the first RA claim during the identification period (01JUN2010-31DEC2010). The SIFRA score was derived for each patient. RA-related indicators were sub-grouped as clinical and functional status, extra-articular manifestations, surgical history and medications. The strength of each relationship was measured from 0=no relationship to 6=perfect relationship, and assessed by six board-certified, clinically active rheumatologists according to the Delphi panel method. The index was previously validated and applied to the U.S. Department of Veteran Affairs, Veterans Health Administration (VHA) data. **RESULTS:** For the total of 1,920 identified RA patients, SIFRA scores ranged between 0 and 69.40, with a mean value of 14.21, and a standard deviation (SD) of 10.26. Mean SIFRA scores were 7.05 (49.57%), which consisted of clinical and functional status variables, followed by 6.32 (44.47%) for medications, 0.48 (3.40%) for radiology and laboratory findings, 0.32 (2.25%) for extra-articular manifestations (pulmonary nodules, subcutaneous nodules, vasculitis ever, Felty's syndrome ever), and 0.04 (0.31%) for surgical history (cervical spine fusion, hand/foot joint replacement, foot joint/ankle/wrist fusion, total hip/knee/elbow/shoulder replacement). **CONCLUSIONS:** SIFRA demonstrated evidence of being a significant determinant for health care costs and biologic therapy use. This study suggests that SIFRA could be an important methodological tool to control for severity in RA-related outcomes research. Any comparative effectiveness studies in RA treatment should include severity scores in the analysis.

PHYSICIAN PANELS SUPPORTING CLINICAL TRIALS AND POST-APPROVAL STUDIES IN ONCOLOGY: A WILLINGNESS-TO-PARTICIPATE STUDY

Potthoff P[1], Brown C[2], Güther B[3], Eichmann F[3]
[1]*Kantar Health GmbH, München, Germany,* [2]*All Global, London, UK,* [3]*Kantar Health Germany, Munich, Germany*

OBJECTIVES: Clinical oncology research projects require participation of oncologists and/or hematologists to recruit patients and/or assess clinical outcomes. A variety of methods is used to recruit office or hospital based physicans. Specifically for studies with an epidemiological aspect, the study should not rely on the typical clinical expert sites, thus, alternative recruitment pathways are increasingly considered. The objective of our study was thus to assess the benefits of using physician panels for site recruitment. **METHODS:** In 2012, a representative survey among members of a managed physician panel (All Global's managed panel of oncologists and hematologists in US, UK, GER, FR, IT and SP) was conducted. A Sample of oncologists and hematologists was selected. The panel was stratified by country and within the strata physicians were randomly selected. 335 out of 1.303 oncologists and hematologists in the sample (25,7%) reported about their former experience with clinical trials and post-approval studies, their willingness to participate in future studies and their adherence to aspects of GCP rules. **RESULTS:** A total of 284 (84,7%) of the physicians have formerly participated in clinical trials and 276 (67,2%) in post-approval studies. A total of 88,9% of the experienced oncologists and hematologists were willing to participate in future studies. More than 80% of this group was ready to be named as principal investigator to an ethical committee, to report serious adverse events to the sponsor of the study and to ask patients for written informed consent. No substantial difference between countries was detected. **CONCLUSIONS:** Since no special incentive was offered for participation the response rate was satisfactory Managed oncologist panels are a cost-effective,

experienced and high-quality source for post-approval studies. Elaborated management processes in multi-country panels guarantee a constant quality of the panel over geographies.

CLASSIFICATION OF COGNITIVE DYSFUNCTION AND COGNITIVE NORMAL USING SCORES FROM FOUR COGNITIVE ASSESSMENTS IN PATIENTS WITH DEPRESSIVE DISORDER

Maruff P[1], Walker V[2], Samp J[3], Essoi B[2], Kurlander JL[2], Akhras KS[3]
[1]*CogState, New Haven, CT, USA,* [2]*OptumInsight, Eden Prairie, IL, USA,* [3]*Takeda Pharmaceuticals International, Inc., Deerfield, IL, USA*

OBJECTIVES: Cognitive functioning is a multidimensional attribute comprising various domains including attention, memory, executive function, and psychomotor speed. The number of impacted domains and magnitude of deficits that equate to a classification of cognitive dysfunction (CD) are unclear. This analysis examined criteria used for CD classification in an observational study of depressed patients. **METHODS:** A large US health plan was used to identify depressed patients with a newly prescribed antidepressant. Consenting, eligible patients were interviewed by telephone and completed a structured assessment of cognitive function measuring 4 domains: verbal episodic memory (Hopkins Verbal Learning Test-Revised), attention (Digit Span Forward), working memory (Digit Span Backward), and executive function (D-KEFS-Letter Fluency Test). Patients were classified into 2 groups based on test scores relative to normative data. "CD" was defined as patients with ≥2 scores that were ≥1.5 standard deviations (SD) below the normative mean (criterion 1) or patients with ≥3 scores that were ≥1.0 SD below the normative mean (criterion 2). Patients not meeting either of these were classified as "cognitive normal (CN)." T-tests compared differences between the groups across cognitive domains. **RESULTS:** Of 564 eligible patients who completed the study, 45% met criteria for CD. Among these, 63% met both criteria for classification of CD, 19% met only criterion 1, and 18% met only criterion 2. The percentage of patients with scores ≥1.0 SD below the mean and ≥1.5 SD below the mean were significantly higher in the CD group compared to the CN for all 4 tests. Mean scores on all domains were significantly lower ($P < 0.001$) in the CD group compared to the CN group. **CONCLUSIONS:** Among patients with depression, those with cognitive dysfunction had significantly worse functioning across all domains. This suggests that the criteria appropriately identified a subset of patients with impaired cognitive functioning.

RESEARCH ON METHODS – Cost Methods

PRM19

TIME DEPENDENT RESOURCE USE AND COSTS ASSOCIATED WITH DIFFERENT STATES OF DISEASE IN PATIENTS DIAGNOSED WITH HER-2 POSITIVE METASTATIC BREAST CANCER

Frederix GW[1], Severens JL[2], Hövels AM[1], van Hasselt JG[3], Raaijmakers JA[4], Schellens JH[5]
[1]*Utrecht University, Utrecht, The Netherlands,* [2]*Erasmus University Rotterdam, Rotterdam, The Netherlands,* [3]*Slotervaart Hospital & Netherlands Cancer Institute, Amsterdam, The Netherlands,* [4]*Utrecht University & GlaxoSmithKline, Utrecht, The Netherlands,* [5]*Netherlands Cancer Institute & Utrecht University, Amsterdam, The Netherlands*

OBJECTIVES: Adequate reflection of disease progression and costs over time is essential in cost-effectiveness analyses (CEAs) based on health state transition models. However costing studies normally investigate the burden of metastatic breast cancer (MBC) without explicitly examining impact of specific disease states on health care costs over time. The objective of this study was to assess time-dependent costs of different health states of human epidermal receptor 2 (HER-2) positive MBC and the factors contributing to these costs. **METHODS:** In The Netherlands, HER-2 positive MBC patients were identified in three different hospitals. Resource use was collected during 24 months, which was linked to unit costs and related to time with respect to date of MBC diagnosis, disease progression and death for each individual patient. Subsequently, monthly costs for different health states were calculated. Finally, a nonlinear mixed effect modelling approach was used to provide a quantitative description of the time course of cumulative progression costs. **RESULTS:** Costs during stable disease were constant over time with a mean of €3,236. In contrast, monthly costs for progressive disease demonstrated a change over time with the largest costs in the first two months after diagnosis ($p<0.005$). The developed mixed effect model adequately described cumulative cost time course and associated variability. During the last months of life, costs varied over time, with the last month of life as the most expensive one with a mean of €4,522 per patient per month. **CONCLUSIONS:** To reflect costs of HER-2 positive MBC accurately in Markov models, costs stable disease can be defined time-independent, however, costs of progressive disease should be defined time dependent, and costs related to the final months of life should be modeled as such. The mixed effect model we have developed could now be considered for adequate description of the time-dependent cost of progressive disease.

PRM20

ASSESSING THE FUTURE BURDEN OF RENAL REPLACEMENT THERAPY IN THE UNITED KINGDOM

McEwan P[1], Ward T[1], Righetti C[2], Brenner M[2], Lebmeier M[2]
[1]*HEOR Consulting, Monmouth, UK,* [2]*Bristol-Myers Squibb Pharmaceuticals Ltd., Uxbridge, UK*

OBJECTIVES: The UK has an ageing and growing population and the prevalence of renal replacement therapy (RRT) has grown by 5.0% annually since 2000. RRT accounts for over 2% of the current NHS expenditure. Transplantation increases survival, improves quality of life and maintenance costs are less than dialysis. Despite increasing rates of transplantation, an estimated 7,000 patients remain on the waiting list. The objective of this study was to quantify the relationship between graft survival time, total estimated cost and the number of projected patients on the transplant waiting list. **METHODS:** We utilized a population based simulation model with published disease progression, incidence and prevalence parameters specific to the UK. We evaluated the number of years of functioning graft required for transplantation to remain cost saving compared to dialysis; the number of future transplants or improvement in graft survival required to avoid the transplant waiting list increasing. The study utilises UK costs and future costs and benefits were discounted at 3.5% **RESULTS:** Over a 10-year projected time horizon the total per-patient cost saving associated with remaining on dialysis compared to transplant was £276,330; however, a cost saving was conditional upon achieving at least 3-years of functioning graft. In order to maintain the transplant waiting list at approximately 7,000, the number of annual transplants conducted would need to increase from 2,645 in 2010 to 3,640 by 2022 (a 37.6 % increase). At current activity levels the transplant waiting list is projected to increase by approximately 1,983; improvement in graft survival could potentially reduce this by 941. **CONCLUSIONS:** For kidney transplantation to be cost saving recipients must maintain at least 3 years of functioning graft. As early graft failure also impacts on future transplant waiting time, management strategies that maximize graft survival will reduce costs and improve service delivery targets.

PRM21

COMPARISON OF ALTERNATIVE METHODS OF RESOURCE-USE DATA COLLECTION FOR THE ECONOMIC EVALUATION OF HEALTH CARE INTERVENTIONS: A CASE STUDY IN FRAIL OLDER PEOPLE

Franklin M, Gkountouras G, Berdunov V, Tanajewski L, Gladman J, Elliott RA
University of Nottingham, Nottingham, UK

OBJECTIVES: Economic evaluations require patient-level resource-use to estimate patient costs. The National Programme for IT (2002) prompted UK health and social care to record patient-level resource-use using Electronic Administration Records (EAR's). Retrieving EAR's is labour intensive, but may provide better information than self-report methods, such as the Client Service Receipt Inventory (CSRI), particularly in cognitively impaired people. Study objectives are to examine agreement, and associated cost estimates, between resource-use obtained from EAR's or CSRI in frail older (≥70) participants. **METHODS:** Health and social care data for 247 patients (193 cognitively impaired) were sought retrospectively six months post-index hospital admission. Resource-use data were collected using a self/proxy-reported modified CSRI, and EAR systems for primary (PC), secondary (SC), and social (SoC) care. Lin's coefficient (ρc) assessed agreement between methods, where <0.4 = poor agreement. **RESULTS:** Agreement between EAR and CSRI 'per contact' resource-use was: good, primary care ($\rho c = 0.60$); fair, outpatient care ($\rho c = 0.53$). Agreement was incomparable for social care due to different resource-use recording formats; CSRI's inpatient care question was removed due to the preferred detailed information available in EAR's. EAR data provided detailed patient care information, such as diagnosis and procedure type, allowing improved allocation of unit costs. Difference in mean cost per patient between methods varied by service (CSRI/EAR (£): PC = 61/433; SC = 7281/7833; SoC = 252/886); CSRI inpatient costs were simulated assuming perfect agreement with EAR, but using level of information outlined within the CSRI. **CONCLUSIONS:** EAR's provided more complete patient costs. Using EAR's reduces burden upon participants, which is important for frail and cognitively impaired people. Although the CSRI can be modified and simple to administer, poor recall and inadequate detail about patient care contacts prevented accurate patient-level cost estimation. Gaining access to EAR's is labour intensive, but recommended in cognitively impaired participants.

PRM22

CARBON COST-EFFECTIVENESS OF COCOONING IMMUNIZATION AGAINST PERTUSSIS IN ENGLAND AND WALES: AN ECOLOGICAL PERSPECTIVE

Terlinden A[1], Renson B[2], Ponder C[3], Poirrier JE[2], Curran D[2]
[1]*Navigha, Tervuren, Belgium,* [2]*GSK Vaccines, Wavre, Belgium,* [3]*GSK, Research Triangle Park, NC, USA*

OBJECTIVES: The cost-effectiveness of pertussis vaccination has been demonstrated for various vaccination strategies. However, beyond financial cost expressed in monetary terms vaccines also incur environmental cost expressed in CO_2equivalent (CO_2e) emission. By preventing disease, this cost might be offset by avoided events such as doctors' visits, hospital bed stays, medication, amongst other items. In this exercise we examine the CO_2e savings of a pertussis (dTpa) booster dose for cocooning in England and Wales. We propose a complementary measure to the classical Incremental Cost-Effectiveness Ratio that includes environmental cost instead of monetary cost. **METHODS:** The cradle to gate carbon footprint (from raw material extraction, to manufacturing, to disposal) for a typical dTpa vaccine dose was assessed to estimate the total amount of CO_2e emitted ("carbon cost"). A previously published static epidemiological model was used to account for the reduction in incidence of pertussis. Two scenarios were compared: the current pertussis vaccination schedule and the same schedule with additionally a cocooning strategy. **RESULTS:** For each dose of a dTpa vaccine manufactured, results show approximately 1kg of CO_2e was emitted. The model shows cocooning immunization against pertussis is projected to reduce the reported incidence of pertussis in young infants. Results also show that due to the reduction in emitted CO_2e after the introduction of a cocooning strategy, vaccination is an acceptable alternative to the current strategy to control pertussis infection. **CONCLUSIONS:** The method presented demonstrates how traditional economic models can be utilized to model environment features. Assessment of the cradle to gate carbon footprint of a vaccine provides a preliminary view of both the impact on the environmental in general and on the environment profile of health care in the UK.

PRM23

MODELLING THE COST-EFFECTIVENESS OF FIRST-LINE BIOLOGICS FOR RHEUMATOID ARTHRITIS IN ENGLAND AND WALES

Righetti C[1], Lebmeier M[1], Pennington B[2], Brereton NJ[2]
[1]*Bristol-Myers Squibb Pharmaceuticals Ltd., Uxbridge, UK,* [2]*BresMed, Sheffield, UK*

OBJECTIVES: In 2012, NICE initiated a multiple treatment assessment reviewing all licensed biologics for the treatment of rheumatoid arthritis (RA) previously treated

with conventional DMARDs only. The sequence of treatments used after the failure of first biologic treatment was to be included as part of the cost-effectiveness modelling. We therefore built a model to match the treatment pathway for first-line biologics and beyond. **METHODS:** We researched the treatment pathway and existing cost-effectiveness models in order to create an appropriate model. We rebuilt the model used by the technology assessment group in TA195, which considered second-line biologics and beyond. We adapted this model to reflect the current treatment pathway and consider first line biologics. **RESULTS:** We created a patient simulation model, which generated a cohort of virtual patients and tracked their costs and QALYs over the pathway. Patients began treatment with a biologic, and could discontinue at month 6 due to an adverse event (AE), in which case they switched to a different biologic, with first-line efficacy. Patients who did not have an AE discontinued at month 6 if their DAS 28 improvement was insufficient. After discontinuation at month 6, or later, patients next received rituximab, unless contraindicated. If rituximab was contraindicated, or the patient had an AE by month 6, they moved onto another biologic treatment, after which they received a DMARD treatment sequence (including palliative care). Patients who had insufficient DAS28 response on rituximab at month 6 switched to tocilizumab (unless received previously), after which they received the DMARD sequence. Patients who had sufficient DAS28 improvement with rituximab remained on rituximab long-term, until they received the DMARD treatment sequence. Patients could exit the model at any point if they died. **CONCLUSIONS:** We used robust methodology and clinical rationale to assess the cost-effectiveness of licenced treatments reflected across NICE's recommended treatment pathway for RA.

PRM24

MODELLING THE COST-EFFECTIVENESS OF FIRST LINE BIOLOGICS FOR RHEUMATOID ARTHRITIS IN IRELAND

Righetti C[1], Lebmeier M[1], Pennington B[2], Brereton NJ[2]
[1]*Bristol-Myers Squibb Pharmaceuticals Ltd., Uxbridge, UK,* [2]*BresMed, Sheffield, UK*

OBJECTIVES: In 2013, NCPE assessed the cost-effectiveness of subcutaneous (SC) abatacept as a first line biologic for the treatment of rheumatoid arthritis (RA), compared to existing biologics. It was necessary to consider the treatment pathway beyond first line biologics. We therefore built a model to match the treatment pathway for first line biologics and beyond. **METHODS:** We used our individual patient sampling model for England and Wales as a starting point to create a model which considers biologic cycling, to match the treatment pathway in Ireland. We differentiated between the efficacy of a biologic at first line, and at second line or later. **RESULTS:** We created a model which could be used to calculate the cost-effectiveness of biologics for the treatment of RA in Ireland. Patients first received treatment with SC abatacept, intravenous abatacept, adalimumab, etanercept, infliximab, certolizumab pegol or golimumab. If they experienced an adverse event (AE) on that treatment within 6 months, they switched to another biologic at first line efficacy. If not, their response to treatment was tested using the DAS28: if this improved by 1.2 or more, their time on treatment was sampled from a Weibull distribution, otherwise they discontinued at month 6. The patient then moved onto a randomly sampled second line biologic, which was either one of the first line biologics or rituximab. The time on second line biologic was sampled from a Weibull distribution, and then the patient moved onto a third line biologics (second line biologics and tocilizumab). The patient cycled through the biologics until they died, or had received all 8 treatments. After 8 biologics, remaining patients received leflunomide, cyclosporin, azathioprine and palliative care. **CONCLUSIONS:** We used robust methodology and clinical rationale to model the treatment pathway of biologics for RA in Ireland and facilitated cost-effectiveness comparison between first line biologics.

PRM25

A SYSTEMATIC REVIEW OF ECONOMIC EVIDENCE IN HEPATITIS C: METHODS USED IN RECENT ECONOMIC EVALUATIONS

Woods MS[1], Kiri S[2], Ling C[1], McCrink L[1], Zimovetz E[1], Hass B[3]
[1]*RTI Health Solutions, Manchester, UK,* [2]*Boehringer Ingelheim Ltd., Bracknell, UK,* [3]*Boehringer Ingelheim GmbH, Ingelheim, Germany*

OBJECTIVES: To perform a systematic literature review of economic evidence for genotype 1 hepatitis C virus (HCV) treatments and to summarise and assess the methods used in recent economic evaluations. **METHODS:** Multiple databases were searched to identify economic evaluations in patients with genotype 1 HCV. Detailed review methods are presented elsewhere. **RESULTS:** 53 economic analyses and 17 Health Technology Assessment (HTA) documents were identified. Most economic analyses were performed using lifetime horizon Markov models, all for interferon-containing regimens. Most were performed in the United Kingdom (UK) (n = 13), United States (n = 13), or Germany (n = 7). Two recent National Institute for Health and Care Excellence (NICE) submissions were included: telaprevir triple therapy (with peginterferon plus ribavirin) and boceprevir triple therapy, for previously treated and untreated patients. The models used were different; however their structures and some inputs were based on previous NICE appraisals for peginterferon plus ribavirin. There were a number of limitations found in the included economic evaluations, which may have affected the cost-effectiveness outcomes: 1) The models did not adequately capture all health benefits and costs in their quality-adjusted life-year calculations; 2) The models did not account for the possibility of benefits caused by reduced transmission of HCV; 3) The models did not incorporate patient factors that may influence disease progression; 4) Modelling of subgroups may have been insufficient, particularly as the understanding of patient and viral factors that predict treatment response grows; and 5) Some made generalisations for the compensated cirrhosis population that were not comparable with the UK population. **CONCLUSIONS:** Recent economic models have generally adhered to previous iterations of HCV models and have not evolved with our knowledge of the disease. In light of upcoming treatment alternatives, model refinement may be necessary to capture the increasingly complex treatment decisions that will be required.

PRM26

IMPACT OF USING EITHER MULTIPLICATIVE OR ADDITIVE UTILITY DECREMENTS IN DECISION MODELS

Cure S[1], Despiégel N[2], Guerra I[1]
[1]*OptumInsight, Uxbridge, UK,* [2]*OptumInsight, Nanterre, France*

OBJECTIVES: In cost-utility analyses (CUAs) it is common to estimate the utility of patients while on treatment or when experiencing comorbidities by adjusting their baseline utility with the treatment/comorbidity-related utility decrement. This study assessed the impact of adjusting patients' baseline utility with additive versus multiplicative utility decrements on the lifetime quality-adjusted life years (QALYs) in CUAs for two chronic illnesses. **METHODS:** Two Markov models were developed. In the first model, utility during treatment was obtained by adjusting the baseline utility with the treatment-related utility decrement; treatment was given for one year. In the second model, utilities with comorbidities were obtained from external sources and were combined with the health state utilities by considering the lowest value. In both models, the response of the multiplicative, additive and the combined approach was investigated by comparing the number of QALYs gained over a lifetime. **RESULTS:** In the first model, as treatment was only given during the first year, the impact on the number of QALYs gained over a lifetime was minimal. Thus, a similar incremental cost-effectiveness ratio per QALY (ICER/QALY) was obtained with all the approaches. In contrast, for the second model, the number of QALYs gained over a lifetime between the approaches was significantly different. This is because comorbidities were experienced during a longer period of time. Consequently, the difference in ICER/QALY was also substantial. **CONCLUSIONS:** When developing CUA, either a multiplicative or combined, rather than additive, approach should be used to calculate the utility of patients during treatment or with comorbidities, using utility decrements, if considerable uncertainty is present in the baseline utility. However, if QALYs gained with treatment or with comorbidities represent only a small fraction of the overall QALYs gained, the difference between the approaches is not expected to have a significant impact on the results.

PRM27

UNCHARTERED TERRITORY – ANALYSIS OF CROSS-BORDER SERVICE PROVISION WITHIN PUBLIC HEALTH SYSTEMS

Moran P, Teljeur C, Murphy L, O'Neill M, Harrington P, Ryan M
Health Information and Quality Authority, Dublin, Ireland

OBJECTIVES: The European Union's (EU) 2011 Directive on cross-border health care establishes the right of EU citizens to receive treatment abroad and be reimbursed in their home country. While the focus has been on patient mobility and access, it may also facilitate international outsourcing of services between countries. This research examines the methodological challenges in evaluating the costs and consequences of cross-border service provision. **METHODS:** Using the example of deep brain stimulation (DBS) treatment in Ireland, we conducted an economic analysis of the provision of cross-border services from the perspective of the public health system. This included an analysis of clinical and cost-effectiveness, ethical and societal implications and the challenges of integrating care between separate health systems. **RESULTS:** Accurate modelling of the provision of a new or expanded service serves as the basis for evaluating costs, impact on patients and potential gaps in continuity of care. Cost minimisation analysis may be appropriate under some circumstances, with due regard to the importance of patient selection and follow up. Cross-border services may have significant implications for equity of access, with potential negative consequences for those most in need of treatment. Results of the economic analysis indicate that a national DBS service in Ireland would cost an additional €20,900 per patient over 10 years. The potential for anomalies within health systems with a mixture of private and public funders is highlighted, with the difference being reduced to €4,100 per patient in a single payer scenario. **CONCLUSIONS:** Health care funding structures can impact significantly on the cost-effectiveness of cross-border services, even when differences in the actual cost of care are minimal. Given the externalities involved, analysis from the payer perspective may be too narrow for the economic evaluation of routine cross-border provision of elective services.

PRM28

EMPIRICAL EVIDENCE FOR THE VALIDITY AND RELIABILITY OF RESOURCE-USE MEASURES BASED ON PATIENT RECALL: A SYSTEMATIC REVIEW

Thorn J, Noble S, Moore T, Hollingworth W
University of Bristol, Bristol, UK

OBJECTIVES: Accurate measurement of resource use is required for economic evaluations alongside clinical trials. Patient-completed questionnaires are commonly employed as a means of collecting data; however, concerns over data quality persist, and there is little certainty about best practice. This review collates the evidence concerning the validity and reliability of resource-use measures based on patient recall with the aim of aiding health economists in developing better measures. **METHODS:** A search strategy incorporating terms covering health care resources, utilisation, patient-reported measures and validation/reliability concepts was applied to the MEDLINE, EMBASE and PsycINFO bibliographic databases. Studies were included if they reported original research to inform costing studies, and were about patient or proxy self-reports of direct health care-related resource use in which a comparator (to assess validity or reliability) was specified. Studies were excluded if they were not in English or if they assessed general population surveys. Reference and citation lists of included studies were hand searched to identify additional studies. Data on study and population characteristics, type of instrument, recall period and sample size were extracted. Results and conclusions concerning the validity and reliability of reports of types of resource use consumed (*e.g.*medication, inpatient stays) were also extracted. **RESULTS:** A total of 13,367 abstracts were identified as potentially relevant through the database searches. Following abstract and full-text screening, 60 articles were deemed relevant, with a further 9 identified through hand searching. The majority focused on adults (60/69),

and nearly half originated from north America (31/69). Emerging themes suggest that better accuracy is achieved when patients are answering questions about inpatient and specialist care. **CONCLUSIONS:** There is only a limited amount of validity and reliability information available to inform best practice for resource-use measurement in clinical trials. This ongoing review will identify the gaps, giving a clearer view of where research efforts should be concentrated.

PRM30

FUTURE COSTS INCLUSION IN PUBLISHED ECONOMIC EVALUATIONS: WHAT IS THE CURRENT SITUATION?

Gros B[1], Soto J[2], Casado MA[1]
[1]*Pharmacoeconomics & Outcomes Research Iberia, Madrid, Spain,* [2]*Carlos III University of Madrid, Madrid, Spain*

OBJECTIVES: Nowadays, there is a general agreement about the need of including future related medical costs in life years gained while no consensus has been achieved about future unrelated medical costs (indirect medical costs) and future non-medical costs. The aim of this study has been to assess the extension of published economic evaluations that incorporated future costs and what types of future cost were included. **METHODS:** Three general health economic journals (*Pharmacoeconomics, Value in Health and European Journal of Health Economics*) were reviewed to identify economic evaluations from 2008 to 2011. Only complete economic evaluations were accepted for this research. From each selected article, future cost inclusion was evaluated along with the type of future costs included. **RESULTS:** A total of 148 articles were founded from the three journals fulfilling the inclusion criteria; 67 of them (45.27 %) incorporated future related medical costs, 9 (6.08 %) included also future unrelated medical costs and none included future non-medical costs. Percentage of articles including future costs increased from 2008 (33 %) to 2011(57 %) and no differences were detected between the three journals in the proportion of economic evaluations incorporating future costs. **CONCLUSIONS:** Despite most of health economic guidelines advice the need of incorporating future costs in l economic evaluations, less than the half of articles reviewed incorporated them. Moreover, the inclusion of future unrelated medical costs and future non-medical costs was much lower. Results of economic evaluations can change dramatically depending on future costs inclusion. It is necessary to change the current practice and systematically include future related medical costs in the base case of economic evaluations and future unrelated medical costs and future non medical costs at least in sensitivity analysis.

PRM31

CHALLENGES OF CONDUCTING ECONOMIC EVALUATIONS USING LINKED ELECTRONIC HEALTH RECORDS - CPRD AND HES IN THE UNITED KINGDOM

Asaria M[1], Walker S[1], Sculpher MJ[2], Palmer S[1], Manca A[3], Abrams KR[4], Hemingway H[5], Denaxas S[5], Morley KI[5], Shah A[5], Timmis A[6], Gale C[7]
[1]*University of York, York, UK,* [2]*Centre for Health Economics, York, UK,* [3]*University of York, Heslington, UK,* [4]*The Institute of Cancer Research, Sutton, UK,* [5]*UCL, London, UK,* [6]*Barts and the London School of Medicine and Dentistry,, London, UK,* [7]*Leeds University, Leeds, UK*

OBJECTIVES: A range of linked electronic health records (LEHR) datasets are becoming available in the NHS in England. Understanding the benefits such large LEHR datasets can offer when performing cost-effectiveness analysis and overcoming the challenges inherent in utilising such datasets using as a case study: the CALIBER (Cardiovascular Disease Research using Linked Bespoke Studies and Electronic Records) dataset to assess the cost-effectiveness of treatment of patients with chronic stable angina. **METHODS:** The CALIBER dataset links primary care data from CPRD with secondary care data from HES, mortality data from ONS and disease-specific data from MINAP. This dataset is used to provide a generalisable baseline for cost-effectiveness models and to provide effectiveness estimates for treatments observed in the dataset. It is also used to explore decisions that, due to ethical concerns, could not be researched through RCTs - for example, optimal durations and combinations of treatments used in current practice. The statistical methods of matching, differences in differences and instrumental variables are used to overcome the selection bias problems associated with inferring treatment effects using observational data. The models are also combined with RCT results for novel treatments to assess their cost-effectiveness in a real world as opposed to trial setting. **RESULTS:** There were significant challenges involved in working with LEHR ranging from correctly linking the data to plausibly imputing missing data and correcting for selection bias in estimates. Having addressed these challenges we were left with a rich dataset, from which to estimate costs, risks of health events and treatment effects in a generalisable real world setting. **CONCLUSIONS:** While the selection biases associated with the use of LEHR within the NHS makes them challenging to work with, the large sample sizes, generalisability of the results and relatively low cost of the research makes them a hugely valuable resource for economic evaluation.

PRM32

DEVELOPMENT OF THE SCHARR HUD (HEALTH UTILITIES DATABASE)

Rees A, Paisley S, Brazier J, Cantrell A, Poku E, Williams K
University of Sheffield, Sheffield, UK

OBJECTIVES: The retrieval of studies containing evidence of health state utility values (HSUVs) is currently problematic using generic bibliographic databases such as Medline. This is due to a lack of standardised search vocabulary and inadequate and inconsistent indexing. The objective of this project is to develop a bibliographic database providing access to details of research studies containing health state utility values generated using the EQ-5D and other preference-based instruments. **METHODS:** The initial phase of the project has focussed on the EQ-5D. An alpha version of the database was created using Mendeley reference management software. A corpus of potentially relevant studies was identified by searching Medline and by sifting the reference lists of systematic reviews of HSUVs in a range of diseases and conditions. The sifting of retrieved studies is an ongoing process. Studies are included in the database if they contain estimates of HSUVs. The names of instruments used in the studies, including and in addition to the EQ-5D, are extracted and added to the database record to create a searchable index of instruments. A beta version of the database, using bespoke software to improve functionality, is currently undergoing ad hoc testing. **RESULTS:** The alpha version of the database contains over 3,500 potentially relevant studies identified by the search process. Several hundred studies have been data extracted and indexed. The names of over 50 instruments, including quality of life, disease specific and generic preference-based measures have been added to the index. A programme of sifting, data extraction and indexing is ongoing. Public access to the beta version of the database is planned for Autumn 2013. **CONCLUSIONS:** The purpose of the health utilities database is to improve access to HSUV evidence, in the first instance in studies using the EQ-5D with a view to including all major preference-based utility measures.

PRM33

THE REVIEW OF PUBLICATIONS OF PHARMACOECONOMIC RESEARCH IN RUSSIA DURING 2007-2012

Yagudina R[1], Kulikov A[1], Mirkasimova G[1], Litvinenko M[2]
[1]*I.M. Sechenov First Moscow State Medical University, Moscow, Russia,* [2]*First Moscow State Medical University named after I. M. Sechenov, Moscow, Russia*

OBJECTIVES: To analyze the publications on methodology and normative regulations of pharmacoeconomic studies, including materials providing results of conducted researches in Russia or translated international publications, as well as to analysis the dynamics of publications and identify the structure of methodological approaches in Russia. **METHODS:** The screening of publications from the data of the Central Medical Scientific Library of the First MSMU was conducted based on the key words - "pharmacoeconomic*" and "pharmacoeconomical*" with corresponding endings. The time horizon of the study was 6 years (from 2007-2012). **RESULTS:** By the beginning of 2013, 280 literature sources were found and analyzed in the timeline from 2007 to 2013. It was found that the most common type of publications for the reporting period have been the inaugural dissertations showing the researches results - they are accounted for about 47% of all studies, followed by further research reports, accounted for 44%, methodical publications - 5%, dissertations devoted to the methodology of the pharmacoeconomics- 3%, regulatory guidance documents and translations of foreign studies - 1%. The most common structure of published researches was monocenter (56%), with a retrospective time-restricted directivity (74%). Russian authors use the methodology of the "cost-effectiveness" analyzing in their works the most frequently (48%). 64% of Russian researchers take into account only direct costs, 32% of researchers analyze their studies based on indirect costs. **CONCLUSIONS:** Based on our review of the published works from 2007 to 2012, we can make a conclusion on the formation and development of high-grade pharmacoeconomics as an independent research area in the Russian Federation.

PRM34

EVALUATING DIFFERENT MODES OF RADIOTHERAPY BASED ON A PATIENT-LEVEL SIMULATION MODEL

Quik EH[1], Feenstra TL[1], Postmus D[1], Krabbe PFM[1], Langendijk H[2]
[1]*University of Groningen, University Medical Center Groningen, Groningen, The Netherlands,* [2]*UMCG, Groningen, The Netherlands*

OBJECTIVES: Use of proton instead of photon radiation therapy for head and neck cancer reduces the primary tumor and damage to adjacent organs risk, which results in fewer complications. These complications decrease quality of life (QOL). To support better decision making concerning which patients benefit most from proton therapy, a patient-level simulation model is developed and applied to compare outcomes. **METHODS:** Model estimates, such as patient and tumor characteristics, follow-up time, and survival, were based on patient-level data containing patients treated with radiation therapy as first line therapy for head and neck tumor in The Netherlands between 1980–2010 at the UMC Groningen (n=277) and VU Amsterdam (n=736). In silico radiation treatment planning schemes for both proton and photon therapy allowed to compare a priori expected health benefits and cost consequences for both therapy modes to support a patient tailored choice. **RESULTS:** Patients experienced their first event at a median time of 30 (0-270, SD 34) months' time. Loco-regional recurrency in 29%, distant metastasis in 4.2%, both combined in 1% and dead in 13.3% of patients. Cost per year for photon was estimated €15000, proton €30000, disease free state €190, local regional recurrence €28000, metastases €35000, and both €35000. For the complication sticky saliva costs per year of an average patient were €31, xerostomia €194, dysphagia €57, tube feeding €4262, and hypothyroidism € 117. Proton radiation therapy leads to less complications and improved QOL. **CONCLUSIONS:** Given the high costs of proton therapy, this was found not to be cost-effective compared to best photon therapy in an average patient with head and neck cancer. However, the outcomes vary substantially between patients. Depending on patient and tumor characteristics for selected patients with high complication risks, proton therapy can be a better option.

PRM35

THE ECONOMIC FOOTPRINT OF THE GREEK PHARMACEUTICAL INDUSTRY

Tserkezis E, Paratsiokas N, Tsakanikas A, Athanasiadis A
Foundation for Economic & Industrial Research (IOBE), Athens, Greece

OBJECTIVES: To assess the overall impact of the production and distribution of pharmaceutical products in the Greek economy, in terms of Value Added, GDP, employment and tax revenues. **METHODS:** The overall impact in the Greek economy is estimated as an exogenous change in the economic activity by using the Leontief input-output model. **RESULTS:** The results indicate that the direct effect of the industry on domestic economic activity is €1.5 billion in terms of GDP. The indirect effect, which represents the value created by auxiliary sectors as (main suppliers) of the pharma industry is €2.2 billion. Finally, the induced effect, which is the impact from the final consumption, as a result of the wages and salaries gained by employees across the production chain of the specific industry is €3.8 billion. Hence, the overall effect on GDP is approximately €7.5 billion, which repre-

sents almost 3.4% of the country's GDP (2010). In terms of employment 23.000 are directly employed in the sector, while the total benefit for the Greek economy (both direct and indirect) is estimated to approximately 132.000 jobs. Finally, the industry accounts for nearly €400 million tax revenue, half of which affects the economy directly. **CONCLUSIONS:** Taking these effects in consideration it stems that for every €1 of Value added in the production / distribution of the pharmaceutical sector some €2.6 of Value added is created as an indirect effect and €5.3 as an induced effect. Additionally every job position in the sector in the pharmaceutical (production / distribution) sector supports 2.5 jobs due to indirect effects and almost 6 jobs in the economy. Finally, for every €1 in tax revenue provided by the sector, an additional €1.6 is generated though indirect effect and a total of €2.2 if the induced effect is taken into consideration.

PRM36

AN ASSESSMENT OF THE USE OF UTILITY DATA IN LONG-TERM COST-EFFECTIVENESS MODELS OF LIPID LOWERING THERAPIES

Kuan RK[1], Wang A[1], Cong Z[2], Zolfaghari S[1], Gandra SR[2], Nordyke R[1]
[1]*PriceSpective LLC, El Segundo, CA, USA,* [2]*Amgen, Inc., Thousand Oaks, CA, USA*

OBJECTIVES: To determine through a literature review how economic evaluations incorporate utility data into models when estimating long-term cost-effectiveness of lipid lowering therapies in primary and/or secondary cardiovascular disease (CVD) prevention. **METHODS:** We used MEDLINE to identify published articles reporting cost-effectiveness models. Inclusion criteria included: English language articles published from 2000-2013, studies in adults ≥18 years old, studies assessing statins or ezetimibe for primary and/or secondary CVD prevention, and studies in the US, Canada, UK, Spain, Germany, Australia, Sweden, France, and Italy. Two researchers independently identified articles and disagreements were resolved by consensus. **RESULTS:** Sixty-one studies fulfilled the inclusion criteria. Forty-eight studies assessed the long-term cost-effectiveness (≥10 years) of lipid-lowering therapy— 20 studies were in primary CVD prevention, 19 were in secondary prevention, and 9 were in both primary and secondary prevention. 36/48 studies incorporated utility parameters into their models. 23/36 models differentiated short-term versus long-term utility impact of cardiovascular events. Eleven models were able to differentiate between short-term and long-term utilities through model structure, where separate health states were created for events versus post-events (e.g., stroke versus post-stroke), and utility values could be assigned to these health states accordingly. Twelve models were able to differentiate short-term versus long-term utilities by changing the model inputs, where different utility values were applied to a health state according to length of time after the event (e.g., event year versus subsequent years for a health state, or <6 months versus >6 months from time of event). Eleven models accounted for the occurrence of multiple events by applying disutilities or combining utilities multiplicatively for patients experiencing ≥1 event over time. **CONCLUSIONS:** Around two-thirds of the published long-term models differentiated short-term versus long-term utility impacts of cardiovascular events through model structure or utility inputs, which should be incorporated into future models on this topic.

PRM37

AN EXCEL CALCULATOR TO ESTIMATE RHEUMATOID ARTHRITIS COSTS IN TURKEY

Baser O[1], Burkan A[2], Baser E[3], Koselerli R[2], Ertugay E[2], Altinbas A[4]
[1]*STATinMED Research/The University of Michigan, Ann Arbor, Michigan, MI, USA,* [2]*Social Security Institution, Ankara, Turkey,* [3]*STATinMED Research, Ankara, Turkey,* [4]*Diskapi Yildirim Beyazi Education and Research Hospital, Gastroenterology Clinic, and STATinMED Research, Ankara, Turkey*

OBJECTIVES: To build an Excel calculator, taking demographic and clinical characteristics of rheumatoid arthritis (RA) patients in Turkey, and estimate the annual health care costs. **METHODS:** 2009-2011 data from MEDULA, the Turkish national health insurance database, was used for the study. RA patients (ages 18-99) were identified for the identification period (June 1, 2010 - December 31, 2010) using International Classification of Disease Tenth Revision Clinical Modification (ICD-10-CM) codes. Patients were grouped as prevalent and incident cases and required to have two RA diagnoses at least 60 days apart. In order to estimate risk-adjusted total annual costs for prevalent and incident cases, generalized linear models (GLMs) were used. Patients' demographic and clinical characteristics were factors to determine the expected annual cost value, with coefficients of the characteristics built in the Excel calculator. A marginal effects table was created after GLM estimation by using such calculation. **RESULTS:** A total of 2,613 patients met all inclusion criteria, of which 693 were incident and 1,920 prevalent cases. Patients' demographic and clinical characteristics were entered into the Excel calculator. Risk-adjusted annual total costs were calculated at €2,021 for prevalent cases and €1,818 for incident cases. The most expensive contributor to annual expenditures was prior biologic use for both groups. Prevalent patients who were prescribed disease-modifying anti-rheumatic drugs (DMARDs) in the baseline period incurred €5,898 more costs than those who were not. For incident cases, male patients incurred lower costs (€1,818 - €708 = €1,110), whereas respiratory comorbid conditions increased the total expected health care cost of incident RA patients by €916 (€1,818 + €916 = €2,734). **CONCLUSIONS:** In outcomes research, an Excel calculator serves as an important tool to estimate and compare RA-related health care costs.

PRM38

UNCOVERING THE GAP BETWEEN MODEL VALIDATION RECOMMENDATIONS AND PRACTICE

Kleintjens J, Akpo H
Deloitte, Diegem, Belgium

OBJECTIVES: Health technology agencies and payers rely on economic models to evaluate the value of new treatments. It is therefore critical to ensure the scientific credibility of these models through validation, which is also required by NICE since 2012. The aim of this study is to understand which of the validation methods recommended in health economics and financial guidelines are practically used across different disease areas and business fields. **METHODS:** For this study we reviewed guidelines, economic models for diabetes, cardiovascular diseases, and cancers, as well as risk-prediction models. The identified validation methods were collected and categorized into three groups: face validity, internal verification, and cross validity. **RESULTS:** Twenty-two (22) economic models, 8 risk prediction models, 5 financial and 7 health economics guidelines were identified. In the guidelines we found 3, 14 and 5 methods within the face validity, internal verification, and external validity categories respectively. Almost three quarters of the 22 methods identified were also described in the ISPOR guideline on model validation and the other guidelines described 5 to 15 methods. External validation was done for 14 out of the 22 economic models reviewed in which (part of) the model results were compared against other clinical/epidemiology studies (14 models) or other validated models (10 models). Internal verification was mainly done through comparison against the trials that the models were built on (10 models). Out of the remaining 13 internal verification methods only 3 were performed for the economic models. Face validation was only performed for 3 economic models. **CONCLUSIONS:** This study found that there is a substantial gap between the validation steps recommended and those actually performed. Hence a more consistent and pragmatic approach needs to be taken to validate economic models. In addition, the validation methods performed need to be consistently reported.

PRM39

ANALYSIS OF HEALTH CARE COSTS IN ELDERLY PATIENTS WITH MULTIPLE CHRONIC CONDITIONS USING A FINITE MIXTURE OF GENERALIZED LINEAR MODELS

Eckardt M, Brettschneider C, van den Bussche H, König HH
University Medical Center Hamburg, Hamburg, Germany

OBJECTIVES: Multimorbid individuals consume a disproportionally large share of health care resources. Usually standard (1-component) regression techniques are applied to analyse costs in samples of patients with multiple chronic conditions. However, the patient specific number and combination of co-occurring single diseases results in inhomogeneous data leading to biased estimates when using traditional regression techniques. In this study we analyse health care costs in a sample of patients suffering from multimorbidity using a more elaborate approach to address this heterogeneity. **METHODS:** We used a subsample of N=1050 patients from a multicentre prospective cohort study of multimorbid primary care patients aged 65 to 85 years in Germany who completed a questionnaire on health care utilization covering a 6-month-period. We applied a finite mixture of generalized linear models, which belongs to the group of statistical learning algorithms, in order to control for unobserved heterogeneity of patient level health care costs focussing on the identification of multimorbidity patterns. **RESULTS:** We detected four different groups of patients with regard to total costs. The effect of the presence of an additional disease on costs differs between these groups. Two diametrically opposed cost trends were detected with respect to the number of co-occurring diseases. While in one group containing hypertension, joint arthrosis, diabetes, gout, anxiety and lower limb varicosis cost increased with the number of co-occurring diseases, in a second group including severe hearing loss, asthma/COPD, osteoporosis, neuropathies, Parkinson's disease and chronic ischemic heart disease cost decreased. Diversities between groups were also found in the results indicated by diametrically opposed influence of single diseases. **CONCLUSIONS:** Our results indicate existing unobserved heterogeneity in costs among patients suffering from multimorbidity with different combinations of single diseases which would remain unconsidered using standard regression techniques. Especially different costs trends were detected with regard to the number and nature of co-existing diseases.

RESEARCH ON METHODS – Databases & Management Methods

PRM40

USE OF THE CLINICAL PRACTICE RESEARCH DATALINK (CPRD) TO ASSESS 'REAL-WORLD' MANAGEMENT OF TUBEROUS SCLEROSIS COMPLEX (TSC) IN THE UNITED KINGDOM

Demuth D[1], Nasuti P[1], Richards C[1], Gray L[2], Price L[2], Magestro M[3]
[1]*IMS Health, London, UK,* [2]*Novartis Pharmaceuticals UK Limited, Frimley, UK,* [3]*Novartis Pharmaceuticals Corporation, East Hanover, NJ, USA*

OBJECTIVES: TSC is a multi-system genetic disorder associated with benign lesions throughout the body, neurological manifestations, and impaired cognition. As many as 8000 people in the UK may have TSC; many cases likely go undiagnosed. Long-term morbidity and treatment burden associated with TSC are significant, suggesting substantial economic burden. This preliminary study assessed presentation patterns of select TSC manifestations in CPRD. **METHODS:** TSC patients were retrospectively identified in CPRD (Read: PK5.00) and linked Hospital Episodes Statistics (HES; ICD-10: Q85.1) databases. CPRD includes over 5 million active patients from UK primary care practices (~8% coverage). A total of 55% of practices (375) are linked to HES, allowing events in secondary care to be analysed (e.g. hospitalisations, procedures). Patients not linked to HES were excluded. Available history was extracted for each patient; descriptive statistics for select TSC-related diagnoses and procedures are presented. All ages reported below are median values. **RESULTS:** A total of 244 patients (49% male) with a TSC diagnosis were identified; age at diagnosis was 8 years, with 70% under 18 years. Patient data history was 20 years; 3 and 11 years pre/post initial TSC diagnosis. By age 4, 72% had a record of epilepsy; by 16 years, 9% had a record of subependymal giant-cell astrocytoma (SEGA); by 18 years, 1% had obstructive hydrocephalus; by 43 years, 4% had renal angiomyolipoma (AML) [median age at initial recorded diagnosis]. **CONCLUSIONS:** Preliminary analyses affirm the utility of CPRD in a real-world study of TSC, and the many emergent TSC-related manifestations, in a longitudinal fashion. Data are suggestive of evolving diagnostic and treatment patterns (30% adults) and may highlight a need for better coordination of adult care. Relatively low prevalence of AML was unexpected and

warrants further investigation. Robust analyses are planned to comprehensively describe the clinical and economic burden of TSC in the UK.

PRM41

EXPLORING THE IDENTIFICATION OF MULTIPLE SCLEROSIS INCIDENT COHORTS IN CLAIMS DATABASES: METHODOLOGY AND CHALLENGES

Capkun-Niggli G[1], Lahoz R[1], Nordstrom B[2], Fraeman K[2], Chen W[3], Simeone JC[2], Dickinson S[1]
[1]*Novartis Pharma AG, Basel, Switzerland,* [2]*Evidera, Lexington, MA, USA,* [3]*Novartis Pharma Co. Ltd., Shanghai, China*

OBJECTIVES: To explore whether multiple sclerosis (MS) incident cohorts can be identified in claims databases. **METHODS:** We used several approaches to try and identify MS incident cohorts in the US Department of Defense (DOD) and MarketScan® databases, based on diagnostic and treatment history. Patients were first identified with 1 year of no MS claims or treatment before their first MS claim. Sensitivity analyses identified patients with 1–4 years of no MS claims or treatment before their first MS claim. **RESULTS:** In patients with a 1-year baseline history with no MS claims or treatment, age and baseline characteristics were similar to all MS patients. The mean age at index date (second MS claim) was ~50 years, in contrast with previous research reporting a mean age at diagnosis of 25–40 years. Patients aged ≤65 years with ≥1 MS claim and 4 years of continuous baseline enrolment were identified in the DOD (n=16 444) and MarketScan® (n=16 352) databases. With increasing years of baseline history, more patients showed evidence of pre-existing MS; the percentage of total patients with no MS claim or treatment before the first MS claim decreased from 53.3% (1 year history) to 42.2% (4 years history) in the DOD database, and from 23.5% to 15.5% in MarketScan®. Despite the decrease in patient numbers, the mean age at index date remained high (44–49 years). **CONCLUSIONS:** Results indicate that >4 years of patient history is needed to define an incident MS cohort in claims databases. However, the 4-year claim and treatment-free cohort may be useful for studying treatment patterns and their impact on outcomes in recently treatment-naïve MS patients. There are substantial challenges in retrospectively identifying incident cohorts of MS patients using claims databases and a need for additional, large, real-world data sources to study newly diagnosed MS patients.

PRM42

SCREENING CHARACTERISTICS AND DIABETES BIOMARKERS IN FRENCH AND UK PATIENT-LEVEL DATABASES

Cabrera C[1], Le Jeunne P[2], Lee A[3], Thomas F[4], Mian N[3], McDonell A[5]
[1]*AstraZeneca, Mölndal, Sweden,* [2]*IMS Health, Paris, France,* [3]*AstraZeneca GMD UK, Cheshire, UK,* [4]*AstraZeneca France, GMD, Paris, France,* [5]*IMS, London, UK*

OBJECTIVES: Describe the patient characteristics and diabetes markers of type 2 diabetes (T2D) patients in the newly launched IMS LifeLink Diabetes Cohort in France. Monitor the data quality through comparison of measures with a French national survey of diabetes patients (ENTRED), the UK National Diabetes Audit (NDA) where possible, and the "gold standard" UK Clinical Practice Research Datalink (CPRD). **METHODS:** The IMS Diabetes cohort in France supplements patient-level data from general practitioners with additional patient data via pop-up technology within electronic medical records to facilitate robust epidemiological studies. This study compares the T2D patients in the Diabetes Cohort with similar populations in terms of gender, age, disease duration, and proportion of patients meeting key disease-specific targets (data presented as summary statistics). **RESULTS:** Patient characteristics and diabetes markers were analyzed for T2D patients in the Diabetes Cohort (n=5,142), ENTRED (n=3,894), UK NDA (n=1,909,494), and UK CPRD (n=268,618). The mean (SD) age in years was 66 (12.58) in the Diabetes Cohort, 66 in ENTRED, and 61 (15.35) in CPRD. The mean (SD) time since T2D diagnosis was 8 (7.7), 11, and 7.7 (6.2) years in the Diabetes Cohort, ENTRED, and CPRD, respectively. Mean (SD) BMI was 30.5 (5.76) in the Diabetes Cohort, 29.5 in ENTRED, and 30.8 (6.51) in CPRD. HbA1c target level of ≤6.5% was met by 32.5%, 34%, 23.5%, and 26% of the patients in the Diabetes Cohort, ENTRED, CPRD, and NDA, respectively. **CONCLUSIONS:** Health care systems and data collection methods vary across EU countries in general. Data monitoring helps assess data quality and robustness. Based on comparison of patient characteristics and diabetes markers, the IMS Diabetes Cohort population does not appear to differ from the ENTRED population. Although some differences between the Diabetes Cohort and CPRD data were noted, this unique French Diabetes Cohort appears appropriate for epidemiological research.

PRM43

MEDICAL AND PHARMACY CLAIMS-BASED ALGORITHMS FOR IDENTIFYING RELAPSES IN PATIENTS WITH MULTIPLE SCLEROSIS

Capkun-Niggli G[1], Lahoz R[1], Verdun E[1], Dickinson S[1], Lowy A[1], Nordstrom B[2], Dahlke F[1]
[1]*Novartis Pharma AG, Basel, Switzerland,* [2]*Evidera, Lexington, MA, USA*

OBJECTIVES: To develop appropriate algorithms for identifying and classifying relapses among patients with multiple sclerosis in claims databases. **METHODS:** Algorithms for detecting relapses in claims databases were identified by literature searches and refined by neurologists and database experts to identify relapses in inpatient and outpatient settings. Definitions were used in the US Department of Defense (DOD) and MarketScan® databases to determine annualized relapse rates (ARR) occurring after index date (date of second MS medical claim separated by ≥30 days, following ≥12 months of continuous enrollment) during the 12-month and all available follow-up time. **RESULTS:** A relapse was defined as an inpatient visit with a primary ICD-9-CM diagnosis code 340.xx or both an outpatient visit with any 340.xx diagnosis code and oral or intravenous corticosteroid use ≤7 days of the outpatient visit. ARR estimates in the DOD (N=15,447) and MarketScan® (N=35,134) databases were 0.25–0.30 and 0.20–0.27, respectively. For inpatient relapses, estimates were 0.04–0.06 in the DOD database and 0.02–0.03 in the MarketScan® database. The corresponding estimates for outpatient relapses were 0.20–0.23 and 0.18–0.24. Severe relapses required an inpatient visit plus additional evidence of brain or spinal magnetic resonance imaging ≤7 days before or during hospitalization, or an outpatient visit combined with extended treatment (starting 0–30 days after outpatient visit) with ≥1 of the following: a further course of intravenous corticosteroids >7 days after the first course; a course of oral corticosteroids >7 days after the intravenous course; intravenous immunoglobulins or plasma exchange. Algorithms for identifying atypical relapses were also developed. **CONCLUSIONS:** General and outpatient ARRs are consistent between the two distinct claims databases and are similar to those reported in the literature. Differences in inpatient ARRs may indicate differences between clinical practices in the two systems. Further investigation in the real-world setting is required.

PRM44

COMPARISON OF METHODS TO IDENTIFY STAGE IIIB OR IV METASTATIC LUNG CANCER PATIENTS FROM ELECTRONIC MEDICAL RECORDS

Stafkey-Mailey D, Landsman-Blumberg P, Farrelly E, Eaddy M
Xcenda, Palm Harbor, FL, USA

OBJECTIVES: Increased use of electronic medical records (EMR) has necessitated efficient ways to identify patients with certain clinical characteristics. This study compared use of standard fields and standard language recognition of progress notes to identify patients with metastatic lung cancer within an oncology-specific EMR. **METHODS:** Lung cancer patients (ICD-9-CM: 162.2 - 162.9) with second line erlotinib treatment were identified from a proprietary EMR. Method 1 identified metastatic disease using standard data fields for diagnoses (196.x – 198.x) and/or stage (3B/IIIB or 4/IV); Method 2 utilized keyword searches for indications of metastases or stage within progress notes. Chart reviews were used to confirm advanced disease. Positive and negative predictive values (PPV and NPV) were then compared across methods. **RESULTS:** A total of 740 patients were identified with suspected metastatic disease; 60.1% (n=448) using Method 1. Of the remaining 292 patients, 282 (96.5%) were identified by metastases and 117 (40.1%) by stage keywords (Method 2). Overall, 671 (86.6%) were confirmed "metastatic" with chart review and 5 patients excluded for evidence of other cancers. Overall, PPV was 100% and NPV 6.3%. Of those identified as metastatic using the standard fields, the PPV for metastases and stage were 65.5% and 66.3% respectively and 99.3% combined. The PPV and NPV among the 287 patients identified only by keyword searches, was 98.2% and 8.7% respectively for metastases and 49.3% and 89.9% respectively for stage. **CONCLUSIONS:** Utilization of standard EMR fields for diagnosis and disease stage, when used together, resulted in identification of large numbers of confirmed metastatic lung cancer patients. However, for those patients requiring text searches for metastases and stage, neither separately nor in combination, could adequately identify metastatic disease patients. Further standardization of EMRs and consistent entry within oncology practices could reduce the need for labor-intensive, costly human chart review in real-world oncology research.

PRM45

ASSESSMENT OF A CANADIAN PRIMARY CARE ELECTRONIC MEDICAL RECORD DATABASE FOR USE IN OBSERVATIONAL STUDIES

Frise S[1], Reidel K[2], Tarride JE[1], Corner N[2], Dziarmaga A[1]
[1]*AstraZeneca Canada Inc., Mississauga, ON, Canada,* [2]*IMS Brogan Canada, Kirkland, QC, Canada*

OBJECTIVES: Observational data derived from clinical practice is becoming increasingly important to answer questions that cannot be addressed by RCTs. Although there are a number of administrative databases in Canada, access to more comprehensive, longitudinal clinical data such as smoking status, body weight and laboratory values in the primary care setting is limited. The objective of this study was to evaluate a Primary Care EMR (Electronic Medical Record) system to determine its feasibility for use in observational studies. **METHODS:** We analyzed de-identified patient data from primary Health Care Professionals (HCPs) including General Practitioners from 2009-2011. Comprehensiveness and completeness of each variable by visit were evaluated. First steps were taken to understand how the patient population compares to data from published sources. **RESULTS:** There were 3,019,954 patient visits observed by 255,274 active patients (≥1 visit). The patient visits were entered by 497 HCPs (152 physicians). Data are available for demographics, vitals, smoking status, laboratory values, prescriptions, medical history, diagnosis (ICD-9), short term absences and referrals. Completeness of each variable by visit ranged from 26% for pulse to 100% for age, sex, lab results and referrals. Initial assessment revealed that 85.6% of written prescriptions and 88% of diagnoses were recorded using structured fields. The median age of patients in the EMR was 37.2 years compared to 39.9 years reported by Statistics Canada (July 2011). Younger age groups were overrepresented, with the largest difference found in those 20-29 years; no difference was observed for sex. **CONCLUSIONS:** The status of electronic primary care health records in Canada is still in its infancy. The research suggests this is a valuable new addition to support observational studies in Canada. Disease specific validation studies will be required prior to further analysis. Further research is being undertaken to review quality measures.

PRM46

EVALUATION OF DISSEMINATION OF BRAZILIAN NETWORK FOR HEALTH TECHNOLOGY ASSESSMENT (REBRATS)

Gonçalves L[1], Souza KM[2], Elias FTS[3]
[1]*Brazilian Ministry of Health, Brasília-DF, Brazil,* [2]*Brazilian Ministry of Health, Brasília, Brazil,* [3]*Oswaldo Cruz Foundation MoH, Brasília, Brazil*

OBJECTIVES: The Brazilian Network for Health Technology Assessment (REBRATS) is composed of universities, hospitals and managing institutions who have among their goals the objective to elaborate and disseminate HTA information. The network's website and database are found at the http://www.saude.gov.br/rebrats and are tools to disseminate the policies and methodological guidelines of the network's institutional organization and the studies produced by its members. To evaluate the degree of the network's dissemination on national and international levels by analyzing the level of access and the rate of return from site users. **METHODS:** To analyze the number of visits to the REBRATS site registered through the Google Analytics monitoring and data extraction tool, with the intention of identifying

the user's behavior upon navigating the site. **RESULTS:** Since the site began to get monitored on July 1, 2012 and up until June 25, 2013, 19.738 hits were registered, with a monthly average of 1.661 hits. More than 65 countries accessed the site, the majority coming from the USA, UK and Portugal. Brazil leads with 93%. The rate of return of people who frequently accessed the site was 24,7%. Upon navigating the site, more than 45.000 visualizations of the web page were registered. **CONCLUSIONS:** This monitoring began in 2012 and therefore no previous years exist to serve as a basis for comparison. The results show that a considerable number of users have access to the site and consequently know about REBRATS. From the perspective of the website, the number of hits is still low, however, considering that the HTA field is a recent one in Brazil, its growth has been gradual. On an international level, new dissemination strategies are necessary in order to create greater visibility and promotion of the network.

PRM47

DESCRIPTION OF TREATMENT PATHWAYS IN CHRONIC DISEASES USING LARGE GENERAL PRACTITIONER LONGITUDINAL DATA: THE EXAMPLE OF PHARMACOTHERAPY IN PARKINSON'S DISEASE IN THE UNITED KINGDOM

Guelfucci F[1], Neine M[2], Bineau S[3], Milea D[3], Aballea S[2]
[1]*EPHE Sorbonne, Paris, France,* [2]*Creativ-Ceutical, Paris, France,* [3]*Lundbeck S.A.S., Issy-Les-Moulineaux, France*

OBJECTIVES: Identifying treatment pathways based on administrative data or electronic medical records is generally a complex task, as many incidental events may hide the key trends. The purpose of this study was to propose a transparent methodology for defining treatment pathways using a large longitudinal real life database. The application of two alternative algorithms with different variants in Parkinson's disease (PD) was described. **METHODS:** In the first method, a new treatment line was assumed to start when a pre-specified number of consecutive prescriptions of drugs from the same PD drug class or combination of classes (rasagiline, selegiline, dopa agonists, COMT inhibitors, levodopa and derivatives) occurred. In the second method, start and end dates of continuous treatment periods (i.e. without gaps higher than six months between prescriptions) were determined for each drug class independently of each other. Combinations were assumed to be used when different treatment periods overlapped. Algorithms were tested using medical records of patients with Parkinson's disease (PD) extracted from the UK Clinical Practice Research Datalink (CPRD). The outputs of the different algorithms were described in details for ten patients, randomly selected. The sensitivity of the algorithms to changes in assumptions was tested. **RESULTS:** The first algorithm did not systematically capture the addition of a new drug to the current treatment as combined drugs were not necessarily prescribed or renewed during the same consultations. However, the second method well captured the treatment lines observed but sometimes created undue treatment lines from isolated prescriptions. This issue was overcome by deleting short lines lasting less than three months. **CONCLUSIONS:** The second algorithm developed in this study provided an accurate description of the treatment strategies developed by prescribers in Parkinson's disease in the UK using a limited number of assumptions and may be useful for other chronic diseases.

PRM48

IDENTIFICATION AND QUALITATIVE ASSESSMENT OF REAL WORLD DATA SOURCES: EXAMPLE OF LYMPHOMA AND MULTIPLE MYELOMA IN EUROPE

Noibi SO[1], Bertwistle D[1], MacDougall F[1], Berger K[1], Mehta J[2], Trask PC[2]
[1]*IMS Health, London, UK,* [2]*Sanofi, Cambridge, MA, USA*

OBJECTIVES: To identify and assess real world data sources for observational research on lymphoma and multiple myeloma (myeloma) in Europe. **METHODS:** Structured (EMBASE and MedLine) and grey literature searches were conducted to identify relevant European data sources. Identified data sources were screened based on the following criteria: inclusion of patient-level data and patients with NHL, HL, or MM diagnoses, possession of data dictionaries, and ongoing data accrual. Where regional registries were proven to feed data into national registries, only the national data source was retained for evaluation. Data sources passing initial screening were subjected to further evaluation based on publicly reported information, questionnaires and / or interviews with data source owners, and informed by lymphoma and myeloma treatment pathway analysis. **RESULTS:** One hundred eighty-six data sources from 21 countries were identified; of which cancer registries (R) accounted for 65%. The remaining 35% non-registry (NR) sources included biobanks, clinical audits, data linkage initiatives, drug databases and electronic medical records. Screening removed 101 sources. Of the 85 sources retained after screening, roughly half (52%) were NR sources and a majority (74%) were from six countries: France, Germany, Spain, Sweden, The Netherlands, and The UK. NR data sources generally collected more data attributes than R data sources. These data attributes included symptoms (collected by 52% NR, and 21% R data sources), treatment regimens (81% NR, 40% R), and resource use (49% NR, 8% R). **CONCLUSIONS:** Compared with disease registries, non-registry data sources in Europe typically have more diverse data attributes and are therefore potentially better for lymphoma and myeloma research. This result may guide the selection of data sources for observational research. As scrutiny of real-world outcomes for reimbursement of oncology drugs increases, much work remains to be done to increase the visibility and utility of data sources for health care payers and providers.

PRM49

COVERING THE PASS: DEVELOPMENT OF PROTOCOL TEMPLATE LANGUAGE (PTL) FOR DATA COLLECTION AND DATA MANAGEMENT (DM) IN POST-AUTHORIZATION SAFETY STUDIES (PASS)

Oberthur Johnson L[1], Watts H[1], Krishnan S[1], Zarotsky V[2], Spannheimer A[3], Siebenaler J[1], Gulyas S[1], Clark S[1]
[1]*OptumInsight, Eden Prairie, MN, USA,* [2]*Optum, Eden Prairie, MN, USA,* [3]*OptumInsight (Deutschland) GMBH, Munchen, Germany*

OBJECTIVES: To address non-interventional study (NIS) protocol DM and data collection requirements in PASS observational study designs. These studies may include =>1 cohorts, retrospective or prospective data collection, disease or treatment-based inclusion criteria, various outcomes (safety, prescription pattern or off-label use, comparative effectiveness, quality of life or other patient-reported outcomes[PRO], health economics, or other objectives), site/investigator selection (in-house, commercial, professional organization, or government databases), and country-specific requirements. **METHODS:** Studies that used integrated and non-integrated DM systems were evaluated to identify criteria for use and associated protocol template language (PTL), including required, preferred, or optional text based on various study designs and objectives. **RESULTS:** Multiple DM systems were evaluated and algorithms created with use criteria. For integrated DM systems that combined data capture and trial management, simplified PTL was identified. DM PTL was adjusted to include paper or electronic data capture (EDC) methods, paper/electronic-based PROs, paper/electronic case report forms (CRFs), data (eg. subject/physician entered, site or aggregate, medical or laboratory records) and appropriate subject data protection. For non-integrated systems that required separate DM and trial management, additional PTL was identified for these complex DM systems. The templates denoted minimum required language and suggested extended language for more elaborate designs. To support the numerous NIS study design types, we included decision trees to account for various study goals, associated outcomes, and data collection requirement. Our data collection decision tree summarized the variety of potential study designs with frequently used study goals/outcomes and associated data collection techniques. **CONCLUSIONS:** Integrated DM systems provided the most flexibility and simplicity of protocol template language. All template language was created as adjustable to meet the typical study designs encountered in PASS studies. This additional information was to support the protocol development team in creating the final protocol in a timely manner and in reviewing client-provided templates.

PRM50

BUILDING A REAL WORLD PRACTICE-BASED NETWORK DATA PLATFORM TO LINK RARE DISEASE PATIENTS: CASE STUDY OF MYELOFIBROSIS PATIENTS IN THE UNITED STATES

Lee A[1], Iqbal SU[1], Hess G[2], Fonseca E[3], Redmond S[3], Wang H[4], Rose M[5], Neumann F[6], Cohen P[6]
[1]*Sanofi, Cambridge, MA, USA,* [2]*Leonard Davis Institute, University of Penn, Philadelphia, PA, USA,* [3]*IMS Health, Plymouth Meeting, PA, USA,* [4]*Sanofi, Bridgewater, NJ, USA,* [5]*Sanofi, Chilly-Mazarin , Cedex, France,* [6]*Sanofi Oncology, Cambridge, MA, USA*

OBJECTIVES: Conducting real world evidence (RWE) research on patients with rare diseases is particularly challenging when using only one type of data (e.g. insurance claims). Myelofibrosis (MF) is a rare, hematological cancer with global annual incidence rate of <1 - 2.4 cases per 100,000 patients. MF is characterized by the reduced ability of bone marrow to synthesize blood cells which can result in anemia, thrombocytopenia, and higher risk of infection. Absent adequate, recent data on MF patients, a practice-based network (PBN) data platform was developed to facilitate RWE research on MF patients. **METHODS:** MF patients observed in IMS Health databases between November 2010 to October 2012 were identified. Academic centers of excellence and large community oncology practices treating MF patients were then identified to link additional patients into the platform using a HIPAA-compliant patient de-identification algorithm. Patient demographics and attributes of dispensed prescriptions, private practitioner visits, and electronic medical record data including laboratory information were collected across patients from January 2000 to March 2013. Descriptive analyses of demographic and clinical characteristics were conducted to assess the generalizability of the sample versus literature. **RESULTS:** A total of 6362 U.S. MF patients were identified in the platform. Mean (SD) age was 67 (12.6) and 45% of patients were female. Mean (SD) Charlson Comorbidity Index was 4.36 (2.4). Among the subset of 529 patients with laboratory results, 63% were identified as anemic and 34% had platelet counts 50,000 - 100,000 / microL. All U.S. geographic regions were represented. **CONCLUSIONS:** Demographic and clinical results suggest that this large sample of MF patients is comparable to prior estimates of the broader MF population. This case study of U.S. MF patients suggests it is important to look beyond any one data source and to build PBN platforms with key clinical domains spanning multiple geographic regions when conducting RWE research on patients with rare diseases.

PRM51

FROM CLINICAL TRIAL TO REAL-WORLD EVIDENCE: A SYSTEMATIC APPROACH TO IDENTIFYING DATA SOURCES FOR OBSERVATIONAL RESEARCH

Parasuraman B[1], Tomic KS[2], Winchester CC[3], Westergaard M[1], Johansson S[4]
[1]*AstraZeneca R&D, Wilmington, DE, USA,* [2]*Oxford PharmaGenesis™ Inc., Newtown, PA, USA,* [3]*Oxford PharmaGenesis™ Ltd., Oxford, UK,* [4]*AstraZeneca R&D, Mölndal, Sweden*

OBJECTIVES: Observational studies are often planned on an ad hoc basis, with the risk that methods are inconsistent and that aims overlap rather than complement each other. Our objective was to develop a systematic approach for identifying observational data sources for an integrated global programme of real-world evidence gathering, to support an important new indication for an antiplatelet drug. **METHODS:** Systematic literature and Web searches, supplemented with email and telephone contact with data owners, were used to identify and characterize registries and health care databases suitable for use in observational studies of myocardial infarction and acute coronary syndromes. The ability to identify patients across data sources was also assessed. Data were captured and evaluation criteria applied, including compatibility with aspects of an ongoing randomized clinical trial (patient population, treatments, outcomes, and length of follow-up [≥3 years]). Selection criteria included accessibility; availability of inpatient, outpatient, cardiac event, and drug data; and generalizability. **RESULTS:** Over 2700 publications were screened; we identified 216 registries and 380 databases (primarily of administrative claims and electronic medical records). Of these, 12 registries, and 21 databases met the evaluation criteria and were assessed in depth. After application of the selection criteria, 5 registries and 12 databases were recommended. Recommended data sources ranged in size, each capturing data on between 4000 and 11 million

patients, and were geographically diverse, representing populations in Europe, the USA, and Australia. Each recommended data source had unique strengths and limitations for use in real-world evidence studies, and together they had the potential to provide consistent and complementary information. The study output provided a valuable tool for global and local investigators. **CONCLUSIONS:** Observational data sources are diverse. A systematic understanding of real-world evidence can guide the development of a coherent strategy for designing observational studies to support clinical research.

PRM52

FEASIBILITY OF USE OF MEDICAL TRANSCRIPTION DATA FOR REAL WORLD EVIDENCE GENERATION IN THE UNITED STATES: A PILOT STUDY OF PATIENTS WITH SYSTEMIC LUPUS ERYTHEMATOSUS INITIATED ON BELIMUMAB

Narayanan S
Ipsos Healthcare, Gaithersburg, MD, USA

OBJECTIVES: To assess the feasibility of use of medical-transcription data for real-world clinical evidence generation in the US. **METHODS:** Majority of clinical practices in the US are experimenting digitization of patient medical records for two reasons: patient-management/care-delivery and billing/administrative/legal documentation purposes. Increasingly, physicians are using medical-transcription services, where physicians dictate details of patient visits and send the voice-recording-device to medical-transcription organization which processes voice-data and delivers electronic-files back to clinics; physicians review/revise/append the electronic-documentation and adds data to their patient-database-repository for future use. This pilot study assessed the utility of de-identified medical-transcription data in evaluating patient-physician dynamics and real-world treatment patterns/outcomes and documented adverse-events(AEs) using random set of adult SLE patients who initiated belimumab (a recently-launched biologic) within the past 2years as part of usual care. SLE was chosen specifically because of its complex clinical management issues. **RESULTS:** Nineteen belimumab patient transcription-records (de-identified) were reviewed (mean age:39.4yrs; female:95%). Top-4 clinical-manifestations at belimumab-start were: musculoskeletal(68%)/mucocutaneous(53%)/constitutional(42%)/renal(21%). Physicians discussed belimumab-attributes (specifically, infection-risks/AEs/etc), asked patients to do their own research on belimumab, and cited insurance/reimbursement-issues prior to belimumab-start in 58%, 26% & 26% of cases respectively; 11% of patients asked for belimumab. Top-3 documented-reasons for belimumab-start were: steroid-sparing(32%), control autoimmune diathesis(11%), control SLE-flares(16%). In 47% of patients, belimumab (at initiation) replaced another medication (majority:steroids/immunosuppressants); concomitant SLE-medications were: antimalarials(84%)/oral-steroids(68%)/Immunosuppressants(47%). Average belimumab-duration was 8.1months (overall data availability/patient:23.8months). During the observation period, 42% had >=1AE (e.g., diarrhea/rash/bronchiolitis/alopecia/upper-respiratory-track-infection), 42% discontinued belimumab (but 26% re-started) and 47% had some physician-documented improvement in outcomes (e.g., joint-pain/rash/energy level/fatigue). One patient had documented steroid-stoppage post-belimumab initiation. **CONCLUSIONS:** Medical-transcription data may provide documented real-world evidence of treatment dynamics and clinical status/outcomes associated with patient care. In this random cohort of SLE patients using belimumab, belimumab appears to provide some demonstrable benefits in almost half of the patients.

PRM53

UPDATE OF THE PATIENT-REPORTED OUTCOME AND QUALITY OF LIFE INSTRUMENTS DATABASE (PROQOLID): INCLUSION OF E-PRO INFORMATION

Caron M, Perrier LL, Acquadro C
Mapi Research Trust, Lyon, France

OBJECTIVES: In 2002, PROQOLID was launched to provide an overview of existing PRO instruments and a facilitated access to the instruments and their developers through the structured presentation of synthesized, reliable, and constantly updated data. With the constant growth of electronic capture of patient-reported outcomes, detailing information about modes of data collection (i.e., paper vs. electronic) in PROQOLID might become a crucial step in updating the database. The objective of this study was: (1) To review how e-PROs are currently reported in PROQOLID; and (2) To propose (if needed) ways of clarifying and updating e-PRO information. **METHODS:** PROQOLID was searched to retrieve current information about e-PROs using an advanced search engine. **RESULTS:** The e-PRO information was found under the category "mode of administration." Three options could be chosen: computer-administered, electronic-administered, and IVR (Interactive Voice Response) version. Out of the 751 instruments in the database, 37 (5%) were reported with e-PRO information. Information about existing translations of electronic versions was clearly specified for three questionnaires. To clarify and update e-PRO information in PROQOLID, several recommendations are proposed: (1) To create a new category, i.e., mode of data collection, in order to differentiate it from the "mode of administration" category; (2) To categorize each mode of data collection into five subcategories [i.e., Hand-Held Device, IVR, Internet web-data capture, Pen, and Tablet]; and (3) To provide a list of all translations available in each mode of data collection. **CONCLUSIONS:** This review has shown that PROQOLID already includes e-PRO information. Recommendations are given on how to modify the organization and content of the database to present the information on electronic capture of PROs.

PRM54

USEFULNESS OF A COMMERCIAL HOSPITAL CLAIMS DATABASE TO IDENTIFY CURRENT ANTI-VASCULAR ENDOTHELIAL GROWTH FACTOR TREATMENT PATTERNS IN PATIENTS WITH EXUDATIVE AGE-RELATED MACULAR DEGENERATION IN JAPAN

Narimatsu A, Adachi K, Wang ECY
Bayer Yakuhin, Ltd., Tokyo, Japan

OBJECTIVES: Access to large-scale public health claims databases is limited due to privacy concerns and lack of a unique identifier in Japan. Since such databases were not originally designed for outcomes research, we assessed the usefulness of one of the commercial databases in identifying treatment patterns in routine clinical practice. **METHODS:** Treatment patterns for patients with exudative age-related macular degeneration (AMD) using anti-vascular endothelial growth factor (anti-VEGF) was selected as an example to enhance our understanding of real-world clinical practice. A retrospective open-cohort study of patients diagnosed with AMD and treated from January 2010 to December 2012 at community hospitals employing Diagnostic Procedure Combination payment system was conducted by using hospital claims database provided by Medical Data Vision, Co., Ltd. Strengths and weaknesses of using the database were also identified. **RESULTS:** During the study period, 248 patients were diagnosed with AMD and received ranibizumab, 19 patients received pegaptanib, and two patients received aflibercept. Among the patients who received ranibizumab, the average number of ranibizumab injections per year was 3.21±2.38. The strength of the database was granularity of data including daily medication and medical procedural histories that allow us to obtain key parameters of analyzing treatment patterns. A major weakness was no unique identifier for patients; thus, a patient would be recorded as two different entries in the database if s/he visited two different hospitals. **CONCLUSIONS:** The results show that the commercial hospital claims database was useful to understand treatment patterns of exudative AMD at non-university hospital settings. Since treatment guidelines are usually written based on published clinical trial evidence, this type of database research provides an understanding of real life clinical practice and its associated patient outcomes, contributing to better adherence and future updates of treatment guidelines.

PRM55

COMPARISON OF THE PRICES USED IN THE MANUFACTURERS' BUDGET IMPACT ANALYSES AND THE PRICES FROM REIMBURSED DRUGS LIST

Iwanczuk T, Zawodnik S, Misiak J, Chodacka A, Sejbuk K
Agency for Health Technology Assessment in Poland, Warsaw, Poland

OBJECTIVES: To compare official prices and refunding limits of the selected drugs with the prices and limits used in the manufacturers' Budget Impact Analyses (BIAs) submitted in the reimbursement applications and in the manufacturers' documentations from request for removing, altering the level or method of financing of medicines to AHTAPol and to verify the accuracy of their assumptions. **METHODS:** Prices and limits proposed in BIAs in years 2007-2011 and official prices and limits for the same medicine were compared. Only BIAs for medicines which had been reimbursed for at least one year were included in the analysis. The official prices and limits were obtained from reimbursed drugs list published in Ministry of Health's Orders. **RESULTS:** In the studied period, 72 drugs were included in the analysis. Among them, 51,39% (37/72) were from reimbursement applications and 48,61% (35/72) were from requests for removing, altering the level or method of financing of medicines, respectively. As a result, 13% (9/72) of the prices proposed in the BIAs were underestimated. Median and mean difference (MD) between official prices and prices used in BIAs for the same medicine were 95% and 91% respectively. The overestimation was found in 39% BIAs (28/72); median = 117%, MD = 124%. Rest of the prices were equal 49% (35/72). Limits were underestimated in 8% (6/72) of the BIAs. Median and mean difference between official prices and prices used in BIAs were 97% and 98% respectively. Overestimation of the limits was found in 57% (41/72) of the BIAs; median = 133%, MD = 117%. Rest of the limits were equal 35% (25/72). **CONCLUSIONS:** Among the contradictory prices and limits official ones were higher than the prices assumed in BIAs for the same medicines. There is a strong need for further research.

PRM56

DEVELOPING A PUBLICATION STRATEGY IN THE CONTEXT OF OUTCOME RESEARCH: A REVIEW OF THE LITERATURE

Laloyaux C, Boyer M, Delbecque L
Business & Decision Life Sciences, Brussels, Belgium

OBJECTIVES: Many public health decisions are made based on information contained in medical publications. Therefore developing a publication strategy is a benefit for the pharmaceutical industry as it ensures an efficient dissemination of drug efficacy and safety evidence and an ethic development of the publications. In the context of outcome research, a publication strategy should take into consideration specific aspects related to the field (e.g., dealing with local, regional and global levels) and is important to ensure that unbiased information is provided to medical decision makers on time for the good of public health. A literature review was conducted to investigate if published guidelines on the development of a publication strategy in the context of outcome research exist. **METHODS:** A literature search of English articles was conducted on MEDLINE and Scopus. Search terms included "publication strategy" OR "publication planning" OR "publication coordination" AND "health economics" OR "health outcome" OR "outcome research" OR "medical economics". Independent extraction of articles was performed using predefined data fields. **RESULTS:** The search provided four citations; all were discarded after reviewing the abstracts. However, a simple search for the keywords "publication strategy" OR "publication planning" returned 85 hits in fields as various as psychology, political science, environmental science and medicine. None of the citations was specific to outcome research. **CONCLUSIONS:** The results of the literature search showed that the development of a publication strategy is an important concept through many different domains. However, no published guideline on the development of a publication strategy in the context of outcome research was found. A publication strategy specific to outcome research publications will be presented including recommendations regarding the key aspects that should be covered in an efficient outcome research publication strategy such as a critical assessment of published literature, identification of gaps, and development of a strategic plan.

PRM57

TELLING THE INSIDE STORY: ACTIVITY AND PERFORMANCE METRICS FOR A TYPICAL INTERNATIONAL MULTI-LANGUAGE MULTI-CENTER NON-INTERVENTIONAL STUDY WITH THE INTRIAL DATA CAPATURE SYSTEM

Eichmann F[1], Hausner S[1], Schwunk M[1], Faber S[1], Potthoff P[2]
[1]*Kantar Health Germany, Munich, Germany,* [2]*Kantar Health GmbH, München, Germany*

OBJECTIVES: Getting insight into the technical and logistical challenges of a typical global non-interventional EDC study by analyzing the pure log file numbers: from application scalability to data handling and processing. **METHODS:** To analyze EDC activity and performance metrics, a global oncological observational study managed via the INTrial EDC application was selected. System log files were used for quantitative and qualitative performance/workflow-related aspects and time measurements. **RESULTS:** Study parameters: The study ran for 4 years and was conducted in 39 countries with 6 languages, 382 sites, 3395 patients and 1612 users. The electronic Case Report Form for a single patient consisted of up to 2513 fields with a total number of 1,574,627 filled-in fields for the whole study. 24,382 translations were imported into the EDC system. Using 845 possible system queries per patient, 163,703 of these were commented and resolved, 30,451 manual queries were inserted. In total, 4,938,215 page calls took place for reading purpose and 582,052 for writing purpose (average of 3,781 page calls per day, 2.6 calls per minute). 6,060,981 field entries or changes (value or status) were carried out (average: 4,151 changes per day). Performance: Time between real data collection and data entry by site: 25% within 5 days, 22% from 6 to 20 days and 24% from 21 to 60 days. 92% of all manual queries had been commented by the site. Average time for resolving site comments for system queries: 29 days. Average time for translation processing: 19 days. **CONCLUSIONS:** A suitable technical system like INTrial can help to improve and optimize the study workflows. Easy to use data entry and data management functionalities and additional tools like multi language support, translation import or archiving are substantial – always in combination with a well trained and enthusiastic study team and established procedures.

PRM58

4-VALENT VACCINE PATIENTS – STATISTICAL ASSESSMENT OF A NEW ESTIMATION METHODOLOGY

Schroeder-Bernhardi D[1], Grunow S[2], Zoellner YF[3]
[1]*IMS HEALTH, Frankfurt am Main, Germany,* [2]*IMS Health, Frankfurt am Main, Germany,* [3]*Hamburg University of Applied Sciences, Hamburg, Germany*

OBJECTIVES: The objective was to estimate the number of patients in Germany who received a 4-valent vaccine in 2011. This estimation was based on data collected through a sample of GP/Pediatrician practices (Vaccine Analyzer [VA] sample (0.43%; 1.13%). **METHODS:** The VA-sample was compared to the German population by age/gender. This comparison shows a disproportional distribution of the VA-sample. A disproportional sample distribution may result in biases of final estimates. Hence, we opted for a methodology to mitigate estimation biases that would result from a straight-forward projection methodology. The VA-sample was restricted to eligible practices. For the projection of the patient sample counts to the universe, a specific formula was used. The assumption is that the sampling ratio in terms of doses equals the sampling ratio in terms of patients. This assumption is theoretically valid as per medical recommendation one dose per patient shall be used. In summary, the estimation of total number of universe patients can be considered feasible from statistical point of view. **RESULTS:** The methodology to estimate total patient numbers is statistically valid and utilizes data sources in an efficient way. The assumption with regard to the conversion of patients into doses is in line with empirical findings. The stratified projection caters to disproportional distribution of VA-sample doctors. **CONCLUSIONS:** The usage of patient age information from the VA-sample is theoretically feasible. The empirical validation with independently sourced German Longitudial Prescription data of statutory insured patients shows differences, which is a certain weakness. As most vaccine-prescriptions are not patient-based the coverage is only 0.07% at paediatricians and 0.39% at GPs. However, VA-age distributions show an overall correlation of 80% which let the usage of VA-age distribution appears feasible. The suggested estimation method is methodologically sound and delivers results confirmed by observation, and statistically preferable to straightforward projection methods which are prone to bias.

PRM59

APPLICABILITY OF JAPANESE HEALTH CARE DATABASE TO CLINICAL TRIAL PLANNING FOR DYSLIPIDAEMIA DRUG

Yamamoto Y[1], Nagayasu S[1], Tomosugi T[1], Matsuoka N[2], Takata A[2], Kanmuri K[2], Imai K[2], Fujimoto Y[2]
[1]*MinaCare co.Ltd., Tokyo, Japan,* [2]*Pfizer Japan Inc, Tokyo, Japan*

OBJECTIVES: Clinical trial simulation (CTS) is encouraged to prevent clinical trials (CT) from failing. Health care database (HDB) is a potential source for baseline characteristics in CTS. The study evaluates, 1) overlapping between distribution of baseline characteristics extracted from Japanese HDB and also from two Japanese CTs for dyslipidaemia drugs, and 2) applicability of HDB as a sampling frame (SF) for baseline data in CTS for dyslipidaemia drug development. **METHODS:** We extracted data from MinaCare HDB which contains both insurance claims and health check-ups of people insured by employment-based insurances as of April 2013 and built two SFs according to eligibility criteria of the protocol in two CTs (Protocol-A and Protocol-B) conducted by Pfizer Japan Inc. Distribution of patient characteristics at screening, such as body mass index (BMI) and low density lipoprotein cholesterol (LDL-C) levels, were compared between SFs (n=1663 for Protocol-A, n=5011 for Protocol-B) from MinaCare HDB and CTs, for Protocol-A (n=165) and Protocol-B (n=459), respectively. **RESULTS:** For both two protocols, we found similar distribution of age, sex, weight, and BMI when comparing descriptive statistics (e.g., mean, standard deviation (SD)). However, LDL-C in CTs was higher than in SFs; e.g., in Protocol-A, patients without prescription for dyslipidaemia showed LDL-C (mg/dL) of 169.9±19.2 from the CT vs. 160.2±16.5 from the SF. Among the patients with prescription, LDL-C was 132.3±31.0 from the CT vs. 118.4±31.0 from the SF. A similar difference was observed for Protocol-B. This finding showed non-weighted sampling from the SF would cause biases in CTS. At the same time, this result suggested that various CTS's assumptions by weighted sampling might be useful. Further evaluation is recommended. **CONCLUSIONS:** The present study provides relevant information that there is considerable similarity in the demographics between SFs from Japanese HDB and Japanese CTs, suggesting usefulness of HDB with application of weighted sampling with CTS.

RESEARCH ON METHODS – Modeling Methods

PRM60

DOES IT MATTER? DISCOUNTING AND ITS ROLE IN ANALYSING THE COST-EFFECTIVENESS OF PREVENTATIVE INTERVENTIONS

Starkie Camejo HJ[1], Van Kriekinge G[2], Li X[3]
[1]*GlaxoSmithKline, Uxbridge, UK,* [2]*GlaxoSmithKline Vaccines, 1300 Wavre, Belgium,* [3]*GlaxoSmithKline Vaccines, Wavre, Belgium*

OBJECTIVES: The UK runs a human papillomavirus (HPV) vaccination programme for girls aged 12-13 years to protect them from cervical cancer (CC). When long-term health benefits such as these occur, with costs occurring at the outset, cost-effectiveness analyses are very sensitive to the discount rate used. In view of this, the National Institute for Health and Care Excellence (NICE) will consider analyses with discount rates of 1.5% for costs and outcomes. Therefore, we modelled the cost-effectiveness of vaccination with the AS04-adjuvanted HVP-16/18 vaccine (BV) compared with HPV-6/11/16/18 (QV) with discount rates of 1.5%. **METHODS:** A published lifetime Markov cohort model replicating the natural history of oncogenic and low-risk HPV infection was adapted to the UK and run for a cohort of 100,000 girls aged 12. Vaccine efficacy against vaccine-type and non-vaccine type HPV was obtained from each vaccine's respective clinical trials. Lifetime protection was assumed for both vaccines. Input data were obtained from the literature, public databases and expert opinion. All costs were updated to 2012 values and reflected an NHS perspective. The incremental cost effectiveness ratio (ICER) of vaccinating with the BV vs. the QV was evaluated. Sensitivity analyses were performed on key variables. **RESULTS:** The model estimated that compared with QV, BV saved an additional 277 CIN1 cases, 1,460 CIN2/3 cases, 53 CC cases and 23 deaths, but did not protect against 7,747 GW cases. Discounting at 1.5% results in +54 QALYs gained and £2.4 million saved. However, applying a discount rate of 3.5% results in -52 QALYs and £1.1 million saved. Sensitivity analyses showed results were robust. **CONCLUSIONS:** Applying a discount rate of 1.5% for both costs and outcomes focuses the appraisal on the long-term outcomes, such as CC and CC-death, of the vaccination programme, and to the finding that the BV was shown to dominate QV.

PRM61

INVESTIGATING THE VALIDITY OF THE UKPDS OUTCOMES EQUATIONS IN CURRENT CLINICAL PRACTICE

McEwan P[1], Ward T[2], Bergenheim K[3]
[1]*Swansea University, Cardiff, UK,* [2]*HEOR Consulting, Monmouth, UK,* [3]*AstraZeneca, Mölndal, Sweden*

OBJECTIVES: The UKPDS 68 equations are routinely used to assess the benefits associated with glucose control in type 2 diabetes mellitus (T2DM) cohorts. Their validity has been questioned because they were derived from a cohort of newly diagnosed T2DM subjects and diabetes management practices have evolved considerably. The objective of this study was to re-calibrate the equations to contemporary health care data and assess their continued relevance. **METHODS:** We utilized data from The Health Improvement Network (THIN) database over the period 1/1/2004 to 31/12/2009. We selected patients either aged > 64 years with HbA1c >7.5% and diabetes duration >10 years or aged >55 years with at least 1 established cardiovascular risk factor. Weibull survival equations were fitted to the following endpoints; myocardial infarction (MI), stroke, congestive heart failure (CHF), ischemic heart disease (IHD), amputation, blindness and end-stage renal disease (ESRD) using R. Missing data was modeled using multiple imputation. **RESULTS:** Data were available on 68,990 T2DM subjects meeting the inclusion criteria with mean age 66.1 years, 46% female, 8.8 years duration of diabetes; with mean body mass index (29.7m/kg^2), HbA1c (8.0%), systolic blood pressure (147.5mmHg), total cholesterol (5.1mmol/l) and HDL cholesterol (1.3mmol/l). Log hazards (standard error) associated with unit changes HbA1c were 0.097(0.011) for MI, 0.084 (0.008) for CHF, 0.051 (0.009) for stroke, 0.112(0.02) for blindness, 0.043 (0.007) for ESRD and 0.225 (0.017) for amputation. These estimates were statistically consistent (at the 95% level) with the original UKPDS log hazards except for IHD (non-significant in the THIN database) and ESRD (non-significant in UKPDS). **CONCLUSIONS:** In general, the UKPDS equations retain their validity for assessing the relationship between HbA1c and macrovascular and microvascular complications. It is likely that use of UKPDS equations will overestimate the incidence of IHD and under-estimate the incidence of ESRD.

PRM62

VARIANCE REDUCTION THROUGH ANTITHETIC VARIATES AS A MEANS OF DEVELOPING COMPLEX VBA MODELS WITH REASONABLE COMPUTATION TIMES

Bennett H, Tetlow AP, McEwan P
Swansea University, Cardiff, UK

OBJECTIVES: Modelling chronic conditions such as diabetes necessitates the development of complex models, raising issues of computational intensity and execution time. While the use of compiled languages such as C++ is more computationally efficient, concerns may exist regarding their transparency compared to commonly used VBA in Microsoft Excel. This study investigates the application of antithetic variates to the pseudo-random numbers of Monte Carlo simulation, to provide reductions in stochastic uncertainty, through the introduction of negatively correlated pairs of simulation replicates, as a means of developing complex VBA models with reasonable computation times. **METHODS:** A

simulation model of type 2 diabetes, based on the UKPDS 68 outcomes equations, was executed with and without the application of antithetic variates. The impact of the technique was evaluated through comparison of total cost and benefit estimates, predicted over a long-term horizon of 40 years. **RESULTS:** An approximate four-fold reduction was observed in the Monte Carlo Error (MCE) associated with estimated mean incremental costs and benefits, when antithetic variates were applied over 1,000 simulations of 1,000 individuals. For a fixed number of runs (1,000), the number of replicated individuals required to achieve 99% accuracy (MCE/mean<1%) in incremental cost and benefit estimates fell from approximately 500 and 550 respectively, to fewer than 50 with antithetic variates. Similarly, for a fixed cohort size (1,000) the same level of precision was produced with fewer than 10% of the simulation runs required otherwise. **CONCLUSIONS:** The use of antithetic variates can improve the precision of modelling output; reducing the number of simulation runs and thus computation time required to perform analyses. The use of such variance reduction techniques should be pursued in the simulation of chronic conditions, as a means of achieving manageable run times and facilitating the extensive scenario and sensitivity analyses required as part of economic evaluations.

PRM63

MODELLING THE ADENOMA AND SERRATED PATHWAY TO COLORECTAL CANCER (ASCCA)

Greuter MJ[1], Xu XM[2], Lew JB[2], Dekker E[3], Kuipers EJ[4], Canfell K[2], Meijer GA[1], Coupe VM[1]
[1]*VU University, Amsterdam, The Netherlands,* [2]*University of New South Wales, Sydney, Australia,* [3]*Academic Medical Center, Amsterdam, The Netherlands,* [4]*Erasmus MC University Medical Center, Rotterdam, The Netherlands*

OBJECTIVES: Most models developed for colorectal cancer (CRC) screening evaluations are based on the adenoma-carcinoma pathway only. Currently, there is increasing evidence that serrated lesions can also develop into CRC. This study aimed to develop a model that reflects both the adenoma-carcinoma pathway and the serrated pathway to CRC and that includes characteristics of polyps. **METHODS:** The Adenoma and Serrated pathway to Colorectal CAncer (ASCCA) model was built using the scientific literature, expert opinion, data from the Dutch COCOS trial and Dutch cancer registry data. A flexible model structure was chosen to examine the impact of two alternative natural history assumptions: (i) all CRCs arise from adenomas and (ii) 15% of CRCs arise from serrated lesions. The two model versions were calibrated manually using a systematic, step-by-step approach. **RESULTS:** Calibration resulted in 19 parameter sets for the adenoma-carcinoma pathway and 13 for the serrated pathway, matching the age- and sex-specific adenoma and serrated lesion prevalence in the COCOS trial and several other intermediate model outcomes. For the first natural history assumption, progression rates from advanced adenoma to CRC between 1.6% and 2.7% were found to produce model-based age-standardized incidence rates within the 95% confidence interval of the Dutch incidence in 2009. For the second assumption, these progression rates were between 1.3% and 2.2%. Mean duration from adenoma to CRC was 24 years. **CONCLUSIONS:** The ASCCA model will be used to evaluate the (cost-)effectiveness of different screening and surveillance strategies for CRC. Future analyses will evaluate the upcoming Dutch screening program using the two calibrated model versions. The implication of different test accuracies for different types of polyps with their characteristics can be taken into account in a straightforward manner. Furthermore, the impact of structural as well as parametric assumptions concerning the serrated pathway can be addressed.

PRM64

MICROSIMULATION OR COHORT MODELLING? A CASE STUDY IN CHRONIC OBSTRUCTIVE PULMONARY DISEASE (COPD)

Lin F[1], Thomas S[2], Baldwin M[3]
[1]*Novartis, East Hanover, NJ, USA,* [2]*Novartis Pharmaceuticals Corporation, East Hanover, NJ, USA,* [3]*Novartis Pharmaceuticals UK Limited, Horsham, West Sussex, UK*

OBJECTIVES: Markov models are commonly used to study time dependent disease progression. While most models are cohort based, due to their limitation of dealing with heterogeneities, continuous variables, and dynamic strategies, individual-based microsimulation is being increasingly used. The objective was to compare microsimulation to cohort approach in modeling COPD, while validating the two approaches against findings from TORCH trial. **METHODS:** We developed both models to study COPD progression in a cohort defined by the characteristics of TORCH patients. The microsimulation randomly generated a large number of patients and tracked each patient's the lung function (FEV1), exacerbations, and mortality, based on individual's characteristics and disease history. The cohort model included four COPD stages and death; it modeled exacerbations as events, assuming no impact on transitions or future exacerbations. Both models were populated by published data and results were compared against TORCH findings. **RESULTS:** The mean decline in FEV1 over 3-year was 126 ml in microsimulation, 49 ml in cohort model, compared to 117 ml in TORCH. The annual rates of moderate and severe exacerbations were 0.94 and 0.18 in microsimulation, 1.12 and 0.18 in cohort model, compared to 1.13 and 0.19 in TORCH. The 3-year mortality was 17.4% in microsimulation, 12.2% in cohort model, and 15.2% in TORCH. Microsimulation required simulating at least 3500 patients to obtain stable estimates, which took 4 minutes to run each scenario. It would take 300 hours to run 5000 scenarios for sensitivity analysis, while the cohort model took less than 1 minute. **CONCLUSIONS:** In COPD, patient heterogeneity and disease history can be conveniently captured in microsimulation, while parameter uncertainties are easily assessed using cohort approach. The cohort approach is simple to develop, but its inherent Markovian property cannot fully represent COPD pathology. Microsimulation is flexible in mimicking COPD progression, but it is computational expensive.

PRM65

SIMULATING PATIENT POPULATIONS – DIFFICULTIES IN CONTROLLING THE ROLL OF THE DICE

Teljeur C, O'Neill M, Murphy L, Harrington P, Ryan M
Health Information and Quality Authority, Dublin, Ireland

OBJECTIVES: In developing probabilistic models to analyse cost-effectiveness, it is possible to control many model parameters using random seeds so that output differences should be due to the interventions being modelled rather than due to chance differences in the model parameters. However, at the point of intervention, the simulated patient effectively enters a parallel universe where outcomes may legitimately be better or worse irrespective of the intervention. The purpose of this study was to present an example of reduced health outcomes contrary to expectation. **METHODS:** Using a model developed to evaluate the impact of different MRI-based breast cancer surveillance strategies, the total benefits measured for individual simulated patients were compared between surveillance and no surveillance. Random seeds were used to ensure model parameters were matched between different model runs. Model structure ensured that later detection of cancer could not be associated with a better outcome. For breast cancer occurrence, random seeds were matched until the first incidence. Individuals could have multiple cancers. **RESULTS:** Across 7 surveillance strategies, compared to a situation of no surveillance, life expectancy was unchanged for between 97.7% and 99.0% of individuals. Depending on the surveillance strategy, between 0.98% and 2.2% of individuals had increased life expectancy, and between 0.04% and 0.1% of simulated individuals experienced a reduced life expectancy. A larger number of individuals had reduced life expectancy due to surveillance, but this is attributable to the detection of DCIS which does not always develop into invasive cancer. **CONCLUSIONS:** When comparing interventions using probabilistic models, chance variation can result in poorer outcomes despite the intervention. Although these anomalies are not apparent in summary figures as there may be an "on average" benefit, their occurrence is legitimate and should not be artificially prevented.

PRM66

ADHERENCE TO DISEASE-SPECIFIC RECOMMENDATIONS FOR PHARMACOECONOMIC STUDIES IN RHEUMATOID ARTHRITIS

Makady A[1], Frederix GW[2], Hövels AM[2]
[1]*Utrecht University, Zeist, The Netherlands,* [2]*Utrecht University, Utrecht, The Netherlands*

OBJECTIVES: Previous research has demonstrated wide varieties in modelling methods of pharmacoeconomic (PE) studies focussing on biological drugs for the treatment of rheumatoid arthritis (RA). To eradicate this variety, disease specific guidelines were presented in 2002 by OMERACT-ILAC. The objective of this study is to assess whether recently published PE studies adhered to these recommendations. **METHODS:** A literature review was conducted for PE studies evaluating TNF-α inhibitors use in RA. Four different databases (e.g. Embase, NIHR-EED) were searched for PE studies published that focus on Adalimumab between October 2003 and May 2013. Methodological quality of included studies was checked against the CHEC-checklist. Data extraction forms were used to retrieve information such as study outcomes (QALY's, costs, ICER) and modelling methods and parameters (e.g. time horizon, sources for costs and effectiveness data). Finally, information retrieved from all studies was compared to recommendations proposed by the OMERACT-ILAR guideline to assess adherence to these recommendations. **RESULTS:** Nine studies were identified that met all inclusion criteria and were included in our analysis. All studies met at least 12 of the 19 items of the CHEC checklist for quality and 3 studies met all 19 items. Study outcomes varied considerably in QALY's calculated, costs and ICER's. Patient subtypes, modelling methods, sources for cost and effectiveness data also varied significantly. Only 2 of the 12 recommendations published in the OMERACT-ILAR guideline were unanimously implemented in all 9 studies of our review. Only 1 study was found to contain all elements of guideline recommendations, albeit with some limitations **CONCLUSIONS:** We demonstrate that modelling methods still widely differ and adherence to disease-specific guidelines for the conduct of PE studies in RA is very low. Development of strict disease-specific guidelines in RA and subsequent adoption by re-imbursement agencies is vital to ensure comparability,validity and credibility of future PE studies.

PRM67

MODELING A SWITCH FROM TRIVALENT TO QUADRIVALENT INFLUENZA VACCINE IN CANADA AND THE UNITED KINGDOM

Thommes EW[1], Ismaila A[2], Meier G[3], Bauch CT[4]
[1]*GlaxoSmithKline Canada, Mississauga, ON, Canada,* [2]*GlaxoSmithKline, Mississauga, ON, Canada,* [3]*GlaxoSmithKline Vaccines, Wavre, Belgium,* [4]*University of Guelph, Guelph, ON, Canada*

OBJECTIVES: Current trivalent influenza vaccines (TIVs) contain only one of the two currently circulating influenza B lineages (Victoria and Yamagata). Worldwide, in about half of all influenza seasons since co-circulation of the two B lineages commenced, the dominant B lineage did not match the one chosen for inclusion in the TIV. Quadrivalent influenza vaccines (QIVs) would help address this problem by including both B lineages each season. We modeled the impact of a country-wide switch from TIV to QIV on the yearly population-wide rates of influenza cases and influenza-associated events, in both Canada and the UK. **METHODS:** We calculated projections using a dynamic transmission model which incorporates four interacting influenza strains, transmission-rate seasonality and age-specific mixing within the population, run over a 40-year time horizon. Influenza vaccine coverage rates in Canada and the UK were taken from public sources, TIV efficacy was obtained from a meta-analysis (Tricco et al., in press), and QIV efficacy was assumed to be similar to TIV without B lineage mismatch. **RESULTS:** Across Canada, the model estimates that a switch from TIV to QIV would, in an average influenza season, avert 9% (relative) of influenza cases (=237,000 cases), 9% (=86,000) of general practitioner (GP) visits, 9% (=12,000) of emergency room (ER) visits, 8% (=2,500) of hospitalizations, and 7% (=330) of deaths. Across the UK, the model estimates that 0.7% (=70,000) of influenza cases, 0.8% (=19,000) of GP visits, 0.8% (=600) of ER visits, 0.8% (=800) of hospitalizations, and 3% (=270) of deaths would be averted. **CONCLUSIONS:** In both Canada and the UK, a country-wide TIV-QIV switch is predicted to bring about a clear reduction in the burden of influenza. The relatively greater impact of the switch in Canada is due principally to that country's higher vaccine uptake among people younger than 65 years.

PRM68

HEALTH ECONOMIC ANALYSIS OF PNEUMOCOCCAL VACCINATION – EXAMPLE FROM BULGARIA

Manova M[1], Savova A[1], Petrova G[2]
[1]*Medical University Sofia, Faculty of Pharmacy, Sofia, Bulgaria,* [2]*Medical University of Sofia, Sofia, Bulgaria*

OBJECTIVES: To evaluate cost-effectiveness of pneumococcal vaccination of children with 10-valent (PHiD-CV) compared with 13-valent pneumococcal conjugate vaccine (PCV-13). **METHODS:** A Markov cohort model which simulates in a Bulgarian birth cohort the disease process of invasive disease (ID) (meningitis and bacteremia), community acquired pneumonia (CAP), and acute otitis media (AOM) over life-time caused by S. pneumoniae and non-typeable Haemophilus Influenzae (NTHi). The cohort model essentially considers the perspective of the health care payer. Bulgarian specific epidemiological and demographic data and data from other country sources were obtained for the model. Base case assumptions include estimates of pneumococcal and NTHi infection rates as well as vaccine efficacy based on published literature, 94% vaccine coverage, herd protection and a (3+1) vaccination schedule. One-way sensitivity analyses performed to assess the impact of changes in key model assumptions. **RESULTS:** PHiD-CV and PCV-13 are projected to prevent 29.4 and 29.9 cases of invasive diseases respectively and 437 and 434 bacteremia hospitalizations respectively . PHiD-CV in comparison with PCV-13 is projected to prevent additional 9393 cases of AOM, 426 myringotomies and 2801 GP visits. Vaccinating a birth cohort with PHiD-CV is expected to generate 41 more QALYs compared to PCV-13. The estimated total savings for health care system are 1.77 mil Euro. The PHiD-CV is dominant in comparison with PCV-13. Sensitivity analyses indicate that GP visits for AOM and efficacy vs. AOM due to Streptococcus Pneumonia non-Vaccine Types Sp nVT have biggest impact on results. **CONCLUSIONS:** Overall, PHiD-CV is expected to have betterI impact and under the given assumptions, PHiD-CV dominates PCV-13 because it also has a larger cost offsets.

PRM69

CORRELATING COST EFFECTIVENESS OUTPUT WITH PATIENT LEVEL DATA INPUT VIA THE IMS CORE DIABETES MODEL (CDM)

McEwan P[1], Foos V[2], Palmer JL[3], Lamotte M[4], Grant D[5]
[1]*Swansea University, Cardiff, UK,* [2]*IMS Health, Basel, Switzerland,* [3]*IMS Health, Allschwil, Basel-Landschaft, Switzerland,* [4]*IMS Health HEOR, Vilvoorde, Belgium,* [5]*IMS Health, London, UK*

OBJECTIVES: Analysing patient level data (PLD) within cost-effectiveness (CE) models offers the potential to better understand patient profiles associated with greatest health economic benefit. The objective of this study was to contrast the application of average treatment efficacy profiles compared to patient level treatment efficacy in assessing the CE of insulin glargine (IG) versus Neutral protamine Hagedorn (NPH) in Type 2 diabetes mellitus (T2DM) **METHODS:** This study used the IMS Core Diabetes Model (CDM), a validated and established diabetes model to evaluate the CE of switching to IG from NPH using published effectiveness data from a large population based cohort. Average HbA1c reduction after switching from NPH was -0.18% and weight gain was 0.5kg. Annual diabetes specific therapy cost was £573 (IG) versus £320 (NPH). A PLD extract was obtained from NHANES and the CE of IG versus NPH assessed applying (a) overall mean treatment effects (MTE) and (b) baseline HbA1c, BMI and sex adjusted treatment effects (ATE). Costs (2012 UK£) and benefits were discounted at 3.5%. **RESULTS:** For the MTE and ATE scenarios, the incremental cost effectiveness ratio (ICER) was £28,925 and £57,279 respectively. For MTE scenario, 765 (41.1%) of subjects were CE at the £20,000 willingness to pay (WTP) and 47 IG subjects (6.1%) were both cost saving with increased health benefit. Using ATE, 525 (28.2%) were CE at the £20,000 WTP threshold with 164 (31.2%) of IG subjects identified as both cost saving with increased health benefit. The odds ratio (OR) of being both cost saving with greater health benefit was significantly associated with age, OR=0.89(0.87-0.93) and baseline HbA1c, OR=6.11 (4.64-8.03). **CONCLUSIONS:** The identification of patient characteristics associated with greater potential for health gain and reduced cost is an important goal. The analysis of PLD alongside simulation model output provides an additional mechanism for informing health care decision-making.

PRM70

COMPARISON OF MARKOV AND DISCRETE EVENT SIMULATION MODELING TECHNIQUES WITH APPLICATION TO COST EFFECTIVENESS ANALYSES

Chrosny W[1], Stevenson M[2], Munzer A[1]
[1]*TreeAge Software, Inc, Williamstown, MA, USA,* [2]*University of Sheffield, Sheffield, UK*

OBJECTIVES: To assess the bias introduced to absolute costs, absolute QALYs and the incremental cost effectiveness ratio (ICER) associated with Markov models, compared with discrete event simulation (DES) models. To investigate how such biases are a function of cycle length and half-cycle correction. **METHODS:** A hypothetical three health state model was constructed using both Markovian and DES approaches. Costs and utility were assigned to each health state and the ICERs between two treatment strategies were estimated. Six Markov models using different cycle lengths (1 month, 3 month, 1 year), and with and without half cycle correction were constructed. Differences in the absolute costs and QALYs generated between each Markov model were compared with the DES approach and the ICERs generated by each model were compared. **RESULTS:** Markov model simulation was shown to introduce biases in the absolute costs and QALYs when compared with a DES approach. The bias was related to the duration of the time cycle with the results converging to the DES values as the time cycle was reduced. The initial bias in cost fell from 14% to less than 1%; QALY bias was consistently below 1%. The ICERs show bias between 2.4% and 9.6% when using a 1 year cycle and between 0.6% - 5.4% when using a 1 month cycle. The half-cycle correction reduced absolute bias between 2% - 10%, the ICERs were not affected. The time cycle duration was the primary parameter in reducing bias. **CONCLUSIONS:** Markov models introduce bias due to the simplifying assumptions of fixed cycle length and half cycle correction; DES models do not suffer the same biases. It is suggested that when the ICERs produced are close to the Willingness to Pay threshold, Markov models should be analyzed with shorter cycle length or a DES approach adopted to ensure conclusions are robust.

PRM71

MODEL-BASED ECONOMIC EVALUATIONS IN ALZHEIMER'S DISEASE : A REVIEW OF MODELING METHODS

Marty R, Roze S
HEVA HEOR, Lyon, France

OBJECTIVES: To review the modeling-based economic evaluations (MB2E) of acetylcholinesterase inhibitors (ACE) and memantine (MEM) used in the field of Alzheimer's disease (AD). **METHODS:** A systematic literature search was carried out based on several electronic databases such as Medline or the Cochrane Library up to November 2012. Modeling frameworks used to depict the natural history of AD and incorporation of treatment effects were qualitatively described and compared. **RESULTS:** More than thirty MB2E were identified with several local adaptations based on ten original modeling frameworks. First published MB2E were either Markov state-transitions models or partition failure time survival models while most recent MB2E relied on discrete events simulations. The hallmark of the disease, the cognitive dimension, was first introduced to model the disease progression mainly based on the Mini Mental State Examination (MMSE) scale. The two other fundamental-functional and behavioral-dimensions were taken into account as a second step. Models relied on distinct clinical milestones and risk equations to extrapolate intermediate clinical endpoints from clinical trials (mainly on cognition and function) into long-term final endpoints. These latter were delay in severity, loss of patient autonomy, institutionalization, burden of care and quality-adjusted life years. Differences occurred as well on the way inter-patient heterogeneity was incorporated with a trend towards more micro-simulations technics. Eventually, predictors and inter-relations between the several dimensions of the natural history of the disease seemed not to be fully captured in the model structures with challenging needs to assess the resulting potential biases. **CONCLUSIONS:** Advanced modeling methods in the field of AD were being introduced to better capture the continuous, progressive and multivariate natural history of AD. Further work is warranted given the emerging early diagnosis technics, neuropathological biomarkers and targeting therapies.

PRM72

THE COST-EFFECTIVENESS OF SEQUENTIAL FIRST- AND SECOND-LINE TREATMENTS IN METASTATIC RENAL CELL CARCINOMA USING REAL-WORLD DATA AND A PATIENT-LEVEL SIMULATION MODEL

de Groot S[1], Blommestein H[1], Redekop W[1], Oosterwijk E[2], Kiemeney L[2], Uyl- de Groot C[1]
[1]*Erasmus University Rotterdam, Rotterdam, The Netherlands,* [2]*Radboud University Medical Centre, Nijmegen, The Netherlands*

OBJECTIVES: Previous cost-effectiveness analyses of targeted therapies in metastatic renal cell carcinoma (mRCC) have been based on randomised trials and evaluate just one single treatment-line. The aim of this study was to estimate the real-world cost-effectiveness of sequential first- and second-line treatments for patients with mRCC using a patient-level simulation (PLS) model. **METHODS:** Based on patient-level data from a Dutch population-based registry, a PLS model was developed that comprised entities (i.e. patients with mRCC), attributes assigned to the entities (i.e. prognostic factors), and events (i.e. second-line treatment or death). Patients were repeatedly simulated from the model and time-to-event was estimated using a lognormal distribution. A separate sampling process was used to determine which type of event occurred. Time to death following second-line treatment was modelled using a Weibull distribution. Lifetime health care costs were modelled using patient-level data from the registry. **RESULTS:** In current daily practice, 50% (341/686) of patients did not receive any targeted therapy and 42% (291/686) received sunitinib as first-line therapy. In the second line, 31% (33/107) were treated with sorafenib and 31% (33/107) with everolimus. Mean overall survival (OS) was 13.6 months and mean costs were €69,622 for all patients. In a strategy where all patients are treated according to clinical guidelines, mean OS was 15.2 months and costs were €91,059. This meant an increase in OS (1.6 months) and costs (€21,437) compared to current practice, with an incremental cost-effectiveness ratio of €159,107 per life-year gained. Probabilistic sensitivity analyses showed the robustness of these results. **CONCLUSIONS:** A complete disease model and real-world data are essential in estimating real-world cost-effectiveness. Our PLS model allows comparisons between treatment strategies spanning multiple treatment lines, which will ultimately help to reveal the optimal strategy. For example, guidelines-based treatment appears to increase both OS and costs compared to current daily practice.

PRM73

THE ROLE OF SIMULATION MODELING IN PLANNING LONG-TERM CLINICAL TRIALS IN TYPE 2 DIABETES

Foos V[1], Grant D[2], Palmer JL[3], Lamotte M[4], McEwan P[5]
[1]*IMS Health, Basel, Switzerland,* [2]*IMS Health, London, UK,* [3]*IMS Health, Allschwil, Basel-Landschaft, Switzerland,* [4]*IMS Health HEOR, Vilvoorde, Belgium,* [5]*Swansea University, Cardiff, UK*

OBJECTIVES: Long-term cardiovascular outcomes studies are routinely undertaken to demonstrate safety in all new diabetes therapies. Given that diabetes models are extensively validated to contemporary outcomes trials they offer the potential to inform on design of new trials. The objective of this study was to use an established diabetes model to explore the relationship between levels of glycaemic control, major adverse cardiovascular events (MACE) and sample size. **METHODS:** The IMS CORE Diabetes Model (CDM) a validated and widely used simulation model was initiated with patient level data (PLD) drawn from NHANES. The model was run with a five-year time horizon and the sample sizes required to detect a difference in MACE (defined as myocardial infarction, stroke or CV death) at the 5% level as a function of change in HbA1c evaluated. **RESULTS:** PLD from NHANES was available on 1853 subjects with mean (SD) age 63.6(12.1) years, 53% male, duration of diabetes 9.6(8.5) years, baseline HbA1c 7.4% (1.8), systolic

blood pressure 134.9mmHg (22.0) and total cholesterol of 189.8 mg/dl (48.7). The expected five-year cumulative MACE event rate was 9.2% and HbA1c reductions of 0.5%, 1.0% and 1.5% produced relative risk reductions of 7.5%, 9.0% and 10.6% respectively. At the 5% level, the number of patients required to detect a significant reduction in MACE events was 17,786, 11,758 and 1,912 for HbA1c reductions of 0.5%, 1.0% and 1.5% respectively. On average, each half-unit change in HbA1c required an additional 7,937 subjects to detect a significant difference in MACE event rate. **CONCLUSIONS:** Given the requirement to extensively validate health economic models to contemporary outcomes studies it is an obvious extension to use these models to inform on the design of clinical trials. These models offer considerable flexibility in the evaluation of sample size requirements in terms of expected changes in modifiable risk factors.

PRM74

DEVELOPING REALISTIC PATHWAYS IN COST-EFFECTIVENESS MODELS FOR PSORIASIS: WHAT TO DO WHEN A BIOLOGIC FAILS

Mauskopf JA[1], McBride D[2], Mallya U[3], Feldman SR[4]
[1]*RTI Health Solutions, Research Triangle Park, NC, USA,* [2]*RTI Health Solutions, Manchester, UK,* [3]*Novartis Pharmaceuticals Corporation, East Hanover, NJ, USA,* [4]*Wake Forest University, Winston-Salem, NC, USA*

OBJECTIVES: Clinical studies indicate switching to a second biologic or combination therapy with an immunosuppressant after failure of first biologic can be effective in patients with moderate to severe plaque psoriasis not responding to the first biologic. **METHODS:** A systematic literature review was performed to assess treatment pathways included in cost-effectiveness (CE) estimates of biologic treatments of moderate to severe psoriasis and compare these pathways with those recommended in psoriasis treatment guidelines. **RESULTS:** Twenty-one CE modeling studies were identified. Of these 10 estimated incremental cost per responder for >=1 biologics over time horizons varying from 12 weeks to 18 months. Treatment pathways were considered not relevant in these studies. In 11 studies with time horizons up to 10 years where treatment pathways were considered, 5 studies included a switch to non-systemic therapy or best supportive care after failure of the initial biologic. In 6 of 11 studies, failure of the initial biologic was followed by monotherapy with a second-line biologic - one of the recommendations in current treatment guidelines. In only 1 of 6 studies that considered treatment sequencing was the efficacy of the second-line biologic adjusted downwards compared to first line treatment. None of the cost-effectiveness analyses included dose titration with the first-line biologic or combination therapy with a biologic plus methotrexate or phototherapy after failure of the first-line biologic as recommended in some treatment guidelines. **CONCLUSIONS:** In most long term CE studies, failure of the first biologic was followed by biologic monotherapy of the second, without efficacy adjustment. Some treatment guidelines support dose titration or combination treatment after failure of a first-line biologic. Nevertheless, these options were not included in the published CE models with time horizons up to 10 years. For decision makers there may be a need for more extensive models where such strategies are allowed.

PRM75

DECISION ANALYTIC MODELS USED IN ESTIMATING THE COST-EFFECTIVENESS OF DRUG-ELUTING STENTS VERSUS BARE-METAL STENTS: A SYSTEMATIC REVIEW

Burgers LT, Redekop WK, Severens JL
Erasmus University Rotterdam, Rotterdam, The Netherlands

OBJECTIVES: Drug-eluting stents (DES) and bare-metal stents (BMS) are both used widely in percutaneous coronary interventions. However, cost-effectiveness analyses of DES versus BMS conflict about whether the reduction in repeat revascularizations of DES versus BMS offsets the initial higher treatment costs of DES. A systematic review was performed to examine whether modelling methods influenced the cost-effectiveness of DES versus BMS. **METHODS:** We reviewed modelling studies published until January 2012 that compared the costs and consequences of DES versus BMS. General information (e.g. funding) and modelling methods used, related to the framing of the economic evaluation (e.g. population and intervention characteristics, time horizon) and parameterisation of the models were extracted from the relevant studies for each of the individual analyses performed in the studies. Associations between these characteristics and the incremental costs and effectiveness were explored using regression analysis. We also examined whether the results were associated with the quality of the models based on the Philips et al. (2006) checklist. **RESULTS:** Fifteen eligible studies accounted for 498 separate analyses, in which the incremental cost-effectiveness ratios ranged from DES being dominated by BMS to DES being dominant. The most important predictors significantly associated with these differences were several population and procedure characteristics, funding and assumptions concerning stent efficacy. The results and conclusions of individual studies corresponded with the findings of this meta-level systematic review. Overall quality of the models was moderate (55%±17%) and significantly negatively associated with repeat revascularizations avoided. **CONCLUSIONS:** Models are important to obtain valid estimates of the cost-effectiveness of DES versus BMS, and framing decisions (e.g. time horizon) and quality of the models both influence incremental costs and effects. The most influential parameters are identified with this systematic review and we showed the need of examining those parameters and of performing a quality check when interpreting the results.

PRM76

EXPLORATORY STRUCTURAL EQUATION MODELS: A SIMULATION STUDY EXPLORING GEOMIN AND TARGET ROTATION TECHNIQUES ON VARIATIONS OF ESEM MODELS

Sen R
Adelphi Values, Boston, MA, USA

OBJECTIVES: This simulation study evaluates the impact of Geomin and Target rotation criteria on factor loading matrices in the recently developed exploratory structural equation models (ESEM), a method that can be considered a strong alternative to the exclusive use of exploratory factor analysis (EFA) and confirmatory factor analysis (CFA) in patient related outcomes measurement. By combining the steps of EFA and CFA in one unified approach, ESEM saves significant time and effort usually invested in separate iterations of EFA and CFA. **METHODS:** One hundred replications of ESEM models were carried out for variations of sample size and latent factors. *Simulation study 1* examined the behavior of ESEM parameter estimates by changing the values of rotation constant (0.01, 0.001 and 0.0001) in Geomin rotation for a *three-factor single group* model and for N=300 and 1000. Simulation study 2 evaluated the behavior of ESEM parameter estimates for multi-group models using three- and four-factor models for N=150 and 500 per group. Bias, Mean Square Errors (MSE) and standard errors were used to evaluate accuracy of parameter recovery. Item parameters were generated from 27 items belonging to a pilot graduate creativity instrument. **RESULTS:** For study 1, Geomin rotated parameter estimates of factor loadings, means and covariances produce higher MSEs than the follow up Target rotations. In study 2, the parameter estimates for ESEM Geomin show small sample size bias for some parameters while the standard errors produced correct coverage for all parameters under Target rotation method for large N=500 per group. **CONCLUSIONS:** Overall, there was accurate recovery of parameter estimates in the smallest sample of 300 especially in the multi-group models specifically when Geomin rotations were employed. This bodes well for analysis of real data and for the study of measurement invariance across groups. Future studies could include the examination of number of items affecting recovery of parameter estimates.

PRM77

METHODOLOGICAL APPROACHES FOR MODELING CARDIOVASCULAR EVENTS IN COST-EFFECTIVENESS ANALYSES BASED ON OUTCOME TRIALS

Kansal AR[1], Zheng Y[1], Palencia R[2], Ruffolo A[2], Hass B[2], Sorensen S[1]
[1]*Evidera, Bethesda, MD, USA,* [2]*Boehringer Ingelheim GmbH, Ingelheim, Germany*

OBJECTIVES: Historically, cardiovascular (CV) endpoints, including myocardial infarction and stroke, have often been included indirectly in cost-effectiveness analyses (CEA) based on surrogate endpoints from clinical trials, such as cholesterol levels, blood pressure or glycemic control. With the availability of outcomes trials sufficiently powered to show differences in CV endpoints, there is an increasing need to incorporate these data directly into CEA. This study investigated approaches available in the published literature for modeling CV endpoints directly based on outcomes data. **METHODS:** A systematic review of cost-effectiveness models for cardiovascular interventions published in the past 5 years was conducted in PubMed and Embase using a predefined search strategy. Only studies in English language directly integrating trial data on CV endpoints from randomized clinical trials were considered. For each study that met the inclusion criteria, clinical input characteristics and the modeling approach were summarized and evaluated. **RESULTS:** Twenty-three papers were identified for final review, including studies of antithrombotic, heart failure, and lipid lowering therapies. Methodologically, decision trees, Markov models (cohort and individual patient), discrete event simulations as well as hybrids of these approaches were used. Event rates were incorporated either as constant rates, time-dependent risks, or risk equations based on patient characteristics. Although potentially more accurately reflecting the trial data, risks dependent on time and/or patient characteristics were only used where feasible (major event rates >1%/year) and practical (models with fewer than seven health states). Models incorporating data from infrequent events or with numerous health states generally preferred constant event rates. **CONCLUSIONS:** When the risk of CV events is low and/or the disease state is explicitly modeled in detail, constant events rates were most common. For heterogeneous populations or when CV event risk is high, simpler model structures were generally accompanied by patient- or time-dependent event rates where permitted by the available data.

PRM78

TWO-WAY SENSITIVITY ANALYSIS: SHOWING THE IMPACT OF CORRELATED PARAMETERS IN COST-EFFECTIVENESS ANALYSES

Heemstra L[1], Skaltsa K[2], Van Engen A[1]
[1]*Quintiles, Hoofddorp, The Netherlands,* [2]*Quintiles, Barcelona, Spain*

OBJECTIVES: Correlated parameters are a common feature in economic models, but no standard sensitivity analysis (SA) exists to show their impact on cost-effectiveness. The one-way SA only varies one parameter at a time and ignores correlation while the probabilistic SA is typically used to address overall uncertainty. The objective of this study is to propose a standard method for visualising the impact of one variable consisting of two correlated parameters in cost-effectiveness analysis. **METHODS:** A model evaluating the cost-effectiveness of a cancer product was used. Using the Cholesky decomposition, 1,000 correlated random draws were generated from the distributions of the intercept and slope of a linear function determining survival in the model. Each pair was inputted in the model to yield the percentage of simulations below accepted thresholds. Results were visualised using R in a scatter plot with both parameters on a separate axis. Shaded areas represented the percentage of simulations below accepted cost-effectiveness thresholds and an ellipse was added representing 80% of the simulated parameter combinations. A conventional one-way SA was performed for comparison. **RESULTS:** The one way SA found wide ranges of incremental cost-effectiveness ratios (ICER) for the intercept and slope parameters (£10,000 - £50,000 per QALY gained). The method described above found that 78% of the simulated pairs resulted in ICERs below £20,000 per QALY gained, and 93% in ICERs below £30,000. The scatter plot visualised the combined uncertainty and their impact on the ICER. A limitation is that the visualisation only allows for 2 correlated parameters. Also, the use of R to generate the graph complicates incorporation of this SA in Excel models. **CONCLUSIONS:** A method was demonstrated to show the impact of correlated parameters in cost-effectiveness analyses. This method may be especially helpful when assessing the uncertainty around parametric survival fits.

PRM79

ASSESSING THE SIGNIFICANCE OF HBA1C DURABILITY IN COST EFFECTIVENESS ANALYSIS OF 2ND LINE ORAL THERAPIES IN THE MANAGEMENT OF TYPE 2 DIABETES

Foos V[1], McEwan P[2], Palmer JL[3], Lamotte M[4], Grant D[5]
[1]*IMS Health, Basel, Switzerland,* [2]*Swansea University, Cardiff, UK,* [3]*IMS Health, Allschwil, Basel-Landschaft, Switzerland,* [4]*IMS Health HEOR, Vilvoorde, Belgium,* [5]*IMS Health, London, UK*

OBJECTIVES: Due to the progressive nature of type 2 diabetes mellitus (T2DM), therapy escalation or intensification is often required to maintain acceptable levels of glycaemic control. The objective of this study was to assess how differential dual therapy failure rates influence the cost effectiveness (CE) results in T2DM. **METHODS:** This study used the IMS Core Diabetes Model (CDM), a validated and established diabetes model, to evaluate the CE of metformin+ sulphonylurea (M+S) compared to metformin + DPP-4 (M+D). Efficacy data for dual therapy was sourced from a published systematic review; HbA1c and BMI change of -0.8% and 0.199kg/m^2 (M+D) and -0.79% and 0.707kg/m^2 (M+S) respectively were applied. Rates of severe hypoglycaemia were 0.1612 and 1.538 per 100 patient years and 4.596 and 68.769 per 100 patient years for non-severe events in M+D and M+S respectively. Insulin rescue therapy was initiated at an HbA1c threshold of 7.5%. Base case analysis assumed M+D and M+S had the same HbA1c durability; lifetime CE was assessed assuming improvement in durability favouring M+D applied in 10% increments with costs (US$) and benefits discounted at 3.5%. **RESULTS:** In the base case analysis, annual HbA1c increase was 0.26% with mean time to therapy escalation of 5 years; and a predicted cost per quality adjusted life year (QALY) of $211,948. Mean annual increments in HbA1c for M+D of 0.182%, 0.13% and 0.1% were necessary to achieve costs effectiveness at willingness to pay (WTP) thresholds of $100,000, $70,000 and $50,000 respectively. Published HbA1c durability for M+D of 0.052% per year was associated with a cost per QALY of $33,427. **CONCLUSIONS:** This analysis demonstrates that the annual rate of increase in HbA1c exerts considerable influence over predicted CE and is therefore an important variable to study when assessing the CE of new interventions for the management of T2DM.

PRM80

NUTRIECONOMIC EXPLORATORY ASSESSMENT OF A DAILY CONSUMPTION OF PLANT STEROLS-ENRICHED DAIRY PRODUCTS ON STATIN'S INITIATION DELAY: A CONSUMER PERSPECTIVE APPROACH

Bruckert E[1], Durand-Zaleski I[2], Emery C[3], Lafuma A[3], Gagneau M[4]
[1]*APHP Pitié-Salpetrière, Paris, France,* [2]*Santé Publique URCEco APHP, Créteil, France,* [3]*Cemka Eval, Bourg La Reine, France,* [4]*Danone Research, Palaiseau, France*

The efficacy of plant sterols in reducing plasma LDL-cholesterol has been demonstrated. In 2009, the European Food Safety Agency stated that for an intake of 1.5-2.4g/day plant sterols, an average reduction of LDL blood cholesterol from 7% to 10.5% can be expected and such a reduction is of biological significance in terms of reduced risk of coronary heart disease. In France, the consumption of plant-sterols enriched products (PSEP) was part of the official dietary recommendations for hypercholesterolemic subjects when the study was designed. **OBJECTIVES:** The objective was to assess the cost-effectiveness of a daily consumption of PSEP, in the context of a healthy diet, on statin's initiation delay from the consumer perspective, in the *eligible*at risk French population. **METHODS:** A 1 year cycle Markov model was built to estimate the benefit (i.e. delay/avoid statins' initiation) in a French population aged between 45 and 65 years and at risk of drug treatment according to the French Drug Agency recommendations. Information on the evolution of cholesterol level and the different cardiovascular disease risk factors was retrieved in the literature. Costs of statin treatment duration avoidance (i.e. price of PSEP fully paid by the consumers) was estimated according to age and gender. **RESULTS:** The *eligible*population included in the model was respectively 49% and 66% among the French male and female population between [45;65 y]. Based on the selected assumptions, and assuming that healthy diet is already integrated in lifestyle habits, daily cost per statin free life year due to substitution of usual dairy product by a PSEP was estimated at 0.71€/day and 1.01€/day respectively for male and female. **CONCLUSIONS:** This exploratory work allowed getting a first estimation of the cost-effectiveness of the daily consumption of PSEP, from the consumer perspective in accordance with official dietary recommendations for cholesterol management.

PRM81

GENERATING THE COST-EFFECTIVENESS FRONTIER WHEN COSTS AND/OR BENEFITS ARE CORRELATED ACROSS STRATEGIES

Teljeur C, O'Neill M, Harrington P, Ryan M
Health Information and Quality Authority, Dublin, Ireland

OBJECTIVES: The cost-effectiveness efficiency frontier is typically generated by plotting the costs and benefits for a variety of technologies, often summarised as the mean across a large number of simulations. However, the mean across simulations may mask correlations between technologies within simulations. We sought to investigate these issues using a HTA comparing 19 different interventions. **METHODS:** We compared 19 different breast cancer surveillance strategies for women aged less than 50 years with a BRCA1 mutation. We calculated the cost-effectiveness efficiency frontier for 5,000 simulations and also based on the mean costs and benefits for each strategy. We also investigated the probability of a strategy appearing on the frontier and correlations between whether or not different strategies appeared on the frontier. **RESULTS:** The efficiency frontier based on means included 6 strategies. This was the cost-effectiveness efficiency frontier in only 22 (0.44%) of 5,000 simulations. Forty four other frontiers were more likely to be generated by simulations. Two strategies not on the frontier of means had a substantial probability of being on the frontier. Some strategies were negatively correlated such that the appearance of one strategy on the frontier never or seldom co-occurred with another. These negative correlations also occurred between strategies that appeared on the frontier of means. **CONCLUSIONS:** The cost-effectiveness frontier generated by the average costs and benefits of each technology may mask inter-dependencies between technologies. Parameter values that render one technology efficient may render another inefficient, and vice versa. There can also be uncertainty about which interventions appear on the frontier, and the adoption of approaches to select competing interventions solely on the basis of being on the efficiency frontier may be unreasonable.

PRM82

VALIDATING AN INDOLENT NON-HODGKIN'S LYMPHOMA (NHL) COST-EFFECTIVENESS ANALYSIS MODEL USING TWO SOFTWARE TOOLS: KEY IMPLEMENTATION CONSIDERATIONS AND RESULTS

Wehler EA[1], Bilir SP[2], Bertwistle D[3], Leyva V[4], Munakata J[2]
[1]*IMS Health, Alexandria, VA, USA,* [2]*IMS Health, San Francisco, CA, USA,* [3]*IMS Health, London, UK,* [4]*IMS Health, Mexico City, Mexico*

OBJECTIVES: The ISPOR-SMDM Modeling Good Research Practices Task Force highlights the importance of model transparency and validation, including cross validation, as a means to establishing trust and confidence in economic models. (1) To investigate how a technical model validation can be conducted by reconstructing a previously-developed Microsoft Excel cost-effectiveness model using TreeAge; and, (2) to validate the model by comparing the results of two implementations. **METHODS:** An Excel-based cohort model on indolent NHL was reconstructed in in TreeAge using the same model structure, clinical inputs, and costing assumptions. Lifetime costs, life-years, quality-adjusted life-years, and incremental cost-effectiveness ratios (ICERs) were projected and compared for bendamustine-rituximab (Ben-R) versus fludarabine-rituximab (Fdb-R) in relapsed indolent NHL patients in Colombia. All costs were in 2013 Colombian pesos. The base-case results and sensitivity analyses were compared between the two software tools and key implementation considerations were identified. **RESULTS:** Key differences in the two software tools were identified and implementation differences will be described, including handling of survival inputs and application of one-time and per-cycle costs. The TreeAge model produced more favorable results compared to the Excel model. The total costs for Ben-R and Fdb-R were $223,400,660 and $208,115,352 in the TreeAge model, respectively, while in the Excel model they were $291,192,912 and $260,463,392. The ICERs were $11,582,974/LY and $13,815,417/QALY in the TreeAge model and $23,286,360/LY and $27,956,124/QALY in the Excel model. However, once the differences between the two models were accounted for in implementation, the reconstructed TreeAge model produced approximately the same results compared to the original Excel model (23,381,795/LY vs. $23,286,360/LY). **CONCLUSIONS:** There are inherent differences in model implementation in Excel vs. TreeAge that should be considered when performing double implementation and when interpreting the model results. Model validation using two software tools is a practical way to ensure proper and intended implementation.

PRM83

RELATIONSHIP BETWEEN MODELLING APPROACH AND REPORTED OUTCOMES: CASE STUDIES OF MODELS FOR THE TREATMENT OF SCHIZOPHRENIA

von Schéele B[1], Mauskopf JA[2], Brodtkorb TH[1], Ainsworth C[3], Galani Berardo C[4], Patel A[5]
[1]*RTI Health Solutions, Lund, Sweden,* [2]*RTI Health Solutions, Research Triangle Park, NC, USA,* [3]*RTI Health Solutions, Manchester, UK,* [4]*F. Hoffmann - La Roche Ltd., Basel, Switzerland,* [5]*King's College London, London, UK*

OBJECTIVES: Different modeling approaches have been used to estimate the cost-effectiveness of antipsychotics used to reduce psychotic symptoms of schizophrenia. This study systematically reviewed schizophrenia modelling studies, to examine the relationship between the modeling approach used in schizophrenia studies and their reported outcomes. **METHODS:** A systematic literature review of MEDLINE, EconLit, Embase, and the Cochrane Library and an Internet search identified published results of schizophrenia modeling studies from 2000 to 2011. Two independent reviewers performed searches according to a prespecified protocol limited to English-language articles from any country. **RESULTS:** Eighty-three publications reported 80 individual modelling studies that met the inclusion criteria. Fifty-seven studies reported results of 71 pairs of antipsychotic drug comparisons (drug A vs. drug B) as incremental cost-effectiveness ratios (ICERs), such as cost per quality-adjusted life-year (QALY), which allowed a comparison of results. The majority of the economic evaluations used a Markov (23 studies) or decision-tree model 23 studies); 9 studies used a discrete-event simulation (DES) model, and 2 studies used a microsimulation model. Among the 11 comparisons with contradictory results, we focused on the following drug comparisons of atypical antipsychotics with the most studies: risperidone long-acting injection versus oral olanzapine, oral risperidone versus oral olanzapine, oral risperidone or oral olanzapine versus ziprasidone, and oral olanzapine versus oral aripiprazole. Overall, model structure, time horizon, and patient population did not affect study results. Differences among studies with contradictory results generally reflected definition of response and relapse rates in the health states, validity of clinical data sources for transition probabilities, and assignment of utilities to estimate QALYs. **CONCLUSIONS:** The cost-effectiveness results of the majority of models were in agreement regardless of the model structure. In models with contradictory results, most differences could be explained by definition of response, relapse, discontinuation, or adverse-event rates and/or by the selection of sources.

PRM84

LITERATURE REVIEW AND ASSESSMENT TO POPULATE A DECISION-ANALYTIC MODEL EVALUATING A NOVEL PROGNOSTIC IN EARLY LUNG CANCER

Stenehjem D[1], Jiao T[2], Rhien T[2], Bellows BK[2], Kaldate RR[3], Jones J[3], Brixner D[4]
[1]*University of Utah/ University of Utah Hospitals & Clinics, Salt Lake City, UT, USA,* [2]*Department of Pharmacotherapy, University of Utah, Salt Lake City, Utah, USA, Salt Lake City, UT, USA,* [3]*Myriad Genetic Laboratories, Inc., Salt Lake City, UT, USA,* [4]*University of Utah, Salt Lake City, UT, USA*

OBJECTIVES: A novel prognostic test is being developed to predict cancer-related mortality in early non-small cell lung cancer (NSCLC) to inform the use of adju-

vant chemotherapy (ACT). The collection and assessment of data inputs for a U.S. economic model evaluating this prognostic will be reported. **METHODS:** Medline and Tuft's CEA Registry were searched for model parameters using the following terms and MeSH headings: NSCLC, adjuvant chemotherapy, recurrence, utilization, economics, cost, quality of life, utility, cost-effectiveness/-utility/-benefit. Inclusion criteria were randomized controlled trials (RCTs), meta-analyses, heath technology assessments, North American and European studies, quality of life analyses, and early lung cancer. Results were limited to full text and English articles. We also assessed relevant references listed in these articles. **RESULTS:** The search yielded one meta-analysis and 7 RCTs assessing ACT in resected NSCLC. These studies report survival (HR 0.75-0.95 favoring ACT), ACT toxicity (30-85% experiencing grade 3-4 toxicity), and stage distribution (Stage IA-7.6%, IB-29.9%, II-35.3%, III-27.2%). They also include disease free survival (HR 0.66-0.93 favoring ACT), but not stratified by NSCLC stage. Monthly cost of NSCLC was found in two studies (initial $5,255-11,496, continuing $2,602-3,733, terminal $9399-16,470). Two studies reported the U.S. cost of ACT toxicity ($4,629-9,516 per grade 3-4 event). Three studies reported utility values specific to early NSCLC including one with values related to ACT and toxicity with values varying from 0.60 to 0.75. Data reporting current U.S. ACT utilization was not identified. **CONCLUSIONS:** Early NSCLC literature contains the majority of data inputs necessary for this model. Limitations exist, specifically regarding recurrence by stage, current ACT utilization and cost of health care resources. These limitations can be overcome using expert opinion, assumptions for guideline adherence and/or conducting observational studies to inform the model.

PRM85

ANALYSIS OF CAUSAL RELATIONS IN STROKE REGISTRY DATA

Jakubczyk M[1], Niewada M[2]
[1]*Institute of Econometrics, Warsaw School of Economics, Warsaw, Poland,* [2]*Department of Experimental and Clinical Pharmacology, Medical University of Warsaw, Warsaw, Poland*

OBJECTIVES: Stroke–one of the leading causes of death and disability–represents substantial clinical and economic burden. Understanding treatment patterns and causative relations may help e.g. to identify outcomes predictors and cost drivers. **METHODS:** We used Polish Hospital Stroke Registry data on patient baseline characteristics (demographics, risk factors, prestroke disability, stroke severity), hospital management, treatment outcomes and drugs (pre-admission, during hospitalisation, and prescribed at discharge). We used inferred causation approach that deducts causal (not associative) interpretations from patterns of (conditional) independence. In this primary analysis we used 5000 observations from 2007/2008 year, binary variables and assumed no hidden variables. We used Tetrad 4.3.10-6 with PC algorithm. Variables were grouped into five tiers, a priori forbidding some directions of causal influence. Large number of variables led us to a restrictive significance level (α=0.0001). **RESULTS:** New insight can be gained from existence, lack of, and the direction of causal relations. Our results: confirmed (without imposing prior knowledge) the use of cardiovascular drugs in relation with underlying risk factors and natural sequence of drug management (drugs used prior to, in acute stroke and at discharge); surprisingly suggested no causal relation between some clinical characteristics and drug use (e.g. history of stroke/diabetes and oral anticoagulants) or acute stroke treatment (e.g. aspirin, thrombolysis, stroke unit based treatment) and mortality/post-stroke disability; determined the causal direction between some risk factors (e.g hypertension and diabetes, gender and AF) or patient history and prestroke disability (history of stroke or age over 75 and impaired disability); could not unambiguously discover the causal-relation between stroke unit based treatment and unproven efficacy drugs use. **CONCLUSIONS:** Apart from statistical or econometric approach, causal-type reasoning can be used both to confirm the intuition, and to detect new patterns in data. Further research should include the possibility of hidden variables and try to quantify the causal relations.

PRM86

HOW TO SELECT THE RIGHT COST-EFFECTIVENESS MODEL? A SYSTEMATIC REVIEW AND STEPWISE APPROACH FOR TRANSFERRING AN EXISTING HEALTH ECONOMIC MODEL FOR RHEUMATOID ARTHRITIS

van Haalen HGM[1], Tran-Duy A[2], Boonen A[2], Severens JL[1]
[1]*Erasmus University, Rotterdam, The Netherlands,* [2]*Maastricht University Medical Center, Maastricht, The Netherlands*

OBJECTIVES: To a) to perform a systematic literature review to identify existing models for cost-effectiveness analysis of disease modifying anti rheumatic drugs in Rheumatoid Arthritis, and b) to develop and test a method for the selection of a model that is transferable to the Dutch health care setting by simple adaptation. **METHODS:** We searched Medline and Embase to identify relevant studies in the English language between 1-1-2002 and 31-8-2012. For studies that met the inclusion criteria, we applied a 3-step approach in model selection. First, models that did not meet all minimal methodological requirements based on the OMERACT criteria were excluded. Second, the models were assessed based on their fit when transferred to the Dutch health care setting. Transferability factors as published by Welte et al., except for those that were deemed transferable by simple adaptation, were used for this ranking procedure. Finally, the remaining models underwent a general quality check using the Philips checklist. Models showing good fit and high quality were considered to be transferable to the Dutch health care setting using simple adaptation. **RESULTS:** The systematic literature search resulted in 498 papers, which included 33 unique health economic models. Only six models passed the OMERACT methodological requirements. Two of these models had imperfect transferability fit according to Welte. The remaining four models were, according to Philips, of good quality and were expected to be transferable by a simple adaptation. **CONCLUSIONS:** This study introduces a stepwise approach to the identification and selection of health economic models that are transferable by a simple adaptation. This approach can be applied in various therapeutic areas, provided that the minimal methodological requirements are defined accordingly. Availability of health economic models coupled with structured model selection could improve the efficiency, quality and comparability of health economic evaluations.

PRM87

EXTERNAL VALIDATION OF THE SYREON DIABETES MODEL

Zsólyom A[1], Merész G[2], Nagyjánosi L[2], Nagyistók S[2], Nagy B[1], Kaló Z[1], Vokó Z[2]
[1]*Eötvös Loránd University, Budapest, Hungary,* [2]*Syreon Research Institute, Budapest, Hungary*

OBJECTIVES: The Syreon model was developed to predict the long term effects of screening, treatment and control of type 2 diabetes. After a successful internal validation the model's outcomes needs to be compared to outcomes of cohorts that were not used for the modeling exercise. The objective of this study was to demonstrate the methods and results of the external validation. **METHODS:** As a first step, we identified the applicable clinical trials and cohort studies which had not been used to build the model and simulated the patient cohorts for each study according to the published demographic, epidemiologic characteristics and treatment patterns. The incidence rates of the predicted and observed outcomes were calculated for comparison and the results were evaluated using statistical methods and expert opinion. **RESULTS:** 92 validation analyses were performed. The differences between the estimated and measured values of the incidences were within the range of 44% and -100%. The slope of the fitted linear regression line was 0.5326 while the R^2 value was 0.6956. The macular oedema submodel presented the best fit and the estimated values from the foot ulcer submodel had the lowest accuracy compared to values observed in other studies. **CONCLUSIONS:** In overall the model performed well, however it frequently underestimated the incidence of the outcomes observed in the studies. This is most likely due to the limited information about the patient characteristics from the studies under evaluation. In most cases the information published about the population characteristics, treatment patterns and effectiveness were not sufficiently detailed to precisely match the model's input parameters. Without sufficient information average values were used as input parameters, and this way the model presumably simulated healthier patient cohorts than the ones participated in the studies.

PRM88

DISENTANGLING EFFECTS ON FATAL AND NON-FATAL CARDIOVASCULAR EVENTS OVER TIME

Thurston S, Van Hout B
Pharmerit Ltd., York, UK

OBJECTIVES: Within acute coronary syndromes (ACS), the risk of experiencing fatal and non-fatal cardiac events is highest immediately after diagnosis and decreases over time. Visual inspection of survival curves from pivotal ACS trials suggest three potential risk periods. The highest risk (unstable disease) period typically lasts up to 10 days from diagnosis. Patients then become more stable but are still at a high risk of events until approximately 30 days from diagnosis. Beyond 30 days patients are considered stable and at a lower risk of events. Different agents may be best suitable for different periods and may affect different events. The objective of this research is to estimate a model which enables the effects on fatal and non-fatal events following an ACS episode to be disentangled and that distinguishes between periods of disease without accurately knowing how long these periods are. **METHODS:** A Markov model is estimated which distinguishes between three time periods and between fatal and non-fatal events. A likelihood function is derived as well as a Bayesian procedure to estimate the model parameters. The approach is tested using simulated data. Subsequently, event free survival data and overall survival data comparing ticagrelor with clopidogrel are taken from the Kaplan-Meier curves presented in the publication of the PLATO trial and model parameters are estimated based on these data. **RESULTS:** Using simulated data the model mimics the data generating process perfectly and the approach seems quite powerful in distinguishing periods and differences with patient numbers of 500 and above. **CONCLUSIONS:** When applied to the PLATO study we conclude from the model that ticagrelor lowers the probability to experience an event in the unstable and stable high risk disease periods.

PRM89

A DE NOVO ECONOMIC MODEL TO ASSESS THE COST AND QUALITY OF LIFE CONSEQUENCES OF AN INTERVENTION FOR LEVODOPA INDUCED DYSKINESIA AMONGST PATIENTS WITH PARKINSON'S DISEASE

Bhattacharyya S[1], Sacco P[2], Shirore RM[1], Sonathi V[1], Thomas S[2]
[1]*Novartis Healthcare Pvt. Ltd., Hyderabad, India,* [2]*Novartis Pharmaceuticals Corporation, East Hanover, NJ, USA*

OBJECTIVES: Emergence of long-term side effects of treating Parkinson's disease (PD) patients with levodopa, particularly dyskinesia (levodopa induced dyskinesia - LID), limit the ability to optimally treat symptoms and consequences of PD. PD-LID interferes with performance of activities of daily living, ambulation and balance and increases health care costs. There are no approved treatments and no studies examining cost-effectiveness of an intervention for PD-LID. Objective of the present study is to develop a de-novo economic model to identify the value drivers for a drug to be cost-effective for treatment of PD-LID. **METHODS:** The model combines a short-term (6 months) decision tree, to determine initial response to the drug, with a long-term Markov approach to model transition of patients across LID severity over lifetime. The model classifies LID severity using modified Abnormal Involuntary Movement scale (mAIMS) with disease states defined as mild (0-12), moderate (13-18) and severe (19-24). Disease state specific costs included costs of drug treatments, consultations/visits, paramedical services, laboratory tests, radiological examinations, hospitalizations, community/social services and unpaid services. State specific utilities were calculated and assigned based on literature. **RESULTS:** The model suggests that initial response to the treatment, ability to improve and halt worsening dyskinesia health states are the greatest value drivers of the treatment for PD-LID. More than 90% of costs were driven by medical costs. A treatment for PD-LID that results in 6-month response rate of at least 50%, 25% increase in the probability of dyskinesia improving and 25% reduction in the probability of dyskinesia worsening results in a 0.28 QALY gain per patient. **CONCLUSIONS:** This economic analysis suggests that a health care intervention that could improve the clinical parameters of dyskinesia can have significant beneficial impact on costs and utilities. Further studies are required

to characterize the underlying disease progression parameters and strengthen these assessments.

PRM90

OVERVIEW OF HEALTH ECONOMIC MODELS IN TYPE 2 DIABETES MELLITUS (T2DM); A SYSTEMATIC LITERATURE REVIEW

Charokopou M[1], Sabater FJ[2], Townsend R[3], Roudaut M[2], Verheggen BG[1]
[1]*Pharmerit International, Rotterdam, The Netherlands,* [2]*Bristol-Myers Squibb, Rueil-Malmaison, France,* [3]*AstraZeneca, Brussels, Belgium*

OBJECTIVES: To identify and compare economic models developed to evaluate the cost-effectiveness of treatments for type 2 diabetes mellitus (T2DM), and their use in health care decision-making. **METHODS:** This research updates two previously published systematic reviews. The current systematic literature review was performed according to a pre-defined search strategy and review criteria in six commonly used databases from September 2008 to January 2013. In addition, websites of Health Technology Assessment (HTA) organizations across nine countries and major disease conferences' proceedings were also reviewed. For each identified model, key information was extracted and assessed. **RESULTS:** Overall, 2262 citations were identified; 122 full text publications, 169 conference proceedings and 106 HTA reports met the pre-defined inclusion criteria. Among these, 27 models were identified; 6 from full text publications, 18 models from conference proceedings, and 3 models from HTA reports. Most of the included models applied a similar model structure, either using Markov-modelling or micro-simulation techniques, and were based on similar key data sources. A key challenge of T2DM economic modelling is to appropriately predict the long-term progression of relevant risk factors and translate these into clinical and economical consequences of diabetes-related complications. In line with previous findings, the UKPDS risk equations were most commonly used for the above purposes in the newly identified models. Among published studies and HTA submissions, T2DM economic models that are widely published and accepted by HTAs include CARDIFF and CORE. **CONCLUSIONS:** The most commonly employed models in HTA submissions, namely CARDIFF and CORE, have similar techniques to forecast future costs and health outcomes. Hence, the focus for decision makers should be to consider the appropriateness of the critical assumptions regarding data inputs that impact the results.

PRM91

NETWORK META-ANALYSIS WITH FRACTIONAL POLYNOMIALS FOR REPEATED TROUGH FEV1 MEASURES IN COPD: ACLIDINIUM BROMIDE 400 µG BID VERSUS TIOTROPIUM 18 µG QD

Karabis A[1], Jansen JP[2], Lindner L[3]
[1]*Mapi, Houten, The Netherlands,* [2]*Mapi / Tufts University School of Medicine, Boston, MA, USA,* [3]*Almirall UK, Uxbridge, UK*

OBJECTIVES: To estimate the relative efficacy of aclidinium bromide 400 µg BID (AB400), to tiotropium bromide 18 µg QD (TIO18) by means of lung function in patients with COPD, within the first 24 weeks of treatment and illustrate the repeated measures network meta-analysis (NMA) models. **METHODS:** A systematic literature search using a predefined strategy in MEDLINE, EMBASE and the Cochrane Library identified 16 unique placebo-controlled RCTs reporting FEV_1 trough: TIO18 (n=13) and AB400 (n=3). The development of trough FEV_1over time for AB400, TIO18 and placebo (PLA) was modeled with fractional polynomials, and the difference between the parameters of these polynomials within a trial were synthesized across studies with a Bayesian NMA. This type of NMA allows for the simultaneous analysis of outcomes at multiple time points. The within-trial correlation was not available from the publications of the included studies, and as such a sensitivity analyses was performed assuming different values for the correlation. **RESULTS:** Given the fractional polynomial parameters obtained with the NMA model, the corresponding treatment effects over time for AB400 vs TIO18, AB400 vs PLA and TIO vs PLA were estimated. The model with $t^{-0.5}$and log(t) had the best fit according to the deviance information criterion (DIC). These polynomials and within study correlation were used for the modeling of the outcomes over time. AB400 is equally efficacious compared to TIO18 during the first 24 weeks, as the 95% CrI of the difference in CFB between the treatments includes zero while the mean is <15mL. Furthermore, the probability that each treatment was best was calculated as a function of time. **CONCLUSIONS:** This analysis demonstrates the use of the proposed NMA models and suggests that maintenance treatment with AB400 results in comparable improvements in lung function, as TIO18 in COPD patients over a 24 weeks period.

PRM92

EVPI CURVES IN PRACTICE

Jeppsson K[1], Posnett J[2], Carlqvist P[3]
[1]*HERON Evidence Development Ltd., London, UK,* [2]*Heron Evidence Development, Ltd., London, UK,* [3]*Heron AB, Stockholm, Sweden*

When making decisions about the allocation of scarce health-care resources it's not only important to consider the estimated cost-effectiveness (CE) with current evidence, but also the value of additional research. Expected value of perfect information (EVPI) is the amount a decision maker should be willing to pay to eliminate uncertainty surrounding the decision about which option is optimal for different levels of the CE threshold (λ). Although EVPI analysis is being requested increasingly by reimbursement agencies there is still limited literature on the interpretation of EVPI curves. The typical 'textbook' example represents just one of the possible shapes that the curve can take. **OBJECTIVES:** To explore and explain different shapes of EVPI curves based on the position of alternative treatment choices on the incremental cost-effectiveness plane. **METHODS:** A hypothetical probabilistic decision model was developed in which two interventions were compared. Key input parameters were varied to force the model outcomes into different quadrants on the incremental CE plane. The population EVPI, based on a hypothetical number of future patients and the estimated lifetime of the new intervention, was plotted. **RESULTS AND CONCLUSIONS:** The result of this study demonstrates a number of scenarios where the EVPI curve takes a different form compared to the one illustrated in the typical 'textbook' example. For example, when the majority of the plotted outcomes are spread over the northern quadrants the traditional EVPI peak is absent, and this could be explained by the fact that the reduction in decision uncertainty does not outweigh the increased value of opportunity loss. Further, plots spread over the eastern quadrants present a maximum EVPI at zero λ which then gradually decreases. This study may inform the interpretation of EVPI curves, and add value to the analysis of the value of additional research.

PRM93

MODELING MEDICATION ADHERENCE IN COMPARATIVE EFFECTIVENESS RESEARCH

Slejko JF[1], Campbell JD[2]
[1]*University of Washington, Seattle, WA, USA,* [2]*University of Colorado Anschutz Medical Campus, School of Pharmacy, Aurora, CO, USA*

OBJECTIVES: Real-world patients do not exhibit the level of medication adherence seen in clinical trials. Hence, the effectiveness of medications in routine practice may differ. It is important to understand the manifestations of suboptimal medication adherence in a population to assess the potential of adherence-improving interventions and the real-world value of medications. The objective of our study was to compare the clinical outcomes of an adherence naïve framework versus a dynamic adherence framework using the case of statins for primary prevention of cardiovascular disease versus no statin use. **METHODS:** Statin adherence was categorized as PDC≤.20, .20<PDC<.80 and PDC≥ .80 based on a longitudinal epidemiological cohort study of US medical and pharmacy claims. Yearly adherence transitions were incorporated into a Markov microsimulation using Treeage software. Tracker variables were used to store adherence transitions which were then used to adjust probabilities of cardiovascular events (MI, stroke, acute angina) over the patient's lifetime. Statin effectiveness was adjusted between 0% and 100% of trial-based risk reduction. A total of 10,000 microsimulations were used to estimate incremental effectiveness as CV events avoided and quality-adjusted life-years (QALYs). **RESULTS:** In the 10,000-patient statin user cohort simulated by the adherence-naïve model, it was estimated that statin use resulted in 1,162 CV events avoided and 0.39 QALYs gained over a lifetime horizon. The dynamic adherence model estimated that 42% of patients exhibited highest adherence, 40% exhibited intermediate adherence and 18% exhibited low adherence. This model simulated that overall, statin use resulted in 366 events were avoided and 0.18 QALYs gained. **CONCLUSIONS:** A Markov microsimulation used to simulate changes in patients' medication adherence over time reveals differential risk reduction and effectiveness in terms of CV events and QALYs gained. The framework presented here is useful for comparing drugs in which optimal effectiveness and costs may be similar, but differential adherence may affect outcomes.

PRM94

CAUSAL ANALYSIS OF LONGITUDINAL PATIENT TURNOVER DATA AT HEPATITIS-C

Lang Z, Bacskai M, Tóth E, Rakonczai P
Healthware Consulting Ltd., Budapest, Hungary

OBJECTIVES: In recent years the financer in Hungary (NHIFA) has established a detailed and stabile patient turnover database, which reflects time dependent changes. Meanwhile, statistical methods of longitudinal data revealing causal relationship have been becoming widespread. By these new methods, analyses similar to assessment of randomized clinical trials have become available. In our research we studied the causal effects of the strategy of treatment, especially the frequency of retreatment of responder patients on features of status, events and costs of patients diagnosed Hepatitis C. **METHODS:** Causal inference on longitudinal (e.g. patient path) data is possible using the methods of Robins (1999). It makes therapy history exogenous, i.e. independent of the actual status of the patient via dynamical, time dependent reweighting of individual patient paths. Consequently, patient paths can be analyzed similarly to cohort data assessment of randomized clinical trials. The method can be used to confirm the results of RCTs. It can substitute RCTs, too, e.g. if RCTs are ethically impossible. **RESULTS:** We obtained by applying Robins' method that repeated combination therapies decreased the risk of liver related complications and the development of hepatocellular carcinoma. The method applied to cost analysis revealed that despite repeated therapies the costs of newly developed cirrhosis and tumor are higher than the corresponding costs of patients with sustained viral response. **CONCLUSIONS:** Robins'method is appropriate for measuring the causal effects of certain factors of care on patient pathways, especially if patient turnover data are supplemented with physiologic, diagnostic and lab information found in clinical registers.

PRM95

APPROPRIATE EVIDENCE SOURCES FOR POPULATING DECISION ANALYTIC MODELS WITHIN HEALTH TECHNOLOGY ASSESSMENT (HTA): A SYSTEMATIC REVIEW OF HTA MANUALS AND HEALTH ECONOMIC GUIDELINES

Zechmeister-Koss I[1], Schnell-Inderst P[2], Zauner G[3]
[1]*Ludwig Boltzmann Institut for Health Technology Assessment, Vienna, Austria,* [2]*UMIT - University for Health Sciences, Medical Informatics and Technology, Hall i. T.; Innsbruck, Austria,* [3]*Drahtwarenhandlung Simulation Services, Vienna, Austria*

OBJECTIVES: Decision analytic modellers use numerous types of evidence for populating model parameters. Detailed methodological advice on which type of data is to be used for what type of model parameter is required. We aim at reviewing existing HTA manuals and health economic (modelling) guidelines in order to gain advice on appropriate evidence sources for populating models. **METHODS:** We identified manuals and guidelines via the International Network of Agencies for Health Technology Assessment (INAHTA) and by hand search. We included documents from Europe, the USA, Canada, Australia and New Zealand as well as transnational guidelines written in English or German. We systematically sum-

marised recommendations on appropriate evidence sources for different model parameters in a narrative manner. Additionally, information on advantages and disadvantages of sources, on evidence identification methods and on data quality issues was extracted. **RESULTS:** Twenty-eight documents fulfilled our inclusion criteria. We identified a large variety of evidence sources for informing model parameters on clinical effect size, natural history of disease, resource use, unit costs and health state utility values. They comprise research and non-research based sources. The documents do not provide structured advice on the hierarchy of evidence and on the limitations of evidence sources. The information is presented fragmentarily and is not tailored to specific model types. **CONCLUSIONS:** The usability of guidelines and manuals for modelling could be improved by addressing the issue of appropriate evidence sources in a more structured and comprehensive format.

PRM96

MODELLING UNCERTAIN FUTURE EVENTS IN COST-EFFECTIVENESS ANALYSIS

Mahon R

University of York, York, UK

OBJECTIVES: When the appropriate time horizon exceeds the evidence time horizon in a cost-effectiveness decision model, numerous uncertainties arise. One potential source of uncertainty is that of a possible future event that may affect one or more model parameters, e.g. a price shock or the emergence of a new comparator. These uncertain future events (UFEs) are rarely accounted for in health technology assessment and there is a dearth of guidance regarding how they should be modelled. The objective of this study is to describe the circumstances under which UFEs could meaningfully impact cost-effectiveness estimates and to explore and demonstrate appropriate modelling techniques using a motivating example. **METHODS:** Drawing on examples from HTA and other relevant literature, a framework is proposed to outline: when to take explicit account of uncertain future events for the purposes of reimbursement decisions, how different future events may affect value-of-information analysis and what modelling methods are likely to be useful when incorporating UFEs. Taking the example of a decision model seeking to estimate the cost-effectiveness of an early interventional strategy for patients with non-ST-elevation acute coronary syndrome, a future price change is simulated and the framework is applied. **RESULTS:** UFEs are shown to impact 'accept or reject' reimbursement decisions only in very specific circumstances where there is the potential to incur irrecoverable costs, whereas their role in value-of-information analysis is invariable. The applied example shows that the reimbursement recommendation for future populations may change with the occurrence of the future event and that there is value in reducing the uncertainty regarding the nature of the future event. **CONCLUSIONS:** UFEs will only impact expected costs-effectiveness sunder specific and rare circumstances. When it is appropriate to include a future event in a decision model, the uncertainty surrounding its likelihood, timing and magnitude should also be quantified.

PRM97

TECHNICAL ERRORS IN COST-EFFECTIVENESS MODELS: EVIDENCE FROM THE SINGLE TECHNOLOGY APPRAISAL PROGRAMME IN ENGLAND AND WALES

Trueman D, Livings C

Abacus International, Bicester, UK

OBJECTIVES: Modelling for cost-effectiveness studies often relies upon the use of spreadsheets. However, research has shown that approximately 90% of spreadsheets contain technical errors. Furthermore, cost-effectiveness models rely on accurate transcription between many data sources, which increases the risk of errors further. The objective of this analysis was to ascertain the incidence of reported technical errors in cost-effectiveness models submitted to NICE as part of the Single Technology Assessment (STA) programme, which are subject to rigorous assessment by Evidence Review Groups (ERGs). **METHODS:** NICE guidance documents were searched for a wide range of technical error types using the HTAinsite database. Reports were included if the ERG had identified technical errors in the manufacturer's submission and this had been noted at committee level. Included appraisals were analysed to identify categories of errors identified. **RESULTS:** Of the 102 completed STA Guidance documents searched, 39 appraisals met the inclusion criteria of the study, representing a technical error incidence of 38.2% (95% CI: 28.8 – 48.4%). Within these studies, 47 errors were identified in the following areas: computation (47%), logic (17%), transcription (13%) and data handling (9%). Error causes could not be determined in 15% of cases. The magnitude of effect caused by technical errors was difficult to determine, because corrected models often include additional changes to parameters or model structure. **CONCLUSIONS:** The incidence of technical errors identified in the STA programme was lower than has previously been observed in studies of spreadsheet validity although this analysis assumes that ERG groups will identify all technical errors. The true incidence of errors may be higher than reported by this analysis. Use of best-practice methods and increased awareness of the causes and identification of technical errors may help to reduce their pervasiveness.

PRM98

THERAPY ESCALATION THRESHOLDS AND THE POTENTIAL FOR BIASED COST EFFECTIVENESS ANALYSIS WHEN FAILING TO SAMPLE BASELINE HBA1C IN TYPE 2 DIABETES

McEwan P[1], Foos V[2], Palmer JL[3], Lamotte M[4], Grant D[5]

[1]*Swansea University, Cardiff, UK,* [2]*IMS Health, Basel, Switzerland,* [3]*IMS Health, Allschwil, Basel-Landschaft, Switzerland,* [4]*IMS Health HEOR, Vilvoorde, Belgium,* [5]*IMS Health, London, UK*

OBJECTIVES: Due to the progressive nature of type 2 diabetes mellitus (T2DM), patients inevitably require therapy escalation or intensification. In health economic analyses, sampling input parameters is routinely undertaken for probabilistic analysis but non-sampled analysis (mean values) is still commonplace. The objective of this study was to assess how sampling baseline HbA1c in combination with therapy escalation thresholds influences predicted costs and quality adjusted life expectancy (QALE) in T2DM economic evaluations. **METHODS:** This study used the IMS Core Diabetes Model (CDM), a validated and established diabetes model, to evaluate the cost effectiveness of metformin+ sulphonylurea (M+S) compared to metformin + DPP-4 (M+D). Baseline HbA1c was set to 8.0% (non-sampled scenario) with standard error of 0.8 (sampled scenario). Efficacy data for dual therapy was sourced from a published systematic review; HbA1c and BMI changes of -0.8% and 0.199kg/m^2 (M+D) and -0.79% and 0.707kg/m^2 (M+S) respectively were applied. Insulin rescue therapy was applied to both arms at HbA1c thresholds of 6.5%, 7.0% 7.5%. The model was run over a lifetime and costs (US$) and benefits were discounted at 3.5%. **RESULTS:** Total incremental costs were $7,667, $9,571 and $11,644 for M+D versus M+S using sampled baseline HbA1c for therapy escalation thresholds of 6.5%, 7.0% 7.5% respectively; and were $5,258, $2311 and $206 lower using non-sampled values, respectively. A similar pattern was observed for QALE, in which incremental QALE gains were 85%, 42% and 1% lower with non-sampled compared to sampled baseline HbA1c for escalation thresholds of 6.5%, 7.0% 7.5% respectively. **CONCLUSIONS:** The importance of probabilistic analysis within cost effectiveness models extends beyond quantifying the effects of parameter uncertainty. When treatment decision rules are dependent on patient attributes that are subject to variability (such as HbA1c) then failing to accommodate this within the model can significantly bias predicted costs and QALE.

PRM99

MARKOV MODELS IN NON METASTATIC PROSTATE CANCER – AVAILABILITY OF INPUT FACTORS AND STRUCTURURAL UNCERTAINTY

Jacobsen J

LSHTM, Nevlunghavn, Norway

OBJECTIVES: This study aims at reviewing structural differences in Markov Models comparing different treatment strategies for Non-Metastatic Prostate Cancer related to scope, time-horizon, perspective, assumptions and the selection of parameters for the model. **METHODS:** There is an abundant literature on Prostate Cancer. There are however few well performed RCT's comparing different options for management for NMPCa.[1] Due to the lack of conclusive clinical evidence on the best treatment for localised prostate there has been a considerable interest in the modelling of prostate cancer in decision analytic models and economic evaluation.[2] The literature review in this paper focuses on the limited number of papers on economic evaluation related to the condition. In addition there are several articles presenting Markov Models. The evaluation was based on selected items from "Consolidated Health Economic Evaluation Reporting Standards (CHEERS)". **RESULTS:** In NMPCa there are Markov models ranging from two to five health states [9]. The choice of model originates from the underlying assumptions, the aim/scope of the study or the availability of data to feed into the model. The insufficient clinical evidence and few preference based studies of health state values where the most influential elements in structuring the models Little attention is paid to the structural differences in the analysis and the discussions in the available papers. Structural uncertainty is viewed as external to the model and difficult to evaluate unless the structural choices are made transparent.[10]. **CONCLUSIONS:** Models in NMPCa differ in complexity and structure. The ability to evaluate the use of different models is highly dependent on transparency in the different building blocks. The CHEERS framework provided a useful tool in the evaluation input factors and the different Markov Model structures,

BAYESIAN EVIDENCE SYNTHESIS OF SAFETY DATA: A ROBUST OPTION?

Amzal B[1], Nikodem M[2]

[1]*LASER Analytica, London, UK,* [2]*LASER Analytica, Krakow, Poland*

OBJECTIVES: Particularly in the context of HTA evaluations where both post-marketing and pre-marketing data may be considered, the evidence to be synthesized can be sparse, partial and heterogeneous for safety outcomes. The Bayesian option has increasingly appeared as an unrivalled option for such challenging evidence synthesis cases but implementation in practice may be questioned. This work aims at determining how Bayesian meta-analysis or mixed treatment comparison of safety data can be optimized especially regarding the choice of prior distributions and model parameterization. **METHODS:** Based on the latest developments from the DIA working group on Bayesian methods for safety data applied to specific real-world cases of both direct meta-analysis and mixed treatment comparisons (MTC), different model parameterizations and different forms of informative and non-informative prior distributions are tested, with various weights allocated to the clinical data vs. the observational information. **RESULTS:** As opposed to the NICE parameterization of network meta-analysis, the 2-way predictor parameterization of MTC as proposed by the DIA working group provides more robust analysis based on non-informative priors. In the case of informative prior results, the most robust option was seen for equal total weight of clinical vs. observational data. Results of all meta-analyses appeared to be consistent across different model and prior specifications, even with low number of studies (<10). **CONCLUSIONS:** Bayesian evidence synthesis can leverage all available information in a robust manner for both direct and indirect comparisons, with fair quantification of uncertainty. Specific guidance on MTC model parameterization for safety data could complement the current NICE guidelines.

PRM101

THE ROLE OF HALF-CYCLE CORRECTION IN THE MODELS USED FOR HEALTH TECHNOLOGY ASSESSMENT

Nemeth B, Vinczi czki Á

National Institute for Quality- and Organizational Development in Healthcare and Medicines, Budapest, Hungary

OBJECTIVES: To analyse the half-cycle correction and its effect on the final results of Markov models. **METHODS:** In our analysis we focus on the half-cycle correction, which is a method used to deal with the inaccuracy caused by inadequate cycle

length in Markov models. The benefits of half-cycle correction has been widely published in the international literature. We measured the importance of half-cycle correction in the models submitted to the Hungarian HTA Office. We examined when it is adequate to use half-cycle correction and how big role should it have in the process of modelling. **RESULTS:** Our experience shows that only 11% of the submitted models incorporated half-cycle correction. In more than half of these cases the value of the incremental cost-effectiveness ratio (ICER) changed by less than 1% when half-cycle correction was used compared to the base-case scenario. We also found the possibility that in some cases the added benefit of half-cycle correction is not considerable. **CONCLUSIONS:** The necessity of using half-cycle correction is essential in models, when the cycle length is half year or longer and if the number of the cycles of the models is less than 200. In most cases the half-cycle correction results in only a little change in the cost-effectiveness ratio of the submitted models, therefore half-cycle correction should be executed carefully.

PRM102

A REVIEW OF CLINICAL TRIAL SIMULATION METHODS

Schuetz CA[1], Ong SH[2]
[1]*Archimedes, Inc., San Francisco, CA, USA,* [2]*Novartis Pharma AG, Basel, Switzerland*

OBJECTIVES: Randomized controlled clinical trials are the gold standard for determining causal inference. However, trials are expensive, and the results can be difficult to interpret. Our objective was to evaluate methods for clinical trial simulation to understand how the simulation approach can be used for improved trial planning and interpretation of trial results. Our primary focus was trials of type 2 diabetes and cardiovascular disease. **METHODS:** We systematically searched the MEDLINE database for clinical trial simulation studies. We used the MeSH terms: Markov model, Markov chains, simulation, simulation model, microsimulation, computer model, and required type 2 diabetes mellitus and cardiovascular diseases. We restricted the search to studies of humans published in English and found 92 publications. We also considered innovative clinical trial simulation methods from other areas to gain context. **RESULTS:** A number of established techniques — notably, the Archimedes Model, Markov models, and observational analyses— are used for clinical trial simulation. Markov model-based simulations are widely employed, but have structural limitations with regard to the physiological detail they can capture (e.g. multiple comorbidities). Retrospective, observational methods for clinical trial simulation are gaining utility as more databases become available. However, observational methods remain vulnerable to unknown biases. Finally, large-scale simulation models (such as the Archimedes model), with physiological underpinnings, provide accurate and clinically detailed trial simulations. These models are used to simulate trials of therapies not yet marketed, or to forecast late stage trials. Model-based simulations require validations to ensure accuracy. **CONCLUSIONS:** Clinical trial simulation is an increasingly powerful tool, complementing real-world clinical trials. Large scale simulation modeling has been shown to be valuable for estimating and interpreting clinical findings. Recent studies suggest that future developments will leverage both large-scale simulation models and increasingly rich real-world evidence.

PRM103

PROTOTYPE MODEL IN METASTATIC CASTRATE-RESISTANT PROSTATE CANCER (MCRPC): A TOOL TO POSITION NEW TREATMENTS IN THE PATIENT PATHWAY?

Karcher H[1], Dinet J[2], Amzal B[1], Marteau F[3], Obrzut G[4], Pieniazek I[4], Brulais S[5], Gabriel S[2]
[1]*LASER Analytica, London, UK,* [2]*IPSEN Pharma, Boulogne-Billancourt, France,* [3]*Ipsen Pharma SAS, Boulogne-Billancourt, France,* [4]*LASER Analytica, Krakow, Poland,* [5]*Ipsen pharma, Boulogne-Billancourt, France*

OBJECTIVES: New treatments registered in mCRPC are expected to alter the way patients are currently treated. It is hence essential for developers of any new treatment not only to position it within the current therapeutic landscape, but also to anticipate what this landscape will resemble at time of launch. To address this issue, we developed a modeling tool that recast a new treatment's value into the evolving therapeutic landscape. **METHODS:** We conducted a literature review of existing health economic models in mCRPC, including recent HTA reports and conference abstracts. Technical and contextual elements were leveraged to build a flexible prototype economic model for new treatments. The model encompasses disease management from asymptomatic mCRPC to patient's death. It aims at describing the future management of mCRPC in including the current way patients are treated and the following innovative features: flexibility to alter the target population definition and size and to add new therapies. New therapies' effectiveness and their expected positioning within the treatment pathway of mCRPC patients are assessed through the model. **RESULTS:** We have created a dynamic prototype model to position new options in the current and future therapeutic landscape for treatment of mCRPC in Europe. Economic models identified in literature were addressing specific reimbursement questions and were not flexible enough to be re-used for our purpose of assessing therapeutic landscape evolution. However, some technical elements on costs and effectiveness could be leveraged for our model. The tool itself enabled to identify information gaps: epidemiology and real-life data were missing for some new treatments. These could be simulated and introduced in our easily-actualizable tool. **CONCLUSIONS:** An actualizable modeling and simulation tool was developed in mCRPC. This tool enables dynamic identification of the best public health and economic outcomes out of a new potential therapeutic alternative.

PRM104

A REVIEW OF METHODS USED IN HEALTH ECONOMIC MODELS OF CHRONIC MYELOID LEUKEMIA INTERVENTIONS

Marsh K[1], Xu P[2], Orfanos P[1], Benedict A[3], Desai K[1], Griebsch I[4]
[1]*Evidera, London, UK,* [2]*Evidera, Lexington, MA, USA,* [3]*Evidera, Budapest, Hungary,* [4]*Boehringer Ingelheim Pharma GmbH, Ingelheim am Rhein, Germany*

OBJECTIVES: To describe the methods adopted by economic models of CML interventions, assess their strengths and limitations, and develop best practice recommendations. **METHODS:** Examples of different economic modeling approaches used to assess the cost effectiveness of CML interventions were identified in MEDLINE and EMBASE. The studies were reviewed to map the method employed, how and why these approaches were selected, and lessons learned by the authors. **RESULTS:** A total of unique CML models were reviewed. The large majority of these models were published in the last 10 years, with almost half being published in 2011. All but 1 of the models adopted a Markov structure, based around the following health states: chronic phase; accelerated phase; blast phase; and death. In line with best practice recommendations, over 75% of studies modeled progression and survival based on response to treatment. Extrapolation of trial data used a wide range of statistical models. Contrary to best practice recommendations, the fit of these models to the trial data and the validity of the extrapolation were not always tested. A variety of approaches were employed to estimate the health related quality of life associate with health states, including the direct valuation of health states, the use of standard health instruments (such as EQ5D), and mapping methods. **CONCLUSIONS:** Several approaches to the economic modeling of CML interventions were identified in the literature. A number of examples of good practice were identified, including the use of disease response outcomes when modeling progression and survival, and the systematic testing of the fit of survival distributions to trial data. Key challenges facing CML modeling are the validity of extrapolations of trial data given the long time periods over which these extrapolations are required, and the lack of data against which to validate them.

PRM105

MODELLING THE NATURAL HISTORY OF SCHIZOPHRENIA: COMPARISON OF NAÏVE VERSUS ADVANCED STATISTICAL METHODS

Millier A[1], Lenert L[2], Sadikhov S[3], Moreno S[3], Toumi M[4]
[1]*Creativ-Ceutical, Paris, France,* [2]*University of Utah School of Medicine, Salt Lake City, UT, USA,* [3]*F. Hoffmann-La Roche Ltd., Basel, Switzerland,* [4]*University Claude Bernard Lyon 1, Lyon, France*

OBJECTIVES: The literature provides little guidance on statistical methods for estimating parameters of Markov models using longitudinal data. We compared the commonly used naïve (based on raw data) and advanced approaches to estimate two model parameters: transition probabilities and hospitalisation rates. Both the naïve and advanced approaches were applied using data from the European Schizophrenia Cohort (EuroSC) to populate a Markov model in schizophrenia. **METHODS:** EuroSC is a 2-year observational study of patients with schizophrenia (n=1,208), with 5 visits at 6-month intervals. Patients were classified into 8 health states at each visit according to severity of symptoms assessed using the Positive and Negative Syndrome Scale (PANSS). For each health state, both model parameters (hospitalisation days and transition probabilities) were estimated based on raw data by pooling all time intervals (i.e. naïve approach). Similarly, for advanced methods, transition probabilities were estimated using multi-state models while hospitalisation days were estimated using two-part Generalised Estimating Equations (GEEs). Advanced methods adjusted for patient characteristics and included random effects to account for repeated measures. **RESULTS:** The naïve approach showed that the average number of hospitalisation days in a 6-month interval ranged from 4.20 in health state 1 to 19.43 in health state 8. Results from the two-part GEEs provided a range from 4.21 in health state 1 to 14.7 in health state 8. GEEs tended to provide narrower confidence intervals. With regards to transition probabilities, differences between the naïve approach and the multi-state model were mostly seen in the second decimal place. **CONCLUSIONS:** While the naïve approach is frequently used for its simplicity, it has a number of shortcomings including: not accounting for repeated measures and not allowing for adjustment of patient characteristics. To increase the robustness of results, we recommend using statistical models that recognise and account for the unique distributional characteristics of data.

PRM106

SURVIVAL ANALYSIS WITH COVARIATES IN COMBINATION WITH MULTINOMIAL ANALYSIS TO PARAMETRIZE TIME TO EVENT FOR MULTI-STATE MODELS

Feenstra TL[1], Postmus D[2], Quik EH[3], Langendijk H[4], Krabbe PFM[3]
[1]*University Medical Centre Groningen, Groningen, The Netherlands,* [2]*University Medical Center Groningen, Groningen, The Netherlands,* [3]*University of Groningen, University Medical Center Groningen, Groningen, The Netherlands,* [4]*UMCG, Groningen, The Netherlands*

OBJECTIVES: Recent ISPOR Good practice guidelines as well as literature encourage to use a single distribution rather than the latent failure approach to model time to event for patient level simulation models with multiple competing outcomes. Aim was to apply the preferred method of a single distribution on time to event in combination with a multinomial distribution on type of event for parameterizing the primary tumor component of a patient level head and neck cancer model. **METHODS:** Data on patients treated with radiation therapy as first line therapy for head and neck tumor at two university hospitals in The Netherlands between 25-02-1980–13-12-2010 was used (nUMCG=277 & nVUMC=736). Several distributions were tested for model fit, using QQ-plots, AIC, and simulated versus actual data plots to judge best fit. Covariates tested for inclusion were age, gender, tumor location dummies, nstage and tstage. The final model was applied in the patient simulation model. Multinomial regression with the same covariates and time of event added as a covariate was applied on type of event, distinguishing death, loco regional recurrence and metastasis as events. All analyses were performed in R. **RESULTS:** The LogNormal distribution showed best fit. The final model had the following coefficients for the location parameter (se in brackets): Intercept, 8.2 (0.38), Age -0.026 (0.0053), Tstage -0.38 (0.062), Nstage -0.21 (0.076), Locd1 -0.91 (0.22) , Locd2 -0.28 (0.15), Locd3 -0.72 (0.22). Locd refers to location dummies. The estimated value for Log(sd) was -0.44 (0.038). The multinomial model had age, tstage and time of event as significant covariates **CONCLUSIONS:** A disadvantage of this method is that a single distribution has to be fit to a time of event which is the result of different interacting stochastic processes. The resulting distributions showed acceptable fit and could be implemented straightforwardly in the patient level simulation model.

PRM107

EXTRAPOLATING SURVIVAL IN A HETEROGENEOUS PATIENT POPULATION WITH METASTATIC MELANOMA; A CASE STUDY OF INTEGRATING STATISTICAL AND CLINICAL CONSIDERATION

Majer IM[1], Gueron B[2], Kotapati S[3], Van Hout B[4]
[1]*Pharmerit International, Rotterdam, The Netherlands,* [2]*Bristol-Myers Squibb, Rueil Malmaison, France,* [3]*Bristol-Myers Squibb Pharmaceuticals, Wallingford, CT, USA,* [4]*Pharmerit Ltd., York, UK*

OBJECTIVES: While the follow-up time on Ipilimumab trials is in excess of 4 years, HTA models often require survival to be extrapolated to 10 years and beyond. However, patient level data on prognostic factors are rarely available; hence extrapolation methods assume a homogeneous study population and are based on statistical considerations only. Such approaches are criticized for disregarding clinical reality and may be biased. In this study a survival extrapolation model that accounted for heterogeneity was developed based on both statistically and clinically relevant considerations. The method was applied on survival data in patients with Metastatic Melanoma. **METHODS:** Survival data were taken from a randomized controlled clinical trial that compared dacarbazine plus placebo versus dacarbazine plus ipilimumab. Two parametric models were explored to extrapolate survival: a model assuming no heterogeneity in patients and another model that divided patients into three subgroups based on cancer stage observed at baseline and additionally included subpopulations of *a priori* unobserved long-term survivors. Survival of the subpopulations was extrapolated and summed to obtain survival in the overall population. Subgroup formation was guided by expert opinion of oncologists. The statistical and clinical validity of the models were assessed. **RESULTS:** Among commonly used distributions (exponential, Weibull, lognormal) the lognormal distribution fitted the survival data best in the no-heterogeneity model whereas Weibull distribution was used for the heterogeneity model. For statistical validity, both models fitted the data reasonably well. However, the no-heterogeneity model underestimated the long tail of the survival curves. The no-heterogeneity model implied decreasing mortality over time while the heterogeneity model implied increasing mortality, which is more clinically relevant. **CONCLUSIONS:** The no-heterogeneity model fitted the data reasonably well but was not relevant for extrapolation from a clinical perspective. The heterogeneity model captured the long tail of the survival curve best, and provided a statistically and clinically relevant model.

PRM108

BIVARIATE INDIRECT COMPARISON META-ANALYSIS MODEL IN ECONOMIC EVALUATION OF CANCER TREATMENTS

Tan SH, Bujkiewicz S, Abrams KR
University of Leicester, Leicester, UK

OBJECTIVES: A three-state Markov model for cost-effectiveness analysis of cancer treatments requires information on both progression-free survival (PFS) and overall survival (OS). However, data is not always available on both of these outcomes. The objective of this study is to perform a Bayesian bivariate indirect comparison meta-analysis (BICMA) to obtain estimates of both PFS and OS for use in a cost-effectiveness analysis when data on these outcomes is incomplete. **METHODS:** In a UK Health Technology Assessment report on cost-effectiveness assessment of docetaxel with prednisone/prednisolone for the treatment of hormone-refractory metastatic prostate cancer, a two-state Markov model was specified using OS data from a single randomised controlled trial that did not report PFS. We propose the use of a Bayesian BICMA model that jointly estimates OS and PFS, and which in turn allows for the specification of a three-state Markov model incorporating a post-progression phase. Survival data for the trials included in the BICMA were reconstructed from survival curves, presented in the articles reporting the trials, using the method proposed by Guyot et. al. (*BMC Med Res Methodol* 2012;12:9) using the DigitizeIt and R software. **RESULTS:** The Bayesian BICMA model was designed to jointly model the correlated outcomes: OS and PFS using either non-informative or informative prior distribution on the correlation between the outcomes. An informative prior distribution on the correlation between PFS and OS was based on external evidence using prostate cancer trials presented in Halabi et. al. (*Clin Oncol* 2009;27(17):2766-71). Modelling the correlated outcomes jointly using this bivariate model allows prediction of PFS for the comparison of interest. **CONCLUSIONS:** In the absence of evidence on PFS, required for the specification of a three-state Markov model, the proposed method allows PFS to be constructed thus eliminating the need to reduce the cost-effectiveness analysis to a two-state Markov model.

PRM109

THE DETERMINANTS OF INNOVATION – A BRIEF STUDY OF ISSUES INFLUENCING INNOVATION IN THE PHARMACEUTICAL INDUSTRY

Ghouse R
Curo Consulting, Marlow, UK

OBJECTIVES: To examine factors determining the level of innovation in an organisation, examining two factors – market size and the strength of intellectual property rights for a particular drug class **METHODS:** The pharmaceutical industry is used as a case study as it not only relies heavily on R&D, but, with the division between brand name and generic drugs, can provide insight into how the removal of intellectual property rights might affect innovation. The estimation models were based on an economic model for innovation and market size developed by Acemoglu and Linn (2004). Drug approval data obtained from the US FDA was used for the innovation variable; a measure for market size was constructed using prescribed medicines expenditure data from the US Medical Expenditure Panel Survey. The analysis focussed on examining the relationships between the variables using various statistical estimation techniques, starting with a simple OLS log-log model, more general negative binomial and gamma models, as well as fully flexible non-linear smoothing regressions in the form of feed-forward neural networks. **RESULTS:** Brand name approvals increased by 2.64% and generic approvals by 4.2% for a 1% increase in income-based market size. The presence of generic drugs and, thus, weak intellectual property rights did not appear to have a negative effect on research and marketing activity by brand name drugs. Estimates were small, significant, and positive (feed-forward neural networks indicated an even stronger positive relationship between brand and generic approvals), suggesting that the presence of generic drugs might further innovation. **CONCLUSIONS:** It was shown that market size does affect the rates at which pharmaceuticals aim to bring their products to the market. While brand manufacturers react positively to increased market size, weak property rights do not appear to affect innovation output negatively.

PRM110

CROSSOVER ADJUSTMENT IN ONCOLOGY TRIALS USING A RANK PRESERVING STRUCTURAL FAILURE TIME MODEL (RPSFTM): WRAPPING BOOTSTRAPS AROUND ESTIMATES OF LIFE EXPECTANCY FOR CE MODELS

Ray J, Bennett I, Wright E
F. Hoffmann-La Roche Ltd., Basel, Switzerland

OBJECTIVES: Oncology trials increasingly permit switching from standard care (SC) to the new treatment following disease progression. Methods to remove the effect of the active treatment in the SC arm are used by HTA agencies to estimate what the effect of the SC would've been had crossover not occurred. One method is using RPSFT models to derive counterfactual survival times without crossover. For CE modeling, these counterfactual survival times need to be parametrically extrapolated to estimate life expectancy. It is known that the RPSFT approach introduces additional uncertainty and e.g. the standard error of a hazard ratio calculated from counterfactual survival times needs to be inflated. Traditional methods of parametric survival analysis don't account for this increased uncertainty which could influence allocation decisions. **METHODS:** A dataset of 400 patients was simulated assuming a Weibull distribution for PFS and OS with 70% of the patients in the SC arm switching after progression. Life expectancy was calculated in two scenarios. In scenario 1 the RPSFTM adjusted OS had Weibull parameter estimates and covariance calculated directly from the counterfactual survival times. In scenario 2 the data was bootstrapped 1000 times. For each iteration a new RPSFT model, associated counterfactual survival times and Weibull functions were fitted. The mean and covariance of these 1000 parameter estimates was taken. **RESULTS:** Mean incremental life expectancy after adjusting for cross-over was the same with and without bootstrapping. When PSA was run, larger confidence intervals in the scenario with bootstrapping indicated, the traditional approach failed to account for the increased uncertainty and underestimated the probability of the new treatment being less efficacious (0.4% without compared to 13.4% with bootstrapping). **CONCLUSIONS:** Failing to appropriately reflect the uncertainty underlying parameter estimates of crossover adjusted survival times could impact HTA decisions when appraisals are based on the likelihood of a treatment being cost effective.

PRM111

THE USE OF DATA FROM PUBLISHED KAPLAN-MEIER SURVIVAL CURVES IN NICE HTAS

Taylor M[1], Lewis L[2], Yellowlees A[3], Fleetwood K[3]
[1]*York Health Economics Consortium, York, UK,* [2]*York Health Economics Consortium, University of York, York, UK,* [3]*Quantics Consulting Ltd., Edinburgh, UK*

OBJECTIVES: Reporting of survival outcomes from clinical trials is often limited to median survival times, hazard ratios, Kaplan-Meier curves and numbers at risk. The numerical results are not always sufficient for meta-analysis and cost-effectiveness analysis. Further information can be obtained by digitizing and analysing the Kaplan-Meier curves. The most basic analysis approach is to fit a non-linear model to the Kaplan-Meier curve and use this to estimate parameters such as the mean survival time. Methods have recently been developed for estimating individual patient data (IPD) from Kaplan-Meier curves. Once individual patient data is estimated, standard survival analysis approaches can be used to estimate parameters and also provide estimates of uncertainty in the curve fits. The objective of this study was to review the methods commonly used and assess the impact of the improved methods, where IPD is estimated, on the inferences drawn. **METHODS:** We conducted a systematic review of the methods that have been used in NICE HTAs to obtain data from published Kaplan-Meier curves. We examined the frequency of each method, how results were used and any feedback from Evidence Review Groups. Improved methods, estimating IPD, were applied to a selection of studies where this was not conducted in the original analysis. The impact of the improved methods on the conclusions of the studies was assessed. **RESULTS:** The review showed that most HTAs used non-linear models to approximate the Kaplan-Meier curves. It also showed that the improved methods, estimating IPD, can have a significant impact on conclusions drawn from survival results. **CONCLUSIONS:** The estimation of IPD from Kaplan-Meier curves is a valuable method that is currently underutilised. It has the potential to provide better estimates of survival parameters and to improve the characterisation of uncertainty in such estimates. This is especially important when survival curves are extrapolated.

PRM112

A BAYESIAN DYNAMIC MODEL OF ASTHMA IN THE REAL LIFE

Amzal B[1], Timmaraju V[2], Castelnuovo E[3], Boucot I[4], Pribil C[5], Nachbaur G[6]
[1]*LASER Analytica, London, UK,* [2]*LA-SER Analytica, London, UK,* [3]*GlaxoSmithKline, London, UK,* [4]*GlaxoSmithKline, Marly-le-Roi, France,* [5]*GSK France, Marly le roi, France, France,* [6]*GSK France, Marly le roi, France*

OBJECTIVES: Evolution of asthma disease severity over time can be highly dependent on the prescription patterns and drug compliance of patients. The purpose of the modeling is to analyze longitudinal observational data of cohort of asthma patients to describe and quantify the dynamics of adherence, prescriptions, and outcomes and their interaction over time. **METHODS:** We explored and analyzed 5 different observational studies following asthma patients in France over up to 2 years. Main patients' demographics along with prescriptions, ACT and 3-level GINA control scores could be defined every quarter and exacerbations at a given quarter were adjucated based on hospital admissions. Medication possession ratios could be defined quarterly and used as a proxy for adherence. A patient-

level dynamic Bayesian inhomogeneous Markov model with quarterly time-step was then developed to jointly describe prescriptions and outcomes over time in relation with adherence proxy using medication possession ratio, adjusting for patients demographics and seasonality. Internal and external validation was performed. **RESULTS:** . Such Bayesian model could be fitted to the available data with different parameters informed by one or another data source. Treatment switches were associated with severity at the previous quarter while adherence was significantly improved when patients are switched and when they are less controlled in the previous quarter. Risk of exacerbations was depending on the control score and season at the present quarter and on the risk of exacerbation at the previous quarter. Control was significantly improved by a better adherence and to a lesser extent by a treatment escalation and improved severity at the previous quarter. **CONCLUSIONS:** This Bayesian dynamic model allowed quantifying the most important interactions between drug uses and effects on control and exacerbations over time, hence providing a powerful tool for real-world outcomes predictions in asthma patients.

PRM113

UNCERTAINTY QUANTIFICATION OF LARGE-SCALE HEALTH ECONOMIC SIMULATION MODELS

Zheng P, Dinh T

Archimedes Inc., San Francisco, CA, USA

OBJECTIVES: Large scale simulation models (e.g. Archimedes Model, MISCAN) are increasingly used to predict cost-effectiveness of medical interventions and to drive reimbursement decisions. These models are complex and involve hundreds of parameters and inputs. Quantification of parameter uncertainties using traditional sampling-based approaches (e.g., Monte Carlo sampling and its variants) can be prohibitively expensive for these models. **METHODS:** We overcome the limitations of traditional probabilistic sensitivity analysis through a 4-step process. First, we conduct a thorough survey of all parameters and their confidence intervals. Second, we use local sensitivity analysis to evaluate the effects of each parameter on the outcome of interest. Third, based on results from single-parameter sensitivity analysis, we rank and identify a group of parameters that have the largest effects on the outcome. We then employ response surface (RS) approximation methods to create a mathematical model of the model predictions for these parameters. We use Latin Hypercube sampling (LHS) to generate data points and multivariate adaptive regression splines (MARS) to build the response surface approximations. Fourth, we sample parameters from their joint distributions, and then use the constructed response surface to calculate the probability distribution of the predicted outcomes. **RESULTS:** We apply the above methodology to quantify uncertainties in predictions of the Archimedes Model for effectiveness of colorectal cancer (CRC) screening by colonoscopy (COLO) and fecal immunological test (FIT). We started out with 200 parameters and identified 20 parameters that have significant influences on predicted effectiveness of CRC screening. We conclude that there is a 89% chance that COLO will save more life years FIT, after accounting for parameter uncertainties. Similarly we estimate that there is a 61% probability that FIT is more cost effective than colonoscopy. **CONCLUSIONS:** We have developed a robust and efficient methodology for quantifying parameter uncertainties of large-scale simulation models used for cost-effectiveness analysis.

CATALOGUE OF EQ-5D SCORES FOR CHRONIC CONDITIONS IN DENMARK

Hvidberg MF, Ehlers L, Petersen KD

Aalborg University, Aalborg, Denmark

OBJECTIVES: EQ-5D catalogues have been developed and tested in US and UK. The current study aims to develop a Danish preference-based EQ-5D 3L scores catalogue for around a hundred of the most common monitored chronic conditions. The development is based on experiences from the US and UK, but adding new factors of importance such as health habits, BMI, social networks and stress. **METHODS:** The marginal disutility estimates will be calculated using CLAD and OLS regression on a single source population from a random sample: the National Danish Health Survey Data from 2010 which is a self-administrated survey with approx. 38.000 respondents age ≥16. The survey data is combined with data from national registers containing individual health data e.g. diagnosed chronic conditions during hospitalization, medication, use of hospitals as well as socio-economic data. The catalogue differs from UK and US catalogues' by adding health habits information and by using ICD-10 classifications from registers as well as it is based on Danish EQ-5D tariffs. The marginal disutility is calculated for each chronic condition controlling for age, gender, ethnicity, income, education and comorbidity etc. **RESULTS:** Marginal disutility estimates (EQ-5D) for around a hundred ICD-10 chronic conditions are presented and compared. It is expected that this new knowledge will contribute and qualify prioritization debate, when results are published and combined with knowledge of for example factors of importance and burden of disease in costs. **CONCLUSIONS:** The catalogue will provide scientist with an "off-the-shelf" tool for use in health economic evaluations. Marginal disutilities estimates can be used to estimate QALY's in CEA for a wide variety of conditions in Denmark.

PRM115

PATIENT PREFERENCES ON TREATMENTS FOR ERECTIL DYSFUNCTION DEFINED BY MEANS OF DIFFERENT ATTRIBUTE GROUPS: THE METHOD OF ADMINISTRATION IS THE MOST VALUED ATTRIBUTE AND THE ORODISPERSIBLE TABLET IS THE MOST PREFERRED LEVEL

Gutiérrez P[1], Rebollo P[2], Mendivil J[3], Vera V[2], Cazorla D[3], Rodríguez-Aguilella A[2], Osorio G[3]

[1]*Hospital Universitario de Canarias, San Cristóbal de La Laguna, Spain,* [2]*LASER Analytica, Oviedo, Spain,* [3]*Bayer HealthCare, Barcelona, Spain*

OBJECTIVES: Phosphodiesterase type 5 inhibitors (PDE5i) for the treatment of erectile dysfunction (ED) have similar pharmacologic profile. Patient preferences may influence the outcome of treatment. The objective was to assess patient preferences on treatments for ED by applying Conjoint Analysis. **METHODS:** Seven attributes were selected through a literature review and a consultation with 25 patients treated of ED and 5 experts: effectiveness (E), rapidity of onset (R), duration of effect (D), adverse events (AE), methods of administration (MA), price (P) and interaction with alcohol and food (I). 3 groups of scenarios were selected using "Orthogonal Design": Phase 1, 9 scenarios with 4 attributes (R, D, MA, I); Phase 2, 16 scenarios with the 7 attributes; Phase 3, 9 scenarios with 4 attributes (E, MA, P, I). It was applied the "Order of simulated preference" method by using cards with symbols and text. Interactions of age, comorbidity and frequency of sexual intercourses with preferences were studied. **RESULTS:** The set of 16 scenarios was very difficult for patients. A total of 314 patients participated in Phase 1, 99 in Phase 2 and 178 in Phase 3. Order of preferred attributes: Phase 1: MA (57.99%), D (16.68%), I (14.57%) y R (10.76%); Phase 2: MA (40.53%),E (21.98%), R (8.98%), P (8.11%), D (7.46%), AE (6.67%),I (6.25%); Phase 3: MA (53.9%), I (22.45%), P (12.50%), E (11.14%). The preferred MA in the 3 phases was the orodispersible tablet with reference to pill and injectable. No statistically significant associations were found with age, comorbidity and frequency of sexual intercourse. **CONCLUSIONS:** . Patients gave more importance to the attribute "method of administration" in any of the three phases performed. The preferred MA was orodispersible tablet over pill and injectable.

PRM116

CHOOSING HEALTH STATES FOR ELICITATION OF POPULATION PREFERENCES FOR THE EQ-5D

Adams R[1], Reddy B[1], Kind P[2], Barry M[1], Walsh C[3]

[1]*National Centre for Pharmacoeconomics, Dublin, Ireland,* [2]*University of York, York, UK,* [3]*Trinity College Dublin, Dublin, Ireland*

OBJECTIVES: The EQ-5D-3L descriptive classification defines a total of 243 health states which presents a problem when seeking to establish social preferences. As it would be challenging to value all 243 health states, a subset is chosen but the basis for this selection varies across national valuation studies. The aim of this study was to choose health states based on the most commonly found health states experienced by the Irish population. **METHODS:** EQ-5D data from four different datasets were combined to determine what health states are prevalent in Ireland. Data from a general population study of health (SLAN), an over 70 population cohort, a rheumatoid arthritis and psoriatic arthritis cohort. The most commonly experienced health states were determined and these were arranged on a 5 dimensional lattice. Health states were chosen using the Manhattan distance metric. **RESULTS:** A total of 12,520 ratings of self-reported EQ-5D health states were included. Fifty two per cent of the cohort had perfect health (11111). Ninety five per cent of states include at least one '1' and no '3'. 126/243 health states were not experienced in these datasets. The Manhattan distance between health states was measured. The imposition of such a metric facilitated the identification of clusters of states and associated centroids. Distance sampling was used to identify states within the clusters. A simple random sampling strategy was also used across the lattice to ensure coverage of health states outside of the cluster **CONCLUSIONS:** Previous population preference elicitation studies have used theoretical approaches to health states elicitation, which could lead to health states being directly valued which are rarely experienced in the population. The approach presented here uses the information already known about the population, to inform choice of health states for population valuation of health using the EQ-5D.

PRM117

HEALTH UTILITIES INDEX (HUI®): POPULATION REFERENCE STATISTICS

Horsman JR[1], Furlong WJ[1], Feeny DH[2], Torrance G[3]

[1]*Health Utilities Inc., Dundas, ON, Canada,* [2]*University of Alberta, Portland, OR, USA,* [3]*McMaster University, Toronto, ON, Canada*

OBJECTIVES: To describe HUI reference statistics available from clinical and general population health studies. **METHODS:** Reviews of published literature, unpublished reports and corporate databases were used to identify summary statistics or data available for calculation of summary statistics. Published examples illustrate the use of HUI reference statistics for health-related quality of life (HRQL) scores to assess the health of patients relative to general populations and of general populations between countries. **RESULTS:** Summary statistics of HRQL scores were compiled from published clinical studies (n=5), population health surveys (n=6), or provided by investigators of individual studies (n=3). Statistics from four sets of published results were used to identify health problems among patients treated for acute lymphoblastic leukemia in childhood in a recently published study. Results from the Joint Canada/US Survey of Health (JCUSH), conducted at the same time in both countries using the same survey methodology are presented here in brief. The mean HUI3 score in Canada (0.88) was slightly higher than in the US (0.87) ($p<0.05$). However, the mean HUI3 score for those with less than a high school education in Canada (0.81) was much higher than the mean for the same group in the US (0.74) ($p<0.05$). HUI Mark2 (HUI2) and HUI Mark3 (HUI3) summary statistics by country, gender, race and age groups are presented in 43 tables on the HUI web-site (www.healthutilities.com). **CONCLUSIONS:** The results highlight the usefulness of continuous preference-based measures of population health such as the HUI3. Population reference data enable international comparisons of population health and provide normative data with which to interpret results from clinical studies. The publicly available summary statistics of interval-scale preference-based measures for the HRQL of reference populations provide valid, reliable and cost-effective results for clinical and general population studies.

PRM118

PATIENT PREFERENCES IN THE CHOICE OF DISEASE MODIFYING DRUGS FOR MULTIPLE SCLEROSIS

Bergmann A[1], Lang M[1], Bischoff C[1], Schicklmaier P[2], Schiffhorst G[3], Nolting HD[3], Rellecke J[3], Kunz E[2]

[1]*NTD study group, Neuburg/Donau, Germany,* [2]*Biogen Idec GmbH, Ismaning, Germany,* [3]*IGES Institut GmbH, Berlin, Germany*

OBJECTIVES: There is a variety of disease modifying drugs available for the treatment of multiple sclerosis (MS). These drugs are associated with different characteristics in key attributes such as side effects, mode of administration etc. The current study was carried out to assess the importance of treatment characteristics for patients' preferences in an ecologically valid design. **METHODS:** In a discrete choice experiment (DCE), MS patients from 38 neurological practices in Germany (n=1,153) were asked to choose the most and the least preferred drug (best-worst-scaling) among hypothetical multi-attribute alternatives with varying levels of the following key attributes: mode of administration, local and systemic side effects, frequency of administration, and required monitoring of the patient. This design (Case-3, multi-profile case) simulates a real choice situation between different hypothetical multi-attribute pharmaceutical treatment alternatives. **RESULTS:** On average, patients (~75% female) were 42 years of age with 9.6 years of disease duration, and ~90% reporting prior experience with parenteral modes of administration. Count analysis (Flynn & Louviere, 1992; Orme, 2009) yielded that mode of administration was the most important attribute guiding patients' preferences, with 'oral application' being most desired (selected as best option in 63% of the cases). Notably, the studied systemic side effects, such as flu-like symptoms or gastrointestinal disorders were only half as important as mode of administration for patients' choice. The second most relevant attribute was frequency of administration, with 'administration once a week' being the most preferred attribute level (in 47% of the cases). **CONCLUSIONS:** Our data indicate that for MS patients, the most important attributes of MS disease modifying drugs are route of administration (oral being the number one choice by majority) and frequency of administration (with intake once a week being the most preferred), probably because these aspects meet the patients' need for low treatment burden in daily life.

PRM119

RELIABILITY AND VALIDITY OF A THAI VERSION OF LAM EMPLOYMENT ABSENCE AND PRODUCTIVITY SCALE (LEAPS)

Pumpaisalchai W[1], Ruengorn C[2], Karahong K[3], Jamroenkhajonsuk P[4], Pongdoung T[1], Udombhornprabha A[5]

[1]*Suanprung Hospital, Chiang Mai, Thailand,* [2]*Faculty of Pharmacy,Chiang Mai University, Chiang Mai, Thailand,* [3]*Omkoi Hospital, Chiang Mai, Thailand,* [4]*Sobprab Hospital, Lampang, Thailand,* [5]*College of Public Health Science, Chulalongkorn University, Bangkok, Thailand*

OBJECTIVES: Work-loss disability from ailments especially depression become shortcoming in economic development thus demands early reverts. No reliable tool to evaluate work-loss diability in Thai developed. We assessed reliability and validity of Thai version of Lam Employment Absence and Productivity Scale (LEAPS),direct patient report outcome subsequent to ailments. **METHODS:** An original LEAPS was officially acquired,validated by language experts, distributed to field-test from patients age above 18 years with ailments seeking treatment at hospital. The scale reliability employed item-scale and inter-item consistency with standardized Chronbach's alpha coefficient. The scale discrimination for patient with income or non-income job was determined and compared using area under curve for Receiver Operating Characteristics (AuROC) with Chi-square test. **RESULTS:** There were seven main LEAPS items with five responder choices. Of 201 patients, 86(42.8%) male,115(57.2%) female, mean (SD)age of 39.6(15.2) years recruited from 3 hospitals. 132(65.7%) and 69(34.3%) patients were classed in income job and non-income job respectively. Background education were graduate 76(38%), vocational certificate 35(17.5%), high school 42 (21%) and primary education 42(21%). 74 (37.2%) of patients had been diagnosed with co-morbidities whom 13(18%) and 61(82%) were psychological and physical illness respectively. Overall 120(60%) of patients complained about their health problems which demanded medical treatment within one week, where 58(29%) reported the condition not interfere with daily activities whereas 36(18%) indicated that the conditions were severe and needed hospitalization. The responder to LEAPS was 94.5%. Reliability test for overall internal consistency Chronbach's alpha coefficient were 0.834 with AuROC of 0.78,95%CI:0.72-0.85. The AuROC for non-income generating vs income-generating group of 0.82,95%CI:0.71-0.92 vs 0.77,95%CI:0.69-0.86 were not significant different (p=0.528) with corresponding Chronbach's alpha coefficient of 0.811 vs 0.842 (p=0.667). **CONCLUSIONS:** Thai version Lam Employment Absence and Productivity Scale(LEAPS) is reliable to use among Thai patients. The scale is robust with consistency among Thai patients with employment and loss productivity regardless of income-generating job and highly predictive for work-loss disability.

PRM120

A SYSTEMATIC REVIEW OF PATIENTS' TREATMENT SATISFACTION AND/OR PREFERENCE PATIENT-REPORTED OUCOMES MEASURES USED IN CLINICAL TRIALS

Pease S[1], Savre I[2], Rudell K[3], Perret C[2], Symonds T[4]

[1]*Pfizer Inc, Whitmore Lake, MI, USA,* [2]*MAPI Research Trust, Lyon, France,* [3]*Pfizer Limited, Tadworth, UK,* [4]*Pfizer Ltd., Surrey, UK*

OBJECTIVES: To determine the availability of Patient Reported Outcome (PRO) instruments measuring Patient's Treatment Satisfaction and/or Preference for drug therapies. **METHODS:** The authors conducted a systematic review of the published literature using established biomedical literature databases (Medline and Embase), ClinicalTrials.gov as well as a PRO specific database (PROQOLID). The instruments identified through the various sources were selected according to specific criteria: 1) Include: PRO instruments of Treatment Satisfaction or Preference as a sole concept OR PRO instruments with at least two domains of Treatment Satisfaction or Preference; 2) Exclude: Evaluation of biomarker control OR No information found on the PRO instruments. **RESULTS:** The systematic literature review identified a total of 720 articles on biomedical databases and 1634 closed clinical trials on Clinicaltrials.gov. The search in PROQOLID identified ten PRO instruments. From an initial review, 130 instruments were considered of particular relevance. Upon detailed review, 88 PRO instruments met selection criteria - nine of which were solely designed for a specific study. Of these 88 PRO instruments, 31 were generic (35%). The most disease-specific measures were for use in diabetes (n = 11; 13%)), then 7 pain instruments (8%), 5 respiratory questionnaires (6%), 2 urological questionnaires (2%) and 2 treatment specific instruments (2%). The remaining 30 (34%) instruments covered individual conditions ranging from anaemia to osteoporosis. **CONCLUSIONS:** There are at least 88 patient's treatment satisfaction/preference instruments published for possible use in clinical trials; 31 of which are useful for evaluating satisfaction / preference for drug therapies without reference to a specific therapy area. For those disease-specific measures, assessment of content validity and psychometric properties should be assessed before chosing the most appropriate measure for a given study.

PRM121

DUAL BACK TRANSLATION VERSUS SINGLE BACK-TRANSLATION METHODOLOGY WHEN TRANSLATING PATIENT REPORTED OUTCOMES (PRO)

Talbert M[1], Brandt BA[2], McKown S[1], Gawlicki MC[2], Heinzman A[3], Polltiz A[4]

[1]*Corporate Translations Inc., Chicago, IL, USA,* [2]*Corporate Translations, Inc., East Hartford, CT, USA,* [3]*Corporate Translations Inc., East Hartford, CT, USA,* [4]*Corporate Translations, Inc., Chicago, IL, USA*

OBJECTIVES: To determine whether dual back-translators improve the translation process for Patient Report Outcomes (PRO). **METHODS:** Four (4) PROs were translated using dual back-translators. The two back-translators worked independently, possessing no knowledge of the other's back-translation. The translated PROs were: a physical assessment questionnaire containing 1507 words with medical terminology, a physical assessment questionnaire with simple terminology containing 593 words, a COPD questionnaire containing medical concepts with 713 words, and a cancer treatment questionnaire containing colloquial terminology and 403 words. Instances of the following scenario were tallied during analysis: one back-translation accurately reflected the source, the other back-translation inaccurately reflected the source, but revealed an error in the forward translation. The same PROs were analyzed again, focusing only on one of the back-translators to compare the number of forward translation revisions that occur when using a single back-translator. **RESULTS:** After analysis, 184 forward translation revisions occurred when using dual back-translators. 11 out of the 184 were a revision to a forward translation where one back-translation was correct despite the other back-translation being incorrect. This occurred 4 times amongst Slavic family languages, 3 times amongst Indian languages, 3 times amongst Southeast Asian languages, and once with Chinese. No such revisions occurred amongst Latin and Germanic language families. After analysis of the translated PROs with just one back-translator, a total of 180 forward translation revisions occurred. **CONCLUSIONS:** A second back-translation improves the translation process if the readability of the text of higher difficulty, and if Slavic, Asian and Indian language translations are required. However, the low number of revisions resulting from one incorrect back-translation, while using dual back-translators, demonstrates that one back-translator is acceptable. Since dual back-translators revealed the need for only 4 more forward translation revisions than the single back-translator, the quality output is similar.

PRM122

MOBILE PHONE USE IN PATIENT REPORTED OUTCOMES – A LITERATURE SEARCH

O'Gorman H

Exco InTouch, Nottingham, UK

OBJECTIVES: To demonstrate the increased use of mobile phones to collect patient reported outcomes in research and to show that they are a valid method of data collection. **METHODS:** A literature search was conducted looking at articles published between 2009 and 2013 that referenced electronic diaries of some description. Articles were pulled out that specifically referenced mobile or cellular phones. **RESULTS:** Twenty-four of out of 157 articles found specifically referenced mobile. The studies referenced in these articles were carried out on populations with an age range of 8 years up to 70 and were split into 12 therapy areas including metabolic and genetic disorders, pain, weight management, sexual activity, respiratory and alcohol related. Population size ranged from 15 to 994 (mean 145.6; SD-180), and subjects reported for a minimum of 7 days (up to 6 reports per day) to a maximum of 365 days (mean 107.9 days; SD-112.6). Notably, 17 out of the 24 studies allowed the subjects to use their own mobile phone for the reporting and 11 referenced smartphones specifically. **CONCLUSIONS:** All concluded that mobile phones were suited to collect data from subjects. It was noted that the use of mobiles was acceptable as they are used them in everyday life and found to be convenient; the technology was also inexpensive to implement. The fact that 70.8% of the studies allowed the subjects to use their own mobile phones for the reporting emphasises the practicality of using mobile phones in patient reported outcomes. Although the mean age of all the studies was relatively low, the age range was very wide and researchers can be confident that older populations could use mobile phones to collect these data. The rapid adoption and technical evolution of mobile technologies and ubiquitous nature show that this technology is a valid means to collect patient reported outcomes.

PRM124

EXPLORING THE FEASIBILITY OF THE INSTRUMENT USED IN DETERMINATION OF WILLINGNESS-TO-PAY PER QUALITY-ADJUSTED LIFE-YEAR IN MALAYSIA

Lim YW, Shafie AA, Hassali MAA, Chua GN

Universiti Sains Malaysia, Penang, Malaysia

OBJECTIVES: The lack of empirical and well-accepted cost-effectiveness (CE) threshold is recognized as one of the most important barriers in using Health technology assessment (HTA) in policy decisions and this is no exception in Asia Pacific region. HTAsiaLink, a network of HTA organizations in Asia has embarked on first collaborative research on determining the CE threshold across 4 countries in Asia Pacific region namely Korea, Japan, Malaysia, and Thailand. This pilot study aimed 1)to explore the feasibility of the instrument/methods used 2)to examine the value of a quality-adjusted life-year (QALY) associated with improving quality of life in mild, moderate and severe health condition, and extending life during terminal illness. **METHODS:** Five EQ-5D health states with different health severity (11121, 11212, 11323, 11223

and 22332) were used. For improving quality of life scenarios, willingness-to-pay (WTP) to avoid being in the given health state for a given duration was determined to ensure the similar magnitude of QALY gained (0.2 and 0.4QALYs) across health conditions. Similarly, in extending life during terminal illness and life saving scenarios, WTP for increasing life expectancy for given 0.2 and 0.4QALYs were examined. Data were analysed using Predictive Analytics Software (PASW v18.0). **RESULTS:** The mean WTP/QALY value for 199 adult was estimated at MYR10,505 (SD:17311) for mild, MYR10,906 (SD:15,101) for moderate and MYR14,981 (SD:21,774) for severe health condition. For terminal illness with extended life scenario, it was estimated at MYR19,611 (SD:27,054). Participants took mean of 29.74 minutes (SD:6.77) to response. One-third (32.2%) of the respondents felt the questionnaire was difficult to answer and 7% rated it as very difficult. **CONCLUSIONS:** The instrument used was feasible for determining the value of WTP/QALY. However, further revision of the questionnaire may be required to simplify the research task. This study also suggested that the threshold for Malaysia to be MYR10,505(0.35GDP)–MYR19,611(0.66GDP) per QALY.

PRM125

EPRO MIGRATION AND USABILITY TESTING OF PATIENT-REPORTED OUTCOME (PRO) MEASURES

Wilkins G[1], Two R[1], Churchman D[2], Jenkinson C[3], Dawson J[4]

[1]*PharmaQuest Ltd., Banbury, UK,* [2]*Isis Outcomes, Oxford, UK,* [3]*University of Oxford, Oxford, UK,* [4]*Health Services Research Unit, Department of Public Health, University of Oxford, Headington, UK*

OBJECTIVES: In recent years there has been an increase in interest surrounding the adaptation of traditional paper-based PRO measures to create 'ePRO' (electronic PRO) versions. Questionnaires in this format are intended to be administered to patients via a tablet or PDA device, website or other electronic media. In collaboration with Isis Outcomes, PharmaQuest Ltd. has managed a series of ePRO migration and translation studies. The aim of the study presented here was to produce versions of the Oxford Hip Score (OHS) and Oxford Knee Score (OKS) that can easily be completed by patients through electronic media, and that are conceptually equivalent to the original paper-based measures. **METHODS:** The adaptation process consisted of 3 main steps. Firstly a draft ePRO version was produced and discussed to resolve any formatting issues. The draft was then tested for conceptual equivalence with the paper-based measure via cognitive debriefing interviews with patients from the target population. Finally, a series of usability questions were used to assess the patients' experience of completing the ePRO measure. **RESULTS:** Overall, no comprehension issues were reported during the cognitive debriefing step for these questionnaires, although the clarity of some instructions was questioned. The feedback from usability testing varied predominantly by age group, with older respondents generally reporting more difficulty in using the ePRO device. However, a large majority of respondents reported that the ePRO version was preferable to a paper questionnaire. **CONCLUSIONS:** Cognitive debriefing feedback confirmed that the ePRO versions presented here were conceptually equivalent to the paper questionnaires. The ePRO versions were generally well received by patients, although the usability testing highlighted the importance of clear instructions and intuitive software.

PRM126

LOCALIZATION OF ACTIVITIES AND EQUIVALENCE OF MOVEMENT IN CLINICAL OUTCOMES ASSESSMENTS

Talbert M[1], McKown S[1], Gawlicki MC[2], Brandt BA[2], Angun C[3], Schulz C[2]

[1]*Corporate Translations Inc., Chicago, IL, USA,* [2]*Corporate Translations, Inc., East Hartford, CT, USA,* [3]*Corporate Translations Inc., Odunpazarı, Eskişehir, Turkey*

OBJECTIVES: Clinical Outcomes Assessments (COAs) frequently include questions to assess patients' ability to perform specific activities. Some activities may not be applicable in the target country, necessitating adaptation during translation. When requiring adaptation, a tendency exists to substitute an equally recognizable, but non-equivalent, activity. Consideration of movements and exertion, as well as cultural appropriateness, is imperative. Failure to do so can impede data pooling across languages in multinational trials. **METHODS:** Languages observed were Eastern European, Indian, Middle Eastern, Asian, and Southeast Asian, all of which presented difficulties in adapting "Western" activities. The activities analyzed appeared in actual patient questionnaires that underwent linguistic validation. Alternatives were recommended by linguists and cognitive debriefing subjects. **RESULTS:** In Arabic for Egypt, "bocce" was deemed inapplicable. "Billiards" was suggested as an appropriate alternative as both require standing and light exertion. "Bocce" also posed difficulties for Indian languages. The initial alternative was "cricket," however, cricket requires higher exertion and running. A suitable alternative was "playing marbles," as the Indian version requires standing, light movement, and no running. Questionnaires also may assess one's ability to complete personal hygiene tasks, such as "getting in and out of a bathtub." In Indian languages, cognitive debriefing subjects did not understand "bathtub," as a majority of the target sample do not have "bathtubs" at home. A suitable alternative was "to sit on and get up from a small stool in order to take a bath with a tumbler." This activity replicated both the source movement and exertion with a culturally appropriate activity. **CONCLUSIONS:** Adaptation of Western activities in COAs requires consideration of the movement and exertion involved in the source, as well as maintaining cultural appropriateness and familiarity to the respondent. This is essential when creating a localized questionnaire that will yield sound data across languages.

PRM127

ITEM REFINEMENT AND PSYCHOMETRIC TESTING OF A NOVEL SURVEY FOR EVALUATING PATIENT PERCEPTION AND PREFERENCE FOR HAEMOPHILIA A TREATMENT

Teal SA[1], Brohan E[2], Hettema Y[3], Humphrey L[4], Willgoss T[4], Hudgens S[5], Westfeld M[3], Cappelleri JC[6]

[1]*Pfizer Ltd., Tadworth, UK,* [2]*Adelphi Values Ltd., Manchester, UK,* [3]*Pfizer Italia srl, Rome, Italy,* [4]*Adelphi Values, Bollington, UK,* [5]*Clinical Outcome Solutions, Tucson, AZ, USA,* [6]*Pfizer Inc., New York, NY, USA*

OBJECTIVES: Haemophilia A treatment involves replacement of missing clotting factor (FVIII) by intravenous infusion prophylactically or on-demand. Treatment adherence is influenced by patients' beliefs about their condition, treatment and side effects; mode of administration can also be a significant barrier. This study aimed to assess the psychometric properties of a survey evaluating patient perception and preference for haemophilia A treatment. **METHODS:** A 40-item survey (derived from existing literature) was developed to assess patient perception and preference for haemophilia A treatment and delivery systems in five European countries. Item refinement and analyses involved: 1) item response and dimensionality analyses using classical test theory; 2) finalisation of items based on data analysis and clinical relevance; 3) scoring development; 4) psychometric testing of the resulting scores including 4a) Rasch analysis, factor analysis, item-level discriminant validity tests and item response distributions; 4b) internal consistency reliability; and 4c) known-groups validity. **RESULTS:** A total of 273 male patients with haemophilia A completed the survey. The results support the survey's construct, known-groups; item-level convergent and divergent validity; and internal consistency reliability. A five-factor solution was observed with the following subscales: 1) Ease of using clotting factor treatment; 2) Impact of clotting factor treatment; 3) Risk associated with clotting factor treatment; 4) Burden of clotting factor treatment; and 5) Influence of others on treatment choices. Twenty-seven items were deleted based on redundancy identified through poor psychometric performance and low clinical relevance, and one item was added (to provide a rating on ease of use of treatment which was considered missing from a content validity perspective) resulting in a 14-item scale. **CONCLUSIONS:** A sequential process of item evaluation and reduction resulted in a short, patient-completed 'Perceptions of clotting factor treatment' survey - a brief, psychometrically tested method assessing patient perceptions and preference for clotting factor treatment in haemophilia A.

PRM128

VALIDATION OF THE MULTIPLE SCLEROSIS INTERNATIONAL QUALITY OF LIFE QUESTIONNAIRE IN ELECTRONIC FORM USING ITEM RESPONSE THEORY

Gupta S[1], DiBonaventura M[2]

[1]*Kantar Health, Princeton, NJ, USA,* [2]*Kantar Health, New York, NY, USA*

OBJECTIVES: The Multiple Sclerosis International Quality of Life Questionnaire (MusiQoL) has been validated in paper and pencil form. Validating patient-reported outcomes using Item Response Theory (IRT) along with Classical Test Theory (CCT) methods are becoming progressively more common. The current study examined the psychometric properties of the MusiQoL among patients diagnosed with multiple sclerosis (MS) using an online version of the instrument. **METHODS:** Data were used from a 2012 US survey of patients self-reporting a diagnosis of MS (N=1,000). The online survey collected information on patients' demographics, disease and treatment history, and health outcomes. Participants also completed the Multiple Sclerosis Rating Scale Revised (MSRS-R) and the abbreviated Treatment Satisfaction Questionnaire for Medication (TSQM-9). Internal consistency and concurrent validity were examined for the domain-specific scores and the composite total score of the MusiQoL. IRT (one and two-parameter graded response models) analyses evaluated item discrimination and item difficulty. **RESULTS:** Among 1000 patients with MS, 82.8% were female, the mean age was 48.7 (SD = 11.29), and 76.7% were currently using a disease-modifying medication. Internal consistency (Cronbach's α) of the total scale of the MusiQoL was 0.913 and the domain scores ranged from 0.824 to 0.944. The total score of the MusiQoL were moderately-to-strongly correlated with MSRS-R (r=-0.551), and adequately correlated with the subscales of the TSQM-9 (r=0.138 to 0.348). Items varied in their discrimination (range: 1.507 to 4.814) and difficulty (range: -2.875 to 2.362) parameters. Majority of the MusiQoL domains best discriminated at lower levels of health-related quality of life (HRQoL). **CONCLUSIONS:** IRT and CCT are both helpful means for evaluating the psychometric properties of the MusiQoL. The MusiQoL in electronic form is reliable and valid for evaluating HRQoL in patients with MS, but performs best when discriminating among respondents with poorer HRQoL.

PRM129

FUNCTIONAL OBSERVATION WITH TTO IN CHRONIC DISEASES

Kövér K, Meszaros A

Semmelweis University, Budapest, Hungary

OBJECTIVES: Ageing population will result in an increased social burden of chronic diseases. Therefore we evaluate the impact of three chronic diseases (Diabetes Mellitus;DM, Hypertension;HT, Rheumatoid Arthritis;RA) on quality of life (QoL) in Hungary with EuroQoL-5D-3L (EQ-5D) EuroQoL-Visual Analogue Scale (EQ-VAS) and Time Trade Off (TTO). TTO is useful in health planning, economic evaluation as it is a utility measure when health state is based on the willingness to trade off lifetime **METHODS:** A total of 468 patients were interviewed with EQ-5D, EQ-VAS and TTO. 253 patients with RA, 110 patients with DM and 105 patients with hypertension filled out the questionnaires. In TTO patients need to choose between two alternatives: living with the actual health state for ten years or living with perfect health state for Y years. We used the ping-pong method to find the minimum Z period of time which is offered in exchange for perfect health. **RESULTS:** The EQ-5D mean scores were according to our expectations: RA had lowest (0,525;SD:0,32); DM had 0,73;SD:0,26 and HT had highest (0,769;SD:0,26). In contrast TTO was lowest in DM (0,74;SD:0,24); RA was 0,769;SD:0,21 and HT was 0,815;SD:0,21. TTO results are higher than EQ-5D index scores in all disorders. Moderate correlation (0.2<r<0.7) was observed in all cases between EQ-5D, VAS and TTO at 0.01 significance-level opposed to HT where correlation was lower (r=0,18). **CONCLUSIONS:** The low correlation between EQ-5D and TTO in HT could be due to the lacking disease awareness in many subjects, TTO needs special consideration in such patients. TTO is an easy method to use but some of the patient could not understand the question or they had difficulties to accept the concept of giving up life-years, some needed longer explanation. The answer on the EQ-5D depend only on patient's health state however the answer of the TTO depend on health, social state and religion.

PRM130
VALIDATION OF THE WHOQOL-OLD IN TAIWAN
Yao G, Chien CC
National Taiwan University (Dept. of Psychology), Taipei, Taiwan
OBJECTIVES: To examine the psychometric properties of the WHOQOL-OLD in Taiwan. **METHODS:** Five questionnaires including the WHOQOL-BREF, WHOQOL-OLD, Geriatric Depression Scale (GDS-15), Barthel Index (BI), and Mini-Mental State Examination (MMSE) were used. A total of 524 participants (M = 76.2, SD = 7.5, ages ranged from 60 to 99) from northern and southern Taiwan completed these questionnaires. Cronbach's alpha, correlation analysis, and factor analysis were conducted to examine internal consistency reliability, content validity, criterion validity, and construct validity. **RESULTS:** Among the participants, 180 (34.4%) were male, and 344 (65.6%) were female. The results showed that the originally designed 6-factor model of the WHOQOL-OLD was supported. Fit indices (CFI = 0.93, IFI = 0.93, NNFI = 0.92 and RMSEA = 0.06) were acceptable. The internal consistency coefficients (Cronbach's alpha) ranged from 0.72 to 0.95 for the 6 domains. Content validity coefficients were in the range of 0.41 to 0.80 for item-associated domain correlations. Except for the DAD domain (Death and dying), other domains showed moderate to high inter-domain correlations (Pearson's correlation ranges from 0.24 to 0.70) and provided good criterion related validity with GDS-15 and WHOQOL-BREF (Pearson's correlation ranges from 0.23 to 0.55). **CONCLUSIONS:** The results showed that the psychometric properties of WHOQOL-OLD were acceptable. The WHOQOL-OLD module is a useful instrument for the old people in Taiwan.

PRM131
DEVELOPMENT OF AN INTERVIEWER-ADMINISTERED VERSION OF THE ASTHMA CONTROL QUESTIONNAIRE (ACQ-IA) FOR 6-10 YEAR OLD PATIENTS IN 11 LANGUAGES
Juniper E[1], Mear I[2], Kaschinski D[3]
[1]*McMaster University, Hamilton, ON, Canada,* [2]*Mapi, Lyon, France,* [3]*Boehringer Ingelheim GmbH, Ingelheim am Rhein, Germany*
OBJECTIVES: The Asthma Control Questionnaire (ACQ) was developed and validated to measure the adequacy of asthma control in patients 11-70 years. Since younger children may have difficulty reading and understanding the instructions, questions and response options, an interviewer version (ACQ-IA) for 6-10 year old patients was developed and validated in UK English. If children had difficulty understanding an ACQ question, standardised alternative wording was added (in UK English, alternatives were needed for questions 2-4 and 6). The objective was to develop the ACQ-IA in a further 11 languages [English (Australia), French (Belgium), Korean, Norwegian, Portuguese (Brazil, Portugal), Spanish (Argentina, Guatemala, Peru and the USA), and Swedish] based on the adult ACQ versions, using the methodology developed for the UK ACQ-IA. **METHODS:** First, the concept of each question was defined. For each language there was: (1) forward/backward translation of ACQ-IA instructions; (2) testing of instructions with interviewers; (3) Cognitive interviews with children (6-10yr) with symptomatic asthma (n=5) to identify questions difficult to comprehend; (4) Development of alternative wording for these questions; (5) Testing of the alternatives on a different sample of children (n=5). **RESULTS:** In all languages at least three questions required alternative wording. Most frequently children had problems understanding medical terms such as "asthma," "symptoms," "wheeze," and "short-acting bronchodilator." "Asthma" was usually replaced by "difficulty in breathing" and "symptoms" was followed by examples in brackets (hard to breathe, cough, wheeze). For "wheeze", "whistling sound when you breathe" was the most common alternative. Children usually know their "short-acting bronchodilator" as their "rescue" or "emergency" medicine. **CONCLUSIONS:** Cognitive interviews with children were crucial for identifying ACQ questions difficult for 6-10 year olds to understand and for formulating the alternative wording in each language. The validity of this novel methodology for the ACQ-IA cultural adaptation has been further supported by these successful adaptations.

PRM132
STRUCTURAL VALIDATION OF THE CHRONIC VENOUS INSUFFICIENCY QUALITY OF LIFE QUESTIONNAIRE-14 (CIVIQ-14) : A CONFIRMATORY FACTOR ANALYSIS
Le Moine JG, Katumba KR, Launois R
Rees France, Paris, France
OBJECTIVES: The aim of this study was to confirm the factorial structure of the short version of the CIVIQ questionnaire using Vein Consult Program (VCP) results. **METHODS:** The VCP was an international study aiming to evaluate the impact of chronic venous disease (CVD) on cost and quality of life. The factorial structure of CIVIQ-14 was evaluated using two methods: confirmatory factor analysis (CFA) and multitrait/multi-items matrix. CFA was performed based on the 3-dimensional structure of CIVIQ-14 established in a previous study. 6 indices from CFA were used to assess stability: Chi², Root Mean Square Approximation (RMSEA), Adjusted Goodness-of-Fit Index (AGFI), Standardized Root Mean square Residual (SRMR), Normed-Fit Index (NFI) and Comparative-Fit Index (CFI). In addition, VCP results were also used to evaluate the psychometric properties of the questionnaire. Prior to data analysis, missing data were replaced using multiple imputation and a bootstrap was conduct to take the country-effect into account. **RESULTS:** A total of 47149 questionnaires from 17 countries were available in the VCP, of which 1438 were excluded for more than 50% missing values. Results from the CFA showed an acceptable adjustment of the CVIQ-14's 3-dimensional structure to VCP data. Within absolute-fit indices, both AGFI and SRMR proved the model to be relevant (AGFI=0.905; SRMR=0.034) while RMSEA was slightly over threshold (RMSEA=0.079; threshold=0.07). Relative-fit indices were consistent with absolute indices, with NFI=0.95 and CFI=0.95. Multitrait/mutli-items analysis agreed with CFA, showing all items to be more correlated to their dimensions score, with correlation coefficient superior to 0.4. Evaluating psychometric properties of the scale, Cronbach's alpha proved internal consistency (α>0.8 in all dimension). **CONCLUSIONS:** Confirmatory factor analysis on VCP data supported the stability of the CIVIQ-14 questionnaire factorial structure. An attempt has been made to evaluate the psychometric properties of the questionnaire, but, due to VCP's transversal design, the full process hasn't been achieved.

PRM133
PATIENT REPORTED OUTCOMES WITH MULTIPLE SCLEROSIS IN SLOVAKIA
Tomekova K[1], Tomek D[2], Bielik J[3], Visnansky M[4]
[1]*Slovak Society for Pharmacoeconomics, Bratislava, Slovak Republic,* [2]*Pharmaceutical Faculty at Comenius University, Bratislava, Slovak Republic,* [3]*Trencin University, Trencin, Slovak Republic,* [4]*SLOVAHTA, Bratislava, Slovak Republic*
OBJECTIVES: The current prevalence of Multiple Sclerosis (MS) in Slovakia ranges from 100 till 150 cases per 100 000, actualized by 112 cases with insurance data. There are approx. 6 100 MS diagnosed MS patients. The objective of this paper was to find out all possible data about patients and for patients. **METHODS:** We conducted a research in collaboration with MS patient organizations. No HCP were involved, patient investigators were trained. A. Demography, treatment and socioeconomics (53 items), B. Specific questionnaire (31 items). We disseminated 500 questionnaires, 356 valid questionnaires were at the end evaluated, 78% women, 20% men (2% n. a.), average age 48.5 ± 11.9 , range 23-78 y, median 49.5 y, 52% college/gymnasium, 24% university, equal w + m (p=0.460). **RESULTS:** First symptoms related to SM raised average in the age of 30.9 ± 9.2 y (median 30 y), 12% before the age of 20, 18% after 40 , 41% were diagnosed until 6 months of the first visit by physician, another 21% in 1 y. 30% were diagnosed after more than 2 y. 45% EDSS 4-6.5, 33% EDSS 0-3 and 16% EDSS 7-9.5 (6% did not announced), 60% impaired with walking, 10% wheelchair, 2% in bed, 51% with assistance by daily activities, 9% by any activity. With rising EDSS MS therapy declines and other therapy is rising. **CONCLUSIONS:** The patients with MS in Slovakia, even with a relatively generous support from health care and social care and with available conventional or disease modifying therapy (DMT) suffer a significant decrease of their QoL.

PRM134
RELIABILITY AND VALIDITY OF THE PEDIATRIC QUALITY OF LIFE INVENTORY GENERIC CORE SCALES FOR DUTCH CHILDREN WITH FUNCTIONAL CONSTIPATION
Hartman EE[1], Pawaskar M[2], Dubois D[3], Benninga MA[4], Joseph A[5]
[1]*Tilburg University, Tilburg, The Netherlands,* [2]*Shire, Wayne, PA, USA,* [3]*ULB, Brussels, Belgium,* [4]*Emma Children's Hospital/Academic Medical Center, Amsterdam, The Netherlands,* [5]*Shire Switzerland, Eysins, Switzerland*
OBJECTIVES: Although psychometric properties of the Quality of Life Inventory™ (PedsQL) version 4.0 Generic Core Scales have been established in different pediatric populations, it has not been validated in patients with functional constipation (FC). The primary objective of the current study was to determine the reliability and validity of the Dutch translation of PedsQL in children with FC in The Netherlands. **METHODS:** The PedsQL was administered to 189 children and adolescents (aged 5-18 yrs) who met the Rome III diagnosis criteria for FC and 257 parents (of patients aged 2-18 yrs) recruited from 12 hospitals. Missing responses, internal consistency and reliability (Cronbach's alpha), discriminant validity (t-test comparisons between children with FC and a separate sample of healthy children [from the literature]) and construct validity (Pearson correlation between *a-priori*hypothesized relationships between the PedsQL and disease-specific indicators, including the GI-module and the Defecation Disorder List), and inter-rater reliability between self- and parent-reports (Intraclass Correlations Coefficients, ICC) were assessed. **RESULTS:** The PedsQL showed minimal missing responses (5% child-, 0% parent-report) and achieved good to excellent internal consistency reliability for the Total Score (α 0.86 child, 0.88 parent), Physical Health Summary Score (α 0.75 child, 0.83 parent), and Psychosocial Health Summary Score (α 0.79 child, 0.85 parent). It also distinguished between healthy references and children with FC (d=0.28-0.57 child, 0.49-0.85 parent). The PedsQL was correlated to disease-specific reference measures (r varied from 0.23 to 0.57 child, 0.25 to 0.45 parent) consistent with the *a-priori* hypotheses. ICC's between child and parent-reports ranged from 0.70 to 0.72. **CONCLUSIONS:** The results showed good initial measurement properties of the Dutch version of the PedsQL generic core scales in patients with FC. It could be considered as a valuable tool for measuring health related quality of life in Dutch speaking patients aged 2 to 18 years with FC.

PRM135
PILOT TESTING OF THE POLISH PRE-FINAL VERSION OF "DISABILITIES OF THE ARM, SHOULDER AND HAND" (DASH) QUESTIONNAIRE
Golicki D[1], Krzysiak M[2], Strzelczyk P[3]
[1]*Department of Experimental and Clinical Pharmacology, Medical University of Warsaw, Warsaw, Poland,* [2]*Oddzial Rehabilitacji Dziennej, MCR Stocer, Konstancin Jeziorna, Poland,* [3]*The Kosciuszko Foundation scholar, New York, NY, USA*
OBJECTIVES: To perform a pilot testing of the translated and culturally adapted Polish pre-final version of the DASH questionnaire in a population from a target setting. **METHODS:** Thirty patients (20 men), medium age 41.1 years (range 13 -79) from Rehabilitation Centre STOCER (Konstancin-Jeziorna) took part in pilot testing. The studied population was heterogeneous in terms of side affected (right: 13, left:13, both: 4), diagnosis (20 different diagnoses, most common - brachial plexus injury, n=6) and treatment (both conservative and surgical). Subjects completed questionnaires and were asked if there were questions that were difficult to respond or difficult to understand. After that each patients had to explain in his/her own words the meaning of five randomly chosen questions and their answers. We analyzed: number of missing items by question, number of missing items by patients and distribution of responses for each item. **RESULTS:** Understanding of randomly chosen questions and answers was appropriate. All items, except one, had high frequency of present answers (86.7% - 100%). Item 21 (sexual activity) was omitted by 60% of respondents. Number of missing items by patients ranged from 0 to 6. Five patients (16.7%) had more than 10 percent of the items left blank. Three from these persons were 60 years of age and over and could characterize with

worse cognitive function. Fifteen items had responses with ≥ 35% frequency and three items (turning a key, recreational activities with force, recreational activities with moving arm freely) had responses with ≥ 50% frequency. **CONCLUSIONS:** Patients had no complaints about understanding or difficulty of the adapted version of the questionnaire. Still, there were some items with missing answers (most often - sexual activity). Although, we provide some evidence of content validity, additional testing for the retention of psychometric properties of the translated questionnaire is recommended.

PRM136

IMPACT ON THE ESTIMATED ICER OF INCLUDING AGE-SPECIFIC BASELINE HRQOL IN A MODEL

Teljeur C[1], Adams RC[2], Harrington P[1], Ryan M[1]
[1]*Health Information and Quality Authority, Dublin, Ireland,* [2]*National Centre for Pharmacoeconomics, Dublin, Ireland*

OBJECTIVES: For models that simulate patients over a long span, such as from birth to life expectancy, the baseline HRQoL can be incorporated. Typically this means that younger people have a higher utility than older people. The aim of this study was to investigate the impact of including age-specific baseline utilities in a model that simulated women at elevated risk of developing breast cancer from ages 20 to 85. **METHODS:** A model was developed to evaluate the impact on costs and benefits of breast cancer surveillance in a population of women with a BRCA1 mutation. Women were modelled from age 20 to 85. QALY reductions were associated with the treatment of cancer and were stage-specific. The model was evaluated incorporating age-specific baseline QALYs and also where all ages had a baseline QALY of 1. The impact of age-specific baseline QALY inclusion was evaluated in terms of the ICERs for different surveillance strategies. **RESULTS:** The incremental cost of each intervention and the interventions included in the cost-effectiveness efficiency frontier were unaffected by the choice of baseline HRQoL. However, both the average and incremental cost-effectiveness ratios were changed. For interventions on the cost-effectiveness efficiency frontier, all ICERs were less than €100,000/QALY when age-specific baseline HRQoL values were used. ICERs reduced by an average €11,520 when a uniform baseline HRQoL was used. **CONCLUSIONS:** The use of age-specific baseline HRQoL in a cost-effectiveness model needs to be carefully considered. Inclusion of age-specific baseline HRQoL can favour interventions with an impact at a younger age. Whether age-specific or uniform baseline data are used in a model, the alternative should be considered in a sensitivity analysis.

PRM137

EQ-5D-5L CROSSWALK VALUE SET FOR POLAND

Golicki D, Niewada M
Department of Experimental and Clinical Pharmacology, Medical University of Warsaw, Warsaw, Poland

OBJECTIVES: To estimate EQ-5D-5L crosswalk value set for Poland, based on Crosswalk methodology developed by EuroQol Group. **METHODS:** Based on the data from 3691 respondents from 6 European countries, EuroQol Group has developed a method of obtaining interim values sets for the EQ-5D-5L by means of mapping to the available EQ-5D-3L values sets ("crosswalk" methodology). A significant part of the data in this study came from Polish respondents (n=972; 26.3%). Poland is the first Central European country with EQ-5D-3L time trade-off based social values set published. In order to obtain interim EQ-5D-5L values set, we applied Crosswalk methodology, developed by EuroQol Group, to available Polish EQ-5D-3L values set. **RESULTS:** Estimated Polish values for 3125 EQ-5D-5L health states will be presented. Both, EQ-5D-5L and EQ-5D-3L values sets have the same range (from -0.523 to 1.000), but different means (0.448 vs. 0.380) and medians (0.483 vs. 0.403), respectively. Participation of states worse than dead is less in EQ-5D-5L (5.38%), than in EQ-5D-3L (13.17%) values set. **CONCLUSIONS:** As long as value set based on preferences directly elicited from representative Polish general population sample is not available, estimated crosswalk values set should be used in EQ-5D-5L studies in Poland in order to calculate health state utilities.

PRM138

CROSS (-WALK) AT YOUR OWN PERIL! COMPARING AND CONTRASTING CEA RESULTS WHEN INDIVIDUAL-LEVEL UTILITIES ARE DERIVED FROM EXTERNAL MAPPING ALGORITHMS RATHER THAN ACTUALLY OBSERVED RESPONSES

Patton T[1], Manca A[1], Palmer S[2], Sculpher MJ[1]
[1]*University of York, York, UK,* [2]*Centre for Health Economics, York, UK*

OBJECTIVES: Existing studies exploring the validity of using mapping algorithms to predict utilities in external datasets have found mixed results. We apply a series of published EQ-5D mapping algorithms to individual patient level data from a trial which in fact collected this outcome, with a view to assess the impact of using predicted versus actual EQ-5D values on the results of a cost-effectiveness model. **METHODS:** The RITA-3 trial compared early interventional strategy for patients with non-ST-elevation acute coronary syndrome (NSTE-ACS) against a conservative strategy. EQ-5D data were collected at baseline, 4 months, 12 months and yearly thereafter. A range of other clinical and quality of life outcomes were also collected including the Seattle Angina Questionnaire (SAQ), SF-36 and the Canadian Cardiovascular Society (CCS) Functional Classification of Angina. Using mapping algorithms found in the published literature, we predicted EQ-5D scores using these outcome measures. We then explored what effect the predicted utilities had upon cost-effectiveness estimates in a model compared to those with the actual EQ-5D data. The comparisons were made across five patient subgroups. **RESULTS:** The cost-effectiveness estimates varied according to the original outcome measure used to map and the patient subgroup. The EQ-5D values predicted using CCS scores produced cost-effectiveness estimates much higher than those with the actual EQ-5D data in the trial, whilst the estimates using EQ-5D values predicted using SAQ scores were lower. The values predicted using SF-36 scores gave cost-effectiveness estimates very similar to those with the EQ-5D data, irrespective of the patient subgroup. **CONCLUSIONS:** Analysts should take caution when mapping EQ-5D values from algorithms that have not been externally validated, especially where these algorithms have used clinical outcomes or disease-specific measures of health-related quality of life. Our results suggest that mapping from generic outcome measures might be reasonable.

PRM139

LOST IN TRANSLATION: TRANSLATABILITY OF PSYCHIATRIC TERMS – THE EXAMPLE OF THE MINI–INTERNATIONAL NEUROPSYCHIATRIC INTERVIEW (M.I.N.I.)

Boudrot A[1], Sheehan D[2], Acquadro C[3]
[1]*Mapi, Lyon, France,* [2]*University of South Florida College of Medicine, Tampa, France,* [3]*Mapi Research Trust, Lyon, France*

OBJECTIVES: The Mini-International Neuropsychiatric Interview (M.I.N.I.) is a short, structured diagnostic interview, developed by psychiatrists and clinicians in the USA and Europe, for DSM-IV and ICD-10 psychiatric disorders. The objectives of our study were: 1) To determine if the psychiatric terms used in the M.I.N.I. are translatable worldwide, especially in non-western countries, and 2) To review strategies used to culturally adapt psychiatric terms. **METHODS:** We reviewed the records of all linguistic validation projects involving the M.I.N.I. **RESULTS:** We retrieved 67 language versions, representing 47 countries. The analysis of the translations' content revealed three types of results, depending on the existence (or not) of corresponding psychiatric terminology in the target languages. The standard methodology (forward/backward and clinician review) was used in all countries and adapted, depending on the context. In all western and westernized countries (e.g., Europe, Russia, etc., totaling 49 languages), the psychiatric terms used in the M.I.N.I. were easily translated (i.e., existence of an agreed-upon corresponding terminology). In languages where psychiatric terms do not exist (e.g., certain Sub-Saharan languages), all the clinician-directed parts (titles and clinician-directed instructions/algorithms), which are capitalized in the original instrument, were left in English, and the patient-directed parts were translated in the target languages. In languages where there is a partially agreed-upon terminology (e.g., Thai), the titles as well as the algorithms were translated with corresponding English equivalents between brackets, when necessary. Moreover, in order to follow the typographical conventions of the M.I.N.I., in languages with no capital letters (such as Kannada or Malayalam), the translations used bigger font size. **CONCLUSIONS:** This review showed that terms used to describe psychiatric disorders had no equivalents in some countries, especially in Africa. Translation was not always possible and was even judged to be culturally and linguistically irrelevant in countries where psychiatry is only taught in English.

PRM140

HEALTH-RELATED QUALITY OF LIFE (HRQOL) IN PATIENTS TREATED BY NOVEL ORAL ANTICOAGULANTS (NOACS): REDUCED VERSION OF THE SAWICKI QUESTIONNAIRE

Rodríguez-Aguilella A[1], Viñolas Prat X[2], Campillo-Álvarez Á[1], Martínez Sande JL[3], Alegret Colomé JM[4], Castejón N[1], Osorio Fernández G[5]
[1]*LASER Analytica, Oviedo, Spain,* [2]*Hospital de Santa Creu i Sant Pau, Barcelona, Spain,* [3]*Hospital Clinico Universitario de Santiago de Compostela, Santiago de Compostela, Spain,* [4]*Hospital Universitario Sant Joan de Reus, Reus, Spain,* [5]*Bayer Hispania SL, Barcelona, Spain*

OBJECTIVES: Sawicki questionnaire is a 32-item specific measure for the evaluation of the change in the measure of the Quality of Health Related Life (HRQOL) experienced by patients treated by Novel Oral Anticoagulants (NOACs) versus traditional Oral Anticoagulant Therapies (OAT). The objective of this research focuses on the application of the Rasch model in selecting the most appropriate items of Sawicki questionnaire. **METHODS:** Sample was composed of 689 Atrial Fibrillation (AF) patients in whom an attempt of electrical or pharmacological cardioversion was scheduled within a 4 months inclusion period from baseline (CARDIOVERSE study). Data were analyzed with WinSteps version 3.75 using the Rasch Partial Credit Model. Statistical criteria taken into account for the selection of those items with better psychometric properties were: model-fit and separation statistics, Differential Item Functioning (DIF), unexpected responses and item content. The results were compared with those of the original version of the questionnaire in CARDIOVERSE sample. **RESULTS:** Misfiting items were deleted, resulting in a 12 items version rated on a 4-point Likert-scale. This short form of the questionnaire showed good model fit and represented an accurate measure of the construct. Infit MNSQ ranged from 0.90 to 1.15 (M=1.02; SD=0.09) and outfit MNSQ ranged from 0.90 to 1.18 (M=1.02; SD=0.08). Person separation index and item reliability were 2.11 and 0.99 respectively and item-person map showed that the test was on-target and covered the wide range of the ability scale. Finally, the criterion validity of the short version by age, sex and risk groups was similar to the original version of the questionnaire. **CONCLUSIONS:** Short version of Sawicki questionnaire has adequate psychometric properties in terms of goodness-of-fit-test and reliability. This version makes it possible to have a new short and appropriate HRQoL measure for the study of the effect in QoL experienced by patients treated by NOACs.

PRM141

VALIDITY OF QOL IMPACT ATTRIBUTIONS TO SPECIFIC DISEASES: A MULTITRAIT-MULTIMETHOD COMPARISON

Ware JE[1], Guyer R[2]
[1]*John Ware Research Group, Inc., Worcester, MA, USA,* [2]*John Ware Research Group, Worcester, MA, USA*

OBJECTIVES: To test convergent-discriminant validity of quality of life (QOL) impact attributions to arthritis and respiratory conditions using the multitrait-multimethod (MTMM) approach. **METHODS:** Chronically-ill adults (N=601) with osteoarthritis (OA) and respiratory (asthma, COPD) disease completed Internet-based surveys. Ages ranged from 18-93 (median=58), 66.5% female and 20.7% non-white. QOL impact was measured using 3 methods: QOL Disease Impact Scale (QDIS) and disease severity with specific attribution to each condition, specific

symptoms (joint pain, shortness of breath), and generic physical (PCS) and mental (MCS) summary measures (SF-36). The resulting 10X10 correlation matrix (3 disease-specific, 2 generic) for each disease was evaluated to test convergent validity (correlations > 0.40 between different methods of measuring the same disease) and discriminant validity (significantly lower correlations between different diseases measured by the same method). The MTMM matrix was also analyzed using principal component analysis (PCA) to test for disease versus methods factors. **RESULTS:** The MTMM matrix yielded strong evidence that patients discriminated the impact of one condition from the other. In support of convergent validity, disease specific QOL impact, severity and symptom measures (joint pain for OA, SOB for respiratory) correlated substantially for asthma (0.516 - 0.765) and OA (0.465 - 0.774). In support of discriminant validity, different diseases measured by the same method correlated significantly lower (0.264 - 0.286). PCA yielded two disease-specific factors (OA and respiratory) with high loadings across methods for OA (0.748 - 0.871 and respiratory (0.687 - 0.890) and low secondary loadings (0.085 - 0.262). Generic PCS and MCS measures correlated lower than disease-specific measures, as hypothesized. 2-method (QOL impact, severity) MTMM validations replicated these results across 37 pairs of over-sampled comorbid conditions. **CONCLUSIONS:** Results strongly support the convergent-discriminant validity of survey measures of QOL impact based on attributions to OA and respiratory disease and suggest that disease-specific attributions may improve the validity of QOL impact attributions for other common pairs of comorbid conditions.

PRM142

ESTIMATING THE ASSOCIATION BETWEEN THE OXFORD HIP SCORE (OHS) AND EQ-5D UTILITY VALUES USING DIRECT AND RESPONSE MAPPING METHODS

Rivero-Arias O[1], Chiocchia V[2], Field P[3], Pinedo-Villanueva R[1]
[1]*Oxford University, Oxford, UK,* [2]*Oxford Brookes University, Oxford, UK,* [3]*Oxford Pharmagenesis Ltd., Oxford, UK*

OBJECTIVES: Mapping algorithms can translate disease-specific or generic health-related quality of life measurements into values obtained from preference-based instruments such as the EuroQol 5-dimension questionnaire (EQ-5D). The Oxford Hip Score (OHS) is a disease-specific instrument widely used by orthopaedic surgeons to assess outcomes from hip surgery. There is an algorithm for estimating mean EQ-5D scores from the OHS, but this was developed using early response mapping methods and has limited external validation. We have developed a new mapping algorithm to translate OHS results into EQ-5D domain responses and utilities in a large UK dataset using direct and response mapping methods. **METHODS:** OHS and EQ-5D responses were extracted from the publicly available National Patient Reported Outcomes Measures (PROMs) database. The sample of complete data pairs (n=126 862) was split into estimating (n=51 800, years 2009–10) and external validation (n=75 062, years 2010–12) samples. EQ-5D utilities were estimated directly using ordinary least squares regression and two-part models. EQ-5D responses were estimated using ordered and multinomial logit models. For the two-part and the multinomial logit models, the expected value method was used to calculate utilities. Performance was evaluated using mean square error (MSE) and mean absolute error (MAE). **RESULTS:** The two-part models and the ordered or multinomial regressions performed better than ordinary least square regression. In external validation, the MSE (MAE) was 0.0319 (0.1286) for the two-part model and 0.0315 (0.1249) for response mapping. For EQ-5D index values >0.5 (better health states), response mapping predictions had a slightly smaller MSE and MAE than direct method predictions. Both indirect and direct approaches predicted higher MSE and MAE when EQ-5D <0.5. **CONCLUSIONS:** Response mapping between OHS and EQ-5D was similar or slightly more predictive than direct mapping. Further research is needed to improve the performance of these techniques in poorer health states.

PRM143

META-ANALYSIS OF QUALITY OF LIFE IN CORONARY HEART DISEASE

Stevanovic J[1], Pechlivanoglou P[2], Kampinga M[1], Krabbe PFM[3], Postma MJ[1]
[1]*University of Groningen, Groningen, The Netherlands,* [2]*Toronto Health Economics and Technology Assessment (THETA), Toronto, ON, Canada,* [3]*University of Groningen, University Medical Center Groningen, Groningen, The Netherlands*

OBJECTIVES: A large number of quality of life (QoL) values for patients with coronary heart disease (CHD) are available in the literature. From the abundance of QoL values in CHD, only preference-based values can be directly applied in cost-utility analysis (CUA). In this study we performed a multivariate meta-regression analysis of the preference-based QoL values in CHD. Our aim was to obtain a summarized QoL estimate while accounting for study-level covariates and for the correlation between multiple outcomes both within and between studies. **METHODS:** Studies were considered eligible for this analysis if they reported mean QoL values, standard deviations and the instrument for measuring QoL (e.g. EQ-5D, SF-6D). Additionally, studies reporting separate values of SF-36 and SF-12 QoL instruments were included. The scores of the SF-36 and SF-12 QoL were mapped onto EQ-5D and SF-6D values. Mapped preference-based values were added to the base-case data set that consisted only of published preference-based QoL values. Finally, a multivariate meta-regression model was used in order to estimate pooled, instrument-specific QoL in CHD. **RESULTS:** Our systematic search identified 35 eligible studies reporting 43 preference-based QoL values in CHD as well as 46 studies reporting QoL scores of SF-36 and SF-12. Following instrument-specific QoL estimates were obtained when conducting the analysis on the base-case data set: 0.77 (EQ-5D UK), 0.79 (EQ-5D US), 0.65 (SF-6D), 0.85 (15D), 0.44 (HUI3) and 0.63 (QWB). Age was the only study-level covariate that showed an influence on instrument-specific QoL estimates. Significant heterogeneity was observed when the analysis was conducted on the expanded data set. **CONCLUSIONS:** This study represents the first meta-analysis of QoL in CHD. Given the abundance of QoL values in CHD on the one hand and the requirement for single, accurate QoL values in CUA on the other hand, pooled estimates of QoL could be highly applicable in CUA.

PRM144

THE 'WOUND-QOL': A SHORT QUESTIONNAIRE MEASURING QUALITY OF LIFE IN PATIENTS WITH CHRONIC WOUNDS

Blome C[1], Baade K[1], Price P[2], Debus S[1], Augustin M[3]
[1]*University Medical Center Hamburg, Hamburg, Germany,* [2]*Cardiff University, Cardiff, UK,* [3]*University Medical Center Hamburg-Eppendorf, Hamburg, Germany*

OBJECTIVES: To develop a short questionnaire measuring health-related quality of life (HRQoL) in patients with chronic wounds. **METHODS:** Three validated instruments assessing HRQoL in chronic wounds, the Freiburg Life Quality Assessment for wounds (FLQA-w), the Cardiff Wound Impact Schedule (CWIS), and the Würzburg Wound Score (WWS), were filled in by 154 leg ulcer patients in a prospective study under routine care. For implementation in the new, shorter questionnaire Wound-QoL, those of all 92 items were selected that covered the core content of the three questionnaires and showed good psychometric properties (e. g. number of missing values, inter-item correlations). Internal consistency, convergent validity regarding four generic HRQoL measures such as the EQ-5D, and responsiveness of the Wound-QoL were analysed using the longitudinal study data on the selected items (so-called virtual validation). Subscales were determined with factor analysis. Item, instruction, and response scale wording of the Wound-QoL were harmonized. **RESULTS:** Seventeen items were included in the Wound-QoL questionnaire which could be attributed to three subscales on everyday life, body, and psyche. Both global score and subscale scores were internally consistent with Cronbach's alpha values between 0.71 and 0.91. The global score showed significant convergent validity (r=0.48 to 0.69, depending on the criterion) and responsiveness regarding change in generic HRQoL (r=0.18 to 0.52); the same was true for the subscale scores. **CONCLUSIONS:** The Wound-QoL for measurement of HRQoL in chronic wounds proved to be internally consistent, valid, and responsive in the virtual validation analysis.

PRM145

MAPPING FROM PDQ-39 AND PDQ-8 ONTO EQ-5D UTILITY INDEX IN PATIENTS WITH PARKINSON'S DISEASE: EXTENDED ANALYSIS

Kalabina S[1], Curry AS[1], Milligan G[2], Jackson J[2], Merikle E[3], Filipovic I[1]
[1]*AbbVie Ltd., Maidenhead, UK,* [2]*Adelphi Real World, Bollington, UK,* [3]*AbbVie Inc, North Chicago, IL, USA*

OBJECTIVES: To develop an algorithm for mapping of disease-specific health related quality of life scores to the EQ-5D utility index for patients with PD. **METHODS:** EQ-5D and Parkinson's disease Questionnaire (PDQ) data were obtained for 117 UK PD patients (HY stages 1-4) via a cross-sectional survey of practicing clinicians and their patients. The EQ-5D utility index (UK Tariff) was regressed on PDQ-39/PDQ-8 summary indices (SI) and PDQ-39 domains/PDQ-8 questions using OLS regression. Analysis on PDQ-39 domains/PDQ-8 questions was repeated using OLS with backward elimination. Two-part models (TPM) were conducted on PDQ-39/8 SI and domains/questions respectively consisting of a logistic regression on whether EQ-5D<1 followed by either OLS, GLM with gamma distribution and log link or identity link functions and GLM with Gaussian distribution with log link for the remainder. Mapping equations were used to predict utilities which were subsequently compared to those observed. Models were compared using RMSE values. **RESULTS:** Compared to simple OLS [RMSE 0.1685-0.1924], a model with backward elimination of variables did not improve predictive power. Out of the TPMs the best fitting models were GLM with gamma distribution and identity link function [RMSE 0.1666-0.1929] and GLM with Gaussian distribution and log link function [RMSE 0.1683-0.1912]. All models produced better results utilising the domains of PDQ-39 or individual questions of PDQ-8 than with the SI. **CONCLUSIONS:** All mapping algorithms estimated utilities for patients with HY stage 1-4 with reasonable accuracy. Therefore, mapping functions reported could be used for predicting EQ-5D scores from either PDQ-39 or PDQ-8 when EQ-5D data were not collected. However, simple OLS, TPMs with gamma family and identity function and Gaussian family and log functions resulted in the best prediction and the smallest RMSE values. Further validation is needed to ascertain whether these mapping functions perform well for more advanced patients in HY stage 5.

PRM146

PATIENT-REPORTED OUTCOME MEASURES FOR SYSTEMIC LUPUS ERYTHEMATOSUS CLINICAL TRIALS: A CONTENT VALIDITY AND PSYCHOMETRIC PERFORMANCE REVIEW

Humphrey L[1], Heron L[1], Pilling C[1], Holloway L[1], Højbjerre L[2], Strandberg-Larsen M[2], Hansen BB[2]
[1]*Adelphi Values, Bollington, UK,* [2]*Novo Nordisk A/S, Søborg, Denmark*

OBJECTIVES: Patients with Systemic Lupus Erythematosus (SLE) experience unmet medical needs and many inflammatory symptoms resulting in humanistic and economic burden. This study aimed to create a conceptual model of patient and economic burden, and review patient-reported outcomes (PROs) used to measure such concepts in SLE clinical trials. **METHODS:** An SLE conceptual model was developed from structured review of published articles from 2007-June 2012 identified from literature databases (MEDLINE, PsycINFO, EconLit) plus other sources (PROLabels, FDA/EMA websites, Clinicaltrials.gov). PROs targeting key symptom/impact were identified from the literature. In the context of FDA guidance, the PROs were subject to in-depth review and assessed for face and content validity, and psychometric properties to determine appropriateness for use in SLE trials. **RESULTS:** Pain, fatigue, cognition, daily activities, emotional well-being, physical/social functioning, and work productivity were in the conceptual model identified as key SLE concepts. Of the 63 articles reviewed, 31 reported PRO data. From these and the other sources, 14 PROs were selected for review including SLE-specific health-related quality of life (HRQoL) measures (n=3), work productivity (n=1), and generic measures of fatigue (n=3), pain (n=2), depression (n=2) and HRQoL (n=3) as these were deemed salient for patients with SLE in the literature. The FACIT-Fatigue, BPI-SF (pain) and LupusQoL demonstrated the strongest face validity, conceptual coverage and psychometric properties measuring key concepts in the conceptual model. All PROs reviewed,

except for the Lupus-specific HRQoL measures, lacked SLE patient involvement during development limiting their content validity. The HADS, SF-36v2, EQ-5D-3L and WPAI:Lupus showed suitability for SLE economic models. **CONCLUSIONS:** SLE is a condition associated with clear unmet medical needs and considerable burden to patients. This review highlights the current availability and future need for both disease-specific and generic patient-reported measures of relevant domains of disease signs and symptoms, HRQoL and work productivity.

PRM147

MODE EQUIVALENCE OF INTERACTIVE VOICE RESPONSE (IVR) AND PAPER VERSIONS OF THE BRIEF PAIN INVENTORY (BPI) "WORST PAIN" ITEM IN METASTATIC CASTRATE RESISTANT PROSTATE CANCER (MCRPC) EVALUATED CONCEPTUALLY USING QUALITATIVE METHODS

Bennett A[1], Eremenco S[2], Heon N[3], Scheffold C[4], Schimmoller F[4], Weitzman A[4], Basch E[1]
[1]*University of North Carolina, Chapel Hill, NC, USA,* [2]*Evidera, Bethesda, MD, USA,* [3]*Memorial Sloan-Kettering Cancer Center, New York, NY, USA,* [4]*Exelixis Inc, South San Francisco, CA, USA*

OBJECTIVES: The BPI "pain at its worst in the last 24 hours" item is often administered as a primary or key secondary endpoint in clinical trials using an IVR daily diary. However, evidence of equivalence between the validated paper version and IVR has not been published. This study evaluated conceptual equivalence between IVR and paper version of this item using qualitative methods. **METHODS:** Twenty-six patients with mCRPC in a non-randomized expansion cohort (N=144) of phase 2 study XL184-203 were interviewed to confirm their comprehension of the BPI "worst pain" item administered using an IVR simulation by the interviewer and presented on paper. Patient interpretation of the item's meaning in both modes was elicited and compared to identify similarities between the modes. Patients were also interviewed regarding the usability of IVR during the trial. **RESULTS:** Patients (median age = 68; range 44-81) had ECOG performance status of 0 (38%) and 1 (62%). Nearly all patients answered the IVR version of the question as intended – by considering the past 24 hours (72%; 18% did not specify); including non-cancer related pain (96%); and reporting pain experienced with analgesia (100%). Patients did not interpret the paper version of the pain question differently from the IVR version; 4 patients spontaneously stated that the paper version was the same as the IVR version they had used. All patients reported that the IVR was easy to use to answer the diary. **CONCLUSIONS:** This study provides important qualitative support of conceptual equivalence between an IVR and paper version of the BPI "worst pain" item. These results confirm that this item is well understood by patients, and that they interpret the question similarly whether administered via IVR or on paper. The results also show good usability and acceptability of IVR administration of this important item in clinical trials.

PRM148

A COMPARISON OF THE RELATIVE WEIGHTS OF HEALTH DOMAINS ON GLOBAL RETROSPECTIVE AND EXPERIENCED HEALTH AND WELL-BEING

Joore MA[1], Delespaul PA[2], White MP[3], Maes I[4]
[1]*Clinical Epidemiology and Medical Technology Assessment, Maastricht University Medical Centre; CAPHRI, Maastricht University, Maastricht, The Netherlands,* [2]*Maastricht University, Maastricht, The Netherlands,* [3]*University of Plymouth, Plymouth, UK,* [4]*Clinical and Medical Technology Assessment, Maastricht University Medical Centre; CAPHRI, Maastricht University, Maastricht, The Netherlands*

OBJECTIVES: Are the relative weights of different dimensions of health different when determined by their impact on subjective well-being (SWB; 2 types of self-report: retrospective global evaluation, momentary experience) and health (3 types of self-report: retrospective global evaluation, future prospect, momentary experience). **METHODS:** The study population consisted of persons experiencing psychosomatic, psychological and somatic illness, and members from public. The experience sampling study took 6 days, during which momentary self-reports of health and SWB were obtained. In addition, participants completed retrospective global evaluations of health (EQ-5D), SWB (Life Satisfaction Scale) and preference for a future prospect of health (time trade-off). Regression analysis was used to determine relative weights of EQ-5D dimensions on the outcomes. **RESULTS:** A total of 139 participants were included. Some/moderate problems in usual-activities and anxiety/depression were associated with the largest drop in health for all three types of self-report. Moderate anxiety/depression had a larger impact than moderate problems in usual-activities in momentary as compared to retrospective health-reports. Moderate problems in usual-activities and anxiety/depression and self-care were associated with a drop in retrospective and momentary SWB. Moderate problems in usual-activities was associated with the largest drop in retrospective SWB, while moderate anxiety/depression was associated with the largest drop in momentary SWB. Comparing the relative weights, it was shown that anxiety/depression was more important relative to usual-activities in momentary experiences than in retrospective evaluations. **CONCLUSIONS:** Relative weights of health domains are different, depending on the type of self-report (global or momentary) and concept of value (health or SWB) used. Most notably, the relative weight of anxiety/depression is larger when using a momentary measure, and when taking SWB as the outcome of interest. This finding warrants further discussion and research on the place and value of momentary measures of experience and SWB as outcome in health (economic) evaluation.

PRM149

PATIENT SURVEY: INVESTIGATION ON WHAT IMPACTS PATIENT SATISFACTION, DROP-OUT AND COMPLIANCE IN PATIENT DIARIES

Ross J, Holzbaur E, Ross E
Almac Clinical Technologies, Souderton, PA, USA

OBJECTIVES: Patient Reported Outcomes (PROs) play an important role in patient-centered research where compliance is important. To better understand patient preferences when participating in PROs, survey research was conducted in 2013. This presentation investigates what impacts patient satisfaction, drop-out and compliance. **METHODS:** An internet-based survey was administered to a global sample of patients who participated in at least 1 clinical trial that included patient diaries in the past 2 years. The survey asked questions about the most recent trial with a diary focusing on the patient's diary experience. **RESULTS:** A total of 398 patients provided complete responses. On a scale of 1-7 (1=Very Bad; 7=Very Good), mean satisfaction rating=5.4. Satisfaction was categorized for sub-group analysis purposes: Positive Satisfaction (75%); Ok Satisfaction (16%); Negative Satisfaction (9%). Time per diary entry had the biggest impact on satisfaction. Those whose diaries took <=30 minutes had the highest percentage of positive satisfaction (78%) and those whose diaries took >30 minutes had the lowest percentage of positive satisfaction (46%), $p<0.001$. Patients who were negatively satisfied had the highest percentage (44%) of reporting dropping out or considering dropping out due to diary effort, $p<.0001$. Patients who were negatively satisfied had the highest percentage (67%) of reporting non-compliance with completing diaries ($p<0.01$). Time per diary entry impacted compliance where those patients whose diaries took >30 minutes had the highest percentage of reporting non-compliance (68%), $p=0.03$. **CONCLUSIONS:** When planning patient diaries, it is important to consider the patient population and preferences. As the results show that satisfaction is linked to drop out and compliance, it is important to keep patients satisfied. As time per diary was found to impact satisfaction, it is important to keep patient burden and their experience in mind when developing ePRO instruments and selecting mode of administration. . Satisfied patients lead to higher compliance, retention and data quality.

PRM150

CAN WE USE THE EQ-5D ONLY FOR ASSESSING THE QUALITY OF LIFE OF PATIENTS WITH OSTEOPOROSIS?

Tadic I[1], Lakic D[1], Odalovic M[1], Tasic L[2], Vujasinovic Stupar N[3], Stevanovic D[4], Petrova G[5], Krajnovic D[1]
[1]*University of Belgrade Faculty of Pharmacy, Belgrade, Serbia and Montenegro,* [2]*University of Belgrade – Faculty of Pharmacy, Belgrade, Serbia and Montenegro,* [3]*University of Belgrade School of Medicine, Belgrade, Serbia and Montenegro,* [4]*General Hospital Sombor, Sombor, Serbia and Montenegro,* [5]*Medical University of Sofia, Sofia, Bulgaria*

OBJECTIVES: Osteoporosis is a chronic disease which has impact on specific aspects of health such as pain, physical functioning, social and mental functioning and loss of personal independence. Generic questionnaire EQ-5D explores similar dimensions and therefore is usually used as a questionnaire for assessing the concurrent validity of the specific osteoporosis questionnaires. The objective of this study was to explore for a potential correlation between the similar dimensions of the specific osteoporosis questionnaire QUALEFFO-41 and EQ-5D. **METHODS:** Analyzed data were a part of the study that included 50 patients with osteoporosis and vertebral fractures conducted during the period June 2010 - October 2011. The correlation between the questionnaires was assessed using the Spearman's correlation coefficient. **RESULTS:** Strong correlations were found between EQ-5D index / VAS score and QUALEFFO-41 total score (ρ=-0.73 and ρ =-0.57, $p<0.001$, respectively). The EQ-5D dimensions "Pain/discomfort", "Mobility", "Activities", "Anxiety/Depression" similar to QUALEFFO-41 dimensions "Pain", "Physical function", "Leisure, social activities", "Mental function" were also strongly correlated (ρ=0.42, ρ =0.76, ρ =0.46 and ρ=0.32, $p<0.001$, respectively). **CONCLUSIONS:** Strong correlations between similar dimensions of the compared questionnaires were notified. Negative values of the Spearman's correlation coefficient indicated that total score of the QUALEFFO-41 were scored in the reverse order. There was only one QUALEFFO-41 dimension ("General health perception") that is not similar to any of the EQ-5D dimensions. Although there was a strong correlation between the total scores of compared questionnaires, the results of the EQ-5D questionnaire should be observed with caution, because it does not contain all important dimensions that osteoporosis affects.

PRM151

VALIDITY, RESPONSIVENESS AND RELIABILITY OF THE ARTHRITIS-SPECIFIC WORK PRODUCTIVITY SURVEY ASSESSING WORK PRODUCTIVITY WITHIN AND OUTSIDE THE HOME IN PATIENTS WITH PSORIATIC ARTHRITIS

Osterhaus J[1], Purcaru O[2]
[1]*Wasatch Health Outcomes, Park City, UT, USA,* [2]*UCB Pharma, Brussels, Belgium*

OBJECTIVES: The arthritis-specific Work Productivity Survey (WPS) estimates arthritis-related productivity limitations at workplace and within home, and on social activities, during the preceding month. There is an unmet need for an instrument assessing similar limitations in psoriatic arthritis (PsA). Following its validation in rheumatoid arthritis, this analysis aimed to assess the psychometric properties of WPS in adult-onset active PsA. **METHODS:** WPS comprises 9 questions evaluating employment status, workplace and household productivity. Psychometric properties were assessed using data from RAPID-PsA (NCT01087788). The WPS was completed at baseline and every 4 weeks (wks) until Wk24. Validity was evaluated via known-groups approach, comparing patients (pts) with a worse vs better health state, defined by the 1st and 3rdquartiles cut-off of pt scores to DAS28(CRP), HAQ-DI, SF-36 and PsAQoL. The responsiveness and reliability were assessed comparing WPS mean changes in ACR20 or HAQ-DI MCID=0.3 responders vs non-responders at Wk12. Comparisons were conducted in the Randomized Set (observed cases) using a non-parametric bootstrap-t method. **RESULTS:** Results confirmed the discriminant validity of WPS. Compared to pts with a better health state, pts with a worse health state had significantly more days of household work lost, household work with reduced productivity, social activities missed, outside help hired and a significantly higher interference rate of arthritis. Similarly, employed pts with a worse health state had significantly more work days lost or with productivity reduced by $\geq$50%, and higher interference of arthritis on work productivity. WPS was also responsive to clinical changes, with responders reporting significantly larger improvements at Wk12 in WPS scores vs non-responders. The effect sizes for changes in productivity in responders were moderate ($0.5<SRM<0.8$) or small. **CONCLUSIONS:** These analyses demonstrate that the WPS is a valid, responsive and reliable instrument for measurement of productivity within and outside the home in adult-onset PsA.

PRM152
TRANSLATION AND CULTURAL ADAPTATION OF THE POLISH VERSION OF "DISABILITIES OF THE ARM, SHOULDER AND HAND" (DASH) AND QUICKDASH QUESTIONNAIRES
Golicki D[1], Krzysiak M[2], Strzelczyk P[3]
[1]Department of Experimental and Clinical Pharmacology, Medical University of Warsaw, Warsaw, Poland, [2]Oddzial Rehabilitacji Dziennej, MCR Stocer, Konstancin Jeziorna, Poland, [3]The Kosciuszko Foundation scholar, New York, NY, USA
OBJECTIVES: To translate into Polish and adapt culturally DASH and QuickDASH outcome measures. **METHODS:** We followed recommendations issued by Insitute for Work and Health (IWH, 2007). Two forward translations were made – by an informed (T1) and uninformed translator (T2). Discrepancies were discussed and resolved with participation of the third unbiased investigator and a synthesis of translations was produced (T12). Two native speakers, totally blind to the original version, translated back T12 version into English (BT1 and BT2). Eight experts: 2 orthopedic surgeons, physiotherapist, sworn translator, 2 English native speakers, psychologist and a Polish language specialist formed an Expert Committee (EC). Committee consolidated all the versions, review all the translations and reached a consensus on any discrepancy found. Decisions were made to achieve semantic, idiomatic, experiential and conceptual equivalence with the original version. **RESULTS:** We report 65 discrepancies raised by Expert Committee members and their solutions. The Polish pre-final versions of DASH and QuickDASH questionnaires, ready for pilot testing, were produced. Written reports from all stages of the process were submitted to the IWH Cross-Cultural Adaptation Review Committee for approval. **CONCLUSIONS:** Numerous translation discrepancies were resolved by discussion by Expert Committee. The Polish pre-final versions of DASH and QuickDASH questionnaires were produced and used in pilot testing.

PRM153
LINGUISTIC TRANSLATION AND CULTURAL ADAPTATION OF FUNCTIONAL ASSESSMENT OF CHRONIC ILLNESS THERAPY-TUBERCULOSIS INSTRUMENT INTO ARABIC LANGUAGE
Dujaili JA[1], Syed Sulaiman SA[1], Hassali MA[2], Awaisu A[3], Blebil AQ[1], Dujaili MA[4], Bredle J[5]
[1]Universiti Sains Malaysia, Minden, Malaysia, [2]Universiti Sains Malaysia, Penang, Malaysia, [3]Qatar University, Doha, Qatar, [4]Baghdad Medical City, Baghdad, Iraq, [5]FACITtrans, Elmhurst, IL, USA
OBJECTIVES: Functional Assessment of Cancer Therapy- General (FACT-G) was adapted to develop a disease specific subscale for pulmonary tuberculosis (PTB) patients in Iraq. The current study aimed to linguistically validate Functional Assessment of Chronic Illness Therapy- Tuberculosis (FACIT-TB) measurement scale into Arabic language and to produce a translated version which was conceptually equivalent to the original U.S. English version for use in clinical practice and research. **METHODS:** The linguistic validation process comprised of general procedures derived from internationally accepted guideline for linguistic validation and cultural adaptation of FACIT measurement system; including 1) Forward translation, 2) Reconciliation, 3) Back translation, 4) Review, 5) Spelling and grammatical verification. Furthermore, the translated questionnaire was pretested at Thoracic and Respiratory Diseases Specialist Center in Baghdad, Iraq. **RESULTS:** Issues encountered during the linguistic validation process of FACIT-TB into Arabic language pertained to linguistic and semantic nuance were resolved. Pretesting was completed in seven Arabic-speaking TB patients with a mean age of 40.14 years. In addition, respondent need about 15.35 minutes (range 10-20 minutes) to complete the questionnaire. In general, respondent reported no significant problem with understanding the content of the Arabic version of FACIT-TB. Furthermore, they reported no culturally-irrelevant item. The instrument was found to be comprehensible, clear and relevant to the value of PTB patients in Iraq. **CONCLUSIONS:** Linguistic validation of FACIT-TB into Arabic language was completed according to a recognized and rigorous double-back translation method to achieve, to the greatest degree possible, equivalence of meaning and measurement between the two different country versions. It will provide an additional parameter to evaluate the effectiveness of TB program for patients in Iraq. Health care providers in the national TB control program should make a judicious utilization of this instrument in helping patients to cope with their illness and in predicting TB treatment outcomes.

PRM154
ESTIMATING THE SOCIAL DISTRIBUTION OF HEALTH IN ENGLAND
Asaria M, Griffin S, Cookson R, Koh J
University of York, York, UK
OBJECTIVES: To develop a model of quality adjusted life expectancy (QALE) in England and estimate the social distribution of both mortality and morbidity by socio-economic characteristics such as gender, ethnicity and deprivation. METHODS The 2011 wave of the Health Survey for England (HSE) is used to model EQ-5D as a function of gender, ethnicity, index of multiple deprivation and other relevant characteristics using appropriate regression techniques to account for the skewness of the EQ-5D distribution. Previous waves of the HSE are used to validate the model. ONS life tables and the ONS longitudinal study data are used to model life expectancy as a function of the same characteristics. The two models are combined to give a multivariate prediction model for QALE as a function of these characteristics. This prediction model is combined with population level aggregate data on the key characteristics and used to estimate a population QALE distribution. **RESULTS:** There is a substantial social gradient in the health distribution as represented by QALE in England. The QALE differential between most and least disadvantaged fifths of the social distribution is 12 years, compared with a difference of 5 years in life expectancy when morbidity differentials are not taken into account. **CONCLUSIONS:** The QALE prediction model allows us to estimate quality adjusted life expectancy distributions for various subsets of the population, and shows that focusing on life expectancy alone substantially underestimates the degree of health inequality. Our model can be used both for obtaining a more accurate picture of the overall level of health inequality in society and for evaluating the overall impact of population health interventions on health inequality.

PRM155
USING STRUCTURAL EQUATION MODELING TO DETECT RESPONSE SHIFT AND TRUE CHANGE IN HEALTH-RELATED QUALITY-OF-LIFE SCORES OF BREAST CANCER PATIENTS AFTER SURGERY
Nakamura K[1], Shimozuma K[1], Suzukamo Y[2], Taira N[3], Shiroiwa T[4], Shibahara H[1], Saito S[5]
[1]Ritsumeikan University, Kusatsu, Japan, [2]Tohoku Universitiy, Seidai, Japan, [3]Okayama University Hospital, Okayama, Okayama, Japan, [4]National Institute of Public Health, Saitama, Japan, [5]Okayama University, Okayama, Japan
OBJECTIVES: This study aimed to capture response shift and true change in health-related quality of life (HRQOL) scores of breast cancer patients after surgery. **METHODS:** A data set from a prospective study to identify predictive factors of HRQOL (Taira N, Shimozuma K, *et al*: Breast Cancer Res Treat, 2011) was analyzed, which included HRQOL scores of physical well-being (PWB) and emotional well-being (EWB) scales of the FACT-G in 191 female breast cancer patients during a two-year postoperative period (at baseline [1 month after surgery]), 6, 12, and 24 months postoperatively). Oort's structural equation modeling approach was used to investigate three aspects of response shift: (a) a change in the respondent's internal standards of measurement (i.e., recalibration); (b) a change in the respondent's importance of values (i.e., reprioritization) and (c) a redefinition of the target construct (i.e., reconceptualization). **RESULTS:** All three aspects of response shift were observed. Recalibration and reprioritization were occurred in three items of PWB ('nausea', 'trouble with family', 'side effects'). Reconceptualization was observed from PWB to EWB in two items ('nausea' and 'pain') and from EWB to PWB in two items ('sadness' and 'nervousness'). True change, which was calculated after adjustment of response shift, was observed in PWB (the across occasion difference of common factor mean [alpha] = 0.238, $P < 0.001$) during first 6 months, and in PWB (alpha = 0.605, $P < 0.001$) and EWB (alpha = 0.234, $P < 0.05$) during first 12 months, while observed data analyses indicated statistically significant change in PWB and EWB during first 12 months. **CONCLUSIONS:** Captured response shifts in this study may be affected by various pre- and post-operative events such as notification of cancer and/or received treatments. These results will help improve reliability of HRQOL measurements in a longitudinal study.

PRM156
FACTORIAL INVARIANCE OF THE WHOQOL-OLD ACROSS GENDER, AGE, AND RESIDENT AREA IN TAIWAN
Yao G, Chien CC
National Taiwan University (Dept. of Psychology), Taipei, Taiwan
OBJECTIVES: To examine the factor invariance of the WHOQOL-OLD across gender, age, and resident area for the old people in Taiwan. **METHODS:** Data were collected from 512 Taiwan elderly people (M = 76.2, SD = 7.5, ages ranged from 60 to 99) including 177 males and 335 females. 232 aged from 60 to 75 and 279 aged from 76 to 99. 334 live in the southern rural area and 176 live in the northern metropolitan area. To examine the factorial invariance of the WHOQOL-OLD, the sample was divided into two groups on different gender, age, and resident area. First, a baseline six-factor model was tested for different gender, age, and resident area respectively. Second, multi-sample analysis was conducted across gender, resident area, and age. Specifically, equal constrains on factor loadings, error variances, and factor variances were imposed. Model comparisons by using Chi-square difference tests were conducted to examine the factor invariance across gender, age, and resident area. **RESULTS:** Multi-sample analysis revealed that the factor loadings were invariant across different gender, age, and resident area groups respectively. Besides, when imposing equal constrains on the factor loadings, item variances and factor variances, the model fit indices revealed that the only complete factor invariance model was across gender but not age and resident area groups. **CONCLUSIONS:** This study suggests the underlying factor construct of the WHOQOL-OLD are similar to different degree across different gender, age, and resident area groups. We conclude that the WHOQOL-OLD is a practical measurement tool for different gender, age, and location groups for the old people in Taiwan.

PRM157
A REVIEW OF COGNITIVE INTERVIEWING METHODOLOGIES DURING LINGUISTIC VALIDATION OF CLINICAL OUTCOME ASSESSMENTS (COAS)
Simon M[1], Sweeney E[1], Moravec H[2]
[1]TransPerfect, New York, NY, USA, [2]TransPerfect, San Francisco, CA, USA
OBJECTIVES: Per ISPOR and FDA guidelines, conducting cognitive interviews during the linguistic validation of COAs is recommended to increase comprehension and conceptual equivalence between language versions. However, multiple methods are available to conduct cognitive interviews, partially enabled by the increased availability and ease of technology to facilitate the interviews. This poster will review the various methodologies that can be used to conduct cognitive interviews. **METHODS:** A review of cognitive interview methodologies from past projects as well as potential alternative methods was conducted, including: 1) in-person interviews, 2) telephone interviews, and 3) interviews via video conferencing. Consideration was given to ease of scheduling, cost, and quality/comphrensiveness of feedback. **RESULTS:** Each methodology presented pros and cons, including: 1) in-person interviews enable the interviewer to gauge the respondent's body language, signaling where he/she may be having difficulty with an item but are unable to verbalize feedback; however, the interviews are more costly and present organizational challenges (i.e. scheduling, travel, etc.); 2) telephone interviews enable easier scheduling of interviews and reduce cost, but do not allow the interviewer to gauge the body language of the respondent and respondents may not feel comfortable providing feedback over the telephone; 3) interviews via video conferencing may enable easier scheduling of interviews, allow an interviewer to gauge the body language of the respondent, and provide a lower-cost alternative, but the availability of the technology can present challenges in certain regions. **CONCLUSIONS:** There are various ways of conduct-

ing cognitive interviews during the linguistic validation process of COAs. Further research is required to develop industry guidelines to ensure that the interviews are able to achieve their purpose: garnering accurate and meaningful feedback from respondents in order to increase comprehension and cross-cultural equivalence of multiple language versions.

PRM158

DEFINING STANDARDS OF CLINICIAN QUALIFICATIONS FOR THE LINGUISTIC VALIDATION OF CLINICAL OUTCOME ASSESSMENTS (COAS)

Sweeney E, Nakonechny A
TransPerfect, New York, NY, USA

OBJECTIVES: As the linguistic validation of COA instruments often includes a review of medical terminology, it is important to confirm that the in-country clinician reviewer has sufficient qualifications to ensure quality as well as to elicit the highest level of conceptual equivalence in a linguistic validation project. This poster will consider each type of COA (Clinical Outcomes Assessment) and recommend guidelines for the qualifications of medical reviewers. **METHODS:** An examination was conducted of past linguistic validation projects involving an in-country review step with a medical professional. A review was completed of COAs (Clinician-Reported, Caregiver-Reported, as well as Patient-Reported questionnaires and diaries) within various therapeutic areas. This review also included an analysis of the specific background of each in-country clinician reviewer. **RESULTS:** In the examination of linguistic validation projects that included a medical review step, it was determined that the experience level of clinician reviewers varied between projects. In an effort to standardize this step, a minimum experience requirement based on study needs and project type is proposed. **CONCLUSIONS:** After a thorough review of past linguistic validation projects, it is suggested that an in-county clinician reviewer should, at a minimum, encompass the following qualifications: 1) 2+ years experience diagnosing and/or treating the patient population; 2) M.D. or relevant equivalent in the target country; 3) Native-language and/or advanced medical terminology training in the target language/country. Implementing minimum qualifications standards will help to ensure that an in-country medical reviewer will conduct a high-quality review for linguistically validated COAs.

PRM159

EVALUATION OF THE PSORIASIS AREA AND SEVERITY INDEX (PASI) AS PATIENT RELEVANT OUTCOME IN THE BENEFIT ASSESSMENT OF PSORIASIS THERAPIES

Gutknecht M, Augustin M, Rustenbach SJ, Schäfer I
University Medical Center Hamburg-Eppendorf, Hamburg, Germany

OBJECTIVES: Psoriasis vulgaris is one of the most frequent chronic diseases in dermatology and can cause a high disease burden and reduction of quality of life. The severity of psoriasis is determined by the clinical parameter PASI (Psoriasis Area and Severity Index). It is the most often cited measurement to determine the efficacy of therapies. Since the assessment of patient relevant treatment benefit gains importance in treatment evaluation, the objective of the study was to test to what extent PASI improvements agree with patient relevant benefit parameter. **METHODS:** A multicenter longitudinal observational study was conducted in n = 218 patients with psoriasis vulgaris. Data collection took place at the beginning of psoriasis treatment and between three and eight weeks after treatment. In addition to PASI, physician and patient data were collected, e.g. socio-demographics, clinical features, dermatological quality of life (DLQI), and assessment of treatment. **RESULTS:** Each level of PASI (50, 75, 90) showed relevant improvements in patient reported outcomes. The satisfaction with the treatment and the patient benefit was greater, the higher PASI was reached. This effect was not seen for DLQI. However, improvements were only significant for PBI for all levels of PASI. Furthermore, results showed that not only changes in PASI but also its absolute value at the end of treatment has an impact for the patient reported assessment of therapy. Values < 3 in comparison to < 5 resulted in better values of PBI and higher treatment satisfaction. **CONCLUSIONS:** The clinical reduction of the severity of psoriasis vulgaris correlates with the improvement of the quality of life and with the patient defined treatment benefit. However, the PASI does not completely reflect the patient relevant outcome in the benefit assessment. Therefore, it is recommended to make additional elicitation of patient defined objectives and benefits in the evaluation of psoriasis therapies.

PRM160

THE INFLUENCE OF CHOICE TASK LAYOUT ON THE OUTCOMES OF A DISCRETE CHOICE EXPERIMENT

Veldwijk J[1], Lambooij MS[2], van Til JA[3], Smit HA[4], de Wit GA[5]
[1]*National institute for public health and the environment, Bilthoven, The Netherlands,* [2]*National Institute of Public Health and the Environment, Bilthoven, The Netherlands,* [3]*University of Twente, Enschede, Overijssel, The Netherlands,* [4]*University Medical Center Utrecht, Utrecht, The Netherlands,* [5]*National Institute for Public Health and the Environment, Bilthoven, The Netherlands*

OBJECTIVES: To test to what extent the presentation of choice tasks contrasting display in words or graphics, influences the attribute estimates, relative importance and participation probability and the conclusions drawn from a Discrete Choice Experiment (DCE). **METHODS:** A DCE questionnaire was sent to the parents of 2,500 newborn babies aged 6 weeks at maximum. Each questionnaire contained two versions of the same 9 choice tasks, one in which the levels were presented in words, and one with graphic attribute levels. The DCE consisted of five attributes: vaccine effectiveness, frequency of severe side effects, protection duration, location of vaccine administration, out-of-pocket costs. Choice consistency was estimated, panel-mixed logit models were conducted to estimate the relative importance of the attributes and internal sample validation was calculated. **RESULTS:** In total 13% answered consistent on all choice tasks, 19% answered inconsistently in one choice task, and 51% answered inconsistently in more than two choice tasks. Respondents who were presented with word choice tasks at first were significantly more consistent compared to respondents that were presented with graphic choice tasks at first. Although out-of-pocket costs was the most important and frequency of severe side effect was the least important attribute in both datasets, the relative importance of the other attributes differed. All results differed by educational level. Estimated and observed choices showed higher correlation in the word dataset. **CONCLUSIONS:** The presentation of the choice tasks by either using words or graphics influences study outcomes. The use of graphics to present attribute levels in choice tasks seems less preferred by respondents and showed a reduced validity. Besides extensive pilot testing, discussions about the presentation of the choice tasks should be included in the focus group stage of the designing process. Extensive research on respondents' interpretation of choice tasks should be conducted to enable the formation of choice task presentation guidelines.

PRM161

SIMILARITIES AND DIFFERENCES ACROSS SAME LANGUAGE QUESTIONNAIRES FOR DIFFERENT COUNTRIES: LINGUISTIC VALIDATION OF THE ASTHMA SYMPTOM DIARY (ASD) AND KIDNEY DISEASE AND QUALITY OF LIFE (KD-QOL-36)

Neewoor S, Scharf L
ICON PLC, Oxford, UK

OBJECTIVES: Prior to use in an international study, the Asthma Symptom Diary and Kidney Disease and Quality of Life underwent linguistic validation into over 30 languages. This involved linguistic validation work on common languages targeted for different countries via the forward / backward translations or adaptation steps and cognitive debriefing step. This study aims to investigate similarities and differences in the translation of key terms and wordings and determine potential patterns across groups of languages. **METHODS:** This investigation was carried out as follows: 1) Identification of key terms and words; 2) Collation and comparison of the translations across the same language versions; 3) Identification of similarities and differences; and 4) Review of discussions and issues from the translation process. **RESULTS:** The linguistic validation process was shown to be able to identify and resolve important cross-cultural differences. Key findings included the identification of potential recurring translation issues between same language groups. Within the German, French and Spanish languages, technical terminology was translated alike whilst there were differences in the way non-technical, socially constructed wordings, emotions and symptoms were translated due to such factors as idiomatic formulations and cultural differences. Across the English languages, the text was simplified or elaborated as part of the adaptation process. Across the Russian and Chinese languages there were differences in the way technical and disease-specific terms were translated. **CONCLUSIONS:** With the insight of the linguistic validation process, important differences were identified and resolved between technical terms and general wordings across same language groups. Cognitive debriefing is highly recommended and this will ensure appropriate comprehension across cultures and facilitate International comparison and pooling of data.

PRM244

DETERMINING THE MAGNITUDE OF A DETECTABLE AND A RELEVANT TREATMENT BENEFIT IN AESTHETIC MEDICINE USING A PHOTOGUIDE AND THE INTERNET

Pleil A[1], Bushmakin AG[2], Shields A[3], Jensen J[1], Cappelleri JC[4]
[1]Pfizer, Inc., San Diego, CA, USA, [2]Pfizer Global Research and Development, Groton, CT, USA, [3]Adelphi Values, Boston, MA, USA, [4]Pfizer Global Pharmaceuticals, New York, NY, USA

OBJECTIVES: Photoguides are used as measures of treatment effect. To interpret the results, an understanding of what change is "enough" is required. The purpose of this study was to determine the Patient Detectable Difference (PDD) and Patient Relevant Difference (PRD) in scar severity using a discrete choice experiment with paired comparisons of scar photos via the internet. **METHODS:** Patients were asked to select the scar most like their own from a 5-photo photoguide as the referent. Each patient was then presented with a randomly selected scar from a scar library previously scored on severity by clinicians. For the PDD, patients were asked if the random scar was better, worse, or about the same. For the PRD, patients were asked if they would undergo treatment to "get" the random scar as opposed to keeping the referent scar. Each exercise was repeated five times. Optimal cutoff scores for PDD and PRD were based on a random intercept logistic model (RILM). **RESULTS:** Using a series of RILM estimations across 514 participants, the PDD was calculated as 15.4 points on a 100-point scale (area under curve = 0.85, sensitivity = 0.83, specificity = 0.73). In subgroup analyses by gender and scar source, the PDD ranged from 9.5 to 22.0 points. The replicate analysis adjusting for directionality of preference (improvement only) showed a PRD of 26.9 points (area under curve = 0.97, sensitivity = 0.90, specificity = 0.93), which ranged from 19.5 to 32.0 in the subgroups. **CONCLUSIONS:** Results show that, as expected, scar patients report detectable differences in scar severity that are smaller than what they report as relevant differences necessary to choose treatment. The Internet-based approach using a discrete choice experiment is a novel method to quantify the threshold of detectable and relevant differences in scar severity using a photoguide.

PRM162

PARENT RATINGS OF ABILITY TO CONSENT FOR CLINICAL TRIALS IN FRAGILE X SYNDROME

Bailey D[1], Raspa M[1], Wheeler A[2]
[1]*RTI International, Research Triangle Park, NC, USA,* [2]*University of North Carolina at Chapel Hill, Chapel Hill, NC, USA*

OBJECTIVES: Advances in understanding the neural underpinnings of intellectual disabilities (ID) such as fragile X syndrome (FXS) have led to clinical trials testing medications addressing disease-specific targets. Individuals with ID ought to have a voice in consenting for clinical trials, but the extent to which they are capable of doing so is unknown. We discuss the importance of involving individuals with ID in the consent process and report results from a study of parents' perceptions of their child's ability to consent. **METHODS:** A survey was conducted with 422 families who had a child with FXS. Parents rated items assessing their child's abil-

ity to understand and complete six consent tasks. They also provided information about themselves (maternal education, willingness to enroll child in a clinical trial) and their child (age, autism status, thinking/reasoning ability, gender). **RESULTS:** Factor analysis confirmed that the six items comprise a single factor. However, we found a clear hierarchy of difficulty; the least difficult tasks were "understands that this medication is different from his/her regular treatment" and "realizes that he/she can choose to participate in the study or withdraw at any time." The most difficult were "can make a decision about study participation" and "understands and weighs potential benefits and risks of participating in the study." Although 29% of parents reported that their son was not at all capable of participating, the remainder exhibited a range of decisional skills. Factors associated with this variability include gender, autism, cognitive ability, age, and parents' willingness to enroll their child in clinical trials. **CONCLUSIONS:** Parents rate many individuals with FXS as able to participate in the consent process, but they will likely need support to maximize effective participation. We conclude with a brief review of strategies to support more inclusive participation in the consent process for people with ID.

PRM163

RESULTS OF A STUDY USING A TABLET PC TO COLLECT PROS IN ELDERLY POPULATION

Pau D[1], Nguyen L[1], Pibre S[1], Gokou S[1], Paget J[2]
[1]*Roche, Boulogne-Billancourt, France,* [2]*Lincoln, Boulogne Billancourt, France*

OBJECTIVES: Primary objective of the Percepolis study was to look at patient's perception regarding their Erythropoiesis Stimulating Agents (ESA) treatment of anemia in chronic kidney disease. Many discussions arose at the set-up of the study regarding the best collection method of PROs as target population was old. The following factors helped to make a decision towards ePRO: - Clinical data were collected using an eCRF and previous experience of studies using PROs showed it was difficult to mix method of collecting data, - PRO was the primary endpoint of this study and needed to be carefully monitored, - Most elderly people use new technologies (cellular phone, PC), - Twenty questionnaires needed to be equally distributed. **METHODS:** This is a 6-month multicenter prospective Non-Interventional Study (NIS). Patients had to complete questionnaires at baseline and around 6-month in order to analyze the importance they gave to their ESA treatment characteristics. Technology used was the Tablet PC Samsung Galaxy Tab and specific interface was developed on the Operating System (O.S.) Android to maximize ease of use of the device for patients and investigators. For example, patients only had to select an answer on the screen to display the next question using the tactile functionnalities of the device. When connecting to the electronic data capture system, O.S. was detected in order to fit the screen's display of the HTML pages. **RESULTS:** A total of 789 patients were included, 93% patients answered at least one questionnaire at baseline, 87% after 6 months of treatment. Mean age of the study population was 73 years old (± 13 years). Most PROs (95%) were answered using the Tablet PC. **CONCLUSIONS:** ePROs can be used in elderly population as long as tools are adequately developed to simplify use of devices. ePROs also allowed following online study recruitment and questionnaires data entry.

PRM164

HOW BURDENSOME IS COMPLETION OF ELECTRONIC PATIENT-REPORTED OUTCOMES (EPRO)? ITEM COMPLETION TIMES AND QUALITATIVE EVIDENCE FROM STUDIES IN FOUR DIFFERENT HEALTH CONDITIONS

Arbuckle R[1], Tolley C[1], Burbridge C[2]
[1]*Adelphi Values, Bollington, UK,* [2]*Pfizer Ltd., Surrey, UK*

OBJECTIVES: The patient burden of completing large numbers of patient-reported outcome (PRO) items is often a concern; particularly when PROs must be completed daily, or at multiple timepoints over long studies. However, as ePRO and mPRO (technology that utilizes patients' personal tablets and smartphones) methods advance, PRO completion becomes quicker and easier. How long does it actually take patients to complete ePROs? How burdensome do patients find ePRO completion? **METHODS:** ePRO allows collection of the time taken to complete a set of PRO items. We summarise data from four qualitative studies across a range of health conditions (fibromyalgia, a women's health condition, pediatric constipation and pediatric irritable bowel syndrome). In all four studies, small samples of patients (n=20-65) completed an ePRO diary daily for 5-9 days during pilot testing prior to cognitive debriefing. Completion times and missed days were collected. During the cognitive debriefing interviews patients were asked how burdensome the PRO completion was and if they had difficulty fitting it into their daily routine. **RESULTS:** The PROs being developed had 15-35 items, but two included skip patterns, reducing the item burden. Average completion times ranged from 2.5-5.5 minutes per diary. For diaries without skip patterns, mean 'per item' completion times were calculated to range from 9.4-15.7 seconds. The majority of patients (93-100%) reported that the PRO was quick and easy to complete and not burdensome. Missed diary rates were consistently low with only 0-12% of patients missing more than one diary completion in the two studies where this information was collected. **CONCLUSIONS:** These data provide evidence that patients (including children) can complete ePRO diaries very quickly, don't find this burdensome, and are happy to complete relatively large numbers of items daily. If ePROs are carefully designed, using skip-patterns and event driven items, completion burden can be reduced even further.

PRM165

HARMONIZING MEASUREMENT OF ADHERENCE ACROSS THE 4-ITEM AND 8-ITEM MORISKY MEDICATION ADHERENCE SCALE USING CROSS-SECTIONAL DATA FROM PATIENTS TREATED FOR IRRITABLE BOWEL SYNDROME

Pedersini R[1], Isherwood G[2], Vietri J[3]
[1]*Kantar Health, Epsom, UK,* [2]*Kantar Health, Epsom, Surrey, UK,* [3]*Kantar Health, Milan, Italy*

OBJECTIVES: The 4-item Morisky Medication Adherence Scale (MMAS-4) and the more recent 8-item version (MMAS-8) have been both validated, and their concurrent validity has been assessed among hypertensive patients, but the extent to which the two scales can be compared against one another has not been determined. The current analysis assessed whether adherence scores obtained with the two scales on different patients can be compared or integrated across studies. **METHODS:** Data were taken from the 2011 and 2012 US National Health and Wellness Survey (NHWS). The NHWS is a large cross-sectional survey representative of the total adult population in several major markets; current analyses were limited to the US (n~75,000/year). Respondents self-reported physician diagnosis of various health conditions, including 9,633 who reported a diagnosis of IBS. Adherence was measured with MMAS-4 in 2011 and MMAS-8 in 2012. The two adherence scales were evaluated by comparing the frequency distributions of the MMAS scores in the two scales, Cronbach's alpha and inter-item correlations, and the creation of a new 4-item scale including the questions in MMAS-8 that best matched the questions in MMAS-4. **RESULTS:** In IBS patients, both MMAS-4 and -8 scores are Poisson-like distributed, with median at zero (high adherence). Chronbach's alpha was 0.64 for MMAS-4 and 0.70 for MMAS-8, while average item-test correlations were 0.70 and 0.59, respectively. The reduced 4-item scale created out of MMAS-8 is also Poisson-like distributed, Cronbach's alpha was 0.67 and the average item-test correlation was 0.71. **CONCLUSIONS:** Data obtained with the two MMAS show similar qualitative and quantitative characteristics, suggesting that it may be appropriate to integrate data sources using the two different versions, particularly when the responses to the subset of 4 MMAS-8 items are available. Future research should confirm that the scales can be integrated in different therapeutic areas.

PRM166

USING FEEDBACK FROM PATIENTS IN DETERMINING SUITABILITY OF THE PERCEIVED DEFICITS QUESTIONNAIRE (PDQ) AND THE RESOURCE UTILIZATION IN DEMENTIA-LITE (RUD-LITE) FOR USE IN CLINICAL TRIALS IN PRODROMAL ALZHEIMER'S DISEASE

Lenderking WR[1], Steenrod A[2], Rudell K[3], Klapper S[2], Howard K[2], Gaudig M[4]
[1]*Evidera, Lexington, MA, USA,* [2]*Evidera, Bethesda, MD, USA,* [3]*Pfizer Limited, Tadworth, UK,* [4]*Janssen Alzheimer Immunotherapy, Neuss, Germany*

OBJECTIVES: Many instruments used to assess outcomes of treatment for Alzheimer's disease (AD) have no published evidence for their content validity in mild cognitive impairment (MCI) or prodromal AD (pAD). The objective of this project was to evaluate the content validity of AD patient reported outcome (PRO) instruments in this population. **METHODS:** Two waves of interviews were conducted: First, 11 patients with MCI and their informants/ (carers) evaluated several AD PROs (Alzheimer's Disease Medication Administration Questionnaire (ADMAQ), Abbreviated Resource Utilization in Dementia-Lite (RUD-Lite), Perceived Deficits Questionnaire (PDQ), and Abbreviated Dependence Scale (AB DS); Second, 8 patients with pAD reviewed the modified PDQ, and their carers reviewed the RUD Lite. Interviews were transcribed and analysed. **RESULTS:** Results of Wave 1 identified the PDQ and the RUD-Lite as the most promising measures for this cohort. Some minor modifications were suggested for the PDQ, and a separate section was added to the RUD-Lite. Results of Wave 2 showed pAD carers viewed the content of the RUD- Lite as less relevant because the patients are not functionally restricted enough to utilize resources at this early stage of the disease, although the newly added domain for the pAD population was understood and applicable. The modified PDQ was more acceptable to pAD patients than the original version. **CONCLUSIONS:** Even well-established measures for AD patients should have their content validity evaluated prior to their use in pAD or MCI populations. In this study, we found that the PDQ and RUD –Lite needed modifications to be more relevant in early stage patients.

PRM167

RECOMMENDATIONS FOR THE SUCCESSFUL LINGUISTIC VALIDATION OF CLINICAL OUTCOME ASSESSMENTS FOR LIMITED PATIENT POPULATIONS

Moravec H[1], Chulis C[2], Sweeney E[2]
[1]*TransPerfect, San Francisco, CA, USA,* [2]*TransPerfect, New York, NY, USA*

OBJECTIVES: Timeline and budget considerations for the linguistic validation of Clinical Outcome Assessments (COAs) can vary substantially depending on patient population requirements and target locales. Rare diagnoses and/or small populations of native speakers of a language can lead to a small pool of eligible patients for cognitive debriefing respondents. This review highlights considerations necessary to promote successful linguistic validation projects and mitigate the potential impact of small patient populations that, in turn, can affect study timelines as a whole. **METHODS:** To assess possible steps to take during study planning and the linguistic validation process, a literature review and examination of past linguistic validation projects were completed. This focused on trials in which a small patient population limited the number of eligible cognitive interviewing respondents, and the issues and solutions associated with each project. **RESULTS:** In order to meet timeline and budget requirements, it is crucial that sufficient steps are taken to ensure cognitive interviewing populations are fully evaluated during a trial's planning stages. Solutions for helping achieve this include: 1) Identification and possible inclusion of broader patient populations with conditions with similar symptoms; 2) Extended timeline consideration for rare diseases or small native-speaking populations at study start; 3) Selection of more general COAs (e.g. not specific to the diagnosis in the case of rare conditions) so cognitive interviewing may be performed on healthy respondents or a broader group of patients. **CONCLUSIONS:** When choosing COAs for global use, an analysis of the intended patient population – including prevalence rates of the condition and size of the native-speaking population – is recommended in order to integrate projected linguistic validation timelines into the overall study plan. It is also recommended that study teams discuss this with their language services team for guidance on timelines and assistance in planning to ensure targeted study milestones are met.

PRM168

USING MOBILE TECHNOLOGY (MHEALTH) TO DEVELOP THE VALUE STORY FOR NEW DRUGS, DEVICES AND THERAPIES: OPTIMISING USER ENGAGEMENT AND ADDRESSING PAYER CONCERNS

Tran JB[1], Hugh-Jones C[2]
[1]*Double Helix Consulting, London, UK,* [2]*McCann Health, London, UK*

OBJECTIVES: This research explored the feasibility of using mobile technology (mHealth) to capture data such as resource utilisation and patient reported outcomes to support the market access of new products. The main objectives were to understand best practices in engaging end users to optimise data collection, and to explore payer opinions on the validity of using mHealth for data collection and its usefulness in the decision making process. **METHODS:** Secondary research was conducted to identify best practices in optimising end user engagement with mHealth solutions. Studies that led to successful outcomes were analysed in detail to understand the key engagement success factors. Qualitative primary payer interviews were conducted in several key European markets to understand the validity of using mHealth to collect data including perceived challenges of leveraging this data to support market access decisions. **RESULTS:** Research showed that interventions that are personalised through data, analytics and behaviour change methodologies are most successful in engaging end users when using mHealth. Payers highlighted several key concerns of using mHealth; namely, data quality and sustainability/scalability. These concerns should be considered and addressed by health care companies who wish to use mHealth as a data platform to support payer decisions. **CONCLUSIONS:** mHealth is a tool that holds promise for many different parts of the health care value chain. This includes leveraging mHealth to support the market access targets of new products, by collecting and using data to enhance the communication of the products' value. The findings from this research highlight best practices to engage users in order to optimise data collection as well as provide insights from payers on the key concerns of doing so.

PRM169

THE INFLUENCE OF HAQ UTILITY MAPPING ALGORITHMS ON THE COST-EFFECTIVENESS OF SECOND LINE BIOLOGICS FOR TREATMENT OF RHEUMATOID ARTHRITIS

Pennington B
BresMed, Sheffield, UK

OBJECTIVES: In 2010, the National Institute for Health and Clinical Excellence (NICE) performed a multiple technology assessment for second line biologic treatments (following the failure of a TNF inhibitor and disease modifying antirheumatic drugs (DMARDs)) for the treatment of rheumatoid arthritis (RA). The Birmingham RA Model (BRAM) was used to obtain incremental cost-effectiveness ratios (ICERs) of £21,100/quality-adjusted life year (QALY) for rituximab versus DMARDs and £130,600 for abatacept versus rituximab. Adalimumab, etanercept and infliximab were dominated by rituximab. NICE recommended rituximab, unless contraindicated, in which case all the other biologics were recommended. The BRAM used in the NICE assessment used a linear regression model to translate Health Assessment Questionnaire (HAQ) scores into EQ-5D scores, however other algorithms exist. The objective of this study was to understand how the algorithm used to map from HAQ to EQ-5D affects the ICERs generated by the model. **METHODS:** The BRAM used in the NICE assessment used a linear regression model to translate Health Assessment Questionnaire (HAQ) scores into EQ-5D scores, however other algorithms exist. The objective of this study was to understand how the algorithm used to map from HAQ to EQ-5D affects the ICERs generated by the model. **RESULTS:** The ordering of the effectiveness of treatments did not change with the mapping algorithm used, however there was substantial variation in the magnitude of the ICER. The ICER for rituximab versus DMARDs varied from £21,594/QALY to £32,039/QALY depending on the exact algorithm used. The ICER for abatacept versus rituximab varied from £124,776/QALY to £167,687/QALY. **CONCLUSIONS:** The cost-effectiveness results of the BRAM are heavily influenced by the choice of mapping algorithm. In future modelling, the choice of algorithm should be justified, and appropriate sensitivity analyses presented. Further research is needed to identify the most appropriate algorithm(s) for use in health technology assessment.

PRM170

USING RASCH ANALYSIS TO CO-CALIBRATE SCORES FROM OUTCOME MEASURES SPECIFIC TO ASTHMA (ALIS), CHRONIC OBSTRUCTIVE PULMONARY DISEASE (LCOPD) AND PULMONARY HYPERTENSION (CAMPHOR)

Twiss J, McKenna S, Rouse M
Galen Research Ltd., Manchester, UK

OBJECTIVES: Disease-specific patient-reported outcomes (PROs) are designed to be highly relevant to a single disease. It is widely believed that comparisons of outcomes between patients with different diseases is only possible using generic PRO measures. The present study employs a novel method of using Rasch analysis to co-calibrate scores from different disease-specific PROs allowing scores to be compared across diseases. **METHODS:** Three samples of patients completed the Asthma Life Impact Scale (ALIS), the Living with COPD scale (LCOPD) or the Cambridge Pulmonary Hypertension Outcome Review (CAMPHOR), depending on their illness. Each scale utilises the needs-based model of QoL and the scales share 8 common items. The three samples were analysed separately for fit to the Rasch model and then combined and re-analysed. **RESULTS:** The ALIS was completed by 140 asthma patients (mean age=50.6, males = 29.3%); the LCOPD by 162 COPD patients (mean age=69.3, males = 43.8%) and the CAMPHOR by 91 patients (mean age=52.6, males = 29.7%). Each of the scales fit the Rasch model individually (ALIS $Chi^2 = 0.05$; LCOPD $Chi^2 = 0.32$; CAMPHOR $Chi^2 = 0.92$). The combined dataset also fit the Rasch model at first run ($Chi^2 = 0.24$). One common item showed misfit ($Chi^2<0.001$) and non-uniform differential item functioning (DIF) by disease ($Chi^2<0.001$). This item was removed from the analysis and the final co-calibrated scale showed good fit to the Rasch model ($Chi^2=0.48$) with minimal DIF by age, gender or disease. **CONCLUSIONS:** The results showed that it was possible to co-calibrate scores on the ALIS, LCOPD and CAMPHOR. As disease-specific measurement has advantages over generic assessment related to relevance and reproducibility, the results have the potential to enhance PRO measurement in respiratory research.

PRM171

THE E-HEALTH IMPACT QUESTIONNAIRE: DEVELOPING A TOOL TO MEASURE THE EFFECTS OF USING HEALTH-RELATED WEBSITES

Kelly L, Ziebland S, Jenkinson C
University of Oxford, Oxford, UK

OBJECTIVES: The internet is a valuable resource for accessing health information and support. This study aimed to develop a tool (the eHIQ) to measure the impact of using health-related websites which contain experiential and factual information. **METHODS:** A multi-method study with four stages. Stage 1: Themes concerning the impact of using health-related websites were identified through qualitative secondary analysis of interviews exploring patient and carer experiences of health and a relevant literature review. Stage 2: Questionnaire items based upon identified themes were constructed and assessed using expert and patient opinion. Stage 3: Items were administered online and subjected to exploratory factor analysis. Stage 4: The reduced questionnaire and appropriate reference measures were administered online to test convergent validity and external reliability. **RESULTS:** Sixty-seven items were constructed according to the key themes identified through relevant literature and qualitative analysis. Following expert and patient refinement, two independent item pools were entered into psychometric testing. The first item pool (eHIQ-Part 1) related to general views of using the internet in relation to health and second item pool (eHIQ-Part2) related to the impact of using a specific health-related website. Analysis confirmed three domains present in eHIQ-Part 1 and six domains present in eHIQ-Part 2. These domains were tested further during Stage 4 and were found to have high convergent validity, internal consistency and good test-retest reliability. **CONCLUSIONS:** Developing the eHIQ through the use of qualitative analysis and patient-expert opinion enhanced face and content validity. The eHIQ demonstrates good psychometric properties and will enable the measurement of the effects of using health-related websites across a range conditions.

PRM172

DESIGN OF LUPUS IMPACT TRACKER (LIT) VALIDATION STUDY IN FIVE EUROPEAN CLINICAL PRACTICE SETTINGS

Schneider M[1], Mosca M[2], Pego-Reigosa JM[3], Koscielny V[4], Moore-Ramdin L[4], Devilliers H[5]
[1]*Heinrich-Heine-University Düsseldorf, Düsseldorf, Germany,* [2]*University of Pisa, Pisa, Italy,* [3]*Hospital do Meixoeiro, Vigo, Spain,* [4]*GlaxoSmithKline, London, UK,* [5]*Dijon University Hospital, Dijon, France*

OBJECTIVES: Physicians treating systemic lupus erythematosus (SLE) use a variety of tools to monitor disease activity and organ damage however these do not capture the functional burden experienced by patients. Studies suggest that communication between physicians and patients need to be optimized. The Lupus Impact Tracker (LIT), a brief, disease specific 10-item patient reported outcome tool, was developed to assess the impact of SLE on patients daily functioning and well-being. This study aims to evaluate the cross-cultural validity, acceptability and feasibility of the LIT in European clinical practice settings. Potential effect of LIT on communication during the consultation will also be assessed. **METHODS:** This is a prospective, observational, multicenter cross-sectional validation study of SLE patients on standard of care from hospital/clinical settings in five European countries (France, Germany, Italy, Spain and Sweden). 625 patients enrolled to obtain at least 500 evaluable cases irrespective of disease severity. Before the visit, patients will complete self-reported questionnaires: SF-36, Global Evaluation of Change (GEC), care satisfaction and LIT. During visits, physicians will record patient data, assess disease activity using the SELENA-SLEDAI and Physician Global Assessment (PGA), and disease damage using the SLICC/ACR damage index. After the visit patients and physicians complete LIT feedback questionnaires. Analyses will be performed using descriptive statistical methods with no specific hypothesis suggested. **RESULTS:** Psychometric evaluation of LIT in US clinical settings found the tool reliable and valid. Evaluation for use in European clinical practice settings is thus needed. Cross-cultural validity of LIT across countries will be analyzed using differential item functioning (DIF) analysis. Data from the Lupus Impact Tracker-(Patient and Physician) Feedback Questionnaires will be tabulated and summarized. **CONCLUSIONS:** We need improvement of the patient/physician interaction in lupus care. The LIT may be a valid and acceptable tool for use with SLE patients in European clinical practice settings.

PRM173

DEVELOPMENT OF A QUESTIONNAIRE TO EVALUATE FOOD-RELATED WELL-BEING

Guillemin I[1], Allaert FA[2], Arnould B[1], Capuron L[3], Dupuy A[4], Ginon E[5], Lecerf JM[6], Prost M[7], Rogeaux M[8], Urdapiletta I[9], Marrel A[1]
[1]*Mapi, Lyon, France,* [2]*CEN Biotech/CEN Nutriment, Dijon, France,* [3]*Université Bordeaux II, Bordeaux, France,* [4]*Université de Toulouse II – Le Mirail, Toulouse, France,* [5]*Laboratoire d'Expérimentation en Sciences Sociales et Analyse des Comportements (LESSAC); ESC Dijon Bourgogne, Dijon, France,* [6]*Institut Pasteur de Lille, Lille, France,* [7]*Laboratoire de recherches Appliquées Spiral (SPIRAL), Couternon, France,* [8]*Danone, Palaiseau, France,* [9]*Laboratoire Parisien de Psychologie Sociale - Universités de Paris 8 & Paris 10, Saint-Denis, France*

OBJECTIVES: To screen food-related products and support allegation demands, evaluating food-related concepts with appropriate tools is essential. In the absence of such a tool, we developed a specific questionnaire providing insight into the way a person links food to well-being in terms of pleasure, joint comfort, digestive comfort, prevention and immunity. **METHODS:** Semi-directive interviews were conducted with 40 healthy subjects to explore three themes: food, well-being and food-related well-being, and determine the basis of the interview guide for focus group discussions. Twenty-four group discussions (199 subjects in total) were conducted with healthy subjects (n=12) and subjects with joint, digestive or repetitive infection complaints (n=4 per complaint), to investigate definition and experience of food-related well-being. Qualitative analysis was performed to identify concepts of interest. Based on the designed conceptual model and discussion with the scientific committee, items were generated using subjects' verbatim expression. Face-to-face cognitive interviews were conducted with 29 healthy subjects to ensure comprehension and appropri-

ateness of the resulting test questionnaire. After revision, the pilot questionnaire was created. **RESULTS:** Concepts elicited during group discussions revolved around pleasure and health. The test questionnaire consisted of 199 items divided into six modules: "grocery shopping", "cooking", "places where meals are eaten", "conviviality", "eating and drinking", and "eating habits and health". Items within the first five modules assess subject behaviour and benefits (pleasure, psychology, digestion, physical condition); the module "eating habits and health" assesses beliefs. Cognitive interviews led to minor rewordings, removal and addition of items. The resulting pilot questionnaire consisted of 174 items distributed across the 6 aforementioned modules. **CONCLUSIONS:** We developed a unique tool that comprehensively assesses the full picture of well-being related to food and eating habits in the general population. A validation study is underway to establish the scoring and ascertain the psychometrics of the instrument before it can be used in clinical studies.

PRM174

METHODOLOGY AND DEVELOPMENT OF 'POLISH DICTIONARY OF QUALITY OF LIFE TERMS'

Golicki D[1], Farkowski MM[2], Grabowska-Krawiec P[3], Szkultecka-Debek M[4], Zawodnik S[5], Baran J[6], Borowiec L[7], Czech M[5]
[1]*Department of Experimental and Clinical Pharmacology, Medical University of Warsaw, Warsaw, Poland,* [2]*Institute of Cardiology, Warsaw, Poland,* [3]*Department of Immunology and Clinical Allergology, Military Institute of Medicine, Warsaw, Poland,* [4]*Department of Dermatology, Military Institute of Medicine, Warsaw, Poland,* [5]*Department of Pharmacoeconomics, Medical University of Warsaw, Warsaw, Poland,* [6]*Postgraduate Medical School, Grochowski Hospital, Warsaw, Poland,* [7]*Servier Polska Sp. z o.o., Warsaw, Poland*

Lack of an established Polish terminology is a serious limitation of the development of health-related quality of life (HRQoL) studies in Poland. **OBJECTIVES:** To develop Polish dictionary of terms used in the studies of HRQoL. **METHODS:** In February 2012, HRQoL Special Interest Group of ISPOR Poland Chapter took on the task of preparing Polish dictionary of HRQoL terms. Following steps were planned: (1) preparation of a list of target English-language terms, (2) preparation of a reference list of translations typically used in Polish literature, (3) step-by-step translation of English terms by individual experts (4) analysis and approval of proposed translations by Expert Committee, (5) re-analysis of key terms, (6) preparation of pre-final vocabulary, (7) reviews by Review Committee, (8) preparation and publication of the final version. The list of English terms was based on following sources: popular English-language HRQoL textbooks, key words from papers published in leading peer-reviewed journals in the field, ISPOR guidelines concerning patient-reported outcomes, websites of generic HRQoL instruments. The reference lists of translations used in Polish literature was based on pharmacoeconomics and psychology textbooks, EBM dictionaries and HRQoL papers published in Polish peer-reviewed journals. Expert Committee was comprised of seven Polish investigators with vast experience in the field of HRQoL studies. Review Committee was formed by three authorities in the field of psychometrics, statistics and epidemiology. **RESULTS:** Till June 2013, there were 13 meetings of Expert Committee: three focused on the development of methodology and ten - on analysis and approval of proposed translations. Initially, we identified 1640 English terms from different sources. After removal of duplicates, final English list comprised of 1314 terms. Pre-final version of vocabulary, ready for peer-review, consists of 1051 proposed Polish translations. **CONCLUSIONS:** We anticipate, that dictionary prepared by the ISPOR Poland Chapter will support practical usage of PRO in Poland.

PRM175

MAPPING THE OXFORD HIP SCORE (OHS) TO EQ-5D: A TEST OF MODEL PERFORMANCE

Sungher DK, Diamantopoulos A
Symmetron Limited, Elstree, UK

OBJECTIVES: The lack of preference-based utility data places great importance on the accuracy of mapping functions. The objective of this study is to assess the predictive accuracy of statistical models which address the unique properties of EQ-5D. **METHODS:** A large dataset from the Patient Reported Outcome Measures (PROMs) programme reporting EQ-5D and OHS values for patients who have undergone total hip replacement, during April 2010 and March 2011, was used to develop 6 mapping functions using different statistical methods: Ordinary Least Squares (OLS), standard Tobit, adjusted Tobit, two-part logit (TPL), response-mapping and censored least absolute deviation (CLAD). Three different model specifications were investigated, including the total OHS, individual item score and individual item responses. Each model specification was examined using goodness-of fit measures. The predictive accuracy of each model was analysed using the mean absolute error (MAE) and mean squared error (MSE). Model performance was compared in an internal and external validation. **RESULTS:** The OHS individual item response variables proved to give the best model fit and were therefore used across all models. The OLS and TPL models consistently demonstrated the highest predictive accuracy, providing the lowest MSE and the closest estimation of the mean EQ-5D. The response-mapping approach was the poorest predictor in estimating individual values; however it was able to predict the median with perfect precision. Models using Tobit and CLAD frameworks provided the poorest predictions. **CONCLUSIONS:** The OLS and TPL models proved to be the most accurate in predicting EQ-5D on an individual level, whilst the response-mapping model is recommended for predicting the median. Using inaccurate mapping functions such as the Tobit models developed in this study can have a substantial impact on CEA results and reimbursement decisions.

PRM176

TRANSLATION AND CULTURAL ADAPTATION OF THE SF-6D QUESTIONNAIRE FOR USE IN ARABIC-SPEAKING COUNTRIES

Dawoud DM[1], Soliman AM[2], Alhyas L[3], Amin MEK[4], Hussein M[5], Mohamed O[4]
[1]*Cairo University, Cairo, Egypt,* [2]*AbbVie Inc., Libertyville, IL, USA,* [3]*Ministry of Health, Abu Dhabi, United Arab Emirates,* [4]*University of Wisconsin-Madison, Madison, WI, USA,* [5]*University of Tennessee, College of Pharmacy, Memphis, TN, USA*

OBJECTIVES: The use of pharmacoeconomic evaluations, e.g. cost-utility analysis (CUA), in resource allocation is gaining attention in Arabic –speaking countries. The Short Form-6D (SF-6D) is a generic preference-based measure of health-related quality of life (HRQoL) that can be used to generate health-state utilities for use in CUAs. The objective of this study is to translate and culturally-adapt the SF-6D for use in Arabic-speaking countries, with particular focus on Egypt and the United Arab Emirates. **METHODS:** The study followed the International Quality of Life Assessment (IQOLA) methodology. Two forward translations, one consensus and one backward translation were undertaken. The translators (professional linguists and bilingual pharmacoeconomists) reported the difficulties encountered in the translation process. An advisory committee of six researchers and three clinicians, who are native Arabic speakers and proficient in English language, assessed the consensus version for accuracy, cultural compatibility and cognitive burden. The difficulties encountered during the process were categorized as grammatical, idiomatic, semantic/conceptual, and cultural. The backward translation was completed by a professional medical translator, reviewed and assessed by the committee. **RESULTS:** Five items raised discussion during the process for grammatical (1 item), semantic (1 item), idiomatic (1 item) and cultural (2 items). For example, "emotional problems" had to be culturally adapted and "down-hearted and low" had to be substituted. The committee members approved the forward translation as linguistically and grammatically accurate. Minor changes were made to the forward translation to improve cultural appropriateness. The Backward translation did not reveal major problems and equivalence to the original was confirmed following committee review. **CONCLUSIONS:** The translation and cultural adaptation of the SF-6D into Arabic resulted in a conceptually equivalent and culturally appropriate version. Psychometric validation and a valuation survey will be needed to assess its validity for use in the target populations.

PRM177

ASSESSING MEASUREMENT EQUIVALENCE OF DIFFERENT FORMS OF ADMINISTRATION OF THE CAMBRIDGE PULMONARY HYPERTENSION OUTCOME REVIEW (CAMPHOR) USING RASCH ANALYSIS

Twiss J[1], McKenna S[1], Graham JE[1], Swetz KM[2], Sloan J[2], Gomberg-Maitland M[3]
[1]*Galen Research Ltd., Manchester, UK,* [2]*Mayo Clinic, Rochester, MN, USA,* [3]*University of Chicago Medicine, Chicago, IL, USA*

OBJECTIVES: Electronic formats of patient-reported outcome (PRO) measures are now routinely used in clinical trials. Their use promises a range of benefits such as improving access to patients, increasing compliance, reducing missing data and avoiding errors associated with data entry. When changing from paper and pen to an electronic administration it is necessary to establish their equivalence. This is the first study to evaluate the use of Rasch analysis for this purpose. **METHODS:** Three groups of US patients with pulmonary hypertension participated. A clinical sample completed an electronic version of the CAMPHOR (*e-sample*) and two different samples completed the pen and paper administration (*pp1* and *pp2*). Analyses were conducted on the CAMPHOR activity limitations and quality of life (QoL) scales. The three databases were analysed separately for fit to the Rasch model. Data were then combined, re-analysed and assessed for differential item functioning (DIF). **RESULTS:** The three datasets were matched randomly for sample size (n=147). Mean age (years) and percentage male respondents were as follows: *e-sample* (51.7, 16.0%); *pp1* (50.0, 14.0%); *pp2* (55.5, 40.4%). After minor adjustments to the three datasets, fit to the Rasch model was achieved (Chi^2 values for activity limitations and QoL respectively were *e-sample* (0.11, 0.07); *pp1* (0.18, 0.12); *pp2* (0.40, 0.30)). Fit was also achieved for the combined sample after minor adjustments (activity limitations Chi^2 = 0.21, QoL Chi^2 =0.12). Importantly, no evidence of DIF by mode of administration was found. **CONCLUSIONS:** Equivalence of the electronic and pen and paper administrations of the CAMPHOR was established. The results showed how the Rasch model can be utilized to determine the equivalence of alternative formats of PRO measures. This methodology has the added advantage of avoiding the need for complex study designs such as matching samples for disease severity or repeated administration of alternative formats of questionnaires.

PRM178

MODELLING THE RELATIONSHIP BETWEEN THE WOMAC OSTEOARTHRITIS INDEX AND EQ-5D

Wailoo AJ[1], Hernández M[1], Escobar Martinez A[2]
[1]*University of Sheffield, Sheffield, UK,* [2]*Hospital Universitario Basurto, Bilbao, Spain*

OBJECTIVES: Economic evaluation typically is conducted using health state utilities to estimate treatment benefits. However, such outcomes are often missing from studies of clinical effectiveness. This study aims to bridge that gap by providing appropriate methods to link values from the Western Ontario and McMaster Universities Osteoarthritis Index (WOMAC) to the EQ-5D utility instrument. **METHODS:** Patients from a large registry of Spanish patients (n=7072 observations) with knee or hip osteoarthritis who completed both WOMAC and EQ-5D was used. A mixture model approach was used based on distributions bespoke to the EQ-5D UK value set to estimate EQ-5D as a function of WOMAC pain, stiffness and function subscores. **RESULTS:** A five class mixture model provides very close fit to the observed data at all levels of disease severity. The overall mean (0.542 vs 0.542), median (0.620 vs 0.636) and the percentage of observations at full health (15 vs 14.8) were very similar between the observed data and the estimated model respectively. Stiffness has limited relationship to EQ-5D, whereas functional disability and pain are strong predictors. **CONCLUSIONS:** EQ-5D can be reliably estimated from WOMAC subscale scores without any systematic bias using the results based on a bespoke mixture model method.

PRM179

DIFFERENTIAL ITEM FUNCTIONING IN A SATISFACTION ITEM BANK

Campillo-Álvarez Á, Rodríguez-Aguilella A, Castejón N, Cuervo J, Rebollo P
LASER Analytica, Oviedo, Spain

OBJECTIVES: In the last years, the assessment of patient satisfaction has become an area of great interest due to its implications, especially in the management of chronic diseases. Across the board, satisfied patients tend to have better adherence to medication. It affects a patient's prognosis and treatment costs. High-risk hypertension and Diabetes Mellitus (DM) (types I and II) are two chronic diseases with high prevalence. The objective of this research was to examine Differential Item Functioning in a previously developed Satisfaction with Treatment item bank between these chronic diseases as a first step to improve the item bank. **METHODS:** The sample consisted of a total of 283 patients diagnosed with DM and 1.517 high or very high-risk hypertensive patients. Uniform DIF between both samples was investigated using Winsteps. The presence of DIF in thirteen items from a satisfaction bank was analyzed. **RESULTS:** Ceiling effect was detected and an item-person map showed that the test was off-target and didn't cover the highest range of the ability scale. DIF was present between patients with Diabetes Mellitus (I and II) and high-risk hypertensive patients. Differences above one logit were found in three items, two related to adverse-events, which diabetes patients found harder to endorse, and one to oversights, harder to endorse for high-risk hypertensive patients. A difference in the same direction was found in two more items pertaining to convenience, with differences in this case larger than 0.75 logits. **CONCLUSIONS:** This study represents a psychometrically valid initial effort to improve patients with chronic diseases satisfaction assessment. The DIF analysis has allowed improving the item satisfaction bank, selecting those items which could provide better information in order to develop a satisfaction questionnaire better tailored to specific patients. Future research is recommended considering different chronic pathologies and to reduce the ceiling effect associated with the satisfaction measures.

PRM180
THE IMPACT OF DSM-5 ON THE DEVELOPMENT OF DRUGS TO TREAT SCHIZOPHRENIA
Meyers OI
Truven Health Analytics, Cleveland, OH, USA
OBJECTIVES: In May 2013, the American Psychiatric Association released the fifth edition of the Diagnostic and Statistical Manual of Mental Disorders (DSM-5), a classification system for psychiatric and certain neurologic conditions. DSM-5 brings significant changes to many diagnostic categories as compared to the previous DSM-IV-TR. The objective of this review was to examine the changes in the Schizophrenia criteria and discuss the impact these changes may have for industry. **METHODS:** A line-by-line review of the DSM-5 and DSM-IV criteria was undertaken. Significant changes were highlighted and discussed from the point of view of sponsors of clinical trials for psychopharmacologic agents being developed to treat Schizophrenia. **RESULTS:** The primary diagnostic criteria for Schizophrenia in DSM-5 are little changed. The major change in the so-called "active-phase symptoms" is with the mix of symptoms that can meet this criterion. Five key symptom areas must be present to meet criteria. In DSM-IV, any two symptoms were sufficient and in some limited cases, even just one was enough (bizarre delusions or Schneiderian first-rank auditory hallucinations – conversing voices). According to the DSM-5 criteria, there always must be at least two symptoms to meet Criterion A, and one of the two must be either delusions, hallucinations, or disorganized speech. Other important changes include changes to the course specifiers, the elimination of Schizophrenia subtypes, and the addition of an optional framework for clinicians to rate the severity of the primary symptoms. **CONCLUSIONS:** The changes in DSM-5 pose both challenges and opportunities for industry. The changes in the DSM-5 criteria may translate into changes for how we go about developing medical products to treat psychiatric disorders, including Schizophrenia. There will need to be an investment in research and education, and sponsors must examine the possibility of developing new endpoints and outcome assessments for use in clinical trials.

PRM181
THE VALUE OF PILOT TESTING PRO SYMPTOM DIARIES PRIOR TO CONDUCTING COGNITIVE DEBRIEFING INTERVIEWS IN CHILDREN/ADOLESCENTS: QUALITATIVE AND QUANTITATIVE INSIGHTS
Arbuckle R[1], Holloway L[1], Carson RT[2], Dennee-Sommers B[3], Abetz-Webb L[1]
[1]*Adelphi Values, Bollington, UK,* [2]*Forest Research Institute, Jersey City, NJ, USA,* [3]*Endpoint Outcomes, Boston, MA, USA*
OBJECTIVES: To pilot test daily electronic symptom diaries in pediatric chronic constipation (CC) and irritable bowel syndrome with constipation (IBS-C) for approximately one week prior to cognitive debriefing interviews. **METHODS:** Separate child and parent eDiary measures of CC/IBS-C symptoms were developed based on concept elicitation interviews with children with CC/IBS-C and their parents. The eDiaries were completed by 36 children/adolescents (aged 6-17 years) with CC/IBS-C and 30 parents (of 6 month-11 year old children with CC/IBS-C) for 5-9 days prior to cognitive debriefing. Children and parents were trained to use the eDiary and following the pilot test, children and parents were interviewed separately about their experiences completing the eDiaries and the symptom items. Item descriptive statistics were calculated using the eDiary data collected during the pilot test. **RESULTS:** Both eDiaries were well understood, all items were considered relevant, and no symptoms were identified as missing from the eDiaries. During cognitive debriefing, the children were able to reflect on their experiences of completing the eDiary as opposed to considering hypothetical scenarios to debrief the items. Although 9 children and 15 parents reported challenges with transmitting data, mean compliance rates were high (94% and 92%, respectively), indicating low levels of missing data and that the eDiaries were easy to use overall. Mean completion times were 3.72 minutes for children and 3.96 minutes for parents, providing further evidence of low burden. All item responses were normally distributed and demonstrated expected patterns of response (e.g., most reported 0 or 1 bowel movement daily). **CONCLUSIONS:** Pilot testing eDiaries prior to cognitive debriefing interviews, especially with children, provides respondents with the experience of completing the eDiary, facilitating a more informed qualitative interview. Pilot testing also provides preliminary quantitative item performance data and important insights about the usability of eDiaries.

PRM182
THE IMPACT OF DSM-5 ON THE DEVELOPMENT OF DRUGS TO TREAT AUTISM SPECTRUM DISORDER
Meyers OI
Truven Health Analytics, Cleveland, OH, USA
OBJECTIVES: In May 2013, the American Psychiatric Association released the fifth edition of the Diagnostic and Statistical Manual of Mental Disorders (DSM-5) which is a classification and diagnostic system for psychiatric and certain neurologic conditions. DSM-5 brings significant changes to many of the diagnostic categories as compared to the previous edition of the manual. The objective of this review was to examine the changes in the Autism Spectrum Disorder (ASD) criteria and discuss the impact of these changes for industry. **METHODS:** A line-by-line review of the DSM-5 criteria for Autism Spectrum Disorder and the DSM-IV criteria for Pervasive Developmental Disorders was undertaken. Significant changes were highlighted and discussed from the point of view of sponsors of clinical trials for psychopharmacologic agents being developed to treat these conditions. **RESULTS:** The changes to the diagnostic criteria for what were known in DSM-IV as pervasive developmental disorders (PDD) are sweeping. ASD, now in a section of the DSM titled "Neurodevelopmental Disorders," is a single entity in DSM-5 with several levels of severity that effectively replaces the five PDDs that were separately classified in DSM-IV. Notable changes include the addition of severity levels to the ASD criteria, changes to the social interaction and social communication criteria, and the addition of hyper- or hyporeactivity to sensory input or unusual interest in sensory aspects of the environment, as an illustrative example of restrictive, repetitive patterns of behavior, interests, or activities. **CONCLUSIONS:** The numerous and significant changes in DSM-5 pose both challenges and opportunities to industry. We need to take a careful look at DSM-5 to understand what the changes mean for how we go about developing medical products to treat psychiatric disorders. This means the need for investment in research, education, and new ways of approaching the development of endpoints and outcome assessments in clinical trials.

PRM183
ESTIMATING THE IMPACT OF ENDOGENOUS SUBSTANCE ABUSE ON SELF-REPORTED HEALTH STATUS
Gu NY
University of New Mexico, Albuquerque, NM, USA
OBJECTIVES: The impact of addictive substance abuse (SA) on overall well-being, such as patient's self-reported health status, may suffer from endogeneity bias. The purpose of this study is to estimate the impact of SA on patient's health status using the instrumental variable (IV) approach. **METHODS:** The sample was extracted from the 2011 Substance Abuse and Mental Health Services Administration (SAMHSA) data for 36,347 adult US respondents who indicated SA status. Treating SA as exogenous, a single-equation probit model was used. Treating SA as endogenous, bivariate probit models were employed using different IVs. The outcome variable was the self-reported health status (1=better than good; 0=fair or poor). Other exogenous variables controlled in the model were respondents' age, gender, race, marital status, education level, employment status and family income. IVs were respondents' age at SA initiation, SA frequency and substance availability. Exogeneity, over-identification and weak instrument tests were performed to ensure the validity and appropriateness of the IVs. **RESULTS:** About 50% of the respondents were between 18-25 years old. Over 56% indicated SA and approximately 36% had initiated SA before age 18. The single-equation probit suggested that SA was associated with at least a 2% decrease in overall health status ($p<0.01$), compared those who never had SA. After adjusting for endogeneity bias, the negative relation between SA and health status increased by at least two-fold ($p<0.01$). All tests indicated that the IVs used were valid and the results were significant. **CONCLUSIONS:** The findings suggest that estimating the impact of SA on health status should consider adjusting the endogeneity bias induced by individual characteristics and environmental factors such as age at SA initiation, frequency of SA use and substance availability in the community. Further investigations on the effect of SA abstinence durations on health status should be explored to strengthen their associations.

PRM184
THE IMPACT OF DSM-5 ON THE DEVELOPMENT OF DRUGS TO TREAT ATTENTION-DEFICIT/HYPERACTIVITY DISORDER
Meyers OI
Truven Health Analytics, Cleveland, OH, USA
OBJECTIVES: In May 2013, the American Psychiatric Association released the fifth edition of the Diagnostic and Statistical Manual of Mental Disorders (DSM-5) which is a classification system for psychiatric and certain neurologic conditions. DSM-5 brings significant changes to many diagnostic categories as compared to the previous edition of the manual. The objective of this review was to examine the changes in the Attention-Deficit/Hyperactivity Disorder (ADHD) criteria and discuss the impact these changes may have for industry. **METHODS:** A line-by-line review of the DSM-5 and DSM-IV criteria for ADHD was undertaken. Significant changes were highlighted and discussed from the point of view of sponsors of clinical trials for psychopharmacologic agents being developed to treat ADHD. **RESULTS:** One of the more notable changes to ADHD criteria in DSM-5 is in the age of onset cutoff. To meet DSM-IV criteria, symptoms had to be present before age 7. In DSM-5 this was changed to 12. Additionally, symptoms present before the age of onset cutoff had to cause impairment to meet the DSM-IV criteria, but in DSM-5 there is no such requirement. Another significant change lies in the fact that while DSM-IV did not make a distinction between childhood and adult ADHD, in DSM-5, from age 17 on, only 5 of 9 symptoms in one or both categories are required, rather than 6. Several other changes related to differential diagnosis and functional impairment were noted as well. **CONCLUSIONS:** The significant changes in DSM-5 pose

both challenges and opportunities for industry. The changes in the DSM-5 criteria may translate into changes for how we go about developing medical products to treat psychiatric disorders, including ADHD. There will need to be an investment in research and education, and sponsors must examine the possibility of developing new endpoints and outcome assessments for use in clinical trials.

PRM185
THE IMPACT OF DSM-5 ON THE DEVELOPMENT OF DRUGS TO TREAT MAJOR DEPRESSIVE DISORDER
Meyers OI
Truven Health Analytics, Cleveland, OH, USA
OBJECTIVES: In May 2013, the American Psychiatric Association released the fifth edition of the Diagnostic and Statistical Manual of Mental Disorders (DSM-5), a classification system for psychiatric conditions. DSM-5 brings significant changes to many diagnostic categories as compared to the previous edition. The objective of this review was to examine the changes in the Major Depressive Disorder (MDD) criteria and discuss the impact these changes may have for industry. **METHODS:** A line-by-line review of the DSM-5 and DSM-IV criteria for MDD was undertaken. Significant changes were highlighted and discussed from the point of view of sponsors of clinical trials for psychopharmacologic agents being developed to treat MDD. **RESULTS:** The primary symptom criterion for MDD remains unchanged, requiring five of nine symptoms, over a two-week period. The changes of note have to do with the differential diagnoses and specifiers. One change that received significant attention in the time leading up to the publication of DSM-5 was the elimination of the bereavement exclusion, which discounted bereavement after the loss a loved one within the first two months as part of the normal grief process. In terms of specifiers, a new addition in MDD is "with anxious distress," referring to episodes of depression characterized by at least two of five symptoms of anxiety. DSM-5 notes that this is associated with "greater likelihood of treatment nonresponse."Therefore, this is a factor sponsors may wish to consider in developing their trial inclusion/exclusion criteria. **CONCLUSIONS:** The significant changes in DSM-5 pose both challenges and opportunities for industry. The changes in the DSM-5 criteria translate into changes for how we go about developing medical products to treat psychiatric disorders, including MDD. There will need to be an investment in research and education, and sponsors must examine the possibility of developing new endpoints and outcome assessments for use in clinical trials.

PRM186
PATIENT NETWORKS AS A DATA SOURCE FOR PATIENT REPORTED OUTCOMES RESEARCH. CARENITY EXPERIENCE
Castejón N[1], Chekroun M[2], Martínez García J[1], Gay CH[2], Rebollo P[1]
[1]*LASER Analytica, Oviedo, Spain,* [2]*carenity.com, Paris, France*
OBJECTIVES: To explore the potential of online patient networks (PN) as a viable source of PRO data for clinical research. Several PNs have emerged in the last few years in different European countries, and as a natural meeting point for chronic patients with an active engaged with their communities, they represent a promising source of patient reported data. In this original, the experience with the French PN "Carenity" is described. **METHODS:** Given the great heterogeneity of the users of "Carenity", and the fact that the test was computer-led by definition, a Computer Adaptive Test (CAT) was considered the best choice. The authors decided to use a culturally adapted version of CAT-Health system, which measures generic health-related quality of life (HRQoL). However, in absence of a calibration for the French population, a selection of the best items was used, using the Spanish calibration as a reference. All patients in the PN were invited to participate in the test. A score was estimated for the test using the Spanish parameters, as a rough approximation of the real score. Age, sex and the main pathology of the subjects were also collected. **RESULTS:** Preliminary results from the first week of data collection show 601 patients answered (Women: 404, Men: 140). The most frequent reported pathologies and their t-scores were multiple sclerosis (N:92,M:37.91,SD:5.85), fibromyalgia (N:81,M:36.65,SD:4.99), ankylosing spondylitis(N:60,M:37.74,SD:5.32) and both types of diabetes (I: N:53,M:50.38,SD:10.94, II: N:41,M:48.12,SD:10.04). Significant differences ($p<0.05$) were found in diabetes patients by sex, and between both types of diabetes and the other 3 most common pathologies. **CONCLUSIONS:** Carenity PN seems to be a fast way to obtain PRO scores directly from patients. Preliminary results show differences in the expected direction.

RESEARCH ON METHODS – Statistical Methods

PRM187
DEFINING THE PROPER METHODOLOGY TO USE IN A DATA-PEEK FOR POWER (DPP)
Eisenberg D, Wasser T
HealthCore, Inc., Wilmington, DE, USA
OBJECTIVES: Late phase research is conducted outside the RCT setting where there is uncertainty as to how many subjects are needed to find differences between groups. Due to the lack of real-world information (non-RCT) in late phase designs, there are no tangible inputs for power calculations. This research defines a bias-free method to examine data while determining sample size. **METHODS:** As an example of the application of a DPP, a study examining the decrease of HGbA1c values in two different insulin delivery methods was examined in patients with several comorbid conditions. Literature examined found little to no data and a DPP was used to determine effect size (ES) and standard deviations (SDs) once 30 patients had been enrolled in each group. The DPP procedure was: 1) Determine the test statistic; 2) Identify the power formula most appropriate to the test statistic; 3) Determine the ES, variation and assumptions needed for the data-peek in the form required by the formula; 4) Construct a matrix of possible sample size values; and 5) Select a sample size that is obtainable and answers the research question. **RESULTS:** Data for group A demonstrated a mean reduction of 2.75% ±0.760, group B mean reduction of 3.01% ±0.636. Exact power analysis showed 113 subjects per group would be needed. A matrix of likely sample size based on these values ranged from 44 to 193 per group. Based on this DPP, a sample of 120 per group was selected as the sample size that would deliver clinically meaningful results. **CONCLUSIONS:** A DPP is useful in late phase research to define appropriate sample size where no data exist. It is important to note that DPP methods do not require significance testing, but the benefit is no need for a correction for multiple comparisons at the time of the final analysis.

PRM188
FAULTY CONNECTIONS: CAN CRITICISMS OF NETWORK META-ANALYSIS IN NICE SUBMISSIONS BE AVOIDED?
Martin A, Rizzo M, Iheanacho I
Evidera, London, UK
OBJECTIVES: To assess 1) how network meta-analyses (NMAs) included within manufacturer submissions to the National Institute for Health and Care Excellence (NICE) have been criticised by its Evidence Review Groups (ERGs); 2) how some of these criticisms might be avoided in future submissions; and 3) the extent to which such avoidance might increase the likelihood of a new intervention being approved. **METHODS:** We reviewed the ERG reports of all NICE technology appraisals published since January 2007 to identify those where the manufacturer's submission included an NMA. Subsequently, all criticisms made by the ERG of such analyses were analysed to seek common themes; and assess how often any one type of criticism was associated with a rejection by NICE. **RESULTS:** A total of 181 NICE technology appraisal reports were evaluated. These covered 243 separate interventions, 83 (34%) of which were drugs for cancer. Overall 37–64% of submissions cited NMAs, of which 43–83% were criticised, with this proportion having increased over time. Avoidable criticisms related to flaws in the systematic review methodology used to identify relevant RCTs for the analysis; inappropriate pooling of data from heterogeneous studies; and use of suboptimal statistical approaches in conducting the NMA. Unavoidable criticisms related to the lack of RCTs available for competitor drugs in the population of interest. However, no association was found between flaws in the NMA and a decision by NICE not to approve the use of the intervention. Instead, such rejection was associated mainly with a lack of evidence of clinical efficacy or cost-effectiveness in the target population. **CONCLUSIONS:** Most criticisms of NMAs could be avoided by a more rigorous and transparent approach to conducting and reporting the underlying systematic review and statistical analysis. However, rejection of submissions remains a considerable risk where the underlying evidence is weak.

PRM189
METHODOLOGICAL CHALLENGES IN COMPARING TOPICAL THERAPIES IN DERMATOLOGY IN THE ABSENCE OF HEAD TO HEAD STUDIES
Greiner RA[1], Batscheider A[1], Eheberg D[1], Gohlke A[1], Pfiffner C[1], Ehlken B[1], Macheleidt O[2], Hutt HJ[2]
[1]*IMS Health, Munich, Germany,* [2]*LEO Pharma GmbH, Neu-Isenburg, Germany*
OBJECTIVES: German HTA agency requires evidence about the additional benefit of a new pharmaceutical versus an appropriate comparator as basis for price negotiations. This is challenging when head-to-head studies (H2HS) or randomized placebo-controlled trials (RPCTs) are missing and particularly in dermatology, where topical therapies in registration trials are usually compared to their individual vehicle. The aim of this research was to describe different approaches to assess the additional benefit of a new topical therapy under these limitations. **METHODS:** For ingenolmebutate-gel (IMG) and the appropriate comparator diclofenac-hyaluronic-acid (DHA) bibliographic literature search was conducted for RCTs followed by sequential screening on H2HS, comparable endpoints, RPCTs, common bridge comparator, H2HS of vehicles alone, RPCTs of vehicles. The similarity of vehicles was assessed by comparison of efficacy and safety profile. The lack of H2HS demands to conduct the following approaches depending on the comparability of vehicles: 1. An adjusted indirect comparison due to Bucher 1997 (vehicles are placebo-like or adequately similar) 2. Linkage of direct comparisons due to Wells 2009 (possible when H2HS or RPCTs of vehicles are available) 3. Mixed treatment comparison (MTC) (prerequisites as mentioned for Bucher). **RESULTS:** 5 RCTs for IMG versus 3 RCTs for DHA were identified with comparable endpoints. No RPCTs for topical therapies or for their vehicles, no H2HS of vehicles, no bridge comparator and no clear evidence for the adequate similarity of both vehicles could be detected. Therefore, the prerequisites of all available statistical methods are not met and cannot thoroughly be applied. Notwithstanding these limitations, Bucher (RR[95%KI]: 4.14[2.03;8.47]) and MTC both favor IMG significantly while Wells showed non-inferiority (RR[95%KI]: 0.8[2,03;8,47]) in the primary endpoint of IMG versus DHA. **CONCLUSIONS:** A definition of adequate similarity for vehicles by German HTA agencies is needed to enable the use of methodologically sound indirect comparisons or MTCs in reimbursement dossiers.

PRM190
USE OF MULTIVARIATE BAYESIAN EVIDENCE SYNTHESIS TO REDUCE UNCERTAINTY AROUND CLINICAL EFFECTIVENESS AND QUALITY OF LIFE ESTIMATES
Bujkiewicz S[1], Thompson J[1], Sutton A[1], Cooper N[1], Harrison M[2], Symmons DP[2], Abrams KR[1]
[1]*University of Leicester, Leicester, UK,* [2]*University of Manchester, Manchester, UK*
OBJECTIVES: In health technology assessment, decisions about reimbursement of new health technologies are largely based on effectiveness estimates. These estimates are sometimes also used to predict the health-related quality of life outcomes, such as EQ-5D, as part of economic evaluation. However, sometimes these effectiveness estimates are not readily available. When many alternative instruments measuring these outcomes are being used (and are not all reported) or an extended follow-up time of clinical trials is needed to evaluate long-term endpoints (and drug development is at an early stage), data on relevant outcomes may be limited. The aim of this study was to develop methodology that would allow synthesis of all available evidence to assess interventions early and reduce uncertainty around relevant outcomes. **METHODS:** Bayesian multivariate meta-analysis

methods have been developed for synthesis of diverse sources of evidence: multiple outcomes (including surrogate, potentially short-term endpoints) and other external evidence. These methods were applied to an example in rheumatoid arthritis where outcomes such as the Health Assessment Questionnaire (HAQ), the Disease Activity Score (DAS-28) and the American College of Rheumatology (ACR20) are synthesized. External information about correlations between the outcomes was included in the form of informative prior distributions. Estimates of HAQ were then mapped onto EQ-5D. Also in an alternative approach, the multivariate framework was applied to model jointly the utility estimates and the clinical effectiveness outcomes. **RESULTS:** The use of multivariate meta-analysis led to reduced uncertainty around the effectiveness and utility estimates. Combining the HAQ with DAS-28 gave a 19% reduction in the uncertainty around the estimate of HAQ and also 16% around the estimate of EQ-5D. **CONCLUSIONS:** By allowing all relevant data to be incorporated in economic evaluations of new health technologies, this multivariate approach to meta-analysis can lead to reduced uncertainty and hence more efficient decision-making in health care.

NETWORK META-ANALYSIS OF MULTIPLE OUTCOMES: A SIMULATION STUDY AND APPLICATION

Achana F, Dequen P, Gray L, Cooper NJ, Abrams KR, Owen RK
University of Leicester, Leicester, UK

The usefulness of a multivariate approach to compare treatments in the context of pairwise meta-analysis has been widely demonstrated in the literature. However, this approach has not yet been considered for multiple treatment comparisons. We believe that extending such methodology to network meta-analysis (NMA) will increase the primary evidence base allowing us to compare more interventions across multiple outcomes measures. Borrowing strength between outcome measures using multivariate NMA can also potentially increase the precision of relative treatment effect estimates and reduce the impact of outcome reporting bias.**OBJECTIVES:** To extend standard NMA to incorporate multiple outcomes of interest and evaluate the use of multivariate NMA models through simulated and real datasets. **METHODS:** We developed a random effects multivariate NMA model to account for the correlation between multiple outcome measures. The potential benefits of this method were demonstrated in a simulated example comparing univariate and bivariate NMAs for continuous outcome measures. We further explored the application of our multivariate NMA model using a case study comparing anti-obesity pharmacological interventions for waist circumference, weight change and BMI change from baseline. **RESULTS:** The simulation study showed that through use of multivariate NMA the precision in mean relative treatment effects increased compared to a standard univariate NMA. This held true under multiple scenarios testing model parameters including both within- and between-outcome correlations. Similar findings were obtained from the application to the example dataset in obesity. **CONCLUSIONS:** Our method proves particularly useful in reducing uncertainty around relative effectiveness estimates when the outcomes included for analysis are highly correlated. However, the advantages of the multivariate NMA are limited where there is little correlation between outcome measures. Further work will explore the applicability of multivariate NMA methods to different types of outcomes such as binary outcome measures.

HANDLING VARIABILITY IN TIME ENDPOINTS IN MULTI-CENTRE TIME AND MOTION (T&M) STUDIES: A CASE STUDY OF ERYTHROPOIESIS-STIMULATING AGENTS FOR ANAEMIA MANAGEMENT IN 13 CENTRES IN ITALY

Kritikou P[1], De Cock E[2], Proskorovsky I[3], Payne KA[3], Tomic R[4]
[1]*Evidera, London, UK,* [2]*Evidera, Barcelona, Spain,* [3]*Evidera, Dorval, QC, Canada,* [4]*Roche S.p.A., Monza, Italy*

OBJECTIVES: In multi-centre Time and Motion (T&M) studies, time endpoints can be highly variable due to differences in centre practices. Our aim was to assess the impact of the type of analysis employed on the results of a T&M study. **METHODS:** Data from 13 centres were analyzed in relation to each of the following: drug preparation, distribution, and injection, using three methods. Base case methodology included a random intercept generalized linear mixed effect model assuming gamma distribution with log link function to account for potential centre clustering effect and non-normality of the outcome measure. The two alternative methods were: standard linear regression (assuming time data are normally distributed) and gamma regression with log link function (assuming time data are positively skewed), both of which do not account for centre clustering effect. Sample means and variability as measured by 95% confidence interval (CI)) were also compared. **RESULTS:** For the base case, mean time was 0.53 min (95% CI: 0.33-0.85) for "preparation", 0.30 min (95% CI: 0.22-0.40) for "distribution", and 0.81 min (95% CI: 0.59-1.11) for "injection". Mean time resulting from the standard linear regression was markedly higher for "preparation": 0.66 (95% CI: 0.59-0.73), and similar for "distribution" and "injection": 0.34 (95% CI: 0.30-0.37) and 0.84 minutes (95% CI: 0.79-0.88), respectively. Using the gamma regression yielded similar results to standard linear regression: 0.65 (95% CI: 0.59-0.71), 0.31 (95% CI: 0.29-0.34), and 0.83 minutes (95% CI: 0.79-0.88), respectively. The base case scenario detected a "centre-clustering" effect, hence producing substantially wider CIs compared to both alternative methods which ignore dependence in the data. **CONCLUSIONS:** Although mean task times remained relatively stable across the various methods, 95% CIs were substantially wider for random intercept model. If "centre-clustering" is detected, random effects regression models must be employed to produce valid confidence intervals around point estimates.

PRM193

BAYESIAN NETWORK META-ANALYSIS TO ASSESS RELATIVE EFFICACY AND SAFETY OF CANAGLIFLOZIN IN PATIENTS WITH TYPE 2 DIABETES MELLITUS (T2DM) INADEQUATELY CONTROLLED WITH METFORMIN

Pacou M[1], Taieb V[1], Abrams KR[2], Diels J[3], van Sanden S[4], Garg M[5], Schroeder M[6], Kaur V[7], Nielsen ATN[5], Nuhoho S[6], Neslusan C[8], Hemels M[5]
[1]*Amaris, London, UK,* [2]*The Institute of Cancer Research, Sutton, UK,* [3]*Janssen Pharmaceutica, Beerse, Belgium,* [4]*EMEA HEMAR Analytics, Janssen EMEA, Beerse, Belgium,* [5]*Janssen Cilag, Birkerød, Denmark,* [6]*Janssen UK, High Wycombe, UK,* [7]*Consultant, Mumbai, India,* [8]*Janssen Global Services LLC, Raritan, NJ, USA*

OBJECTIVES: To assess the relative efficacy and safety of canagliflozin (CANA), a sodium-glucose co-transporter (SGLT) inhibitor, as add-on to metformin, compared to sulphonylureas (SU), pioglitazone, DPP-4s, GLP-1s and dapagliflozin. **METHODS:** Bayesian network meta-analysis was conducted based on a systematic literature review described separately. Outcomes of interest included HbA1c, weight and hypoglycaemia. Networks were based on treatment- and dose-specific nodes where possible. Non-informative priors were used; selection of fixed versus random-effect model was based on DIC. Studies causing inconsistency (identified through the comparison of direct and indirect evidence in the network) were identified with a clinical expert and excluded from the base case. **RESULTS:** 25/17/7 studies reported results at 26/52/104 weeks (w) respectively. HbA1c-reduction (2) at 26w/52w was best for exenatide 2mg and liraglutide 1.8mg. CANA 300mg had a higher reduction versus DPP-4s (h=-0.11 to -0.39) and dapagliflozin 10mg (==-0.12 to -0.38) across all time points; while CANA 100mg conferred at least as large reductions (==0.01 to -0.30 and 0.00 to -0.26 respectively). The analysis at 104w was conducted based on the pooling of SUs. CANA 300mg and 100mg ranked first/second before liraglutide 1.2mg/1.8mg (s=-0.11/-0.13 and -0.02/-0.04 respectively). Both CANA doses had higher weight-reductions than SU, DPP-4s and pioglitazone, and provided reductions comparable to GLP-1s and dapagliflozin. Odds ratios for hypoglycaemia versus SU ranged from 0.03 to 0.11 for DPP-4 and SGLT. **CONCLUSIONS:** NMA of add-on therapies to metformin suggests that CANA 300mg is associated with increased HbA1c-reduction versus DPP-4s and dapagliflozin while CANA 100mg provides at least similar effects. Additionally, results suggest increasing relative efficacy of CANA over time versus liraglutide and CANA reached at least as large HbA1c reductions as liraglutide at 104w. Weight reduction was comparable to GLP-1s and substantially higher than all other classes. All classes showed significantly less risk of hypoglycaemia compared to SU.

PRM194

ESTIMATING CHRONIC DISEASE PREVALENCE FROM CLAIMS DATA: REDUCING BIAS BY ACCOUNTING FOR DISEASED INDIVIDUALS WHO DO NOT GENERATE CLAIMS

Signorovitch J[1], De G[2], Drabo E[3], Guerin A[4]
[1]*Analysis Group, Inc., Boston, MA, USA,* [2]*Analysis Group, Inc., New York, NY, USA,* [3]*University of Southern California, Los Angeles, CA, USA,* [4]*Analysis Group, Ltee., Montreal, QC, Canada*

OBJECTIVES: Claims data are often used to estimate the prevalence of chronic diseases, typically by dividing the number of patients with disease-related claims (e.g., ≥1 or ≥2 claims) by the number of studied individuals. Such estimates will have a downward bias because not all diseased patients will generate disease-related claims within their enrollment period. This downward bias can be substantial for underserved diseases that lack effective treatments. We explored whether an empirical Bayes estimator for the number of diseased individuals who do not generate claims could improve the accuracy of claims-based prevalence estimates. **METHODS:** As an example, we studied the prevalence of a rare dermatological condition without any FDA-approved therapies. After accounting for enrollment time, individuals in a large nation-wide claims database were identified as having 0, 1, 2, 3, etc., disease-related claims. These counts were modeled using a mixture of Poisson distributions, with an unknown mixing distribution. Empirical Bayes approaches, which are frequently used to estimate numbers of unobserved species in ecological experiments, were used to estimate the number of diseased individuals without claims, and to provide adjusted prevalence estimates. **RESULTS:** Out of over 4 million individuals with at least one year of continuous enrollment, n=2,026 had disease-related claims, comprised of n=1,422 with one claim, n=317 with two claims, n=134 with 3 claims, etc. The traditional method for estimating prevalence identified 4.9 cases per 10,000 persons. After applying the empirical Bayes approach, the estimated prevalence increased to 7.9 cases per 10,000 persons, and became closer to published prevalence estimates based on non-claims data sources. **CONCLUSIONS:** In this example application, prevalence estimates based on claims data were increased by over 60% by using empirical Bayes approaches to account for large numbers of diseased individuals who did not generate claims. The increased prevalence estimates were more consistent with the published literature.

PRM195

APPLICATION OF COPULAS IN ECONOMIC EVALUATION

Crespo C[1], Monleon A[1], Díaz W[2], Rodriguez C[1], Brosa M[3], Rios M[1]
[1]*University of Barcelona, Barcelona, Spain,* [2]*Universidad de Antioquia, Medellin, Colombia,* [3]*Oblikue Consulting, Barcelona, Spain*

OBJECTIVES: To analyse the applicability of copulas distribution in economic evaluation. **METHODS:** We have analyzed data from an observational prospective study of patients with allergic rhinitis in Spain (n=498). Main data were direct cost (€2012) and Health Related Quality of Life (SF-12). We have calculated the goodness of fit for copulas (Gumbel copula, Clayton Copula, Frank Copula, Normal Copula, Plackett Copula and T copula) based on the empirical process comparing the empirical copula with a parametric estimate of the copula derived under the null hypothesis. We have used inversion of Kendall's tau method to fit copulas. A multivariate independence sample was generated to compare with copulas results. This process was replicated for a 100 times to obtain p-values by bootstrap method. **RESULTS:** Marginal distribution of direct cost was a 3-parameter Gamma distribution (shape=1.856, scale=0.00324, location=10.97). Marginal distribution of Health Related Quality of Life was associated to a 1- gamma (shape 2.9253 and scale 0.16104). P-value range were 0.093 to 0.144 for independent distribution, 0.004 to 0.031 for Gumbel copula, 0.246 to 0.522 for Clayton Copula, 0.545 to 0.814 for Frank Copula, 0.463 to 0.716 for Normal Copula, 0.373 to 0.628 for T Copula and 0.549 to 0.847 for Plackett Copula. Frank Copula and Plackett Copula had the best goodness of fit. Kendall's Tau for Fran Copula showed a correlation of -0.4212. **CONCLUSIONS:** Copulas distribution allows us to adjust better the non-lineal relation between cost and effectiveness. Furthermore, this kind of approach could improve probabilistic sensitivity analyses.

PRM196

VALIDATION OF DISEASE STATES IN SCHIZOPHRENIA: COMPARISON OF CLUSTER ANALYSIS BETWEEN THE UNITED STATES AND EUROPEAN POPULATIONS

Thokagevistk K[1], Millier A[2], Lenert L[3], Sadikhov S[4], Moreno S[4]
[1]*Creativ-Ceutical, Chicago, IL, USA,* [2]*Creativ-Ceutical, Paris, France,* [3]*University of Utah School of Medicine, Salt Lake City, UT, USA,* [4]*F. Hoffmann-La Roche Ltd., Basel, Switzerland*

OBJECTIVES: A set of disease states for patients with schizophrenia was previously published using a statistical clustering method, applied to Positive and Negative Syndrome Scale (PANSS) data from US patients. While factor analyses of the PANSS have shown remarkable stability of the structure across international populations, it is unknown whether similar multidimensional disease states would also be stable. Using data from the European Schizophrenia Cohort (EuroSC), a 2-year observational study in 1,208 schizophrenia patients, we examined the factor structure of the PANSS and identified disease states using the same clustering method as previously. **METHODS:** A principal component analysis (PCA) was conducted using the Kaiser criterion and varimax rotation on PANSS items, followed by a *k*-means cluster analysis on PANSS scores for items most strongly correlated with the PCA domains. For each cluster, a level (low, moderate, high) was assigned to each domain based on the cluster centres values. Kappa statistics were used to measure the agreement in assignment between the published and the derived states sets. **RESULTS:** Five factors accounting for 56% of total variance were obtained from the PCA (positive symptoms, negative symptoms, cognitive impairment, mood disorder, and hostility). As in the analysis of patients in the initial US study, rates of change in root mean squared distance became small after six clusters. When assigning the two sets of states based on levels of positive, negative, and cognitive impairment, the simple, Cicchetti-Allison, and Fleiss-Cohen weighted Kappa statistics (95% CI) were, 0.418 (0.401-0.435), 0.568 (0.553-0.584), and 0.692 (0.676-0.709), respectively. **CONCLUSIONS:** The factor structure, number of discrete states, and combinations of levels of symptoms in states were similar in US and European populations. Resulting moderate-to-substantial agreement in assignment suggests that disease states obtained using *k*-means clustering from the PANSS generalise across international populations.

PRM197

EVALUATING OVERALL SURVIVAL IN ONCOLOGY TRIALS WITH SUBSEQUENT THERAPIES: A METHODOLOGICAL REVIEW AND APPLICATION IN NON-SMALL CELL LUNG CANCER

Jonsson L[1], Fleischer F[2], Bluhmki E[2], Griebsch I[2]
[1]*OptumInsight, Stockholm, Sweden,* [2]*Boehringer Ingelheim Pharma GmbH, Ingelheim am Rhein, Germany*

OBJECTIVES: The use of subsequent therapies has the potential to confound assessment of overall survival (OS) in oncology trials, in particular for trials in early lines of therapy and for malignancies with several registered or investigational treatment options. Standard intent-to-treat analysis is biased, since treatment choices are likely to be influenced by events associated with mortality risk, such as disease progression. We review and compare available statistical methods to obtain unbiased estimates of OS effects in presence of subsequent therapies. **METHODS:** Marginal structural modeling methods include inverse-probability of censoring weighting (IPCW) and inverse-probability of treatment weighting (IPTW). These methods explicitly model both treatment choices and effects of treatments on mortality. Rank-preserving structural failure time models (RPSFT) instead depend on parametric assumptions regarding the effect of investigational and subsequent therapies on survival, and require non-standard estimation methods such as G-estimation or iterative parameter estimation (IPE). We compare the results with the different methods with data from the Lux Lung 1 trial of the tyrosine kinase inhibitor afatinib in non-small cell lung cancer. **RESULTS:** IPCW and IPTW require detailed information on covariates that influence treatment choices and are sensitive to model misspecification. RPSFT may not yield a single estimate of treatment effects due to limitations of the G-estimation procedure. All methods were consistent with a potential OS benefit from afatinib, but the hazard ratio varied from 0.583 (p=0.038) with the pre-specified IPCW method to 0.894 (0.281) with RPSFT/IPE. **CONCLUSIONS:** The proposed methods for obtaining unbiased OS estimates in presence of subsequent therapies rest on assumptions that cannot be tested empirically. There is currently no accepted standard method; pre-specification of model choice is of importance as well as testing alternative methods. Care should be taken to avoid unbalance in subsequent therapy and to record specific information on administered treatments with potential OS effects.

PRM198

QUANTIFYING HEALTH CARE EFFICIENCY: A REVIEW OF PUBLISHED TIME AND MOTION STUDY DESIGN PARAMETERS REFERENCED IN PUBMED BETWEEN 2008-2013

Kritikou P[1], Bassel M[2], De Cock E[3], Payne KA[2]
[1]*Evidera, London, UK,* [2]*Evidera, Dorval, QC, Canada,* [3]*Evidera, Barcelona, Spain*

OBJECTIVES: To review design characteristics of T&M studies applied to health care, with a focus on choice of study design, statistical methodology, and handling of multi-centre data. **METHODS:** A PubMed search was performed using key search terms including "time and motion" (MeSH Term) AND any of the following: cost (analysis), (health) economics, observation(al), and prospective. Articles (English; 2008 or later) were selected based on the following criteria: (1) observational study using T&M methodology; and (2) task-based data collection. Studies that measured broad aggregate health care professional tasks/hospital workflows, in the absence of task- or event-specific timings, were excluded. **RESULTS:** Of 191 identified abstracts, 151 were excluded during screening; upon review, 21 of 40 remaining were retained for detailed assessment. Half (48%) were applicable to Europe, of which 2 were multi-country studies. Medical interventions studied were: drug (48%), diagnostic process (14%), medical procedure (24%), and IT systems to improve clinical management (e.g. EMR) (14%). The majority (86%) of studies were hospital-based, 86% were observational, and 14% employed hybrid methods, including chart review or survey. Only 20% used independent observers. Three quarters (76%) reported descriptive statistics. Of 9 multi-centre studies, one used a random effects regression model to account for "centre clustering", and 8 reported pooled data (3 of which used a "mean of centre averages" approach). Eleven studies (52%) compared two groups, of which 3 applied an analytical design aiming to defect statistical differences, and 2 reported a sample size calculation. **CONCLUSIONS:** This review of T&M studies revealed that descriptive designs are most common (analytical designs using power calculations seem rare). Multi-centre comparator studies rarely use random effects regression models to account for "centre clustering", though considered the method of choice to produce valid confidence intervals around point estimates. In general, statistical methodology is scarcely reported, affecting overall study credibility.

PRM199

THREE TOOLS TO REDUCE THE IMPACT OF COMMON DECISION-MAKING BIASES WHEN CONSIDERING SUBGROUP ANALYSES

Hawkins N[1], Fletcher CA[2]
[1]*Oxford Outcomes Ltd., Oxford, UK,* [2]*Amgen Ltd., Cambridge, UK*

OBJECTIVES: Subgroup analyses of randomized trial data are performed to provide estimates of average treatment effects for patients with specific characteristics. They inform adoption and re-imbursement decisions by identifying groups of patients with favourable risk-benefit or cost-effectiveness ratios. They may also inform decisions regarding the conduct and design of future clinical studies. However, subgroup analyses are essentially observational (patients are not randomized between subgroups) and there is a risk that the differences observed between subgroups may be due to chance rather than reflecting true effects. This risk is exacerbated as typically the same data are used to both select relevant subgroups and to estimate subgroups effects leading to biased estimates and underestimation of uncertainty. This tendency increases as the number of subgroups tested increases. A number of measures are recommended to reduce the risk of bias including: pre-specification, consideration of biological plausibility, and correction of inference for multiple testing. However, the risk of bias is not obviated by pre-specification, correction for multiplicity may lead to discounting of true subgroup effects, and biological plausibility may not be a particularly specific test. In addition, common cognitive and process biases associated with decision-making such as the action imperative, optimism bias, anchoring, and group think may further lead to the inherent uncertainty in subgroup analyses to be effectively underestimated. **METHODS AND RESULTS:** We demonstrate three techniques that may help to counteract these biases: graphical inference methods clearly illustrate the inherent uncertainty in subgroup analysis; Bayesian shrinkage estimation can reduce the effect of anchoring on the observed subgroup effects and encourage consideration of regression to the mean; and reframing exercises (for example, considering the credibility of biological plausibility arguments as if they had been mooted *a priori*) may counter optimism bias. **CONCLUSIONS:** These techniques are illustrated using a published subgroup analysis from the PLATO trial (NCT00391872)

PRM200

PARAMETER IMPORTANCE ASSESSMENT IN A HEALTH ECONOMIC EVALUATION MODEL FOR HEART FAILURE

Cagdas Buyukkaramikli N
Technical University of Eindhoven and Contemporary Analytics, Eindhoven, The Netherlands

OBJECTIVES: Along with uncertainty around the parameters and the initial parameter value assumptions used in health-economic evaluation models, an analysis of the uncertainty around the model inputs/outputs is essential. Parameter importance analysis (PIA) provides an explicit framework to quantitatively identify the contribution of each uncertain input to the output uncertainty. There are several methods available to be used in PIA. The objectives of this research were to investigate different PIA methods with the pros and cons of each method and identify the most robust method with respect to different initial parameter value assumptions. **METHODS:** A health economic model for heart failure is developed to serve as a basis to implement different PIA methods. Six alternative methods are applied: One-way sensitivity analysis, rank correlation analysis, analysis of covariance (ANCOVA), dominance analysis, standardized regression analysis and expected value of perfect parameter information (EVPPI) analysis. Initial parameter assumptions are varied and the robustness of each method is assessed with respect to how close the parameter importance rankings are with different initial parameter assumptions. **RESULTS:** Each technique/initial parameter values' assumption combination generates a different ranking for the importance of the parameters that explain the uncertainty around the expected net monetary benefit with £20,000/QALY. EVPPI is the most robust method with respect to different initial parameter assumptions. However it is the most demanding method in terms of computation time. On the opposite side, one-way sensitivity analysis is the least computation time demanding method; however the importance rankings are very susceptible to change with different initial assumptions. Other Monte-Carlo simulation based methods (e.g. ANCOVA, dominance, standardized regression and rank correlation analysis) are alternative PIA methods, which generate rather robust rankings with different initial parameter assumptions. These alternative methods require substantially less computation times compared to EVPPI with high consistency and robustness to different initial value assumptions.

PRM201

ADJUSTING FOR TREATMENT SWITCHING IN CLINICAL TRIALS WHEN ONLY SUMMARY DATA ARE AVAILABLE – AN EVALUATION OF POTENTIAL METHODS

Boucher R[1], Abrams KR[1], Crowther MJ[1], Lambert PC[1], Wailoo AJ[2], Latimer NR[2]
[1]*University of Leicester, Leicester, UK,* [2]*University of Sheffield, Sheffield, UK*

OBJECTIVES: Treatment switching is an important problem in Health Technology Assessment (HTA), particularly in oncology, which can often bias trial results. Although a variety of statistical approaches have been advocated for adjusting trials subject to treatment switching these all assume that Individual Patient Data

(IPD) is available. In many situations, especially when Indirect Comparison (IC) methods are required to estimate head-to-head effects, it is often the case that IPD is only available for one trial, and summary data for the other. A variety of potential methods are evaluated for the adjustment of such summary data using simulation methodology. **METHODS:** A review of HTA submissions to NICE in which both ICs were used and in which trials were subject to treatment switching was undertaken. A series of simulation studies were undertaken to assess the potential level of bias associated with the methods that are most commonly used for the analysis of such trials. Two broad approaches to adjusting summary data for treatment switching were then evaluated on the simulated data – calculation of Adjustment Factors (AFs), and re-creation and analysis (including bootstrapping) of IPD using scanned survival curves. **RESULTS:** The most commonly reported methods of analysis for studies only presenting summary data were Intention-to-Treat (ITT) and Per Protocol (PP) analyses. Results from the simulation studies indicated that these may be subject to between 0.5% and 140% levels of bias depending on trial characteristics, and that the use of AFs or re-created IPD had potential scope for reducing this. **CONCLUSIONS:** Treatment switching can be associated with considerable levels of bias, and methods for adjusting using summary data, can go some way to compensating for this when IPD is not available as is often the case in Indirect Comparisons (IC). Further extension to a Network Meta-Analysis (NMA) setting is under investigation.

PRM202

MULTIPLE IMPUTATION TECHNIQUES FOR SURVEY DATA WITH MULTIPLE RATING SCALES

Plumpton CO[1], Hughes DA[1], White IR[2]
[1]*Bangor University, Bangor, UK,* [2]*MRC Biostatistics Unit, Cambridge, UK*

OBJECTIVES: Large scale survey data presents a number of challenges to imputation, not least the high number of variables and complexity of the data set. Data may suffer from sparsity in responses, and some questions may be conditional upon previous responses. In addition, survey data commonly contain results from multiple rating scales, which are summed (either directly or weighted) during analysis. We aim to develop a method for the multiple imputation of missing data from complex surveys. **METHODS:** We propose an adaptation of multiple imputation for survey data which contains multiple rating scales, whereby scale summary scores are used within the prediction models. The method is applied to data gathered from a large multinational survey, with data sets from 9 countries. Analysis uses a logistic regression model on each of the 9 data sets, and results are compared from a complete case analysis approach with those from multiple imputation. **RESULTS:** The proposed approach reduces the size of the prediction models from 135 predictors to a maximum of 72. Distributions of imputed data are seen to be consistent with observed data. Results from the regression analysis with multiple imputation are similar to, but show lower standard errors than, results for complete case analysis; for the same regression models a 39% reduction in the standard error is observed. **CONCLUSIONS:** Our adaptation makes multiple imputation practical for large scale survey data with multiple rating scales. For the data considered, analysis of the multiply imputed data shows greater power and efficiency than complete case analysis. The adaptation of multiple imputation makes better use of available data and can yield substantively different results from simpler, less valid techniques.

PRM203

STRUCTURAL FAILURE TIME MODELING OF OVERALL SURVIVAL EFFECTS IN ONCOLOGY TRIALS WITH SUBSEQUENT THERAPIES

Jonsson L[1], Fleischer F[2], Bluhmki E[2], Griebsch I[2]
[1]*OptumInsight, Stockholm, Sweden,* [2]*Boehringer Ingelheim Pharma GmbH, Ingelheim am Rhein, Germany*

OBJECTIVES: Subsequent therapies can confound the evaluation of overall survival (OS) in oncology trials. We evaluated the application of rank-preserving structural failure time modeling for the estimation of OS effects in presence of subsequent therapies through Monte Carlo simulations. Results were demonstrated for a clinical trial: the Lux Lung 1 study of afatinib vs. placebo in non-small cell lung cancer. **METHODS:** In accelerated failure time models, covariates are assumed to affect survival times rather than hazard rates. Counterfactual survival times can therefore be computed, i.e. how long patients would have survived without the investigational or subsequent therapies. The parameters of structural failure time models can be obtained by G-estimation, whereby counterfactual survival times are calculated with hypothetical treatment effects and OS is compared between treatment arms. The G-estimate is the set of hypothetical effects that generate the most similar survival in both study arms. Branson & Whitehead (2002) developed an alternative estimation method for trials with cross-in from placebo to active treatment based on iterative parametric regressions; we extend this framework to the application with subsequent therapies. **RESULTS:** Simulation showed that standard methods are biased in the presence of subsequent therapies affecting overall survival. This includes intent-to-treat analysis, censoring at start of subsequent therapies and subgroup analysis in patients never receiving subsequent therapy. G-estimation often failed to identify parameter values when more than one treatment effect was included in the model. Iterative parameter estimation produced unbiased estimates in simulation studies and predicted a small numeric but non-significant survival benefit of afatinib. **CONCLUSIONS:** Structural failure time models can be useful to obtain unbiased estimates of OS in presence of subsequent therapies. However the assumption of proportionality in survival times cannot be tested empirically and non-standard estimation procedures are required.

PRM204

THERE IS MORE TO DECISION MAKING THAN COSTS AND EFFECTS: HANDLING PRACTICAL CONSTRAINTS IN THE VALUE OF INFORMATION FRAMEWORK

Koffijberg H, Janssen M
University Medical Center Utrecht, Utrecht, The Netherlands

OBJECTIVES: Whether new medical technology is implemented may depend on the balance between costs and effects, but also on practical constraints. Examples are a fixed health care budget and a maximum clinically acceptable risk of adverse events. However, the impact of compliance with such constraints cannot be handled explicitly in the current value of information (VOI) framework. Our objective was to demonstrate proper handling of constraints by extending the VOI framework through separation of cost, effect, and constraint components. **METHODS:** The proposed VOI extension was investigated in a simulation study comparing two hypothetical drugs and their side effects. The VOI extension was also applied to a clinical study concerning the cost-effectiveness of carotid intima-media thickness measurements to improve treatment guidance of patients at high risk of cardiovascular disease. Results of the standard VOI analysis, considering only costs and effects, were compared with results from the extended VOI analysis explicitly considering constraints. **RESULTS:** Standard VOI results may under- or overestimate the value of additional research compared to extended VOI results. In our clinical example, with penalties of $2 and $5 per dollar budget exceedance, standard values for the Expected Value of Perfect Information (EVPI) of $24, and $1,490 were found, with corresponding values of $239, and $565 for the extended EVPI. Ignoring the budget constraint in the standard EVPI analysis therefore resulted in a underestimation of $214 ($2 penalty) and an overestimation of $925 ($5 penalty) of the EVPI per patient. **CONCLUSIONS:** When decision-maker's criteria go beyond costs and effects, standard VOI results may not reflect the actual value of additional research accurately and may therefore jeopardize optimal research prioritization. Determination of the extended VOI, through separation of cost, effect, and constraint components, is straightforward and can support optimal research prioritization regardless of the complexity of the decision criteria considered.

PRM205

MEASURING TREATMENT EFFECTS ON RARE EVENTS USING META-ANALYSIS: AN ASSESSMENT OF EXISTING METHODS

Jamotte A, Roïz J
Creativ-Ceutical, London, UK

OBJECTIVES: Meta-analysis combines results from independent studies to produce robust statistical estimates. This technique is widely used in health care to synthesise treatment effects from clinical studies. However, when dealing with rare events such as rare adverse events, existing meta-analysis methods might not produce good treatment effect estimates, especially when there is no event occurrence in one or both arms of a study. The objective of this study is to compare the performance of various methods in estimating effect size for rare events. **METHODS:** An assessment of meta-analysis methods providing pooled odds-ratios as effect size estimates was conducted for different scenarios. The Inverse Variance Weighted, Peto, Mantel-Haenszel and logistic methods were assessed, with constant, "treatment arm" or empirical continuity corrections added when needed. The scenarios were created using different values of odds-ratio, baseline risk, and group imbalance. For each scenario 5,000 simulations of 10 studies were generated using R software. Coverage, bias and statistical power were used to compare the methods. **RESULTS:** The most commonly used continuity correction is outperformed in every scenario by the two other corrections. The inverse variance method, most commonly used in meta-analysis, performs poorly when the event probability is smaller than 0.10: it is not recommended for sparse data. Peto's method performs well in some scenarios but leads to biased results with high odds ratios and high imbalance. The logistic method is highly biased when baseline risk is low and true odds ratio is high. Under other scenarios it performs well but is most often outperformed by other methods. The Mantel-Haenszel method with empirical correction performs constantly well over the scenarios. **CONCLUSIONS:** These findings may be used to develop guidelines on when to use which method for conducting meta-analysis with rare events. Next steps will be to assess the use of mixed models and Bayesian techniques.

PRM206

METHODOLOGY FOR ESTABLISHING INTERNAL AND EXTERNAL VALIDITY WHEN PROPENSITY SCORE MATCHING IS USED

Eisenberg D[1], Wasser T[1], Placzek H[2], Luthra R[1]
[1]*HealthCore, Inc., Wilmington, DE, USA,* [2]*HealthCore, Inc., Andover, MA, USA*

OBJECTIVES: Propensity score matching (PSM) is an approach commonly used when treatment and control groups are thought to be different on key study variables. When the control group is larger than the treatment group, (as large as 20:1) a good match might be easy to obtain. However, differences may exist between the matched controls and the unmatched controls, indicating poor generalizability of study results. **METHODS:** Groups for the analysis are the unmatched controls (UM), the matched controls (MC) and the treatment cohort (TRT). Analysis methods for these groups in a fully crossed method and interpretation of the results will determine internal (IV) and external validity (EV). Analysis comparing the groups against the outcomes variable will determine if variables need to be controlled for in models that may be developed. **RESULTS:** After the PSM is conducted MC and TRT groups should be compared on the matched variables. Differences at this stage would indicate a poor match and a low level of IV. MC and UM should also be compared on the variables used for matching, as well as the outcome variables of interest. Significant differences on the matched variables would indicate low EV and poor generalizability of results, while differences of MC and UM groups and UM and TRT groups on the outcome variables would indicate that statistical models would need to address covariates as potential confounding effects would be present. Analysis methods can be fit statistics (chi-square or equivalence tests) or typical inferential methods with adjusted p-values greater than 0.05. **CONCLUSIONS:** It is important that research studies maintain good IV and EV. This is often complicated in research where the controls vastly outnumber the treatment group. Proper statistical analysis can go a long way to test and clarify data to make the results as meaningful as possible.

PRM207
NOVEL USE OF MULTIVARIATE JOINT MODELLING TO IDENTIFY PATIENT LEVEL FACTORS ASSOCIATED WITH TREATMENT FAILURE – EXAMPLE OF BOTOX TREATMENT FOR PATIENTS WITH OVERACTIVE BLADDER
Owen RK, Crowther MJ, Tincello DG, Abrams KR
University of Leicester, Leicester, UK
Detrusor overactivity (DO) is characterised by the symptoms of overactive bladder (OAB) including incontinence, urgency, and voiding episodes; though, identification of a cardinal symptom still remains unclear, where treatment efficacy is often evaluated across multiple outcomes. As a result, ascertainment of the most patient impacting symptom is crucial. Joint modelling allows us to evaluate the association between surrogate outcome measures such as patients' symptom profiles and time to perceived treatment failure. **OBJECTIVES:** To determine the most associated OAB symptom with patients' perceived time of treatment failure using a novel application of a joint modelling framework. **METHODS:** To account for the potential correlation between symptoms, we applied a joint model of multivariate longitudinal and time-to-event data to a randomised clinical trial of patients receiving botulinum toxin for DO. We investigate the association of incontinence, urgency and voiding episodes collected at baseline, 6 weeks, 3 months, and 6 months, on patients' perceived time of treatment failure. **RESULTS:** The multivariate joint model was applied to 122 patients (270 data points) with 69 (56.6%) patients reporting treatment failure. The results identified urgency as the most impactful surrogate measure on patients' perceived time of treatment failure, with an estimated hazard ratio of 1.26 (95% CI: 0.97 to 1.64) for every additional urgency episode. Incontinence, voiding episodes and the interaction between symptom measures had a non-significant association. However, in this example, sensitivity to the model choice produced inconsistent estimates due to the limited nature of the data set and therefore results should be interpreted cautiously. **CONCLUSIONS:** This approach illustrates the advantage of applying a joint modelling framework to identify symptoms most associated with time to treatment failure. With an increasing need to identify and assess core symptoms for varying medical conditions, the novel use of a joint modelling approach would appear to be extremely promising.

PRM208
USING MULTI-CRITERIA DECISION ANALYSIS TO SUPPORT ALLOCATION DECISIONS IN LARGE TRANSLATIONAL RESEARCH PROJECTS
De Graaf G, Postmus D
University of Groningen, University Medical Center Groningen, Groningen, The Netherlands
OBJECTIVES: Large translational research projects often have abstract objectives, such as reducing the burden of disease and health care costs from type-2 diabetes (T2DM). Such an abstract objective entails: i) a very large number of possible strategies to reach the objective and ii) a lack of detailed data and high levels in uncertainty. Currently, no methods to support project selection and resource allocation decisions in such a setting are available. **METHODS:** As a case study, we supported a resource allocation decision for the remaining funds in a large Dutch translational research consortium with the aforementioned objective, and compared the results to the decision made at the start of the project. We used the problem structuring, model building methods from multi-criteria decision analysis to identify four different alternative research strategies, and a set of evaluation criteria. Consequently, we used a combination of judgment from experts involved in the project and previously published data on the burden of disease and health care costs to evaluate the alternatives. Finally, a decision analysis was performed using Stochastic Multicriteria Acceptability Analysis for ordinal data (SMAA-O), which allows for the combined use of quantitative and qualitative (ranked) data. **RESULTS:** Using our method, it was decided to allocate remaining resources to the identification of biomarkers and development of technologies that can be used in the prevention of macrovascular complications in T2DM patients. This decision differed from the one made at the start of the project, which was not supported by any formal decision analysis. **CONCLUSIONS:** Our study shows that our method using SMAA-O can be a practical and valuable tool to support decisions on the allocation of research funds within large translational research consortia.

PRM209
CONFRONTING HETEROGENEITY: USING SYSTEMATIC REVIEW EFFECTIVELY FOR META-ANALYSIS
Quigley JM, Woods B, Thompson J, Bryden PA, Scott DA
Oxford Outcomes Ltd., Oxford, UK
OBJECTIVES: The pooling of treatment effects estimated from several trials via meta-analysis or network meta-analysis can be confounded by differences across studies; however, advanced methodologies are available to address many of these issues. Systematic reviews of interventions typically generate a large volume of data and lead to assimilation of a large amount of knowledge by the reviewers. Identifying key variances between trials can be difficult and important nuances can be missed by a meta-analyst. We have designed a novel checklist that highlights key areas of heterogeneity to be considered when designing and undertaking meta-analysis. **METHODS:** It is important to identify differences early on; hence we have developed a checklist that can be applied to the results of a systematic review of randomised controlled clinical trials. Components of the checklist fall into four domains where heterogeneity may be present: population, interventions, outcomes, and risk of bias. Sections documenting the feasibility of network meta-analysis and recommendations for analysis design are also included. The checklist has been retrospectively applied to a recent NICE technology appraisal; percutaneous vertebroplasty and percutaneous balloon kyphoplasty for the treatment of osteoporotic vertebral compression fractures (TA279). **RESULTS:** The checklist identified the following sources of heterogeneity in the nine included studies: inclusion criteria, endpoint definitions, endpoint reporting, presence of cross-over, differences in interventions, risk of bias; and within-trial imbalances in baseline characteristics. The checklist suggests that a quality network meta-analysis of this data should exclude one study with high risk of bias, avoid grouping sham procedures and optimal pain management, and control for baseline pain-score to address imbalance across arms. Meta-regression to control for differences in endpoint definitions or inclusion criteria would likely have been infeasible given the low number of studies. **CONCLUSIONS:** Applying the checklist improved our ability to identify sources of confounding to be addressed or highlighted as caveats in a meta-analysis.

PRM210
IMPLEMENTATION OF INTERNATIONAL CHART REVIEW STUDIES: AN ASSESSMENT OF KEY DESIGN AND OPERATIONAL CONSIDERATIONS FOR SUCCESSFUL CONDUCT
Jean-Mary J[1], Stein D[2], Payne KA[2]
[1]*Evidera, Hammersmith, UK,* [2]*Evidera, Dorval, QC, Canada*
OBJECTIVES: There is an increased need to conduct international chart review studies (chart reviews) since health care databases with required information are not consistently available. Chart reviews offer an alternative for the effective capture and analysis of real-world patient-level data on patient characteristics and outcomes, treatment patterns, treatment effectiveness and safety. For successful implementation, awareness of significant multi-national design and operational considerations is necessary. **METHODS:** A critical review of 13 recent chart reviews conducted in Europe and North America on treatment patterns, clinical outcomes and/or drug utilization and safety was undertaken. Design and operational challenges, opportunities, and learnings are delineated. **RESULTS:** All studies collected data retrospectively. Two studies collected certain information prospectively. Four studies were categorized as post authorization safety studies. Therapeutic areas varied across the studies with 8 studies being in oncology. Sample size ranged from 20-2,000 patients, number of countries ranged from 1-6, and number of sites ranged from 4-375. All studies included at least 1 European country. Across studies, key design considerations include confirming the eligibility and study periods that permit evaluations of recent care patterns yet allow for sufficient follow-up time, case ascertainment and sampling frame methodologies, and safety reporting in the context of retrospective source data. Additionally, key operational considerations include balancing science and practicality in site selection, ambiguous multinational ethical/regulatory requirements, country variations for informed consent, data collection designed to minimize site burden, and effective yet cost-efficient site management for quality data. **CONCLUSIONS:** International chart reviews are proving to be an effective methodology for capturing tailored, patient-level data. These studies can be used to address a myriad of research objectives. Through conduct and assessment of recent chart reviews, the design and operational considerations involved can be understood with opportunities for improvement learned. These lessons will help for better planning and overcoming these challenges.

PRM211
GENERATING AND MAINTAINING MOMENTUM IN POST-AUTHORISATION STUDIES
Vinken A[1], Lis Y[2], Coward G[2]
[1]*PAREXEL International, Amsterdam, The Netherlands,* [2]*PAREXEL International, Uxbridge, UK*
OBJECTIVES: Some observational studies fail to gain momentum while others move smoothly to successful completion. This study set out to determine which factors drive physician motivation in prospective observational studies. **METHODS:** A web based survey was designed using input from structured literature review, investigators and experienced observational study researchers. It comprised 35 questions covering: Scientific and clinical factors (7), Study requirements (11), Operational considerations (6), Financial and legal considerations (4), Personal and professional factors (7). Respondents were asked to rate factors on a scale -5 to +5 (+5 represented very motivational and -5 very de-motivational). Free form comments were also invited. The survey was e-mailed to investigators (n=1160) identified from Citeline® as having performed both prospective observational studies and clinical trials in the last 5 years. **RESULTS:** Overall response was 15% (n=174), Europe (55%) and North America (45%) covering Community care (34%), University hospitals (29%), General hospitals (24%) and dedicated research facilities (13%). Most respondents had experience of >5 clinical trials in the last 5 years (81%) but fewer had similar experience with observational studies (40%). Responses indicate that not all physicians are equally motivated by the same factors. However most important motivational factors were in the scientific and clinical, financial and legal domains including studies which advance medical knowledge and / or patient management and acceptable honoraria. Less important factors were in the personal and professional domain including opportunities to speak at conferences or publish the data. Investigators more experienced in observational research placed greater motivational value on advancing medical knowledge and/ or patient management than less experienced colleagues. **CONCLUSIONS:** The findings provide good insight into which factors really motivate physicians and more customised motivational approaches are likely to minimise study risks. Further sub analyses of the survey data may identify more detailed strategies to pursue.

PRM212
RESEARCH IN HAEMOPHILIA B – STUDIES IN A RARE DISEASE IN TIMES OF REQUIREMENTS FOR HIGH EVIDENCE LEVELS
Schopohl D[1], Berger K[1], Schramm W[2]
[1]*University Hospital of Munich, Muenchen, Germany,* [2]*Rudolf-Marx-Stiftung, Bluterbetreuung Bayern, Muenchen, Germany*
OBJECTIVES: Haemophilia B (HB), a rare disease, occurs in approximately 1:30,000 males and requires individualized therapy with factor IX (FIX) concentrate. Payers in European countries request studies with high levels of evidence for decision making. The objective was to determine the status quo of current studies concerning HB, new FIX products and new therapeutic modalities regarding clinical and real-life evidence. **METHODS:** A systematic literature research was conducted

in EMBASE and MEDLINE, search terms ‚hemophilia B' and ‚FIX'. Inclusion criteria: journal articles (JA), conference abstracts (CA), English language, published between January 2009 and March 2013, studies only. Screening of titles, abstracts and full texts was performed subsequently. Registered trials (RT) concerning HB or FIX were identified in ClinicalTrials.gov. Analysis comprised age group, sponsor, research topic, recruitment status, and study design. **RESULTS:** Screening of 1,639 hits yielded 31 JA describing 35 studies, and 62 CA. FIX was the topic of 21 studies (60.0%) and 29 CA (46.8%). A total of 7 studies focused on various aspects of HB, 6 on haemophilia studies with separate data on HB. Gene therapy was the main focus of 2 JA and 11 CA (17.7%). Screening of 173 hits from ClinicalTrials.gov yielded 47 RT, 42 unpublished. Overall 32 unpublished RT (76.2%) concerned FIX, and 4 (9.5%) gene therapy. Randomized study design was described in one study (2.9%) and 4 RT (9.5%), and 3 studies (8.6%) and 7 RT (16.7%) were prospective observational comparative. **CONCLUSIONS:** Randomized study design or comparator arms were uncommon, and payers' requirements for evidence were not met. Therefore, randomization, comparison to standard of care and documentation of outcome should be discussed. Development of refined statistical methods and exploitation of complementary data like real-life data may help to fill actual evidence gaps in rare diseases.

PRM213

THE ROLE OF DSM IN THE EMA AND FDA AUTHORIZATION PROCESS FOR PSYCHIATRIC DRUGS

Meyers OI

Truven Health Analytics, Cleveland, OH, USA

OBJECTIVES: In May 2013, the American Psychiatric Association released the fifth edition of the Diagnostic and Statistical Manual of Mental Disorders (DSM-5). This is significant for clinicians, researchers, and developers of psychopharmacologic drugs. The previous version of the DSM, the DSM-IV-TR, was published in 2000 and the last time the diagnostic criteria were revised was in 1994, when the DSM-IV was published. The objective of this review was to determine how much of a role DSM has played in the drug approval process in Europe and the US. **METHODS:** For drugs authorized since 2000, summaries of product characteristics (SPCs; EMA) and approved labels (FDA) were reviewed to determine how frequently the DSM is mentioned in the "clinical particulars" or "indications" sections and how frequently DSM criteria are mentioned in the clinical trials sections of the SPCs or labels. The review focused on schizophrenia and psychotic disorders, mood disorders, and for the FDA, attention-deficit/hyperactivity disorder as well. **RESULTS:** For EMA-authorized products, 8 EPARs met the criteria with 10 indications in total. The DSM was never mentioned in the indications or posology sections, but in 7 (70%) of the descriptions of pharmacodynamic properties (section 5.1), DSM criteria were cited as the study inclusion criteria. For FDA-approved products, 17 labels with 22 indications met the review criteria. The DSM was mentioned in 10 of the indications sections (45%) and DSM criteria were cited as inclusion criteria in 20 instances (91%). **CONCLUSIONS:** Regulators in Europe and the US rely heavily on DSM diagnostic criteria, in the sense that these often serve as inclusion criteria for pivotal clinical trials. Given significant changes to the criteria in many diagnostic categories, regulators and sponsors need to familiarize themselves with the document and evaluate their use of DSM criteria going forward.

PRM214

PODCASTS AS A LEARNING TOOL IN A RESEARCH METHODS COURSE FOR PHARMACY STUDENTS

Nguyen TL, Lovett AW, Lundquist LM, Bonner CL

Mercer University College of Pharmacy and Health Sciences, Atlanta, GA, USA

OBJECTIVES: Podcasts (recorded lectures) can be beneficial for all students, particularly English as a second language students who face language barriers when learning in another language. There is limited study on pharmacy student perceptions and podcasts, none from an international perspective. The primary objective was to describe pharmacy students' perceptions on the usefulness of podcasting and a secondary objective was to compare perceptions between native versus non-native English speakers in a pharmacy research course. **METHODS:** All first year pharmacy students (n=157) attending a Research Methods course in 2012 were invited to participate in a survey, which utilized a 4-point Likert Scale (1= strongly disagree, 2=disagree, 3=agree, and 4=strongly agree). Podcasts covered all course topics such as Applied Statistics, Odds Ratio and Relative Risk, Case Reports, Observational Studies, Randomized Controlled Trials, and Economic Evaluations. Descriptive statistics and t-tests were utilized to analyze the data in SPSS. The study was approved by the Institutional Review Board. **RESULTS:** A total of 73% of the class completed the survey (40.2% Caucasian, 32% Asian and 25% African American). A total of 24.1% identified themselves as non-native English speakers, 94.6% lived in the US for greater or equal to 5 years and 66.1% communicated in English at home. The majority of students agreed/strongly agreed that podcasts helped them to prepare for exams (92.9%), podcasts were a useful learning tool (91.2%), promoted understanding of course material (89.3%), helped with missed concepts (96.4%), and facilitated note-taking at their own pace (92.2%) with mean scores 3.34, 3.27, 3.27, 3.48 and 3.48, respectively. Results of the t-test revealed that there is no statistically significant difference between native versus non-native English speaking students in their perceptions of podcast usefulness ($p>.05$). **CONCLUSIONS:** Podcasts are beneficial to a majority of students, despite their language background. Podcasts have the potential to be a valuable learning tool for students taking a research methods course.

PRM215

GRADE FOR QUALITY ASSESSMENT OF EFFICACY AND EFFECTIVENESS STUDIES ON ANTI-TNFS TREATMENT OF RHEUMATOID ARTHRITIS

Taino B, Nobre MRC

INCOR - HCFMUSP, Sao Paulo, Brazil

OBJECTIVES: Assess the quality of evidence on experimental and observational clinical research through the same approach named GRADE (Grading of Recommendations Assessment, Development and Evaluation) **METHODS:** We evaluated the primary endpoint of a random sample from efficacy and effectiveness studies included in a systematic review on the treatment of rheumatoid arthritis with anti-TNFs. The quality assessment was conducted in accordance with the recommendations of the GRADE Working Group available at: www.gradeworkinggroup.org/toolbox/index.htm. It assigns at first high quality for trials and low quality for observational studies. **RESULTS:** The assessment of 8 efficacy and 8 effectiveness studies showed respectively that the quality of evidence were high in 5 and 0; moderate in 3 and 2; low in 0 and 2; and very low in 0 and 4. The risk of bias was present in 3 and 5; imprecision results in 0 and 5; elevated magnitude of effect in 6 and 4; controlled confounding bias in 0 and 3; presence of dose-response gradient in 0 and 1. Indirect evidence and inconsistencies were not found in any of the studies. **CONCLUSIONS:** The quality of evidence of 3 trials and 4 observational studies were downgraded, while 2 observational studies had the quality assessment increased.

PRM216

WHAT VALUE CAN OPERATIONAL FEASIBILITY STUDIES BRING TO POST MARKETING OBSERVATIONAL STUDIES (PMOS)? EXAMPLE OF FEASIBILITY STUDY PERFORMED IN EASTERN EUROPE TO ASSESS HEPATITIS C VIRAL DISEASE/PATIENT MANAGEMENT IN REAL WORLD SETTING

El Kebir S, Bayle D, Gauchoux R

Mapi, Real World Evidence, Lyon, France

OBJECTIVES: Operational feasibility studies provide a good opportunity to assess practicality of large full-scale studies. They are an almost essential pre-requisite and should be well designed with clear objectives. Conducting a pilot study can enhance the likelihood of success of PMOS and potentially help to avoid serious design flaws. The objective of this research is to assess the value of feasibility studies prior to PMOS implementation and highlight the importance of local physicians' feedback. **METHODS:** A feasibility study in 6 Eastern European countries was conducted via collection of physician surveys to assess local standard of care. The feasibility questionnaire was developed to assess operational aspects, such as availability of patient population, site experience and time and willingness to participate. The 37 physicians who received the questionnaire were selected through PubMed; they were all experts who have published regarding HCV infection and were provided with the protocol synopsis **RESULTS:** Out of the 37 selected physicians, 18 gastroenterologists, hepatologists, and infectious disease specialists in Bulgaria, Croatia, The Czech Republic, Hungary, Poland and Romania completed the questionnaire. The participating Physicians were working exclusively in public institutions. The average number of HCV patients seen by year is 140 and out of them 78 are treated by Interferon. They specified that they can enrol 2 eligible patients per month on average. They see their patients frequently during treatment initiation (bi-weekly or monthly). However, the follow-up varies from one country to another (quarterly or semi-annually). Physicians indicated that patient records and data regarding blood tests and procedures are accessible for 100% of the cases. Over 60% of the sites were familiar with Patient Reported Outcomes. Overall, 12 physicians were interested in participating in the Study. **CONCLUSIONS:** The result of this survey helped us documenting routine medical practice and confirming the study design and methodology to be implemented.

PRM217

USE OF SURROGATE OUTCOMES IN HEALTH TECHNOLOGY ASSESSMENTS (HTAS)

Jaksa A, Ho YS, Daniel K

Context Matters, Inc., New York, NY, USA

OBJECTIVES: This study analyzes how frequently surrogate outcomes are used in HTAs and if the validity of these outcomes are discussed and reported within the HTAs. A surrogate outcome is defined by the National Institutes of Health as a biomarker intended to substitute for a clinical endpoint. A surrogate outcome is used when a clinical endpoint of interest is not ideal or does not occur often enough to perform meaningful statistical analysis. It is appropriate to use a surrogate outcome only when there is a strong correlation with the clinical endpoint. Before using surrogate outcomes researchers should confirm that the surrogate outcome is biologically plausible, has a magnitude of association with the clinical endpoint, and reflects changes in the relevant clinical endpoint. **METHODS:** Context Matters (CM) analyzed 1,056 HTAs spanning 38 disease conditions. Each HTA had a primary outcome that could be classified as either a surrogate outcome or a clinical endpoint. Data was analyzed for eight HTA agencies: AHRQ, DERP, SMC, HAS, PBAC, NICE, CADTH, and HIS Scotland. For those HTAs using a surrogate outcome as the primary outcome, CM then determined if the HTA agency reported the use of the surrogate and/or discussed the surrogate outcome's validity. **RESULTS:** Ninety-one percent of HTAs used a surrogate outcome (966 HTAs), but only 11% (109 HTAs) identified it as a surrogate outcome and/or discussed its validity. The agencies that discussed the use of the surrogate outcome most often were AHRQ, DERP, and HIS Scotland at 48.1%, 28.6%, and 29.0% of the time, respectively. **CONCLUSIONS:** Surrogate endpoints are prevalent in HTAs, but the agencies rarely discuss the validity of these endpoints. All agencies failed to discuss the use of the surrogate endpoint in over 50% of their reviews. HTA agencies are not following best practice use of surrogate outcomes.

PROPOSAL OF ECONOMIC EVALUATION GUIDELINE IN JAPAN

Fukuda T[1], Akazawa M[2], Fukuda H[3], Igarashi A[4], Ikeda S[5], Ishida H[6], Kobayashi M[7], Moriwaki K[8], Noto S[8], Sakamaki H[9], Saito S[10], Shimozuma K[11], Shiroiwa T[1], Takura T[12], Tomita N[13]

[1]*National Institute of Public Health, Saitama, Japan,* [2]*Meiji Pharmaceutical University, Tokyo, Japan,* [3]*Institute for Health Economics and Policy, Tokyo, Japan,* [4]*Tokyo Univ. Faculty of Pharmacy, Tokyo, Japan,* [5]*International University of Health and Welfare, Otawara City, Tochigi, Japan,*

[6]Yamaguchi University Hospital, Ube, Yamaguchi, Japan, [7]CRECON Research & Consulting Inc, Tokyo, Japan, [8]Niigata University of Health and Welfare, Niigata, Japan, [9]Meijo University, Nagoya, Japan, [10]Okayama University, Okayama, Japan, [11]Ritsumeikan University, Kusatsu, Japan, [12]Osaka University, Osaka, Japan, [13]National Institute of Public Health, Wako, Japan

OBJECTIVES: Use of economic evaluation of health care technologies is intensively discussed in the government in Japan. In order to make evaluation results comparable, standardized method of evaluation is required. We proposed an economic evaluation guideline in Japan. **METHODS:** We organized a research team for developing guideline. After reviewing guidelines in HTA agencies in the world and current debate on issues, we investigated HTA reports and methodology of economic evaluation studies in several drugs, devices and procedures. Based on the review of these information, the research group discussed and proposed economic evaluation guideline suitable for Japan. **RESULTS:** Proposed guideline consist of 13 items: 1) Objective; 2) Perspective of analysis; 3) Comparators; 4) Method of analysis; 5) Time horizon; 6)Choice of outcomes; 7) Source of clinical data; 8) Costs; 9) Productivity loss; 10) Discounting; 11) Modeling; 12) Uncertainty; and 13) Budget impact analysis. Guideline sentences are classified into 3 levels, principal, recommended, and optional. **CONCLUSION:** This guideline is a proposal by a research team. However, it will be needed in the near future for using economic evaluation of health care technologies. Proposed guideline should be tested by adopting individual studies.

PRM219

DEALING WITH ZERO CELLS IN SPARSE NETWORKS IN BAYESIAN NETWORK META-ANALYSIS

Ivanescu C[1], Skaltsa K[2], Heemstra L[1], Van Engen A[1]
[1]Quintiles, Hoofddorp, The Netherlands, [2]Quintiles, Barcelona, Spain

OBJECTIVES: Bayesian Network Meta-Analysis (NMA) models for binary data are well established and special precautions do not usually need to be taken in the case of zero cell counts. Furthermore, trials with zero cells in both arms are usually excluded from the analysis. However, in sparse networks with only one trial per comparison and zero cells in unique link studies, their inclusion may be mandatory. Zero frequencies may result in numerical instability and/or large variances. The objective of this study was to investigate the effect of different methods dealing with zero cells in sparse networks in Bayesian NMA. **METHODS:** A review was conducted to identify methods dealing with zero cells for binary outcomes in sparse networks in a Bayesian setting. The identified methods were applied to a sparse network with six treatments and one study per comparison. The outcome was grade 3+ Adverse Events and measured by Odds Ratio. A fixed effects model was fitted with binomial likelihood. The performance of the methods was assessed by the residual deviance and the Credible Intervals' (CrI) width was compared. **RESULTS:** We identified three methods: apply a continuity correction (a constant factor of 0.5 or the reciprocal of the opposite treatment size), use of informative priors on treatment effects and placing a distribution on the baseline model. We applied all methods and combinations of them. The model fit was adequate for all methods (residual deviance [10;12.3] for 12 datapoints). The use of different informative priors improved the variability estimates. CrI widths were reduced up to 15 times with respect to the original model with vague priors. **CONCLUSIONS:** Although the debate on the inclusion of studies with zero events in NMA is still open, our research shows that methods are available to address this issue. However, no clear recommendations can be provided.

PRM220

QUALITY ASSESSMENT OF OBSERVATIONAL STUDIES FOR SYSTEMATIC REVIEWS

Kiss N, Tongbram V, Fortier KJ
Oxford Outcomes, Morristown, NJ, USA

Observational studies are frequently included in systematic reviews, especially in those disease areas where RCTs are limited. While there are very specific tools for and guidance on assessing the quality of RCTs, the assessment of observational studies is less standardized. OBJECTIVE: To understand and assess the different tools used to review the quality of observational studies and to make recommendations based on our evaluation. **METHODS:** First, a systematic review of literature from 2005-present was conducted in Embase and Medline to determine the frequency of use of quality assessment for observational studies and the type of tools used to conduct the assessment. Second, we reviewed documentation from NHS guidance on quality assessment of non-randomized studies. Finally, we reviewed two years of approved HTA submissions to see what methods of assessment have been used for submissions. **RESULTS:** A total of 1429 articles were screened. Compared to a similar study on older literature, our review found an increase in the use of quality assessment for observational studies. However, we found that many studies continue to devise their own tool or adapt existing tools rather than use a tool in its entirety. Downs and Black, MOOSE, and STROBE were the most referenced tools, although STROBE was not originally intended for such use. Guidelines centered on "non-randomized" studies were mixed and were not always found to be applicable to observational studies, but instead mostly to single-armed clinical trials. **CONCLUSIONS:** There is still a need for guidance and standardization for observational studies assessment for use in systematic literature reviews. Although quality assessment of observational studies is still not standardized, there are a few methods becoming more frequent in the literature but are difficult to compare across systematic literature reviews because they have often been adapted by each author.

PRM221

AN APPROACH FOR QUANTIFICATION OF PATIENT ADVOCACY GROUP INPUT IN THE HTA PROCESS

Hicks N[1], Toumi M[2]
[1]Commutateur, Paris, France, [2]University Claude Bernard Lyon 1, Lyon, France

Patient input in HTA pathways by the appropriate disease Patient Advocacy Group (PAG) uses principally humanistic and social studies as an evidence base followed by critical evaluation against traditional CEA (Cost Effective Analysis) via a scientific process. Patient and Public Involvement (PPI) in HTA is associated with a low evidence base potentially limiting its value. Research presented at ISPOR 2012 by the same authors concluded a need to improve and standardize PAG input integration in HTA decision making. To investigate the way different forms of knowledge / experience are used by PAGs in NICE HTA for guideline development and new technology review. We will look at: 1) Influence of PAG structure, resource capability, internal process and the impact of PAG advisory board physician representatives on scientific validation of patient input in HTA participation, and 2) Part I results will inform further research into selection and ranking criteria of social derived data compared with CEA. An iterative PPI best practice approach will be followed. Selection criteria: Five UK PAG groups (Neurological, Autoimmune, Rare disease, Cardiovascular and Oncology) will be invited to participate. The NICE PPI Unit will nominate groups when needed. Inclusion criteria: 1) willingness to participate, 2) prior involvement in guideline / new technology assessments; and 3) presence of medical advisory board. Research elements: Application of GRIPP criteria (Guidance Reporting Involvement Patient Public) to ensure a strong evidence base will guide development of an on-line survey and subsequent focus groups and interviews. The survey, designed for SAP review, will study: size of PAG, internal process for HTA involvement, previous HTA involvement, data submitted, PAG knowledge gaps and involvement of medical advisory board. Follow up by focus groups and interviews with PAG and advisory board members to identify insights/ themes.

PRM222

JUGGLING JURISDICTIONS: METHODS FOR CONDUCTING MODULAR SYSTEMATIC REVIEWS?

Thompson J, Hawkins N
Oxford Outcomes Ltd., Oxford, UK

A crucial component of a systematic review is a clear description of the disposition of studies throughout the various steps of the review process (de-duplication, abstract review, full paper review and final inclusion). This is commonly achieved using a PRISMA diagram that shows the number of inclusions and exclusions at each stage of the review. This may be supplemented with details of the reasons for exclusion. To create the PRISMA diagram it is necessary to keep an on-going count of exclusions and inclusions throughout the review process. However, this can pose a challenge where the scope of a systematic review changes from the original specification. This may happen where the set of licensed treatments or HTA requirements vary between jurisdictions or over time. In these cases, it may be time consuming to recreate the on-going counts of exclusions that correspond to the modified scope. We present a methodology for conducting a modular systematic review in which PRISMA diagrams and other descriptions of study disposition can be generated corresponding to any subsequent changes of scope. This is achieved by splitting the review into a set of 'component-reviews' defined by mutually exclusive treatment search terms that comprise the full set of possible intersections between the individual treatments. Throughout the systematic review process separate counts of abstracts, papers and studies are maintained for each of these component-reviews. The results from the component-reviews can then be combined to reflect any final review scope (based on individual treatments). We will illustrate the methodology with an example review of the comparative efficacy of licenced thiazolidinedione's (TZDs) versus placebo in patients with type 2 diabetes mellitus (T2DM) where there are two TZDs licensed in the USA (pioglitazone and rosiglitazone) but only one in Europe (pioglitazone).

PRM223

SOCIAL NETWORK ANALYSIS OF AUTHORSHIP NETWORKS AND THE IDENTIFICATION OF EXPERT ADVISORS

Stoddart SDR[1], Siddiqui MK[2]
[1]HERON Evidence Development Ltd., London, UK, [2]Heron Health Private Ltd., Chandigarh, India

OBJECTIVES: Systematic reviews are often supplemented with the use of external experts to provide guidance on the nuances of the area. This can help add context if a review is used to support trial design or health economic model development. The ideal expert would have a deep understanding of the area and be well connected to those individuals conducting trials. The aim of the current research was to assess whether social network analysis of coauthor networks could be used to rapidly and objectively identify individuals with the qualities desired in an external expert. **METHODS:** Publication lists from a recent systematic review of rheumatoid arthritis were used to produce a list of links between authors and publications. This was then imported into the Gephi program for social network analysis. Within Gephi, matrix multiplication was used to transform this network into a coauthorship network. Eigenvector centrality was then used to infer the amount of access individual authors have to the research community as a whole. The use of eigenvector centrality as a measure of influence within the author network was then validated by correlating the centrality scores of a random sample of authors against independent ratings of desirability of those individuals' expertise. **RESULTS:** The coauthor network for rheumatoid arthritis, while not completely connected, showed a high degree of connectivity (mean degree: 26, network diameter: 5). Eigenvector centrality allowed the identification of key experts, with the highest scoring experts each providing direct access to approximately half of the whole network. Eigenvector centrality measures were a reliable predictor of mean desirability scores from ten raters ($F(1,9)=20.35$, $p=0.0015$, R-squared=0.69). **CONCLUSIONS:** Social network analysis of coauthor networks provides an efficient and robust method for the identification of expertise, and can be used as part of the systematic review process.

PRM224

SYSTEMATIC REVIEW APPROACHES FOR HTA: HORSES FOR COURSES?

Kenworthy J, Langham J, Chetty M
PHMR Associates, London, UK

Systematic reviews aim to identify, select, synthesize and appraise all high quality research evidence relevant to a particular research question, and are widely accepted as the gold standard for providing the best evidence for use in decision making. They are essential, routine components of submission data packages for health technology assessments (HTAs) of products undergoing evaluation for reimbursement and market access. Additionally, systematic reviews are often the source for clinical evidence used in health economic modelling to evaluate cost-effectiveness. Thus, they represent a substantial investment of resources, and incorrect or incomplete reviews could invalidate the proposed clinical and economic value of a product set out in a health technology submission and result in unfavourable reimbursement decisions and/or delayed market access. There are a number of best practice criteria set down for systematic reviews; the most widely recognised being from the Cochrane group. However, when carrying out a systematic review for HTA purposes researchers should be aware of the additional requirements set out by each agency. The Cochrane, UK National Institute for Clinical Excellence (NICE) and Germany's Institut für Qualität und Wirtschaftlichkeit im Gesundheitswesenis (IQWIG) methodological guidelines for conducting and reporting systematic reviews were analysed and an 'inclusive' checklist of requirements was developed to ensure the systematic review and meta-analysis met the broad set of HTA requirements and minimise the risk of having to repeat the procedure or create the need for a HTA review group to carry out its own review, which could potentially lead to an unfavourable reimbursement decision or a restriction on use. An awareness of specific HTA systematic review requirements can help optimise the preparation of a data package for HTA submission and hence maximise the chances of success.

PRM225

CAN A MULTI-CRITERIA DECISION (MCD) OPTIMISATION MODEL HELP DECISION MAKERS IN THE OPTIMAL SELECTION OF VACCINES WHEN EXPANDING THEIR UNIVERSAL MASS VACCINATION PROGRAMME? THE CASE OF POLAND

Topachevskyi O[1], Standaert B[1], Van Bellinghen LA[2], Van Vlaenderen I[2]
[1]*GlaxoSmithKline Vaccines, Wavre, Belgium,* [2]*CHESS, Ternat, Belgium*

OBJECTIVES: The model aims to determine the optimal allocation of financial resources amongst various paediatric vaccines accounting for changes in budget and availability of new vaccines over time. This approach aims to inform decision makers who are seeking to extend their national immunisation programmes about the optimal mix of vaccines and sequence of their introduction, meanwhile accounting for their preferences in clinical and cost outcomes. **METHODS:** An MCD optimisation model was developed in Microsoft *Excel* that considered availability of new vaccines and budget changes over time, optimal mix of vaccines in previous years, budget investment time horizon, cumulative outcomes time horizon, maximal achievable vaccination coverage, specific target populations. The optimal mix of vaccines within an available portfolio was determined by manually programmed linear optimisation based on a defined objective function and budget constraints. The objective function includes maximisation of prevention of disease cases, GP visits, hospitalisations, deaths, and cost savings in disease management. A multi-criteria approach allows for redistributing weights across clinical and cost outcomes in the objective function. Vaccination against rotavirus, varicella, influenza and pneumococcal disease was evaluated, based on disease incidences and direct medical costs from Poland. Relative risk reductions induced by vaccination were based on randomised controlled trials and post-marketing surveillance data. **RESULTS:** Dependent on the definition of objective function, the allocation of budget across a portfolio of vaccines resulted in different recommendations. If deaths-avoided was weighted at maximum, pneumococcal vaccine was ranked first, followed by rotavirus and influenza vaccination. If cost savings received the maximum preference, vaccination against influenza was ranked first, rotavirus second, pneumococcal third, and varicella fourth. The use of a weighted objective function resulted in different vaccines introduction sequences. **CONCLUSIONS:** The use of an MCD optimisation model provides a tool to inform decision makers about the optimal allocation of financial resources over time.

DON'T MAKE ME WAIT: THE VARIANCE REDUCTION TECHNIQUE FOR FASTER MONTE CARLO SIMULATIONS IN COST EFFECTIVENESS MODELS ON WEB

Kutepov G[1], Kostiuk A[2]
[1]*Modelate LLC, Kaiserslautern, Germany,* [2]*University of Kaiserslautern, Kaiserslautern, Germany*

With the rapid pervasion of internet technologies, demand for making health economic evidence, such as mathematical models, accessible through the web increases. Long running computations such as Monte Carlo simulation can impair user experience because of longer waiting time. Our aim is to employ mathematical techniques to reduce the computation time of probabilistic cost effectiveness Monte Carlo models, thus increasing their acceptance when used on the web. We employ the variance reduction technique to reduce computation time while obtaining outcomes with the same Monte Carlo error. The control variate approach is applied. It utilizes information about errors in estimates of known mean Net Monetary Benefit (NMB) quantities to reduce errors in estimation of the cost-effectiveness acceptability curve. The NMB mean value is calculated based on the deterministic counterpart of the model. The said technique has been applied to the published probabilistic decision tree-based Excel model for evaluating cost-effectiveness of breast cancer screening. In this model, different types of probability distributions can be chosen to model uncertainty of disease incidence, mortality rate and intervention effectiveness. By applying the control variate approach we were able to achieve outcome with the same error while performing 50% less simulations as compared to the plain Monte Carlo method. Such performance improvement is yet another step towards increasing user acceptance of web based health economic models with Monte Carlo simulations.

PRM228

SIMULATED TREATMENT COMPARISONS – AN ALTERNATIVE APPROACH TO INDIRECT COMPARISON WHEN STANDARD METHODS ARE NOT FEASIBLE OR APPROPRIATE

Ishak KJ[1], Proskorovsky I[1], Benedict A[2], Chen C[3]
[1]*Evidera, Dorval, QC, Canada,* [2]*Evidera, Budapest, Hungary,* [3]*Pfizer Global Pharmaceuticals, New York, NY, USA*

Health technology assessments (HTAs) rely on comparative evidence about new treatments and competing therapies, which are typically derived using indirect or mixed treatment comparisons (ITC/MTCs). These are not always feasible or appropriate, particularly in rapidly evolving therapeutic areas, like oncology. For instance, some comparisons may not be possible due to incomplete evidence networks; or, heterogeneity between studies due to differences in design or population may make an MTC inappropriate. There is, therefore, a need for alternative techniques, such as Simulated Treatment Comparisons (STCs). This technique is designed to derive comparisons between treatments after adjustment for differences between the populations of the two studies. This targeted comparison requires individual patient-level data (IPD) for at least one of the treatments (the index), and are appropriate when the trials used for the comparison are sufficiently comparable in design and methods, but differ in the profiles of their population in measured risk factors. The differences can be adjusted analytically using IPD via regression equations. This produces endpoint estimates for the index treatment that reflect the profile of the comparator population. These can then be contrasted with published results for the comparator to obtain a measure of difference between treatments. Since only measured risk factors can be included in the adjustment, the potential for residual confounding remains. Another potential bias is a possible "study effect" whereby other differences between studies distort the comparisons. This can be assessed using the reference groups of the trials, if these received the same treatment. STCs have been used in HTA submissions, and it is likely that its use and that of other alternative techniques will increase particularly in areas with rapid drug development. In the presence of heterogeneity or incomplete evidence networks, STCs can provide comparative evidence where these may be otherwise deemed unavailable due to limitations of ITCs/MTCs.

PRM229

THE USE OF EUROPEAN ELECTRONIC HEALTH RECORDS TO INVESTIGATE CANCER TREATMENT PATHWAYS

Langham J, Langham S, Weir S, Ralston S
PHMR Associates, London, UK

RCTs remain the gold standard for evaluation of drug efficacy and safety. However, the only way of identifying treatment pathways and improving understanding of costs and outcomes at different stages of care is via longitudinal observational studies. Observational data from electronic health records (EHRs) are increasingly being used to support pharmaco-epidemiological research. Coverage, data quality and validity of UK EHR databases such as the Clinical Practice Research Datalink (CPRD) have improved in recent years, and many papers confirm the validity of data in diagnoses such as cancer. Published data show that recording of cancer diagnosis and mortality in primary care electronic records is generally consistent with Cancer Registry (CR) data in England. The use of "read codes" in CPRD to identify an event (cancer diagnosis or referral to secondary care) and the possibility of anonymous linkage to secondary care databases (e.g. Hospital Episode Statistics [HES] for information about hospital management as an in- or out-patient, to other CR data, and accurate mortality tracking by the Office for National Statistics [ONS]) allows the data and diagnosis to be validated against multiple sources, as well as identifying treatment pathways in both secondary and primary care. There are some limitations, e.g. not all patients identified in GP practices via the CPRD are linked to other databases. Management data such as secondary care prescribing are difficult to access (not available in HES) but may be available from reviewing anonymized patient notes or by connecting to other datasets. For example, IMS Health links CPRD data with hospital pharmacy audit data and HES data. However these data have only become available recently, are expensive to access and currently patient population coverage is low. We will provide a detailed description of the possibilities for integrated database use to map treatment pathways for cancer patients.

PRM230

SHOULD THERE BE AN OPTION TO "UNREFER" NICE SINGLE TECHNOLOGY APPRAISALS: CASE STUDY OF ARIPIPRAZOLE FOR BIPOLAR I DISORDER IN ADOLESCENTS

Uttley L, Kearns B, Stevenson M
University of Sheffield, Sheffield, UK

Single technology appraisals (STAs) are a key component of the development of NICE technology appraisals guidance, but are a time and resource intensive process. Societal costs are incurred during STAs by holding the NICE Appraisal Committee, via payment to the evidence review group (ERG) and in the opportunity costs of other technologies which are not appraised. In addition, the drug manufacturer also incurs substantial costs in preparation of their submission and throughout the STA process. Recently aripiprazole, an atypical antipsychotic drug for the treatment of manic episodes in adolescent bipolar I disorder, was subjected to an STA and received positive guidance. It was apparent to the ERG from the outset of the appraisal that the conclusion would be positive as: the drug had a small acquisition cost; was already in widespread use; would shortly be going generic; and had a profile similar to its comparators. As the budget impact over a 5-year period estimated by the manufacturer was less than the payment received by the ERG, it was unlikely that the STA represented efficient use of resources. Given a fundamental role of NICE is in assessing cost-effectiveness, the option of un-referring STAs in rare circumstances has appeal. It is proposed that if certain criteria are met then it would be more cost-effective to not proceed with an STA. These include: small patient population, commonly used in current clinical practice, patent expiring in

the near future, and similar levels of efficacy and acquisition cost as key comparators In rare circumstances conducting an STA may not be cost-effective. It is possible that this can be predicted early in the STA process and we propose criteria to aid in this decision. When these criteria are met the possibility of "unreferring" the topic is likely to be the most cost-effective option.

PRM231

THE 2013 REVISION TO NICE'S DISCOUNTING GUIDELINES: DIFFERENTIAL DISCOUNTING HAS GONE BUT UNJUSTIFIED SELECTIVE APPLICATION REMAINS

Paulden M[1], O'Mahony J[2]
[1]*University of Alberta, Edmonton, AB, Canada,* [2]*Trinity College Dublin, Dublin, Ireland*

OBJECTIVES: To call attention to the problems resulting from the National Institute for Health and Care Excellence's (NICE) recent revision to their methods guidance on discounting, which recommends applying a lower discount rate than the reference case rate in selected cases. **METHODS:** NICE's reference case discount rate for costs and health effects is 3.5%. In 2011 NICE amended their economic appraisal guidelines recommending differential discounting of costs and health effects at 3.5% and 1.5% respectively in selected cases. A recently published article in Value in Health criticised this amendment on a number of grounds, including ambiguity over what are the eligible selected cases; the lack of rationale for selective application of differential discounting; the apparent inconsistencies that unjustified selective application give rise to; and, the size of the differential between the two discount rates. In April 2013 NICE published a comprehensive revision of their methods guidelines, in which equal discounting of costs and effects at 1.5% in selected cases is now recommended. **RESULTS:** While NICE's new 2013 guidance no longer includes an unjustified differential between the discount rate on costs and health effects, it still recommends the application of lower discount rates in selected cases. The revised guidance still offers no rationale for such selective application of lower discount rates. This means that many of problems described in the recently published critique of the 2011 amendment still apply to the new 2013 guidance, including a particularly worrying potential for age discrimination. **CONCLUSIONS:** NICE's selective application of lower discount rates in certain cases is not justified and leads to inconsistencies in the appraisal of different interventions. NICE is urged to again revise their discounting guidance, this time ensuring all interventions are treated equally and are subject to the same discount rates.

PRM232

A FLEXIBLE MULTI-STATE MODELLING FRAMEWORK FOR THE SIMULATION OF CANCER PROGRESSION AND CANCER CARE

van der Meijde E[1], van den Eertwegh AJ[1], Uyl - de Groot CA[2], Coupe VMH[1]
[1]*VU University Medical Center, Amsterdam, The Netherlands,* [2]*Institute for Medical Technology Assessment, Rotterdam, The Netherlands*

Most cost-effectiveness models for evaluation of cancer care compare interventions within a single treatment line. However, to investigate the full impact of a new treatment, also downstream effects must be taken into account. Furthermore, most models are based on observed clinical states, whilst these observations depend on the timing of examinations and the choice of diagnostic test. To evaluate the potential of new treatments and diagnostics, the underlying disease process needs to be modeled including the interaction with diagnostics and treatment.**OBJECTIVES:** To build a flexible framework for a disease model, that simulates cancer progression to obtain clinical, patient and economic outcomes, while taking diagnostics treatment pathways and surveillance schedules into account . **METHODS:** The modeling framework discerns two levels to describe disease progression, the level of the patient and the tumor. At the patient level, an individual is characterized by clinical states; "primary tumor only", "local recurrence", "regional recurrence", "distant metastasis, stable", "distant metastasis, progressing" and "death". The clinical state is derived from disease development at the tumor level. Seven tumor growth states are defined: "absent tumor", "dormant tumor", "micro tumor", "small macro tumor", "medium macro tumor", "large macro tumor", "symptomatic tumor". Melanoma progression was used as a case study. The model simulates, in parallel, 11 possible tumor sites, ranging from "local" to "regional" and "distant metastatic" locations. Sites were chosen because they are associated with different treatment and prognosis. The disease model is complemented with a treatment and surveillance module. In this module, treatment choices in each of the clinical states are specified. Treatment choice may depend on patient and tumor features, and subsequently influences rate of transitioning between tumor growth states. For surveillance, timing of surveillance visits, techniques used and their detection rate(s) are specified. **CONCLUSIONS:** The proposed framework provides a flexible and widely applicable cancer modeling design.

PRM233

HOLISTIC DATA GENERATION AND SYNTHESIS FOR HTA ASSESSMENT: BRINGING TOGETHER COMPARATIVE EFFECTIVENESS RESEARCH, PERSONALISED MEDICINE AND PATIENT-CENTRED OUTCOMES RESEARCH

Langham S, Ratcliffe M, Floyd D
PHMR Associates, London, UK

Defining value and generating innovation in health care relies increasingly on real world evidence. Consequently, there is an ongoing evolution in the data needs for health technology assessment (HTA). Three key elements of data generation are comparative effectiveness, personalised medicine and patient-centred outcomes. Integrating these three to support synthesis via systematic reviews, meta-analyses and modeling is necessary to maximise value and drive innovation. Effectiveness is not just about reduced morbidity and mortality. It now covers quality of life, patient satisfaction, intermediate endpoints, and screening/diagnosis/monitoring. Additionally, there is a shift away from effectiveness versus placebo to comparative effectiveness versus other technologies or standards of care in the real world, focusing on the effect on health outcomes in defined patient populations based on ethnicity, comorbidities or age. Personalised medicine signals another shift of focus away from broad, homogenous patient populations to small, more-or-less defined patient subgroups. For example, in oncology, markers such as KRAS, HER-2/neu and BRCA 1,2 are used for prognosis and to direct treatment. To reflect this evolution, comparative effectiveness research programme designs and analytical methods must be able to detect important treatment effects and outcomes for specific patient subgroups. The emergence of patient-centered care adds further complexity to HTA data requirements. The systematic collection of patient-reported outcomes (PROs) and their application to medicine is far from standard in clinical practice, although many clinical trial programmes now include the collection of PROs. For products in development, data generation plans must reflect ongoing changes and evolving complexities. We will review the growing range of methods employed in clinical effectiveness research, and show how personalised medicine and patient outcome programmes can strengthen HTA data packages.

PRM234

AN ANALYSIS OF HOW NOT TO USE COST-EFFECTIVENESS ANALYSIS FOR PRICE-SETTING

Standaert B[1], Ethgen O[2], Emerson RA[3], Postma MJ[4]
[1]*GlaxoSmithKline Vaccines, Wavre, Belgium,* [2]*University of Liege, Liege, Belgium,* [3]*Emerson Consulting c/o GlaxoSmithKline Vaccines, Wavre, Belgium,* [4]*University of Groningen, Groningen, The Netherlands*

OBJECTIVES: Cost-effectiveness Analysis (CEA) and the calculation of the Incremental Cost-Effectiveness Ratio (ICER) together with its comparison with a threshold such as Gross Domestic Product (GDP)/capita, have long been used to assess the value for money of a new intervention compared with a comparator that this new intervention precisely seeks to displace. In this paper we show the paradoxical increase in cost-effective price using data from middle, low and very low income settings. **METHODS:** Using the introduction of rotavirus vaccination compared with no-vaccination as the example. We create a theoretical framework for calculating the ICER by gradually decreasing the investment for treatment of rotavirus related disease (the 'no-vaccination comparator') representing different countries with different GDP levels and decreasing levels of existing health care investment. We compare these results with an analysis of cost-effectiveness using real data from 9 countries representing a range of different GDP levels. **RESULTS:** The theoretical framework works well in situations where the GDP/capita exceeds $10,000 – as expected the cost-effective price decreases with a decrease in the GDP/capita. Below this the scant investment in health care infrastructure, thereby reducing potential cost-offsets, coupled with the significant increase in the potential effect gain, results in a much wider margin between a cost-neutral and cost-effective price that could effectively be set using this approach. **CONCLUSIONS:** Although Cost-Effectiveness Analysis is widely used to assess the value for money of a new intervention for a particular price, we would argue that where investment in health care is low and disease burden is high, the use of CEA leads to paradoxes in price-setting.

PRM235

RE-ENGINEERING OF THE DISTRIBUTION OF DRUGS IN THE HOSPITAL. TOC APPLICATION AND TRZ

Alonso Herreros J
HOSPITAL GENERAL REINA SOFIA, MURCIA, Spain

OBJECTIVES: Presents a reengineering process of the distribution of drugs into the hospital, analyzing all the options available in the market, and looking for alternative solutions that may be more cost-effective. **METHOD:** The processes and subprocesses in the cycle from prescribing, distribution, and drug administration, are defined and discussed based on studies of medication errors (ME). The differential analysis is performed on the subprocesses. As technique for finding creative solutions (new cost-effective alternatives) apply the Theory of Constraints (TOC), and the TRIZ methodology. **RESULTS:** Since patient safety can distinguish four processes: prescription (about 40% of ME), transcription, distribution (about 10% each), and administration (about 40% of ME). In the administration, avoided ME before they reach the patient are minimal (only 2%). In the prescription/transcription there are 4 options: manual prescription, preprinted sheets, electronic prescription, and assisted prescription. In the distribution has 3 options: clasical SUD, filling carts using automated carousels, and automated dispensing systems (ADS). For administration there are other 3 options: manual record, electronic registration, and registration across the barcode. The most expensive option would be the introduction of ADS in all plants (1.4 million€ for a hospital of 280 beds). But these teams only reduces errors about 10% of all ME. Applying the TOC and TRIZ, investment in electronic prescribing, and administration with barcodes is the most cost-effective. Dose-day (sending medication for one day but not rated by patient) could be the most efficient system by simplifying processes. The error difference between Dose-day, and SDU can be annulled by the advantages of the assisted prescription, and administration with barcode **CONCLUSIONS:** It is surprising to invest large sums in improving distribution processes (ADS) - where the fewest mistakes occurs - instead of prescribing and administration. The dose-day with barcode administration would be the most cost-effective theoretical-model.

PRM236

HOW CAN HEALTH ECONOMIC ASSESSMENT METHODS HELP DECISION MAKING IN PORTFOLIO DEVELOPMENT

Akpo H, Popa C, Saka Ö
Deloitte, Diegem, Belgium

OBJECTIVES: The R&D costs of a new drug approximate $1.3 billion and are increasing due partly to regulatory hurdles and development costs. There is a need for smarter investments, which consider the requirements of regulatory bodies, increasing the chances of securing market access and high return on investment. We describe how health economic methods could support capital investment decisions in funding, valuing and bringing new pharmaceuticals to market. **METHODS:** A literature review was performed on health economic and capital investment methods. The different analyses were mapped to the commercial roadmap and R&D pipeline

of a biopharmaceutical company. An approach based on real options valuation model was proposed to support investment and market decisions and to predict the potential net present value (NPV) of a drug. The conceptual structure of the model was face-validated by health economic and valuation experts. **RESULTS:** A decision-tree based valuation method, populated partially by information from health economic tools, was adopted to analyse and clearly communicate R&D investment opportunities, to capture management flexibility and to improve strategic thinking. A feedback loop can be built into the model to analyse resiliency to assumption changes. In early phases, headroom and multi-criteria decision analyses indicate the likelihood of an investment being cost-effective. Phase I and II trials provide early evidence on drug efficacy and tolerability and initial cost estimates. Based on value of information, cost-effectiveness and budget impact models, only drugs deemed to meet authority requirements would be selected. Market intelligence and uncertainties and clinical success probability further enable identification of the optimal portfolio containing drug candidates that maximize NPV for given risk levels. **CONCLUSIONS:** Health economic methods are commonly applied during late stage development, but if implemented alongside capital investment tools from earliest R&D stages they could increase the likelihood of selecting the right products to compose an effective investment portfolio.

PRM237

MULTIVARIATE NETWORK META-ANALYSIS OF PROGRESSION FREE SURVIVAL AND OVERALL SURVIVAL

Jansen JP[1], Trikalinos T[2]
[1]*Mapi / Tufts University School of Medicine, Boston, MA, USA,* [2]*Brown University, Providence, RI, USA*

Cancer treatment effectiveness is often quantified by analyzing time from treatment initiation to the occurrence of a particular event. Very commonly studies report data on overall survival (OS), where the event is death from any cause, and on progression-free survival (PFS), where the event is death from any cause or disease progression, whichever occurred first. Both OS and PFS can inform decision making. Separate meta-analyses of OS and of PFS data ignore the correlation between the outcomes. We introduce a method for the joint meta-analysis of OS and PFS that is based on a tri-state transition model with time-varying hazard rates modeled with fractional polynomials. In English, we assume that, at any time, patients can be in one of three health states: "alive but not progressed", "alive and progressed", and "dead". PFS corresponds to time spent in the first state, and OS to time spent in the two alive states. The proposed approach allows the joint network meta-analysis of OS and PFS, relaxes the proportional hazards assumption, extends to a network of more than two treatments, and simplifies the parameterization of decision and cost-effectiveness analyses. The data needed to run these analyses can be extracted directly from published survival curves. We demonstrate use by applying the methodology to a network of trials for the treatment of non-small cell lung cancer.

PRM238

USING LOWER COST, LOWER EFFICACY INTERVENTIONS CAN IMPROVE POPULATION HEALTH OUTCOMES UNDER BUDGET CONSTRAINTS

Arbel R, Greenberg D
Ben-Gurion University of the Negev, Beer-Sheva, Israel

BACKGROUND: The global economic crisis imposes severe restrictions on budgets allocated to health care. Innovative technologies in medicine may improve patient outcomes but such improvements come at a substantial cost, thus limiting the number of patients that may benefit from them. According to current cost-effectiveness analyses (CEA), most innovative interventions are associated with a higher efficacy and higher costs compared with the standard of care. These analyses do not account for the budget impact associated with implementing the interventions on all eligible patients. Even when a new intervention is highly cost-effective, health care systems may not be able to adopt it due to substantial budgetary impacts. Implementing a substantially lower-cost intervention to a substantially wider population, accepting inferior per-patient outcomes, may improve overall health outcomes under a restricted budget. **OBJECTIVES:** Develop an innovative health technology assessment (HTA) model that combines CEA and budget-impact analyses, thus enabling to compare the impact of intervention alternatives on the entire intended use population, under a pre-specified budget constraint. **METHODS:** We identified the following steps to be included in the model formulation: 1) Define the intended use and the target population. 2) Define two or more interventions, one of them at higher cost and better per-patient outcome, and the second with lower cost and inferior per-patient outcome. 3) Forecast the diffusion of the alternatives into the entire intended use population, under a pre-defined budget, in order to estimate the treated and untreated populations. 4) Calculate the clinical impact of each alternative on the treated population. 5) Calculate the clinical impact of no therapy on the untreated population 6) Compare the aggregated clinical impact of each alternative on the entire intended use population – both treated and untreated. Using the proposed population-based model may result in improved health care outcomes, especially in times of economic downturn and austerity.

EVIDENCE-BASED METHODS IN FOOD SCIENCES AND NUTRITION

Quignot N[1], Amzal B[2]
[1]*LA-SER Analytica, Paris, France,* [2]*LASER Analytica, London, UK*

Evidence-based medicine has emerged as the bottom line of Health Technology Assessments for drug evaluations. Over the last decade, evidence-based assessment of food and nutritional products has accelerated. Specific quantitative tools to synthetize evidence have been increasingly developed, and used for decision support. This work aims at highlighting the critical role of systematic reviews and model-based evidence synthesis in the field of food sciences and nutrition, especially with the view of safety assessment. To first set the scene of food assessment in Europe, the latest Guidelines on Systematic Reviews published by the European Food Safety Authority (EFSA) (EFSA, 2010) are described with the approach on how to handle observational data on the general population. Specific examples of large systematic reviews conducted for estimating food safety accounting for population variability and interactions between food contaminants and drugs are also presented. Details on the model-based meta-analyses of such safety data are described and discussed for the purpose of regulator's decision making. Systematic reviews have been to the context of food and nutritional epidemiology requiring more stringent quality assessment and more advanced management of variability. This resulted in a Bayesian random effect model accounting for population variability. Metabolic interactions between food and drugs were evidenced and variability metrics could be explicated in terms of "uncertainty factors" to be used by the food regulators to assess safety limits for food ingredients, contaminants or drugs and their combined use. Food regulator in EU is aligning and even sometimes anticipating drug regulators in terms of evidence-based safety assessment in the real life. Common tools for model-based evidence synthesis can be applied to quantify safety signals and interaction in the general population.

PRM240

COMPARATIVE EFFICIENCY RESEARCH: META-ANALYSIS OF COST-EFFECTIVENESS STUDIES

Crespo C[1], Monleon A[1], Díaz W[2], Rodriguez C[1], Brosa M[3], Rios M[1]
[1]*University of Barcelona, Barcelona, Spain,* [2]*Universidad de Antioquia, Medellin, Colombia,* [3]*Oblikue Consulting, Barcelona, Spain*

OBJECTIVES: Cost-effectiveness analyses (CEA) have become widely used in several pathologies. Currently, new CEA studies comparing active vs control treatment have been incorporated each year. For this reason, the combination of CEA studies could give a more consistent and accurate estimate of an intervention's efficiency than one study alone. The aim of study was to develop a new method to do comparative efficiency research (COMER) based in individual patient data. **METHODS:** After, adjusted the marginal distribution and copula distribution of a hypothetical cohort, we stated the parameters and distribution estimated like our unknown theoretical distribution. We conducted an iterative analysis of a random Frank Copula distribution with a different range of sample size. We performed a comparison between samples and theoretical distribution in terms of incremental cost-effectiveness ratio (ICER), incremental monetary benefit(IMB) fixed a threshold (k= 20.000 monetary units) and goodness of fit for Frank copula, assuming a tolerance. **RESULTS:** The Theoretical distribution fixed, showed a cost of 604.34 monetary units for active and 516.12 monetary units for control, and a utilities of 0.529 for active and 0.492 for control. ICER for theoretical cohort was 2,380 monetary units per quality-adjusted life year gained and IMB was 653. With a tolerance of 500 monetary units for ICER and 50 monetary units for IMB, only 15.52% of simulations were near the theoretical ICER and only 6.12% of IMB. The amount of individual patients simulated was more than 500 patients per treatment to fit Frank Copula. **CONCLUSIONS:** Preliminary results showed that COMER based in individual patients' data could allow decision maker to know real add-value of a new intervention.

PRM241

EVALUATING THE ECONOMIC IMPACT OF TECHNOLOGICAL ADVANCES IN DIAGNOSTICS: THE CASE OF HIGH THROUGHPUT SEQUENCING FOR HEREDITARY BREAST CANCER

Jacob I, Payne K
University of Manchester, Manchester, UK

Benefits of diagnostics tests generally centre on test accuracy measures. However, additional benefits of diagnostics may include: reduced laboratory time, reduced time to results and increases in the capacity of a laboratory to deliver more tests. New technological developments, such as high throughput sequencing (HTS) are challenging the current methods used in establishing the case for the introduction into clinical practice terms of economic impact. This is evident in the case study developed here examining *BRCA1/2* genetic testing in providing information on the risk of development of breast cancer. Current *BRCA1/2* testing technologies are limited by long (up to one-year) turnaround times, which together with limited resources to increase the volume of tests and associated genetic counselling, has driven the use of a 'risk threshold' to target women eligible for testing. HTS offers the opportunity of decreased turnaround time and increased volume of *BRCA1/2* tests, which will impact on the benefits and costs associated with the diagnostic service. Systematic reviews have identified Markov-type models as the dominant modeling methodology for the assessment of genetic testing. We propose that discrete event simulation (DES) is the appropriate model type to quantify the economic impact of HTS *BRCA1/2* testing as it allows evaluation of the impact of capacity constraints and increased turnaround time on the costs and benefits of this new diagnostic technology. Importantly, DES also allows for the assessment of structural uncertainty by considering changes in patient pathways when using a new diagnostic technology. While DES may be the most appropriate modeling methodology in assessing the economic impact of novel genetic tests; typically the type of data and information required to popuate these models in lacking. We conclude by highlighting the type of data required to both population appropriate models and to adequately assess the economic impact of these novel genetic tests.

PRM242

THE IMPORTANCE OF SENSITIVITY ANALYSES IN HEALTH TECHNOLOGY ASSESSMENTS

Hren R
University of Ljubljana, Ljubljana, Slovenia

In this paper, we critically evaulated analytical design of health technology assessment methodologies, particularly related to sensitivity analyses and willingness-to-pay thresholds. To this end, we have used two studies: the first one analyzing cost-effectiveness of a human papillomavirus vaccination of boys at age 12 against oropharyngeal carcinoma and anogenital warts and the second one examining cost-effectiveness of a universal programme of vaccinating children against pneumococcal disease. We have shown – as expected – that the impact of variation of parameters can be substantial, however, outcomes of sensitivity analyses are often understated both by marketing authorization holders and authorities. Few would

disagree that innovation in health care is worthwhile; the tremendous technological success in pharmacological treatment of HIV patients is a case in point. On the other hand, a relatively large number of "me-too" entries in the pharmaceutical market and the diminishing productivity of R&D sector call for robust methodologies, which could distinguish high-value, breakthrough products. Sensitivity analyses of cost-effectiveness studies should be made pivotal in decision-making process in order to ensure efficient diffusion of innovation.

PRM243
SURVEY DESIGN IN THE ASSESSMENT OF THE IMPLEMENTATION OF RISK MINIMISATION MEASURES FOR MEDICINAL PRODUCTS
Prieto L, Hidalgo-Simon A, Arlett P
European Medicines Agency, London, UK
The introduction of the risk management plan (RMP) has ensured greater proactivity to the pharmacovigilance and post-authorisation benefit risk assessment of human medicines. An RMP may include risk minimisation measures (RMM), public health interventions intended to prevent the occurrence, or reduce the impact of adverse drug reactions associated with the exposure to a drug. The new EU legislation on pharmacovigilance explicitly requires the active monitoring of the outcome of RMM, placing obligations on regulators and industry for this purpose. In this respect, the European Medicines Agency's good pharmacovigilance practices module dedicated to the practical implementation of the legislation on the evaluation of the effectiveness of RMM foresees a dual evidence approach. This approach builds on the assessment of two distinct levels of evidence: the actual implementation of the RMM, and the attainment of its final objective(s). The approach requires research encompassing analysis of implementation (process indicators), and traditional epidemiological research addressing the attainment (final outcome indicators) of RMM. Surveys are usually involved in the assessment of process indicators, in particular when RMM imply the provision of educational information to health care professionals (HCP) and the surveys are intended to measure what the HCP have learned. This paper aims to conceptualise the construction of surveys designed for the analysis of implementation of RMM. Such surveys should be developed following the principles of content validation. This requires a body of relevant questions (items), the sample population to which it will be administered, and a test plan. The test plan includes the type of items to be used, the number of items, the length of administration, how it is to be administered, and how it is to be scored and analysed in terms of item difficulty and discrimination. The paper concludes with a checklist to assist stakeholders in designing surveys for RMM assessment purposes.

DISEASE BURDEN IN EPILEPSY ASSOCIATED WITH TUBEROUS SCLEROSIS COMPLEX: SYSTEMATIC REVIEW
Blieden M[1], Parker L[1], Foster T[1], Segal S[2], Magestro M[2]
[1]*Evidera, Lexington, MA, USA,* [2]*Novartis Pharmaceuticals Corporation, Florham Park, NJ, USA*
OBJECTIVES: To summarize literature on the burden of epilepsy in tuberous sclerosis complex (TSC); TSC is a genetic disease characterized by behavioral disorders, benign tumors in multiple organs, and neurological manifestations including epilepsy. **METHODS:** A systematic search of keywords for TSC and burden of illness was conducted in MEDLINE- and EMBASE-indexed publications from 5/2000-1/2013, and non-indexed materials. **RESULTS:** In total, 83 articles on TSC-associated epilepsy were included. Up to 93% of TSC patients have epilepsy, with severe forms more common than in non-TSC epilepsy patients (infantile spasms, 35-57% vs. 9%; generalized tonic-clonic or grand mal seizures, 37% vs. 7%; complex focal seizures, 87% vs. 33%). Seizure onset is early (median age: 7 months, 82% by age 3). TSC2 gene mutations and cortical tubers, common brain malformations in TSC, are risk factors for early onset and greater severity of seizures. TSC-epilepsy patients have significant disabilities, including high rates of autism spectrum disorders (13-30%) and cognitive impairment/delay (62-80%). Although data are not available on long-term outcomes, early seizure control may reduce cognitive impairment and autism symptoms. Vigabatrin is a first-line treatment option for TSC-associated infantile spasms and focal seizures in infants, but poses a risk of serious retinal toxicity. Other anti-epileptic drugs are available as second-line options; most patients still require polytherapy, and 62% have refractory epilepsy that can necessitate surgery. With high rates of medication use, hospitalizations, and surgeries, TSC-epilepsy patients may consume substantial health care resources, particularly during the first 5 years post-diagnosis. Longitudinal trends in resource use, direct and indirect costs, and treatment patterns for TSC-epilepsy are largely absent from the literature. **CONCLUSIONS:** TSC-epilepsy is common and may be severe, with presentation early in childhood and long-term morbidity. True disease burden to patients, caregivers, and payers remains unknown given substantial data gaps in longitudinal clinical outcomes, treatment patterns, and costs.

PND2
POTENTIAL PREDICTORS OF ALZHEIMER'S DISEASE: AN ANALYSIS WITH THE QUEBEC PROVINCIAL DRUG REIMBURSEMENT PROGRAM DATABASE
Lachaine J[1], Lambert-Obry V[1], Dionne PA[2]
[1]*University of Montreal, Montreal, QC, Canada,* [2]*Pfizer Canada, Kirkland, QC, Canada*
OBJECTIVES: To identify potential determinants of Alzheimer's disease (AD) by analyzing past medical history in terms of previous diseases or treatment exposures of patients with AD compared to patients without the disease, using the Quebec provincial drug reimbursement program database (RAMQ). **METHODS:** This retrospective study included patients covered by the RAMQ who had at least one diagnosis of AD (ICD-9 code 3310) or have received at least one script for an AD medication (donepezil, rivastigmine, galantamine or memantine) from January, 1985 to December, 2011. A control group of patients without AD was created on a 1:1 ratio and matched for age, gender and geographic location. The index date was defined as the date of the first AD diagnosis or the first script for AD medication whichever comes first. Prevalence of diseases and treatment exposures in the years preceding the index date were analyzed according to the occurrence of diseases (ICD-9 codes) and medication utilization (AHFS codification) between AD patients and the control group. **RESULTS:** Data were obtained for a random sample of 34,086 AD patients (mean age of 78.5 years [SD=8.0], 65.2% females). A higher proportion of patients had a diagnosis of organic psychotic conditions (49.6% vs. 9.2%, p<0.001), other psychoses (21.9% vs. 8.6%, p<0.001) and neurotic disorders, personality disorders and other nonpsychotic mental disorders (69.1% vs. 55.4%, p<0.001) in the AD group compared to the control group. Furthermore, a greater number of patients used psychotropic drugs (53.5% vs. 35.9%, p<0.001) and anxiolytics, sedatives and hypnotics (70.3% vs. 65.9%, p<0.001) in the AD group than in the control group. **CONCLUSIONS:** Comorbidities' frequency was higher in AD patients for several diseases and treatments, particularly for mental disorders-related diagnoses and medications.

PND3
EFFICACY OF FINGOLIMOD IN DELAYING CONFIRMED DISABILITY PROGRESSION IN PATIENTS FAILING PRIOR TREATMENT: A MARKOV MODEL APPLICATION TO ESTIMATE TIME TO DISABILITY HEALTH STATES
Bergvall N[1], Rathi H[2], Nixon RM[1], Thom HHZ[3]
[1]*Novartis Pharma AG, Basel, Switzerland,* [2]*Novartis Healthcare Pvt.Ltd., Hyderabad, India,* [3]*MRC Biostatistics Unit, Cambridge, UK*
OBJECTIVES: To estimate the efficacy of fingolimod versus placebo on confirmed disability progression (CDP) and on time to severe disability health states in patients with relapsing–remitting multiple sclerosis (RRMS) failing prior treatment. **METHODS:** Patients failing prior treatment were defined as: 1) ≥1 relapse in the previous year and either ≥1 gadolinium-enhancing T1 lesion or a T2 lesion count ≥9 at baseline, or 2) equal or more relapses in the year prior to baseline compared with the previous year. Hazard ratios (HR) for 3-month and 6-month CDP, measured using Expanded Disability Status Scale (EDSS) scores, were estimated using Cox proportional hazards models. Both per-protocol definitions of CDP and revised definitions used in other trials were analysed. Time from EDSS score 0 to scores of 4 or 6 and to conversion to secondary progressive MS (SPMS) were estimated by fitting a multi-state Markov Transition model to individual patient data from the pooled FREEDOMS placebo groups (HRs accounted for treatment effects) and the London Ontario cohort (SPMS and RRMS–SPMS transitions). **RESULTS:** Using both definitions of treatment failure, fingolimod reduced the risk of 3-month CDP (per-protocol) by 35% (definition 1: HR: 0.65; p<0.05) and 34% (definition 2: HR: 0.66; p<0.05) versus placebo. The corresponding HRs for 6-month CDP were 0.61 (p=0.06) and 0.60 (p<0.05). HRs were generally lower using the revised CDP definition. The Markov Transition model, assuming a 40% reduction, estimated that fingolimod delays the median time to EDSS 4 (2.2 years, 61% increase), EDSS 6 (3.3 years, 52% increase) and SPMS (4.5 years, 62% increase) compared with placebo. **CONCLUSIONS:** Fingolimod is highly efficacious in delaying CDP in patients failing prior treatment, and our modeling approach suggests that this translates into a meaningful delay in time to severe disability health states.

PND4
COMPARING THE EFFICACY OF FIRST AND SECOND GENERATION DISEASE-MODIFYING THERAPIES FOR RELAPSING-REMITTING MULTIPLE SCLEROSIS: A NETWORK META-ANALYSIS
Fogarty E[1], Schmitz S[2], Walsh C[2], Barry M[1]
[1]*National Centre for Pharmacoeconomics, Dublin, Ireland,* [2]*Trinity College Dublin, Dublin, Ireland*
OBJECTIVES: As the number of available disease-modifying therapies (DMT) for relapsing-remitting multiple sclerosis (RRMS) expands, consideration of all evidence on comparative efficacy of newer second generation therapies with established first generation therapies is required to inform clinical care and health policy. This network meta-analysis (NMA) estimates the relative efficacy of DMT in reducing relapses and slowing short-term progression of disability in RRMS. **METHODS:** A systematic review of RCTs of interferon-beta, glatiramer acetate (first generation DMTs), natalizumab, alemtuzumab, fingolimod, teriflunomide, laquinimod, and BG-12 (second generation DMTs) compared with each other or with placebo for the treatment of RRMS, identified 20 eligible RCTs (n=14610). A random-effects NMA model was used to calculate relative annualized relapse rate (ARR) and hazard ratio (HR) of short-term disability progression. **RESULTS:** Statistically significant reductions in ARR versus placebo, between 24% - 69% for second generation DMTs and 16% - 33% for first generation DMTs were found. Alemtuzumab, natalizumab, fingolimod, and BG-12 were significantly more efficacious than other DMTs in reducing ARR. There was greater uncertainty associated with DMT efficacy in reducing short-term disability progression. Significant improvements over placebo in reducing short-term disability progression were restricted to second generation DMTs alemtuzumab, natalizumab, fingolimod, laquinimod, BG-12, and teriflunomide 14mg (HR 0.27 - 0.54). No statistically significant improvements in short-term disability progression were exhibited by first generation DMTs and teriflunomide 7mg. **CONCLUSIONS:** The growing number of innovative second generation DMTs offers the potential of therapeutic advances in reducing relapse rates in RRMS, with less certain benefits on short-term disability progression. Despite these potential advantages, the relative position of second generation DMTs on the RRMS treatment landscape remains to be defined, due to potentially serious side effects, limited long-term safety data and their high cost.

PND5
EFFECTIVENESS OF THE EARLY PSYCHOSOCIAL INTERVENTION ON INSTITUTIONALIZATION OF PATIENTS WITH MILD ALZHEIMER'S DISEASE AND CAREGIVERS' QUALITY OF LIFE – AN ALSOVA STUDY
Martikainen JA[1], Kautiainen H[2], Väätäinen S[1], Välimäki T[1], Hongisto K[1], Hallikainen I[1], Sivenius J[1], Soininen H[1], Koivisto A[1]
[1]*University of Eastern Finland, Kuopio, Finland,* [2]*Medcare Foundation, Äänekoski, Finland*

OBJECTIVES: To assess the effects of early psychosocial intervention on delaying the institutionalization of patients with mild Alzheimer's disease (AD) and on caregivers' health-related quality of life (HRQOL). **METHODS:** Totally, 240 patient-caregiver dyads were recruited to a pragmatic, controlled, and randomized (1:2) clinical trial in 3 hospital districts in Finland between 2002-2006. A primary outcome measure was the intervention's impact on cumulative risk of institutionalization over 36 months of follow up. In the analysis of the primary outcome, Fine & Gray's (1999) proportional subhazards (sHR) model was applied to adjust the impact of competing risk (i.e., death). Main secondary outcome measures were caregivers' global burden (measured by Global Health Questionnaire GHQ) and HRQOL measured by the 15D. The secondary outcomes were analyzed using generalized linear mixed models (GLMM) with hierarchical structure to account for repeated measures and possible clustering by the hospital district. **RESULTS:** After 36 months of follow up, cumulative competing risk adjusted incidence of institutionalization rates (95% CI) were 21.2% (12.5% – 29.9%) and 16.1% (10.3% - 21.9%) in the intervention and usual care groups, respectively. Age and sex adjusted sHR was 1.37 (95%CI 0.75 – 2.52). No statistical significant differences in the secondary outcomes were found. **CONCLUSIONS:** The early psychosocial intervention for patients with mild AD and their caregivers did not delay time to nursing home placement. The results of the present study are consistent with a recently published study (Waldorff et al. 2012 BMJ) reporting no effect of semi-tailored intervention for patients with mild AD and their caregivers. Even if the present study did not manage to show differences between the study groups, it provides the valuable longitudinal dataset for studying long-term disease progression (in terms of correlated cognitive, behavioral, and functional disabilities) and its economic and quality of life consequences for patients with AD and their caregivers.

PND6

MODELING THE IMPACT OF DISEASE MODIFYING TREATMENT ON TIME TO DISABILITY HEALTH STATES IN MULTIPLE SCLEROSIS: AN EVALUATION OF ORAL THERAPIES THROUGH INDIRECT COMPARISONS OF 6-MONTH CONFIRMED DISABILITY PROGRESSION

Bergvall N[1], Rathi H[2], Nixon RM[1], Thom HHZ[3], Alsop J[4], Dunsire L[4]
[1]*Novartis Pharma AG, Basel, Switzerland,* [2]*Novartis Healthcare Pvt.Ltd., Hyderabad, India,* [3]*MRC Biostatistics Unit, Cambridge, UK,* [4]*Numerus Ltd., Wokingham, UK*

OBJECTIVES: To estimate the comparative efficacy of oral therapies (fingolimod, dimethyl fumarate [DMF] and teriflunomide) in delaying progression to disability health states in patients with relapsing–remitting multiple sclerosis (RRMS). **METHODS:** Cox proportional hazards regression models were used to analyse 6-month confirmed disability progression (CDP; based on Expanded Disability Status Scale [EDSS] scores) in the pooled fingolimod FREEDOMS trials. Initial models were constructed with eight baseline covariates as main and treatment-interaction effects and final models with the most predictive covariates were selected using a stepwise algorithm. Models predicted hazard ratios (HRs) for 6-month CDP for fingolimod 0.5mg versus placebo for average TEMSO (teriflunomide trial) and pooled DEFINE/CONFIRM (DMF trials) patients. Time from EDSS score 0 to scores of 4 or 6 and to conversion to secondary progressive multiple sclerosis (SPMS) were estimated by fitting a multi-state Markov Transition model to individual patient data from the pooled FREEDOMS placebo groups (HRs accounted for treatment effects) and the London Ontario cohort (SPMS and RRMS–SPMS transitions). **RESULTS:** Without covariate adjustment, the HR for CDP for fingolimod versus placebo in the pooled FREEDOMS trials was numerically lower (i.e. fingolimod more efficacious) than that for DMF twice daily versus placebo in DEFINE/CONFIRM (0.62 vs. 0.71). In adjusted comparisons, the predicted HR for fingolimod versus placebo in the DEFINE/CONFIRM population was lower than in the FREEDOMS population (initial model, 0.51; final model, 0.60). Fingolimod increased median time to disability health states (EDSS 4, 1.0 years; EDSS 6, 1.5 years) and SPMS (1.9 years) compared with DMF. Comparisons with teriflunomide also showed fingolimod increased times to disability health states. **CONCLUSIONS:** Fingolimod is the only oral treatment that has demonstrated a significant effect on 6-month CDP in a clinical trial and our modeling approach suggests that progression to severe disability health states is delayed by fingolimod.

PND7

EFFICACY OF INHALED ANTIBIOTICS IN CF PATIENTS WITH CHRONIC P. AERUGINOSA INFECTION: A NETWORK META-ANALYSIS

Janssen KJ[1], Higashi K[1], Jansen J[2], Doering G[3], Elborn S[4], Calado F[5], Sagkriotis A[5], Angyalosi G[5], Balp MM[5]
[1]*Mapi, Houten, The Netherlands,* [2]*Mapi, Boston, MA, USA,* [3]*Tübingen University, Tübingen, Germany,* [4]*Queens University Belfas, Belfast, UK,* [5]*Novartis Pharma AG, Basel, Switzerland*

OBJECTIVES: To compare the efficacy of tobramycin powder for inhalation (TIP) relative to tobramycin inhalation solution containing 300 mg/5ml of tobramycin (TIS-T) and 300mg/4ml of tobramycin (TIS-B), aztreonam lysine inhalation solution (AZLI), colistimethate sodium solution (colistin) and colistin inhalation powder (colistin-P) for cystic fibrosis (CF) patients with chronic Pseudomonas aeruginosainfection, by updating a systematic literature review (SLR) and network meta-analysis (NMA) with recently published evidence. **METHODS:** The updated SLR was conducted in Medline, Medline in Process, Embase and the Cochrane Library up to 2012. Individual study results were synthesized and indirectly compared with a Bayesian NMA. As some trials included naïve patients (previously not exposed to the treatment) in one arm, and previously exposed patients to the treatment in the other arm, the naïve and exposed arms were considered separate treatment-by-population groups in the network. **RESULTS:** Three new trials were identified and analysed with eleven trials identified in the previous SLR. In naïve populations, TIP is expected to have similar efficacy as TIS-T, TIS-B, and AZLI (difference in % change in FEV1 predicted at week 4 respectively -1.97 (95% Credible Interval -11.84, 8.03), -2.38 (-12.71, 7.98), and 1.53 (-7.04, 10.00)). Compared to colistin-P, TIP is expected to have similar efficacy, however the point estimate is in favour of TIP (11.36 (-1.75, 24.31)). In exposed populations, TIP is expected to have similar efficacy as TIS-T, TIS-B and colistin (respectively -0.78 (-7.65, 5.99), 0.01 (-10.42, 10.46), and -5.75 (-21.23, 9.89)). No data on naïve and exposed populations was available for colistin and colistin-P, respectively. **CONCLUSIONS:** By conducting an alternative approach where the naïve and exposed arms were considered separate treatment-by-population groups, the full evidence base could be evaluated, including the data for the dry-powder colistimethate sodium inhaler. This will provide relevant information to support clinical decision making in CF.

PND8

CLINICAL EFFECTIVENESS OF LACOSAMIDE AND ITS IMPACT ON CONCOMITANT ANTIEPILEPTIC DRUGS CONSUMPTION IN THE CZECH REPUBLIC

Klimes I[1], Vocelka M[1], Dolezal T[1], Foitova H[2]
[1]*VALUE OUTCOMES, s.r.o., Prague 2, Czech Republic,* [2]*UCB, s.r.o., Prague 8, Czech Republic*

OBJECTIVES: To gather data on clinical effectiveness of lacosamide add-on therapy to standard antiepileptic drugs (AEDs) in the Czech Republic. These data were intended as inputs for a cost-effectiveness analysis. **METHODS:** A retrospective multicenter (n=40) data collection of patients with epilepsy treated with lacosamide for 6 months in clinical practice was performed. Information on the number of seizures and concomitant AEDs before and after lacosamide treatment was observed. In this analysis patients reporting at least a 50% reduction in seizure number 3 months after lacosamide treatment were considered responders. Adverse events reported after initiating lacosamide treatment were collected. **RESULTS:** In total, data from 409 patients were collected, 403 had complete data that were analyzed. Mean (SD) age was 40.4 (±14.2) years and the mean (SD) time since diagnosis 18.7 (±12.8) years. In 91% of patients lacosamide treatment was initiated because of resistance to previous AEDs. Most patients suffered from partial (44.2%), secondary generalized (20.1%) or both (34.0%) types of seizures, or other (1.7%). Following lacosamide administration the mean (median) number of seizures decreased from baseline of 40.3 (12.0) to 25.9 (7.0) (per 3 months). Median (mean) number of seizure reduction was equal to 41% (30%), and 45% were responders. Adverse events occurred in 79 pts (19.6%), with somnolence (6.2%) and dizziness (5.5%) most frequently reported. During lacosamide administration, a decrease in concomitant AEDs number was observed. The mean number per patient decreased from 2.2 to 1.7, as did concomitant AEDs used before and after lacosamide administration: levetiracetam (39% vs. 33%), lamotrigine (38% vs. 32%), carbamazepine (34% vs. 29%), valproate (33% vs. 28%) and zonisamide (17% vs. 8%). **CONCLUSIONS:** Results confirm the effectiveness of lacosamide in the reduction of seizure frequency in clinical practice. In addition, findings suggest that adding lacosamide may lead to a reduced use of other concomitant AEDs.

PND9

COST ANALYSIS OF ANTI-MIGRAINE PRESCRIBING USING A CLAIMS DATABASE

Truter I
Nelson Mandela Metropolitan University, Port Elizabeth, South Africa

OBJECTIVES: To analyse the cost of different anti-migraine products to determine price differences and the impact of generic prescribing. **METHODS:** A retrospective drug utilisation study was conducted on South African medical insurance claims data for 2011. No clinical information was available. **RESULTS:** A total of 797 patients received 1583 anti-migraine products during 2011. The majority of patients (70.14%) were females and 47.05% of patients were between 30 and 49 years old. Only 13.96% of patients claimed their anti-migraine products from the chronic plan of their medical insurance schemes. The average age of patients was 41.61 (SD=14.91) years, with females on average slightly older than males (41.89 years vs. 40.96 years). Clonidine was the most frequently prescribed active ingredient (accounting for 49.21% of the number of prescriptions, yet only for 25.70% of the amount claimed for anti-migraine products). Triptans (selective serotonin ($5\text{-}HT_{1B/1D}$)-receptor agonists) accounted for 27.98% of all anti-migraine prescriptions, but accounted for 45.92% of cost. Five different triptans were prescribed. The average cost per sumatriptan prescription was the lowest (R177.64) of all the triptans. Sumatriptan was the only triptan with generic equivalents. Rizatriptan was the most often prescribed triptan, accounting for 18.51% of prescribing frequency and 29.15% of the amount claimed. Tablets and wafers were the preferred dosage forms. Only 0.32% of prescriptions were for triptan nasal sprays and they were on average the most expensive dosage form prescribed (R428.82 per prescription). **CONCLUSIONS:** The results of this study were in agreement with the findings of previous South African studies. The cost saving implications of generic prescribing were clear in this study. Migraine is an expensive condition to treat and is also affecting the economically active sector of the population. Studies investigating the economic impact of migraine will therefore yield valuable results.

PND10

PRACTICE OF CEREBROPROTECTORS CONSUMPTION IN UKRAINE

Kuznetsov I, Iakovlieva L, Ribka A, Vasileva A, Kyrychenko O
National University of Pharmacy, Kharkiv, Ukraine

OBJECTIVES: Despite the lack of evidence-based efficacy of cerebroprotective drugs, one-third of Europe's population uses of these drugs (WHO statistics). The purpose of the study - to research the dynamics of cerebroprotectors consumption in Ukraine. **METHODS:** Determination of cerebroprotectors consumption by means of frequency analysis, ATC/DDD-methodology during 6 months in 2012 in Ukraine. The consumption of cerebroprotective drugs in money term does not give a true picture about the volume of pharmacotherapy using these drugs, that is why ATC/DDD-methodology was used. As a unit of consumption DDD and PDD were used. **RESULTS:** A comparison of outpatient and inpatient cerebroprotective drugs consumption during 6 months in a neurological hospital and in a drugstore in Kharkov, it was found, that 58 trade names (TN) of drugs in the amount of $ 28218 (the rate of $ 1: 8,16 UAH on 1.10.12), in the hospital 17 TNs were used in the amount of $1518. It is shown, that the inpatient consumption of cerebroprotectors is much higher, than outpatient consumption, for example, vincamine - 2,32 DDDs/100 patients and 1,66 DDDs/100 bed–days; piracetam - 2,59 DDDs /100 patients and 0, 15 DDDs/100 bed-

days, respectively. By frequency of outpatient appointments a combined generic drug fezam (234 appointments, prise $ 5.1), and outpatient cavinton (19 appointments, prise $ 17.27) were used often. **CONCLUSIONS:** In Ukraine, outpatient cerebroprotective drugs consumption is greater than their consumption in hospital due to the lack of prescriptions control.

PND11

UTILIZATION OF ANTI SPASTICITY DRUGS IN MULTIPLE SCLEROSIS: ANALYSIS FROM AN ITALIAN ADMINISTRATIVE DATABASE

Mantovani LG[1], Furneri G[2], Scalone L[3], Ciampichini R[2], Cortesi PA[3], Fornari C[3], Madotto F[3], Chiodini V[3], Cesana G[3]

[1]*Federico II University of Naples, Naples, Italy,* [2]*Charta Foundation, Milan, Italy,* [3]*University of Milano - Bicocca, Monza, Italy*

OBJECTIVES: Spasticity is a common condition among patients with progressive and/or relapsing forms of multiple sclerosis (MS). Current therapies seem to partially control spasticity symptoms, and patients often receive multiple treatments or switch to new treatments to achieve a better control. The objective of this analysis was to assess the current usage of spasticity drugs and relative patterns of utilization among patients with MS, through administrative database analysis. **METHODS:** Using DENALI datawarehouse, we detected MS patients who, during the period January 2000 – December 2009, had at least one disease modifying agent (DMA) prescription Then the usage of drugs commonly used in spasticity (muscle relaxant drugs, baclofen, tizanidine, clonidine, dantrolene) was evaluated in this cohort of patients, in terms of number of subjects receiving at least one prescription, and number of DDD (defined daily doses) per patient per year. **RESULTS:** From 2000 to 2009, the annual number of patients with MS, receiving DMA treatment raised from 10,746 to 12,594. Concomitantly, the annual number of patients receiving at least one muscle relaxant prescription raised from 5.87% (n=631) to 9.42% (n=1,186). The most prescribed drug was baclofen with few patients receiving other drugs commonly indicated in spasticity (dantrolene, tizanidine and clonidine). A relevant number of patients using muscle relaxants also received other drugs for the central nervous system, although its usage achieved a peak in 2005 (8% of MS patients). The analysis of DDD per patient/year suggested that the usage of muscle relaxant might be almost chronic in these patients (in 2009, 303 DDD per patients per year). **CONCLUSIONS:** Only 10% of patients with MS currently receive active pharmacological treatment, although this condition seems affecting more than 20% of MS patients in Europe. Also, there are not relevant alternatives or second line options to baclofen, which is the most commonly prescribed drug in this condition.

PND12

USE OF THE FRENCH CLAIMS AND HOSPITALISATIONS DATABASE TO ESTIMATE THE PREVALENCE AND INCIDENCE OF PARKINSON'S DISEASE IN FRANCE

Blin P[1], Dureau C[1], Grolleau A[1], Corbillon E[2], Jové J[1], Lassalle R[1], Poutignat N[2], Foubert-Samier A[3], Droz C[1], Moore N[4]

[1]*INSERM CIC-P 0005, Université Bordeaux, Bordeaux, France,* [2]*Haute Autorité de Santé, Saint Denis La Plaine, France,* [3]*INSERM U897, ISPED, Université Bordeaux, CHU de Bordeaux, 33076, France,* [4]*INSERM CIC-P 0005, Université de Bordeaux, CHU de Bordeaux, Bordeaux, France*

OBJECTIVES: Few studies have assessed the prevalence and incidence of Parkinson's disease (PD) in France. The objectives of this study were to estimate the prevalence and incidence of PD between 2005 and 2010 using a claims and hospitalisations database. **METHODS:** The EGB database is a 1/97 permanent random sample of the French health care insurance system database linked to the national hospital discharge summary database. Data for all adults with full insurance coverage for PD, or hospitalised with main, related, or associated PD diagnosis, or with at least 3 antiparkinson agent reimbursements over a one-year period were extracted for the years 2004 to 2010. A specific and a sensitive PD criterion were defined: i) patients with a medical diagnosis of PD from full insurance coverage or hospitalisation; ii) same patients plus those without a PD medical diagnosis in the database but a drug pattern compatible with this diagnosis (a second set of at least 3 antiparkinson agent reimbursements over another one-year period and no co-medication with extrapyramidal side effects, as well as no antiparkinson agent pattern specific of another indication). EGB estimations were applied to the French population with age and gender standardization to estimate the prevalence and incidence in France. **RESULTS:** Prevalence of PD increased from 0.27% in 2005 to 0.33% in 2010 using the specific definition of disease, and from 0.38% to 0.46% using the sensitive definition. The incidence rate per year was 0.03-0.04% using the specific definition of disease, and 0.05-0.06% using the sensitive definition. Estimated population size was between 180,000 and 255,000 persons in 2010 with approximately 22,000 to 32,000 new patients per year. **CONCLUSIONS:** The prevalence and incidence of PD in France are likely to be within the range of estimations found in the EGB database using the specific and sensitive definitions of disease; results are consistent with that reported internationally.

BUDGET IMPACT ANALYSIS OF BOTULINUM TOXIN A THERAPY FOR UPPER LIMB SPASTICITY IN THE UNITED KINGDOM

Kurth H[1], Remak E[2], Hortobagyl L[3], Desai K[3], Abogunrin S[3], Dinet J[4], Gabriel S[4], Bakheit AM[5]

[1]*IPSEN Pharma, Boulogne Billancourt, France,* [2]*Evidera, Budapest, Hungary,* [3]*Evidera, London, UK,* [4]*IPSEN Pharma, Boulogne-Billancourt, France,* [5]*Moseley Hall Hospital, Birmingham, UK*

OBJECTIVES: Upper limb spasticity (ULS) secondary to upper motor neurone lesions has a considerable patient and caregiver burden, particularly with regards to pain, activities of daily living and personal care. BotulinumtoxinA (BoNT-A) injections are effective in treating ULS. We developed a budget impact model (BIM) to assess different BoNT-A treatments available in the UK for reducing ULS. We also assessed annual costs of treating each ULS patient with BoNT-A or best supportive care (BSC). **METHODS:** The BIM was developed from the UK NHS (National Health Service) and Personal and Social Services (PSS) perspective. The status quo scenario assumed the three BoNT-As, Dysport® (abobotulinumtoxinA), Botox® (onabotulinumtoxinA), or Xeomin® (incobotulinumtoxinA), are used in 33%, 52% and 15%, respectively, of patients with ULS receiving BoNT-A in the UK. The new market share scenario assumed an increased proportional use of abobotulinumtoxinA (to 73% in year 5) compared to other interventions. The patients were modelled over a 5-year horizon. Epidemiologic data inputs were from published sources. Unit costs for BoNT-As, other health care costs and non-medical costs came from the *British National Formulary*and PSS. Resource-use inputs were obtained from UK clinicians. One-way sensitivity analyses for model inputs were conducted. **RESULTS:** Total care costs were decreased by between £425,765 in year 2 and £1,854,601 in year 5 by shifting market share to abobotulinumtoxinA. In the base-case scenario, BSC (no BoNT-A treatment) or with incobotulinumtoxinA or onabotulinumtoxinA cost more per patient per year than abobotulinumtoxinA. Sensitivity analyses showed that number of patients treated with BoNT-As, time-to-re-injection, and dose per injection of abobotulinumtoxinA and onabotulinumtoxinA were the most influential parameters on budget impact, impacting both drug acquisition costs and physician visits. **CONCLUSIONS:** Study findings suggest that increased use of abobotulinumtoxinA compared with incobotulinumtoxinA and onabotulinumtoxinA for ULS in the UK could potentially reduce total treatment costs.

PND14

THE BUDGET IMPACT OF INTRODUCING BG-12 (DIMETHYL FUMARATE) FOR TREATMENT OF RELAPSE-REMITTING MULTIPLE SCLEROSIS (RRMS) IN CANADA

Dorman E[1], Kansal AR[1], Sarda S[2]

[1]*Evidera, Bethesda, MD, USA,* [2]*Biogen Idec, Weston, MA, USA*

OBJECTIVES: Multiple sclerosis causes significant disability and mortality globally and is especially prevalent in Canada and across Europe. BG-12 is an orally administered disease modifying treatment for relapsing-remitting MS (RRMS) patients currently on the market in the United States and Canada and under review in Europe. A budget impact model (BIM) was developed to assess the financial consequences of introducing BG-12 for the treatment of RRMS in Canada. **METHODS:** A BIM calculated the financial consequences of introducing BG-12 in Canada over three years based on RRMS prevalence, treatment market share, and clinical effects. RRMS prevalence in Canada was derived from published literature and natural relapse rates and disease state distribution from clinical trial data. It was conservatively assumed that 100% of RRMS patients were treated with a disease modifying treatment. BG-12 was assumed to absorb market share proportionally from the following current treatments: interferon beta-1a IM, interferon beta-1a SC, interferon beta-1b, glatiramer acetate, natalizumab, and fingolimod. Treatment efficacy, in terms of reductions in relapse rate, and treatment discontinuation rates were determined from a mixed treatment comparison. Treatment costs (including costs of acquisition, monitoring, and administration) and the cost of relapse were considered. Deterministic one-way sensitivity analyses were conducted to assess the most sensitive input parameters. **RESULTS:** Over three years, the introduction of BG-12 resulted in an average annual increase of CAD279 per treated patient per year, with reductions in costs associated with relapses (CAD192/patient/year) partially offsetting increased drug acquisition costs (CAD471/patient/year). On a population level, the average annual cost increase was CAD16,494,850. The main drivers of budget impact were cost of BG-12, drop-out rates, proportion of RRMS patients treated, and market share assumptions. **CONCLUSIONS:** The acquisition costs of BG-12 for treatment of RRMS are predicted to be partially offset by reduced costs of relapses in the Canadian health care system.

PND15

BUDGET IMPACT OF EVEROLIMUS FOR TUBEROUS SCLEROSIS COMPLEX (TSC) RELATED ANGIOMYOLIPOMA (AML): UNITED KINGDOM PERSPECTIVE

Whalen JD[1], Srivastava B[2], Ozer-Stillman I[1], Gray L[3], Price L[3], Magestro M[2]

[1]*Evidera, Lexington, MA, USA,* [2]*Novartis Pharmaceuticals Corporation, East Hanover, NJ, USA,* [3]*Novartis Pharmaceuticals UK Limited, Frimley, UK*

OBJECTIVES: AMLs are benign tumors common in patients with TSC, associated with high morbidity (aneurysm, hemorrhage, chronic kidney disease), and can result in death. Complication risk may correlate with increased AML volume. Historically, AMLs were treated surgically with embolization or tissue-sparing resection. In the EXIST-2 trial, everolimus significantly reduced AML volume in TSC patients. This analysis estimates the cost of reimbursing everolimus for TSC-related AML to the UK health care system. **METHODS:** A Markov model was built to analyze budget impact over five years. The treated population is estimated using TSC and AML prevalence. Adult patients with growing AML ≥3 cm are assumed eligible for everolimus. Treatment reference costs are from the UK, resource utilization data from The Netherlands, efficacy and safety assumptions from EXIST-2. The model assumed one-year treatment duration. Responding patients (≥30% AML volume reduction) may restart everolimus upon AML regrowth. Costs are discounted at 3.5% per annum. Sensitivity analyses were conducted. **RESULTS:** Up to 1,474 adults in the UK have TSC-related AML; 30% are assumed eligible for everolimus. On average, 165 patients are estimated to be treated annually with everolimus (Year 1: 88; Year 5: 233) at an average cost of £4,600,000 (Year 1: £2,700,000; Year 5: £6,200,000). Over five years, AML-related medical spending decreased £54,000. Annual per patient treatment cost with everolimus is £31,000. Results were most sensitive to patient prevalence, percent eligible for everolimus, and the percent experiencing ≥30% AML volume reduction. **CONCLUSIONS:** TSC is a relatively rare genetic disease for which everolimus is the only non-surgical treatment that has demonstrated efficacy in reducing AML volume. Reducing AML volume may prevent long-term complications and avoid surgeries, resulting in decreased AML-related medical costs. Further long-term studies are needed to better understand the benefits of everolimus in preventing AML-related morbidity and the associated costs.

PND16

NATALIZUMAB FOR RAPIDLY EVOLVING SEVERE RELAPSING-REMITTING MULTIPLE SCLEROSIS (RESRRMS) PATIENTS: 5-YEAR BUDGET IMPACT ANALYSIS (BIA) FROM THE BRAZILIAN PUBLIC PAYER PERSPECTIVE

Nishikawa AM[1], Paladini L[1], Liamas AL[2], Bueno CC[1], Clark OAC[1]
[1]*Evidencias, Campinas, Brazil,* [2]*Biogen Idec Brasil, São Paulo, Brazil*

OBJECTIVES: Multiple sclerosis (MS) is a neurodegenerative disease associated with long-term disability and significant economic impact. With the addition of new agents for the treatment of MS (e.g. natalizumab), there is a need to evaluate the relative value of newer therapies in terms of cost, given health care resource constraints in Brazil. This analysis considered just the indication for rapidly evolving severe relapsing-remitting multiple sclerosis (RESRRMS) patients (≥2 disabling relapses per year, and ≥1 gadolinium-enhancing lesions on brain magnetic resonance imaging or a significant increase in T2 lesion load). Brazilian reimbursement guidelines recommend natalizumab only as 3rd line treatment for MS. A budget impact analysis (BIA) has been created to analyze the impact of introducing natalizumab in RESRRMS treatment in Brazilian Public Healthcare System (SUS). **METHODS:** BIA was based on a Markov model with monthly cycles and 5-year time horizon with MS epidemiological data obtained from Brazilian public database (DATASUS). The model compared current MS treatment options reimbursed by the Brazilian government – interferons-betas, glatiramer acetate and natalizumab (3rd line) with an alternative scenario with 1st line natalizumab. **RESULTS:** The number of Brazilian patients eligible for REHARRMS treatment was estimated to be 1,574, 532 and 110 patients for 1st, 2nd and 3rd line treatment, respectively, in the first year. Compared to the current scenario, the inclusion of natalizumab in the reimbursement protocol for 1st line shows potential savings of USD 729.1K, 524.6K, 360.3K, 200.6K and 83.6K for 5 consecutive years. **CONCLUSIONS:** The inclusion of natalizumab as RESRRMS treatment option is estimated to yield savings of USD 1.9 M in five years for MS treatment in SUS.

PND17

BUDGET IMPACT OF SWITCHING PRAMIPEXOLE IMMEDIATE RELEASE TO PRAMIPEXOLE EXTENDED RELEASE IN TREATMENT OF PARKINSON'S DISEASE; PERSPECTIVE OF THE SOCIAL SECURITY INSTITUTION

Kececioglu S[1], Ulus P[2], Cukadar F[3], Urganci B[3], Ozkan M[3]
[1]*Boehringer Ingelheim Turkey, Istanbul, Turkey,* [2]*Boehringer Ingelheim Turkey, ISTANBUL, TURKEY, Turkey,* [3]*Boehringer Ingelheim Turkey, ISTANBUL, Turkey*

OBJECTIVES: Budget impact analysis of switching Pramipexole Immediate Release (IR) to Pramipexole Extended Release (ER) in treatment of Parkinson's Disease in the Turkish health care setting from a Social Security Institution's (SSI) perspective. **METHODS:** Based upon a literature review demonstrating that, Pramipexole ER is similar to Pramipexole IR in efficacy and safety in treatment of Parkinson's Disease (non-inferiority), budget impact analyses were performed using Microsoft Excel (2007). **RESULTS:** The switch from IR to ER was analyzed for the following formulations 0.75MG /1.50MG /3.00MG /4.50MG per day and patient. The daily pill burden per patient was reduced from 3 to 1 and 6 to 1 for 0,75MG /1,5MG /3,0MG and 4,5MG respectively. The total annual treatment cost per patient was reduced by 2.91%, 6.25%, 1.74% and 3.30% for 0.75MG, 1.50MG, 3.00MG and 4.50MG respectively. **CONCLUSIONS:** The findings of this study indicate that, switching Parkinson's Patients from Pramipexole IR to ER will not result in an additional budget impact for the Turkish health care system from a SSI perspective. However, further research needs to be conducted in order to explore the potential implications of compliance benefits and if they can be translated into long-term savings. No local effectiveness data was available at the time this analysis was performed. Potential benefits in patients' adherence were not considered.

PND18

HEALTH CARE RESOURCE UTILIZATION AND COST AMONG NATALIZUMAB INITIATORS WITH MULTIPLE SCLEROSIS IN THE UNITED STATES

Bonafede MM[1], Johnson BH[1], Watson C[2]
[1]*Truven Health Analytics, Cambridge, MA, USA,* [2]*Biogen Idec Inc., Weston, MA, USA*

OBJECTIVES: To evaluate MS-related health care resource utilization and costs prior to and after initiating natalizumab in the US. **METHODS:** A retrospective administrative claims analysis was conducted using the Truven Health MarketScan Commercial and Medicare supplemental databases to identify adults diagnosed with MS (ICD-9-CM 340) who initiated natalizumab between January 1, 2007 and December 31, 2010 (first claim is the index date). Patients had ≥24 months of continuous enrollment (12 months before [pre-period] and 12 months after [post-period] the index date) and remained on natalizumab for the 12 month post-period. Patients with and without other disease modifying treatment (DMT) during the pre-period were examined. Patient characteristics, MS-related inpatient stays and corticosteroid use were described in the pre- and post-periods. **RESULTS:** The 1458 patients in this study had a mean age of 45.2 years (standard deviation 10.5) and 74% were female. The majority (70.1%) used a DMT during the pre-period. After initiating natalizumab, there was a significant reduction in percentage of patients with MS-related inpatient stays (7.6% vs. 2.4%, p<0.001), MS-related inpatient costs (median $12,078 vs. $9,784, p<0.001) and length of stay (7.12 days vs. 6.26 days, p=0.005). Reduction in percentage of patients with MS-related inpatient stays and costs were numerically higher for patients without DMTs in the pre-period (-6.2% and -$1,496 respectively) compared with those with a DMT in the pre-period (-4.8% and -$1,262, respectively). Compared to the pre-period, there were significant reductions in IV and oral corticosteroid use for natalizumab initiators (-60.1% and -52.9%, respectively, p<0.001 for both). These reductions correspond to a mean corticosteroid cost per patient reduction of $101 across all natalizumab users (p<0.001). **CONCLUSIONS:** The initiation of natalizumab was associated with significant decreases in MS-related inpatient stays and corticosteroid use with corresponding decreases in length of stay and costs among natalizumab users with and without DMTs in the prior year.

PND19

HEALTH CARE RESOURCE USE AND DIRECT COSTS ASSOCIATED WITH FRAGILE X SYNDROME (FXS) IN THE UNITED STATES

Vekeman F[1], Gauthier-Loiselle M[1], Faust E[2], Lefebvre P[1], Lahoz R[3], Duh MS[2], Sacco P[4]
[1]*Groupe d'analyse, Ltée, Montréal, QC, Canada,* [2]*Analysis Group, Inc., Boston, MA, USA,* [3]*Novartis Pharma AG, Basel, Switzerland,* [4]*Novartis Pharmaceuticals Corporation, East Hanover, NJ, USA*

OBJECTIVES: FXS is the most common inherited form of intellectual disability and is associated with comorbidities that impair functioning and adaptive behavior. This study is aimed at evaluating the incremental direct health care costs and resource utilization associated with FXS using administrative health care claims data. **METHODS:** Using the Optum Health Reporting and Insights Employer database covering 1999-2012, subjects <65 years old with ≥1 FXS diagnosis (ICD-9-CM: 759.83) and ≥6 months of continuous enrollment prior to the first observed FXS diagnosis were matched with up to 5 non-FXS controls using high-dimensional propensity score matching. Individuals were followed until the end of continuous enrollment in the health plan. All-cause and FXS-related costs and resource utilization stratified by hospitalizations, emergency room (ER), outpatient, and home care visits were examined. **RESULTS:** 590 FXS individuals (mean[median] age: 25.7[27]; female: 54.1%; employee: 32%) and 2,950 non-FXS controls (mean[median] age: 25.7[27]; female: 52.1%; employee: 32%) were identified. Significant differences were observed between FXS and non-FXS in the all-cause per-patient per-year (PPPY) incidence of hospitalizations (0.414 vs. 0.237; incidence rate ratio [IRR] [95% CI]: 1.75[1.51-2.02]), outpatient visits (14.345 vs. 9.078; IRR: 1.58[1.54-1.62]), and home care visits (1.817 vs. 0.348; IRR: 5.22[4.80-5.69]). Similar results were found for FXS-related hospitalizations (0.206 vs. 0.092; IRR: 2.23[1.80-2.77]), outpatient visits (4.929 vs. 1.976; IRR: 2.49[2.39-2.61]), and home care visits (0.341 vs. 0.029; IRR: 11.70[9.09-15.06]). FXS subjects were also associated with significantly higher PPPY all-cause health care costs (total[SD]: $14,674[47,163] vs. $5,110[18,378]; hospitalization: $4,507[18,141] vs. $1,328[10,203]; outpatient: $4,730[12,538] vs. $2,394[10,515]; drugs: $2,331[6,226] vs. $844[2,244]; p<.01 for all) and FXS-related costs (total: $5,890[16,541] vs. $1,744[10,149]; hospitalization: $2,730[13,628] vs. $788[9,506]; outpatient: $1,799[4,243] vs. $555[1,510]; drugs: $1,008[2,999] vs. $197[1,030]; p<.01 for all), compared to non-FXS controls. **CONCLUSIONS:** The economic burden associated with FXS is significant and underscores the need to improve outcomes of individuals with FXS.

PND20

DIRECT AND INDIRECT COSTS OF MS IN IRELAND

Fogarty E[1], Walsh C[2], McGuigan C[3], Barry M[1], Tubridy N[3]
[1]*National Centre for Pharmacoeconomics, Dublin, Ireland,* [2]*Trinity College Dublin, Dublin, Ireland,* [3]*St. Vincent's University Hospital, Dublin, Ireland*

OBJECTIVES: Multiple Sclerosis (MS) has significant financial consequences for health care systems, individual patients and households, and the society in general. This study examines the distribution of MS costs and resource utilisation across cost categories and from various perspectives, as MS disability increases. **METHODS:** A total of 214 patients with MS were recruited from a specialised MS outpatient clinic in Dublin, Ireland, to participate in an interview-based study on MS-related resource consumption and costs. Mean annual direct medical, direct non-medical and indirect costs per patient were calculated, stratified by MS disability: mild (n=114), moderate (n=72) and severe (n=27). **RESULTS:** Participants were 66% female; mean (sd) age 47.6(12.75) years; mean (sd) EDSS score 3.6(2.6); 53% relapsing-remitting MS. Mean annual direct costs increased as MS disability increased from ~€10,000 in mild disease, more than five fold to ~€56,000 in severe MS. Direct costs exceed indirect costs in mild and severe MS, driven by costly disease-modifying therapies and professional home-help respectively. In contrast, indirect costs dominate in moderate MS (~€32,000 indirect vs. ~€13,000 direct) due primarily to early retirement. Disease-modifying therapies account for 76% of total direct costs in mild MS. A total of 74%-96% of all direct costs are borne by the health care payer in Ireland. Remaining costs are incurred by patients, their families or other non-health care organisations predominantly relating to non-medical resources such as living-aids, home-modifications and home-help. **CONCLUSIONS:** MS is associated with high levels of health care resource consumption and costs, which increase with disability. The majority of direct costs in our study are borne by the health care payer. However out-of-pocket spending at the individual patient level and the contribution of other organisations can be significant, particularly in severe disease. There is potential to significantly reduce the economic burden of MS through interventions which prevent progression to severe disability, support independent living at home and maintain labour force participation.

PND21

THE ANNUAL TREATMENT AND REHABILLITATION COSTS OF PATIENTS WITH PARAPLEGIA IN THE PRIVATE HEALTH CARE SETTING IN GREECE

Tzovolou K, Geitona M
University of Peloponnese, Corinth, Greece

OBJECTIVES: To examine the annual resource use and related treatment costs for patients with paraplegia in Greece in 2011. **METHODS:** This was a prospective study, which recorded data from all inpatient and outpatient visits to Olympion Hospital, a private rehabilitation center in Patras, during 2011. Patient files, which recorded the patients' demographic, clinical and economic/ cost data, were created. Direct costs included medical and pharmaceutical costs, lab tests and direct non-medical costs, which were retrieved through the Center's IT system. Indirect cost data consisted of the loss of individual and family income and were elicited via face-to-face or telephone interviews with the patients or their relatives. Each patient participating in the study signed an informed consent. **RESULTS:** A total of 300 patients were treated in the rehabilitation center in 2011, of which 36 (12%) suffered from paraplegia. Of these, 20 were treated in the inpatient setting and 16 in the outpatient setting. The total average annual cost of treating patients with paraplegia was estimated at €101,228; the average costs of the inpatient and outpatient settings were €86,699 (€74,296 direct cost + €12,403 indirect cost) and €14,529 (€9,445 direct cost and €5,084 indirect cost) respectively. The mean number of hospitalization days for inpatients

were 178. The key cost driver for inpatients was daycare (hospitalization, medical and nursing care, therapies). **CONCLUSIONS:** The annual cost of treating patients with paraplegia in the private health care sector in Greece is high. This study is the first cost study in this disease area and additional studies should be undertaken in order to acquire a more complete picture of the cost of managing disease, in both the private and public health care sectors.

PND22

BURDEN OF L-DOPA-INDUCED DYSKINESIA IN PARKINSON'S DISEASE PATIENTS (PD-LID) IN FRANCE – THE LIDIA STUDY ECONOMIC ANALYSIS (LEVODOPA INDUCED DYSKINESIA IMPACT EVALUATION)

Kryskowiak P[1], Viallet F[2], Brefel-Courbon C[3], Durif F[4], Ory-Magne F[3], Tison F[5], Bourdeix I[6], Rérat K[6], Willemin L[6]

[1]*Hôpital Nord, Amiens, France,* [2]*CH du Pays d'Aix, Aix-en-Provence, France,* [3]*Hôpital Purpan, Toulouse, France,* [4]*Hôpital Gabriel Montpied, Clermont-Ferrand, France,* [5]*Hôpital Haut-Levêque, Bordeaux, France,* [6]*Novartis, Rueil-Malmaison, France*

OBJECTIVES: PD-LID, a complication of L-Dopa treatment, is associated with inability to perform daily living activities, reduction in quality of life and increase in health care costs. Limited data are currently available on the burden of this disease. LIDIA describes medical and non-medical resource utilization and economic impact of PD-LID patients from payer and society perspective according to LID severity: mild (mAIMS score<8), moderate (mAIMS [8-12]) and severe (mAIMS>12) patients. **METHODS:** This observational, prospective, longitudinal, multicentre 6 month-study was conducted by French neurologists specialized in Parkinson's disease (PD). PD patients taking L-dopa for at least 3 years were included, with PD-LID present for more than 3 months and for more than 25% of the time. **RESULTS:** Thirty-three neurologists included 186 patients (mean 68 years old, 52% women) with mean mAIMS score at 10. PD-LID patients were mainly followed by their neurologists (96%) and general practitioner (GP) (84%) with more non-medical follow-up for severe patients. Almost 60% had at least one biological or radiological examination, only 31% required transport. All patients received L-Dopa (including 32% long-acting), and 69% dopaminergic agonists. Only 21% had at least one hospitalization and over 40% needed home layout and mobility equipment. Most patients (70%) were assisted by a caregiver (24h/week), 43% required external assistance (6h/week), 22% received an invalidity allowance. Total costs represent 35117€, 33640€ and 43739€ in respectively mild, moderate and severe patients (on average per patient/year). Non-medical costs (transportations, paid external help, caregivers time, mobility equipment, home layout) are the major cost drivers (80%), including caregiver help (70%), followed by medical (consultations, treatments, hospitalizations)(15%) and indirect costs (allowances and work stoppages)(5%). **CONCLUSIONS:** The LIDIA study confirms that in this disabling disease, the economic burden is mainly supported by the patient family, with the payer part being 23%. Economic burden is greater in patients with severe dyskinesia.

PND23

HERPES ZOSTER IN EUROPE: A REVIEW OF EVIDENCE DOCUMENTING HUMANISTIC, ECONOMIC AND SOCIETAL BURDEN

McCool R[1], Gater A[2], Préaud E[3], Baron-Papillon F[3], Largeron N[3]

[1]*Adelphi Values, Manchester, UK,* [2]*Adelphi Values, Bollington, UK,* [3]*Sanofi Pasteur MSD, Lyon, France*

OBJECTIVES: Herpes zoster (HZ) and its most common complication post-herpetic neuralgia (PHN: pain persisting months after the rash onset) are associated with substantial burden of disease. There is a sharp increase in incidence from the age of 50, impacting individuals, their relatives and society. The objective of our work was to conduct a critical review documenting the Humanistic, Economic and Societal Burden of HZ in Europe. **METHODS:** Systematic searches were conducted in Medline, EMBASE, PSYCHINFO, EconLit, HEED and CRD databases, using a combination of search terms in title and abstracts. Articles, published from 2000 onwards, were selected for full review by two independent researchers in accordance with predefined eligibility criteria. **RESULTS:** From a review of 1448 abstracts, 42 eligible articles, were identified which reported data concerning health care resource use (n=26), direct costs (n=21), indirect costs (n=14), impact on health-related quality of life (HRQoL) (n=21) and impact on caregivers (n=3). Findings across studies highlight that levels of pain severity and the presence of PHN are associated with greater impairments in HRQoL and higher costs of management. At least 50% of employed patients missed work due to the disease. While the incidence of HZ and PHN increase with age, age was not a key driver of overall costs for HZ and PHN. Specifically, while direct costs (e.g. GP, specialists, medications, hospitalisations) tend to be higher for older patients, indirect costs (e.g. work time missed) are higher for younger patients. **CONCLUSIONS:** Available evidence highlights that HZ and PHN result in significant humanistic and economic burden for patients, health care systems and wider societies. There is a tendency to focus upon health care resource use and the direct costs of management which may result in an underestimation of the true burden of HZ and PHN, which is also expected to grow with the ageing European population.

PND24

SIDE-EFFECTS OF ANTIEPILEPTIC DRUGS: THE ECONOMIC BURDEN

de Kinderen RJA[1], Evers SM[1], Postulart D[2], Vader CI[2], Majoie MH[2], Aldenkamp AP[2]

[1]*Maastricht University, Maastricht, The Netherlands,* [2]*Epilepsy Center Kempenhaeghe, Heeze, The Netherlands*

OBJECTIVES: Epilepsy is a brain disorder which is characterized by recurrent unprovoked seizures. The outward effect of seizures can be as dramatic as a wild trashing movement or as mild as a brief loss of awareness. To reduce frequency and severity of seizures, antiepileptic drugs are potentially an effective treatment for patients with epilepsy. However, side-effects are common. The negative consequences of side-effects can lead to treatment ranging from minor care to very expensive hospitalization. This cost analysis has been conducted to provide insight into the costs of side-effects due to antiepileptic drugs in The Netherlands from a societal perspective. **METHODS:** Health care, patient and family and other use of resources for five different categories of side-effects were measured by means of a questionnaire. Respondents were patients with epilepsy who experienced at least one side-effect due to antiepileptic treatment in the last 12 months. **RESULTS:** Based on data from 203 chronic epilepsy patients, the overall societal costs of common side-effects in 2012 are estimated to be €20,751 (CI: 15,049-27,196) per patient per year in the base case analysis. These societal costs exist of: mean health care costs (€4,458), mean patient and family costs (i.e. informal care and out of pocket expenses) (€10,526) and mean other costs (i.e. productivity and daily routine losses) (€5,761). Examining the different categories of side-effects separately, ranging from the most to the least expensive category, the cost estimates were as follows: other side-effects (€13,228), behavioral side-effects (€9,689), general health side-effects (€7,454), cognitive side-effects (€7,285) and cosmetic side-effects (€2,845) per patient per year. Subgroup analyses showed significant differences in costs between patients using monotherapy and those using polytherapy when looking at cognitive and cosmetic side-effects. **CONCLUSIONS:** These estimates should be considered in the overall assessment of the economic impact of a pharmacotherapy.

PND25

HEALTH CARE RESOURCES UTILIZATION IN ALZHEIMER'S DISEASE: AN ANALYSIS WITH THE QUEBEC PROVINCIAL DRUG REIMBURSEMENT PROGRAM DATABASE

Lachaine J[1], Lambert-Obry V[1], Dionne PA[2]

[1]*University of Montreal, Montreal, QC, Canada,* [2]*Pfizer Canada, Kirkland, QC, Canada*

OBJECTIVES: To assess resource utilization before and after the development of Alzheimer's disease (AD), using the Quebec provincial drug reimbursement program database (RAMQ). **METHODS:** This study included patients covered by the RAMQ who had at least one diagnosis of AD (ICD-9 code 3310) or have received at least one script for an AD medication (donepezil, rivastigmine, galantamine or memantine) from January, 1985 to December, 2011. A control group of patients without AD was created on a 1:1 ratio and matched for age, gender and geographic location. The index date was defined as the date of the first AD diagnosis or the first script for AD medication whichever comes first. Health care resource costs were analyzed in terms of emergency room, outpatient clinic, intensive care unit and physician's visits, hospitalizations and long-term care, plus AD medications and other medications costs. Annual health care costs were reported for the 5-years before and the 5-years after the index date. **RESULTS:** Data were obtained for a random sample of 34,086 AD patients (mean age of 78.5 years [SD=8.0], 65.2% females). Before the index date, health care costs were similar between AD patients and the control group, except for the year preceding AD. Indeed, cost per patient for this year increased from CDN$5,126 to CDN$8,839 for the AD group and from CDN$4,466 to CDN$5,212 for the control group (72.4% vs. 16.7% increase respectively). For the 5-year period after the index date, costs were significantly higher for AD patients with an average cost per patient per year of CDN$9,364 vs. CDN$5,864 for the control group (mean difference of CDN$3,500,p<0.001). **CONCLUSIONS:** AD significantly increases health care resource costs, including medical resources and medications. Costs generated by AD patients cumulate over time leading to a major difference in long-term costs compared to non-AD patients.

PND26

COST EFFECTIVENESS OF APOMORPHINE IN THE TREATMENT OF ADVANCED PARKINSON DISEASE IN THE UK AND GERMANY: RESULTS FROM A MULTICOUNTY DECISION ANALYTIC MODEL

Walter E, Said M

Institute for Pharmaeconomic Research, Vienna, Austria

OBJECTIVES: Parkinson Disease (PD) is the second commonest cause of neurological disability and affected approximately 5.2 million men and women worldwide. Continuous subcutaneous apomorphine (CSAI) represents an alternative treatment option of advanced PD with motor fluctuation. The purpose of this analysis was to estimate the cost-effectiveness of CSAI compared with Levodopa/carbidopa intestinal gel (LCIG), Deep-Brain-Stimulation (DBS) and Standard-of-care (SOC). **METHODS:** We developed a multicounty Markov-Model to simulate the long-term consequences, disease progression (Hoehn&Yahr-stages 3-5, percentage of waking-time in the OFF-state), complications and adverse-events. Complications are different for the alternatives (e.g. pump problems in case of LCIG, temporary/permanent complications in case of DBS). We include moderate and severe adverse-events and death. Monte-Carlo-simulation accounted for uncertainty. The model includes 25 health-states. Probabilities were derived from RCT and open-label studies; direct costs (2012) from published sources from the payer's perspective (NHS and German health care systems). QALYs, life-years (LYs) and costs were projected over a life-time horizon and discounted according the national guidelines. **RESULTS:** UK life-time costs associated with CSAI amounts to 70,258 £ and generates 2.85 QALYs and 6.28 LYs (106,530 €, 2.92 QALYs and 6.49 LYs for Germany). Costs associated with LCIG are 117,121 £, achieves 3.06 QALYs and 6.93 LYs (178,405 €, 3.18 QALYs and 7.18 LYs for Germany). The incremental-cost per QALY gained (ICER) was 223,052 £ (281,089 €). Costs for DBS are 88,361.61 £, associated with 2.75 QALYs and 6.38 LYs (121,988 €, 2.85 QALYs and 6.61 LYs for Germany). CSAI dominates DBS. SOC associated UK costs are 68,082.92 £; 2.62 QALYs and 5.76 LYs were reached (91,588 €, 2.73QALYs and 6 LYs for Germany). **CONCLUSIONS:** CSAI is a cost-effective treatment alternative, reducing OFF-time and improving quality-of-life and is associated with a cost-advantage.

PND27

COST-EFFECTIVENESS OF SOMATROPIN ADMINISTRATION WITH INCREASED ADHERENCE DUE TO MONITORING COMPARED TO NON-MONITORED ADMINISTRATION IN PATIENTS WITH GROWTH HORMONE DEFICIENCY

Vitova V, Tichopad A

CEEOR s.r.o., Prague, Czech Republic

OBJECTIVES: All recombinant human growth hormones (rhGH) have the same molecular structure, therefore providing equal efficacy and safety, and are granted the same reimbursement in the Czech Republic (CR). All rhGH are currently administered subcutaneously once a day, differing only in applicators. Easypod is the only applicator that enables monitoring the dose, time and date of each injection and allows feedback control by doctors. The objective was to assess the cost-effectiveness of monitored rhGH treatment administered by Easypod with an increase in reimbursement of 10% compared to the standard non-monitored rhGH administration in CR. **METHODS:** The interim results (n=596) of an ongoing multicenter, non-comparative, observational, longitudinal study (ECOS) were used to populate deterministic cohort model. The model simulated long-term costs and benefits development of rhGH treatment. Evaluation was developed primarily on evidence-based connection (from ECOS) between the monitoring of treatment and patient adherence to the treatment. Increased adherence of monitored patients was transferred to the increased effectiveness of the treatment, based on published study. Model further transformed the long-term treatment benefits to the increased quality of life, using QALY as the target parameter using empirical transformation. Costs were expressed from the payer's perspective. **RESULTS:** Due to an increased adherence in monitored patients, the hypothetical cohort of 10,000 boys generated 9,517 incremental QALY and CZK1.6 billion incremental costs in a lifetime horizon. A hypothetical cohort of 10,000 girls generated 11,504 incremental QALY and CZK1.35 billion incremental costs. The average cost per 1 QALY (ICER) is approximately CZK157,000 for the patient with GHD. **CONCLUSIONS:** Monitoring of the treatment may lead to an increased adherence and more effective treatment at relatively low cost, hence being considered cost-effective. Sensitivity analysis showed that ICER did not exceed CZK500,000 upon the considered uncertainty.

PND28

THE COST EFFECTIVENESS OF BG-12 (DIMETHYL FUMARATE) FOR THE TREATMENT OF RELAPSING-REMITTING MULTIPLE SCLEROSIS IN CANADA

Su W[1], Walker A[2], Sarda S[3], Kansal AR[1], Vicente C[4], Deniz B[3]
[1]*Evidera, Bethesda, MD, USA,* [2]*Heron Evidence Development Ltd., London, UK,* [3]*Biogen Idec, Weston, MA, USA,* [4]*PIVINA Consulting Inc., Mississauga, ON, Canada*

OBJECTIVES: Multiple sclerosis (MS) causes significant disability and diminished quality of life globally. BG-12 is a new oral treatment for relapsing forms of MS that is currently approved in the US and Canada and is under regulatory review in Europe. A cost-effectiveness model was developed to compare the health economic impact of BG-12 against other disease-modifying therapies (DMTs) as first-line treatment for relapsing-remitting MS (RRMS) from a Ministry of Health perspective in Canada. **METHODS:** A cohort-based Markov model was developed to simulate patients' progression through a series of health states, based on the Kurtzke Extended Disability Status Scale (EDSS) over a lime-time horizon. Patients entered the model based on a distribution of baseline EDSS scores, from which they could either progress/regress to higher/lower EDSS state, or remain in the same state. Relapses could occur at any EDSS score. Results from a mixed-treatment comparison were used to inform model inputs for disease progression and relapse rates per treatment. In addition to the overall discontinuation rates reported in trials, patients discontinued treatment on conversion to secondary-progressive MS or reaching EDSS 7. Costs included direct medical costs stratified by EDSS score, along with relapse, adverse events (AEs), and treatment-related costs. Utilities were accrued based on time spent in each EDSS state, adjusted for disutilities associated with AEs and caregiver burden. A 5% discount rate was applied. **RESULTS:** Compared with glatiramer acetate, BG-12 yielded 0.396 incremental quality adjusted life years (QALYs) at an incremental cost of CAD22,437, resulting in an ICER of CAD56,649. Compared with Rebif 44µg, BG-12 resulted in an ICER of CAD10,669. Results were consistent across a wide range of one-way and probabilistic sensitivity analyses. **CONCLUSIONS:** Based on traditional cost-effectiveness thresholds in Canada, BG-12 can be considered a cost-effective option compared to other first line DMTs.

PND29

COST-EFFECTIVENESS OF GLATIRAMER ACETATE AND INTERFERON BETA-1A FOR RELAPSING-REMITTING MULTIPLE SCLEROSIS, BASED ON THE COMBIRX STUDY

Darba J[1], Kaskens L[2], Sánchez-de la Rosa R[3]
[1]*Universitat de Barcelona, Barcelona, Spain,* [2]*BCN HEALTH, Barcelona, Spain,* [3]*TEVA Pharma, Madrid, Spain*

OBJECTIVES: To assess the cost-effectiveness of the Disease Modifying Treatments (DMT), Glatiramer Acetate (GA) and Interferon beta-1a (IFN) in monotherapy alone and in combination for the prevention of relapses with established Relapsing–Remitting Multiple Sclerosis (RRMS) among Spanish patients aged between 18 and 60 years old. **METHODS:** A Markov model was developed to represent the transition of a cohort of patients over a 10 year period using the perspective of the Spanish National Health Service (NHS). The model considered five different health states with one-year cycles including without relapse, patients with suspect, non-protocol defined and protocol defined exacerbations, as well as the category information lost. Efficacy data was obtained from the 3-year CombiRx Study. Costs were reported in 2013 Euros and a 3%discount rate was applied for health and benefits. Deterministic results were presented as the annual treatment cost for the number of relapses. A probabilistic sensitivity analysis was performed to test the robustness of the model. **RESULTS:** Deterministic results showed that the expected cost per patient was lower when treated with GA (€13,843) compared with IFN (€15,589) and the combined treatment with IFN+GA (€21,539). The number of relapses were lower in the GA cohort with 3.81 versus 4.08 in the IFN cohort and 4.18 in the cohort treated with IFN+GA. Results from probabilistic sensitivity analysis showed that GA has a higher probability of being cost-effective than the treatment with IFN or IFN+GA for threshold values from €28,000 onwards, independent of the maximum that the Spanish NHS is willing to pay for avoiding relapses. **CONCLUSIONS:** GA showed to be a cost-effective treatment option for the prevention of relapses in Spanish patients diagnosed with RRMS. When GA in monotherapy is compared with INF in monotherapy and IFN+GA combined, it may be concluded that the first is a dominant strategy.

PND30

ECONOMIC EVALUATION OF THE TREATMENT COMPLIANCE IN PATIENTS WITH PARKINSON'S DISEASE RECEIVED DIFFERENT PREPARATIONS OF LEVODOPA

Ryazhenov VV, Emchenko IV
I.M. Sechenov First Moscow State Medical University, Moscow, Russia

OBJECTIVES: To assess the cost-effectiveness of two conventional combinations of levodopa and decarboxylase inhibitors (benserazide or carbidopa) in the treatment of Russian patients with Parkinson's disease. **METHODS:** The pharmacoeconomic model was developed based on the data from multicentre randomized controlled triple-blind trial (H. Pakkenberg et al., 1976) on the efficacy and tolerance of levodopa+benserazide and levodopa+carbidopa in the treatment of patients with Parkinson's disease previously not treated with levodopa. A six-month time horizon was adopted in the model. The cost analysis included costs of the original preparation of levodopa+benserazide and costs of the available in Russia generic preparations of levodopa+carbidopa and considered on-demand antiemetic treatment with domperidone to reduce the incidence of gastrointestinal side effects of levodopa. The efficacy of treatment was defined as proportion of patients with full compliance to the treatment protocol and proportion of patients without side effects (nausea and vomiting, hyperkinesia). **RESULTS:** Treatment with levodopa+benserazide was associated with significantly lower incidence of patient non-compliance (43% as compared to 76% in the levodopa+carbidopa group). Less patients in levodopa+benserazide group experienced side effects of levodopa. The expenses for antiemetic treatment was 8.7-fold lower in patients treated with levodopa+benserazide as compared to those received levodopa+carbidopa. Total costs in levodopa+benserazide group were 912,264.90 RUB per 100 patients and varied from 682,154.60 RUB to 1,255,226.00 RUB in levodopa+carbidopa groups. The cost-effectiveness ratios (CERs) were 15,692.02 RUB and 21,988.11 – 45,866.08 RUB per one patient with full compliance to the protocol in the levodopa+benserazide and levodopa+carbidopa groups, respectively. The similar results were observed for the CERs estimated per one patient without side effects of levodopa. **CONCLUSIONS:** The present study has demonstrated that administration of levodopa+benserazide is an economically effective strategy in the treatment of Russian patients with Parkinson's disease.

PND31

PHARMACOECONOMIC ANALYSIS OF DIFERENT ANTI-PARKINSONIAN DRUGS USED IN MONOPHERAPY DURING EARLY STAGES OF PARKINSON DISEASE

Belousov DY, Afanasyeva EV, Efremova EA
Pharmacoeconomic research center, Moscow, Russia

OBJECTIVES: To evaluate the cost-effectiveness ratio of antiparkinsonian medication taken as monotherapy in patients with Parkinson's disease (PD). **METHODS:** A cost-effectiveness analysis (CEA) of therapies including pramipexole ER, pramipexole, ropinirole, piribedil and rasagiline has been performed. Direct medical costs including costs of medications and treatment of adverse drug effects for 1-year therapy of PD have been considered. The clinical effect of selected antiparkinsonian medication was assessed in percentage of patients responding to treatment, and also by means of the UPDRS II-III scale. All calculations were done in RUR prices of 2013 (nominal exchange rate RUR/USD = 30/1). **RESULTS:** Pramipexole ER has the lowest cost-effectiveness ratio (CER) of RUR 57,572 per patient/year responding to antiparkinsonian therapy. Hence, pramipexole ER was the most effective antiparkinsonian preparation studied in pharmacoeconomic terms. Based on cost-effectiveness ratio, the medications evaluated can be arranged in the following order: pramipexole ER (RUR 57,572), pramipexole (RUR 59,548), piribedil (RUR 70,921), ropinirole (RUR 71,887), and rasagiline (RUR 91,112). The model results were robust to deterministic sensitivity analysis with variable drug costs. Limitations: Absence of direct comparative evidence from randomized, double-blind, controlled studies makes interpretation of the data difficult. Only short-term studies (up to 24 months) were available and hence do not allow to evaluate the influence of pharmacotherapy on motor fluctuations as well as other longterm factors. **CONCLUSIONS:** The results of the present pharmacoeconomic analysis indicate that pramipexole ER is cost-effective as first line therapy for the treatment of early stages of Parkinson's disease from a Russian health care perspective. All five formulations evaluated, are well below the conditional "willingness to pay ratio" (equal to RUR 1,308607 in 2012). Hence, these preparations would qualify for application in the Russian system of public reimbursement.

PND32

COST-EFFECTIVENESS ANALYSIS OF LACOSAMIDE COMPARED WITH STANDARD OF ANTIEPILEPTIC CARE BASED ON CLINICAL PRACTICE DATA

Vocelka M[1], Klimes J[1], Dolezal T[1], Foitova H[2]
[1]*VALUE OUTCOMES, s.r.o., Prague 2, Czech Republic,* [2]*UCB, s.r.o., Prague 8, Czech Republic*

OBJECTIVES: To perform a cost-utility analysis of lacosamide as add-on therapy to standard antiepileptic drugs (AEDs) compared to standard AEDs alone based on individual patients data derived from actual clinical practice in the Czech Republic. **METHODS:** Based on retrospective data collection of 409 patients with epilepsy treated with lacosamide for 6 months in actual clinical practice, we developed a cost-utility Markov cohort model. The model has 4 basic health states defined by number of seizures within 3 months plus 1 state represented by occurrence of severe side effects and 1 absorption state; death. Each health state was described by utility levels derived from literature. Transition probabilities for the first cycle were derived from observational study data and subsequently published literature. The model time-horizon was 20 years, 1 cycle length covered 3 months, and a 3% discount rate was used for costs and outcomes (Quality adjusted life years (QALYs)). Only costs attributed to drug acquisition were calculated, dosing of each AED was derived from the retrospective study. We performed probabilistic sensitivity analysis (PSA) with 3000 iterations using a willingness to pay (WTP) threshold equal to 3

times GDP per capita (43,000 EUR) in the Czech Republic. **RESULTS:** Over a 20 year time-horizon, add-on lacosamide generated 11.47 QALYs and costs 33,439 EUR (per patient), whereas standard AEDs alone provided 11.09 QALYs and costs 22,916 EUR (per patient), respectively. The base-case ICER was calculated as 27,692 EUR/QALY. Based on the PSA and its cost-effectiveness acceptability curve (CEAC) we calculated that add-on lacosamide has a probability of cost-effectiveness at 43,000 EUR per QALY gained of 80.2% compared to standard AEDs alone. **CONCLUSIONS:** Based on data from clinical practice lacosamide as add-on treatment in patients with partial-onset seizures is cost-effective under the WTP threshold implicitly applied in the Czech Republic.

PND33

COST EFFECTIVENESS OF PHARMACOGENETIC SCREENING PRIOR TO INITIATION OF CARBAMAZEPINE TREATMENT FOR EPILEPSY

Plumpton CO[1], Yip V[2], Alfirevic A[2], Marson A[3], Pirmohamed M[2], Hughes DA[1]
[1]*Bangor University, Bangor, UK,* [2]*University of Liverpool, Liverpool, UK,* [3]*Walton Centre for Neurology and Neurosurgery Foundation Trust, Liverpool, UK*

OBJECTIVES: Carbamazepine (CBZ) is a widely-used, first-line treatment in epilepsy. However, CBZ is associated with hypersensitivity adverse drug reactions (ADRs) ranging from mild rash such as maculopapular exanthema, to hypersensitivity syndrome, Steven-Johnson syndrome and toxic epidermal necrolysis (TEN). TEN is associated with a mortality rate of up to 30%. The presence of the *HLA-A*3101* allele is associated with an increased risk of CBZ-induced hypersensitivity reactions [OR 9.1, 95% CI, 4.0 to 20.7]. *HLA-A*3101* is present in 2% - 5% of populations of Northern European descent. We aim to investigate the cost effectiveness of pharmacogenetic testing for *HLA-A*3101*prior to initiation of CBZ treatment in patient with epilepsy. Patients testing positive for the allele are prescribed an alternative antiepileptic drug, lamotrigine. **METHODS:** A decision analytic model was developed to represent the first three months post initiation of anti-epileptic drug, to cover the period when the majority of severe ADRs manifest. A Markov model (cycle length 1 year) was used to simulate costs (from the perspective of the NHS in the UK) and utilities incurred in subsequent years. This enables modelling of costs and disutilities from long term sequelae of severe ADRs as well as the effectiveness of treatment in terms of remission of seizures. Transition probabilities, costs and utilities were sourced from patient level data from the SANAD trial [Lancet 369(9566):1000-15] and relevant literature. **RESULTS:** Compared with no pharmacogenetic testing, and prescribing CBZ for all patients, the test results in an incremental cost effectiveness ratio of £26,684 per QALY gained. The probability that testing is cost-effective at a threshold of £30,000 per QALY is 0.55, and the cost of preventing a single ADR is £35962. **CONCLUSIONS:** Pharmacogenetic testing for *HLA-A*3101* prior to treatment with CBZ might be cost-effective for populations of North European descent.

PND34

COST-MINIMIZATION ANALYSIS OF TREATMENT OF SPASTICITY WITH BOTULINUM TOXIN TYPE A

Tapias G[1], Crespo C[2], Cuesta M[3], Forne C[3], Garcia-Romero M[4], Pascual-Pascual SI[4]
[1]*Ipsen Pharma, Sant Feliu de Llobregat, Spain,* [2]*University of Barcelona, Barcelona, Spain,* [3]*Oblikue Consulting, Barcelona, Spain,* [4]*Hospital Universitario La Paz, Madrid, Spain*

OBJECTIVES: Botulinum toxin type A (BoNT-A) is considered one of the treatments of dynamic equinus foot deformity due to spasticity in paediatric cerebral palsy (CP) patients, two years of age or older by decreasing hyperactivity and increasing muscle tone in patients. The aim was to compare the cost of Botox® (Allergan) and Dysport® (Ipsen), considering the administered dose per weight (U/kg) in child patients with equinus foot CP related. **METHODS:** We performed an observational, longitudinal and retrospective study with data from clinical records from December 1995 to October 2012. Records included patients younger than 18 years old with spasticity treated with BoNT-A at the Pediatric Neurology Service of the Hospital of La Paz (Madrid), with recorded birth and visit dates, weight and dose by muscle. Cost analysis only evaluated four muscle groups (pronator teres, adductor, semitendinosus and triceps surae) including only direct costs (drug and visit costs). We used bootstrap as sensitivity analysis to assess the robustness of results. Costs were in euros 2013. **RESULTS:** A total of 895 patients treated with BoNT-A for spasticity (543 treated with Botox®, 292 with Dysport® and 60 with both) were included. Baseline characteristics and follow-up were similar in both groups. Patients had an average dose infiltrated per visit of 5.44 U/kg (SD 2.17) for Botox® and 14.73 U/kg (SD 5.26) for Dysport®, and average yearly visits of 3.71 for Botox® and 3.46 for Dysport®. The annual total cost per patient was 850 € for Botox® and 636 € for Dysport®. Of these total costs, annual visit costs of 362 € for Botox® and 347 € for Dysport®, and annual drug costs were 488 € for Botox® and 289 € for Dysport®. **CONCLUSIONS:** Based on the real-world management of pediatric spasticity patients with BoNT-A observed in our study, Dysport® could reduce annual total costs per patient.

PND35

COST-UTILITY ANALYSIS OF DISEASE-MODIFYING DRUGS IN RELAPSING-REMITTING MULTIPLE SCLEROSIS IN IRAN

Imani A, Golestani M, Tabrizi JS, Janati A
Tabriz Medical University, Tabriz, Iran

OBJECTIVES: Disease-modifying drugs (DMDs) are a significant expenditure for treating multiple sclerosis. However, assessment of the cost-utility of DMDs compared with symptom management in the presence of long-term data has been limited. To assess the lifetime cost-utility from the Iranian health care perspectives of 4 disease-modifying drugs relative to symptom management alone in patients with relapsing-remitting multiple sclerosis using evidence from long-term published studies. **METHODS:** A Markov model was developed with patients transitioning through health states based on Kurtzke expanded disability status scale (EDSS). Patient costs included drug costs, other medical and lost worker productivity costs. Patient quality of life was considered in the form of utilities. Costs were valued in 2011 USD, and costs were discounted at 7.2%per annum. Various parameters and assumptions were tested in sensitivity analyses. **RESULTS:** Total costs per patient over the time horizon of a patient's lifetime were estimated at 20285, 144194, 299279, 251255 and 69796 USD for symptom management, Avonex, Betaferon, Rebif and CinnoVex, respectively. As a result, the incremental cost per QALY for patients receiving Avonex, Betaferon, Rebif and CinnoVex was 607397, 1374355, 1166515 and 1010429 USD, respectively, when compared with symptom management. The results were sensitive to changes in time horizon, disease progression and drug costs. **CONCLUSIONS:** DMDs in RRMS patients is associated with increased benefits compared with symptom management, albeit at higher costs. Because patients receiving Avonex incurred slightly higher QALYs than patients receiving other DMDs, treatment with Avonex dominate other DMDs in Iran.

PND36

COST-UTILITY ANALYSES OF NATALIZUMAB VERSUS INTERFERON BETA-1A 44 MCG FOR RAPIDLY EVOLVING SEVERE RELAPSING-REMITTING MULTIPLE SCLEROSIS (RESRRMS) PATIENTS IN BRAZIL

Nishikawa AM[1], Paladini L[1], Liamas AL[2], Bueno CC[1], Clark OAC[1]
[1]*Evidencias, Campinas, Brazil,* [2]*Biogen Idec Brasil, São Paulo, Brazil*

OBJECTIVES: Multiple sclerosis (MS) is a neurologic disease that can dramatically affect patients' quality of life. The aim of this study is to conduct a cost-utility analysis of natalizumab (Tysabri®) versus interferon beta-1a 44 mcg (Rebif®) – a commonly prescribed 1st line disease modifying therapy – in rapidly evolving severe relapsing-remitting MS patients from the Brazilian Public Healthcare System (SUS) perspective. **METHODS:** A Markov model with 20-year time horizon with health states based on Expanded Disability Status Scale (EDSS) and disease relapses was developed. Since there are no published data evaluating long-term course specifically in RESRRMS, it was assumed transition probabilities on EDSS states were based on natural history studies in unselected RRMS patients, and relapse probabilities based on a *post-hoc* analysis of the placebo patients on pivotal natalizumab AFFIRM trial. In each monthly cycle, patients can discontinue treatment, remain stable, progress to higher EDSS state, experience progressive multifocal leukoencephalopathy (PML) or die. For natalizumab, we assumed efficacy data on disability progression and relapse from AFFIRM trial and for interferon beta-1a 44 mcg we assumed efficacy data on disability progression and relapse from pivotal trial PRISMS. Patients with EDSS score $\geq$ 7.5 receive best supportive care. Resource use and costs were validated by an expert panel and valued using Brazilian public official lists (DATASUS and BPS). Costs and outcomes were discounted (5%). Probabilistic sensitivity analyses covered variability in efficacy and costs. **RESULTS:** The use of natalizumab was associated with slower EDSS progression and reduced relapse burden. The quality-adjusted life years obtained with natalizumab and interferon beta-1a 44 mcg were 9.27 and 8.75, and costs were USD119,977 and USD132,446, respectively. In the base-case, natalizumab was dominant versus interferon beta-1a 44 mcg. **CONCLUSIONS:** For a patient with HARRMS, the model shows that natalizumab was dominant when compared to interferon beta-1a 44 mcg in the Brazilian Public Healthcare System.

PND37

COSTS ASSOCIATED WITH THE IMPACT OF PROGRESSIVE MULTIPLE SCLEROSIS: INSIGHTS FROM A THREE YEAR CLINICAL TRIAL (THE CUPID TRIAL)

Green C[1], Shearer J[2], Zajicek J[3]
[1]*Exeter University, Exeter, UK,* [2]*Kings College London, London, UK,* [3]*Plymouth University, Plymouth, UK*

OBJECTIVES: To estimate the costs associated with health and social care resource use in a UK cohort of people with progressive multiple sclerosis (MS). **METHODS:** Health and social care resource use data were collected prospectively over 33 months from a cohort of 458 patients with progressive MS enrolled in a UK clinical trial (the CUPID Trial). Resource use data are used in combination with unit costs (2011 costs) from published UK national sources, and estimates of costs/prices where required. Costs for informal (unpaid) care are estimated using equivalent hourly home care rates for UK NHS and social care services. Data are presented over the 33-month period of follow, and also to allow comparison with other studies, against an estimated 6-monthly cost. Regression analyses were used to explore the impact on cost estimates from explanatory variables. **RESULTS:** The main component of resource us and costs was informal care provided by friends and family, accounting for over 84% of the estimated costs over time. Excluding informal care, the most important cost items, within the remaining sub-total of costs, were social care (52%), health care services (23%), medications (10%), adaptations (8%), and hospitalisations (6%). From a Payer perspective, the estimated mean six-monthly costs of health and social care were £927, but from a broader perspective the estimated six-monthly cost was £10,737, when private and patient costs were included. Regression analyses identified disease severity, as characterised by the EDSS, as the main explanatory driver of cost estimates. **CONCLUSIONS:** This study presents new information to inform on the impact of progressive multiple sclerosis to add to the currently sparse evidence base. Data suggest that costs are considerable and fall mainly on patients and carers. The findings also confirm the central role of disability status in predicting overall costs associated with the impact of progressive MS.

NEUROLOGICAL DISORDERS – Patient-Reported Outcomes & Patient Preference Studies

PND38

TREATMENT ADHERENCE AND COSTS IN MULTIPLE SCLEROSIS: A NARRATIVE REVIEW OF THE LITERATURE

Paz S, Comellas M, Lizán L
Outcomes 10, Castellon, Spain

OBJECTIVES: To appraise the literature relating adherence and other patients' reported outcomes (PROs) to Multiple Sclerosis (MS) costs. **METHODS:** Electronic databases [MedLine/PubMed, Google Scholar, Congress proceedings] were searched to identify publications analyzing MS costs related to adherence, persistence, sat-

isfaction and preferences for MS treatments. Bibliographic references were hand searched. English or Spanish studies published between January 2007 and January 2013 were selected. **RESULTS:** A total of 398 citations were identified; 12 studies accomplished the inclusion criteria. Six referred to PROs and treatment costs; 4 analyzed satisfaction with disease-modifying therapies (DMTs) and 2 assessed preferences for treatment attributes. An increased adherence and persistence on DMTs was associated to higher pharmacy costs and to better clinical outcomes [lower relapse risk (OR=0.71 CI 95%, 0.59-0.85); decreased MS hospitalizations (OR=0.63, CI 95%, 0.47 – 0.83)] leading to a cost reduction of up to 22% patient/year. DMT adherent patients had a significantly lower rate of severe relapses (12.5% vs. 19.5%; *p=0.0200*), lower MS-related or all-causes medical (7.6% vs. 12.5%; *p=0.0447* and 11.2% vs. 20.0%; *p=0.0027*) and emergency visits (8.9% vs. 15.0%; *p=0.0215* and 34.6% vs. 43.5%; *p=0.0305*) than non-adherent. MS-related and all-cause inpatient costs (354.77±2.485.03 vs. 853.13±3,635.48; *p=0.0270* and 648.71±3,753.74 vs. 62.51±265.23; *p=0.0018*) as well as emergency visit costs (46.46±255.94 vs. 1,740.88±6,127.27; *p=0.0076* and 147.82±430.79 vs. 242.42±592.96; *p=0.0044*) were significantly lower in adherent patients. Self-injection [Visual Analogue Scale (VAS) mean 6.9; range 0-10] render higher treatment satisfaction. Slower disability progression (efficacy) was the most preferred attribute (*p<0,001*). Newly developed electronic devices that allow adjusting injection settings as well as adherence objective monitoring appeal more to patients (VAS mean 7.7; range 0-10) than more traditional methods of administration. **CONCLUSIONS:** MS studies assessing adherence and costs are scarce. Treatments and devices better tailored to patients' needs improve adherence, enhance clinical outcomes and procure a reduction on MS costs.

PND39

HEALTH STATE (QALY) VALUES FOR MULTIPLE SCLEROSIS: A REPORT USING DATA FROM THE UNITED KINGDOM SOUTH WEST IMPACT OF MULTIPLE SCLEROSIS (SWIMS) STUDY

Green C[1], Hawton A[1], Zajicek J[2]
[1]*Exeter University, Exeter, UK,* [2]*Plymouth University, Plymouth, UK*

OBJECTIVES: To present health state values (QALY weights) for multiple sclerosis (MS) health states using data from a prospective, longitudinal, cohort study. **METHODS:** Data from a large UK cohort study for MS, the South West Impact of MS (SWIMS) Study, were used for analysis. SWIMS data comprise six-monthly self-report assessments, including EQ-5D and SF-36 health status measures, and data on relapse frequency/severity. Self-report data is supplemented with data from clinician assessment of disability using the EDSS. Health state valuation data are sourced from published UK tariffs (EQ-5D and SF-6D) to present values for MS against EDSS, relapse characteristics, and against other disease related characteristics. **RESULTS:** Analyses of SWIMS data included 1,441 respondents, over an average of 8 time-points. Findings on health state values show a health profile that worsens by disease progression, against EDSS stages, using both the EQ-5D and SF-6D methods. Health state values estimated from EQ-5D data range from 0.76 at EDSS stage 1.0 to 0.03 at EDSS stage 8, with lower values seen for progressive MS. Values estimated from SF-36 data reflect the narrower range of values possible on the SF6D tariffs, with values from 0.7 to 0.53 across EDSS stages 1.0 to 8. Findings demonstrate impact on health state values due to relapse events, with this impact reported at 0.08 using the EQ-5D and at 0.05 using the SF-6D. The impact of relapse frequency, severity and endurance on health has also been assessed. **CONCLUSIONS:** This study presents health state valuation data derived from a high quality longitudinal cohort study, including values (QALY weights) for features/characteristics of relapse events in people with MS. This data can support improvements in the conduct of cost-effectiveness analyses of treatments for MS, and can be helpful in a general health policy context.

PND40

CAREGIVER BURDEN IN FRAGILE X SYNDROME AS A FUNCTION OF A HEALTH STATE UTILITY INDEX IN THE UNITED STATES

Raspa M[1], Bishop E[2], Candrilli SD[3], Mitra D[3], Sacco P[4], Petrillo J[4], Bailey D[1]
[1]*RTI International, Research Triangle Park, NC, USA,* [2]*RTI International, Atlanta, NC, USA,* [3]*RTI Health Solutions, Research Triangle Park, NC, USA,* [4]*Novartis Pharmaceuticals Corporation, East Hanover, NJ, USA*

OBJECTIVES: To assess the association between burden experienced by caregivers of patients with fragile X syndrome (FXS) in the United States and a health state utilities index derived from the Aberrant Behavior Checklist-Community (ABC-C). **METHODS:** A total of 340 US caregivers of children with FXS completed a questionnaire that captured information on FXS-related burden (i.e., specialist visits, medical tests, medications, financial burden, employment status, paid and unpaid caregiving, caregiver injuries, and mental health). Using the ABC-Utility Index (ABC-UI), an estimate of health-related quality-of-life derived from the ABC-C, five utility index categories were created: very low (0.00–0.33); low (0.34–0.66); moderate (0.67–0.77); high (0.78–0.89); and very high (0.90–1.00). After controlling for sex, age, overall ability level, and income, multivariable regression models documented the association between utility score and the nine burden-related outcomes. **RESULTS:** Respondents (283 with FXS male child; 57 with FXS female child) were mostly female (91%), Caucasian (92%), and married (84%), with mean age of 50 years. Approximately 2% of individuals with FXS were in the very low utility category, 30.6% low, 27.1% moderate, 37.6% high, and 2.6% very high. The mean utility score was 0.71. Females with FXS and adults ≥18 years had higher health utilities. Results from regression models indicate that increasing utility values reduced the likelihood of ≥5 (vs. <5) specialist visits (b=-4.583; p<0.001) and ≥2 (vs. 0 or 1) prescription medications used (b=-4.517; p<.001). Similarly, increasing utility score was associated with a decreased likelihood of ≥8 (vs. <8) hours of unpaid caregiving (b=-2.723; p=0.003), ≥1 (vs. 0 or 1) caregiver injuries (b=-7.540; p<0.001), and ≥1 (vs. 0) mental health provider visits (b=-2.613; p=0.002). **CONCLUSIONS:** The ABC-UI appears to function well as a health-related quality-of-life indicator in individuals with FXS. Among caregivers of patients with FXS in the US, significant differences in burden exist across health state utilities.

PND41

DYNAMICS OF QUALITY OF LIFE IN CHILDREN WITH CYSTIC FIBROSIS AGED 5-16 YEARS

Simonova O, Gorinova Y, Vinyarskaya I, Samsonova M, Chernikov V
FSBI Scientific Center of Children's Health, RAMS, Moscow, Russia

OBJECTIVES: For improvement of aiding effectiveness both for clinicians and specialists in the field of health care system one should know quality of patient's life in different time period rating of the disease. **METHODS:** 70 cystic fibrosis (CF) children from Russia and CIS countries 5-16 years were interviewed using HUI version 15Q, while children over 12 years responded on their own (self assessment), information about children younger 12 years was obtained from parents (proxy assessment) .Version was translated into russian language and adapted. HUI currently consists of two systems: HUI Mark 2 and HUI Mark 3. Each HUI2 and HUI3 classification system consists of attributes (domains) of health and 3 to 6 levels of functional ability/disability within each attribute and is very responsive to changes and to highlight avenues of additional study. Single-attribute utility scores and multi-attribute utility scores evaluated corresponding to each system, ranges from 0 to 1. **RESULTS:** Mean Mark 2 has a tendency to increase from 0,85 in children 5 years to 0,95 in children 15 years with reduction in 6 years (0,80), 12 years (0,85) and 16 years (0,85). Same tendency was observed in Mark 3: 6 years- 0,75; 12 years- 0,75; 16 years- 0,77 **CONCLUSIONS:** Decrease of quality of life in above mentioned ages is a result of unadequate treatment in children living in some regions of CIS and severe complications of CF in older children also.

PND42

HEALTH RELATED QUALITY OF LIFE (HRQL) IN PARKINSON'S DISEASE: THE IMPACT OF 'ON' AND 'OFF' TIME

Kerr C[1], Howard CE[1], Johnston K[2], Smith HT[3], Lloyd E[3], Cooper JA[3], McIntosh E[4], Lloyd AJ[1]
[1]*Oxford Outcomes, An ICON plc Company, Oxford, UK,* [2]*Oxford Outcomes, An ICON plc Company, Vancouver, BC, Canada,* [3]*GSK, Brentford, UK,* [4]*University of Glasgow, Glasgow, UK*

OBJECTIVES: Diurnal variation in symptoms and functioning is a feature of Parkinson's disease, referred to as 'on' and 'off time'. Typically patient reported outcomes (PROs) don't capture this variability or its value, instead requesting participants report over the last day or week. This study evaluated the impact and value of 'on' and 'off time' for people with Parkinson's (PwP) by assessing their HRQL and strength of preference. **METHODS:** PwP from UK, Spain, France and Italy (n=305), experiencing ≥ 2 hours 'off time' daily, completed EQ-5D-5L assessments for 'on' and 'off time' that day, followed by a discrete choice experiment (DCE) evaluating 5 treatment attributes: duration of 'on time'; quality of 'off time'; predictability of 'off time'; feelings of anxiety/depression, and dosing frequency. The DCE was informed by qualitative work with patients (n=20), carers (n=6) and health professionals (n=6) in UK and Spain and employed an orthogonal, factorial, fold-over design. Analysis used the mixed-logit model and effects coding of categorical levels (predictability of off-time attribute). **RESULTS:** Mean EQ-5D utility values were significantly lower for 'off time' (0.37, 95%CI: 0.33-0.40) than 'on time' (0.60, 95%CI: 0.57-0.62). All attributes were significant drivers of treatment choice. PwP valued increased duration of 'on time' (per hour per day: OR=1.40, 95%CI 1.31-1.45) and predictability of 'off time' most highly (predictability to within 30 minutes of symptoms returning: OR=1.42, 95%CI 1.15-1.57). High disutility was reported for substantial unpredictablility of 'off time' (OR=0.67, 95%CI 0.49-0.91). **CONCLUSIONS:** Important differences in quality of life between 'on' and 'off time' were found which could be missed by standard PRO assessment, including the relative value that PwP placed on increased duration of 'on time' and predictability of 'off time'. Assessments and interpretation of outcomes in Parkinson's should consider diurnal variation. Capturing this variation and its value may require modifications to PRO design. [Study HO-11-802]

PND43

CULTURAL ADAPTATION AND VALIDATION TO SPANISH OF THE "MS TREATMENT CONCERNS QUESTIONNAIRE-MSTCQ"

Galera J[1], Munteis E[2], Navarro G[3], Meca J[4], Maestre A[5], Perez A[6], Gracia J[7], Pato A[8]
[1]*Novartis Pharma, Barcelona, Barcelona, Spain,* [2]*Hospital del Mar, Barcelona, Spain,* [3]*Hospital Virgen de Macarena, Sevilla, Spain,* [4]*Hospital Virgen de la Arrixaca, Murcia, Spain,* [5]*Hospital de Jaén, Jaén, Spain,* [6]*Hospital General de Alicante, Alicante, Spain,* [7]*Hospital de Albacete, Albacete, Spain,* [8]*Hospital de POVISA, Vigo, Pontevedra, Spain*

OBJECTIVES: Albeit effectiveness of subcutaneous treatments for Multiple Sclerosis (MS) has been demonstrated, adverse reactions and pain may entail problems regarding treatment satisfaction and continuity. This study aims to adapt and validate the Spanish version of the "Multiple Sclerosis Treatment Concerns Questionnaire-MSTCQ", which evaluates satisfaction with the injection device (ID) in 4 dimensions: Injection system (A), Side-effects (B) (flu-like symptoms, reactions, and satisfaction), Treatment experience (C) and Benefits (D). **METHODS:** Two Stages: 1) Cultural adaptation: Forward-backward translation and expert (n=6) and patient (n=30) panels; 2) Validation: Observational, cross-sectional, multicenter study. A total of 143 adult patients suffering from MS and using an ID were evaluated. Tools employed: MSTCQ, *Patient-Reported Indices for Multiple Sclerosis* (PRIMUS), *Treatment Satisfaction Questionnaire for Medication (*TSQM), Morisky Green and Patient Injection Site Reaction (ISR) and Injection Site Pain (ISP). Psychometric properties: Feasibility (% valid cases and ground/ceiling effects); Reliability (Cronbach α) and test-retest (41 patients, Intraclass Correlation Coefficient, ICC); as well as construct (Factorial analysis of dimensions A and B, FA) and convergent (Spearman MSTCQ vs. TSQM) validity. **RESULTS:** Mean age(SD) in cases was 41,94(10,47) years, 63% female, 88,11% suffering from Relapsing-Remitting MS. MSTCQ feasibility was adequate (missing 0%-2,80%). High internal consistency, total score (A+B) α =0, 89, by dimensions α (A, B and C): 0,76, 0,89 and 0,92, respectively. Furthermore, a concordance was found between total (ICC= 0, 98) and by dimensions ICC (A, B and C) scores: 0,82, 0,97 and 0,89, respectively. The FA confirms dimensions A and B from the original questionnaire. Lastly, the association between total and by dimensions scores, from MSTCQ and TSQM was, overall, moderately strong (Rho between-0, 74, y 0, 42) and significant

(p<0,05; p<0,01). **CONCLUSIONS:** The Spanish version of the MSTCQ questionnaire is a feasible, reliable and valid tool for the evaluation of satisfaction with the injection device in the treatment of MS.

PND44

ELICITING PATIENTS' PREFERENCES FOR EPILEPSY DIAGNOSTICS: A DISCRETE CHOICE EXPERIMENT

Wijnen BFM[1], de Kinderen RJA[1], Colon AJ[2], Dirksen CD[3], Essers BAB[4], Hiligsmann M[1], Leijten FFS[5], Ossenblok PPW[2], Evers SM[1]

[1]*Maastricht University, Maastricht, The Netherlands,* [2]*Epilepsy Centre Kempenhaeghe, Heeze, The Netherlands,* [3]*Clinical Epidemiology and Medical Technology Assessment, Maastricht University Medical Centre; CAPHRI, Maastricht University, Maastricht, The Netherlands,* [4]*Clinical and Medical Technology Assessment, Maastricht University Medical Centre; CAPHRI, Maastricht University, Maastricht, The Netherlands,* [5]*Brain Center Rudolf Magnus, University Medical Centre Utrecht, Utrecht, The Netherlands*

OBJECTIVES: Diagnosing epilepsy is a lengthy and burdensome process for patients and their family. Although the need for a more patient-centered approach in clinical practice is widely acknowledged, empirical evidence regarding patient preferences for diagnostic modalities in epilepsy is missing. The objectives of this study are 1) to identify to what extent important attributes of diagnostic procedures in epilepsy affect preferences for a procedure; 2) to determine the relative importance of these attributes; and 3) to calculate overall utility scores for routine electroencephalography (EEG) and magnetoencephalography (MEG) registrations. **METHODS:** A discrete choice experiment was performed to determine patients' preferences, which involved presentation of pair-wise choice tasks regarding hypothetical scenarios. Scenarios varied along six attributes: "Way of measuring brain activity"; "Duration"; "Freedom of movement"; "Travel time"; "Type of additional examination"; and "Chance of additional examination". Choice tasks were constructed using a statistically efficient design and the questionnaire contained 15 unique unlabeled choice tasks. Mixed multinomial logistic regression was used to estimate patients' preferences. **RESULTS:** A total of 289 questionnaires were included in the analysis. McFadden's pseudo R^2 showed a model fit of 0.28 and all attributes were statistically significant. Heterogeneity in preferences was present for all attributes. "Freedom of movement" and "Chance of additional examination" were perceived as the most important attributes. Overall utility scores marginally differ between MEG and routine EEG. **CONCLUSIONS:** Our study suggests that the identified attributes are important in determining patients' preference for epilepsy diagnostics. It can be concluded that MEG is not necessarily more patient-friendly than a routine EEG in primary diagnostics and, regarding additional diagnostics, patients have a strong preference for long-term 24h EEG over EEG after sleep deprivation. Furthermore, barring substantial heterogeneity within the parameters in mind, our study suggests that it is important to take individual preferences into account in clinical decision-making.

PND45

QUALITY OF LIFE OUTCOMES IN MULTIPLE SCLEROSIS: A REVIEW OF THE LITERATURE

Rouse M, McKenna S, Twiss J, Graham JE, Wilburn J

Galen Research Ltd., Manchester, UK

OBJECTIVES: Multiple sclerosis (MS) is a chronic neurodegenerative disease affecting the central nervous system. There are a variety of symptoms and activity limitations associated with MS including mobility problems, muscle spasticity, fatigue and mental health problems. In order to gain an accurate insight into the impact of MS on patients it is important for accurate patient-reported outcome (PRO) instruments to be applied. The purpose of this review was to evaluate the available MS-specific PRO measures. **METHODS:** The online literature databases PubMed, Psychinfo and Web of Science were used for the search. The search identified all studies that used a PRO measure in the study design and was restricted to publications from the last fifteen years. Only measures used in at least three clinical trial studies were included. The measures identified were evaluated in terms of; source of items, item reduction methods, unidimensionality, practicality, responsiveness, reliability, internal consistency and face, content and construct validity. **RESULTS:** The search yielded 2317 articles, of which 1066 were duplicates and removed. The review of the remaining articles identified six measures that met the review criteria: MSIS-29, LMSQoL, MSQoL-54, HAQUAMS, MSQLI and PRIMUS. In addition, the MUSIQoL was reviewed because of recent development activity. Most of the measures exhibited some weaknesses. Only the PRIMUS performed well on all the review criteria. It was the only measure to apply a clear theoretical framework and meet the strict measurement requirements of the Rasch model. **CONCLUSIONS:** The PRIMUS is recommended for use in clinical trials. The review suggests that many clinical trials are using PROs that have not benefitted from the use of Item Response Theory and modern psychometric approaches.

PND46

PATIENT-CENTERED OUTCOMES IN UPPER LIMB SPASTICITY: RESULTS FROM A LARGE INTERNATIONAL COHORT STUDY (ULIS-2)

Balcaitiene J[1], Kurth H[2], Pheodoroff K[3], Jacinto J[4], Turner-Stokes L[5]

[1]*IPSEN Pharma, Boulogne-Billancourt, France,* [2]*IPSEN Pharma, Boulogne Billancourt, France,* [3]*Gailtal-Klinik, Hermagor, Austria,* [4]*Serviço de Reabilitação de adultos 3, Alcoitão, Portugal,* [5]*King's College London, London, UK*

Muscle spasticity following stroke may interfere with motor and activity performance, cause pain, and lead to secondary complications. Goals of spasticity management include improving function (active and passive) and body image, and facilitating concomitant treatments. The efficacy of BoNT-A in upper limb spasticity (ULS) patients focusing on reduction of muscle tone and pain is well established. However, there are no specific ULS patient-reported outcome measures (PROs) available. As patients with ULS are highly heterogeneous, there is a need to develop measures to capture realistic, patient-specific treatment goals. **OBJECTIVES:** To assess effectiveness of BoNTA on ULS considering patient-specific experience. **METHODS:** A prospective multinational, multicenter (84 centers in 22 countries), observational, post-marketing, longitudinal study (ULIS-2), investigating routine use of BoNT-A for treating post-stroke ULS. Primary outcome: achievement of the patient's primary goal for treatment using Goal Attainment Scaling (GAS). Goals were set together by physicians and patients/caregivers. Patients were able to rate goals for importance. Secondary outcome: global assessment of benefits by both physician and patients/caregiver. **RESULTS:** Among the 456 adults with post-stroke ULS presenting for treatment with BoNT-A, the most commonly selected primary treatment goals were passive function (132 (28.9%)), active function (104 (22.8%)), pain (61 (13.4%), and impairment (105 (23%)). Patients rated 404/456 primary goals (88.6 %) as "important" (395/456 (86.6%) as "very" or "moderately" important), indicating high patient involvement in goal-setting. Overall, 363 (79.6%) (95% CI 75.6% to 83.2%) patients achieved (or overachieved) their primary goal. GAS T-scores were strongly correlated with rating of global benefit and other standard measures (correlations of 0.38 and 0.63, respectively; p<0.001). **CONCLUSIONS:** Patient-centered goal setting and evaluation using GAS to calculate changes of health-related status is a feasible way to capture changes in ULS patient experience. GAS as primary outcome measure in ULIS-2 is a step closer to a PRO in ULS patients.

PND47

PATIENT PREFERENCES AND PRIORITIES FOR ANTI-EPILEPTIC DRUG TREATMENT

Fargher EA[1], Marson A[2], Jacoby A[3], Ring A[3], Williamson P[3], Hughes DA[1]

[1]*Bangor University, Bangor, UK,* [2]*Walton Centre for Neurology and Neurosurgery Foundation Trust, Liverpool, UK,* [3]*University of Liverpool, Liverpool, UK*

OBJECTIVES: Clinical trials in epilepsy may not routinely prioritise patient-oriented outcomes that consider the harms of treatments in addition to their benefits. To date, no systematic empirical research has been undertaken to assess the views of people with epilepsy about treatment outcomes. The aim was to identify which outcomes of drug treatment are considered important to three groups of adults with epilepsy: (i) recently diagnosed, (ii) established diagnosis, (iii) women of childbearing age. **METHODS:** Semi-structured individual interviews containing ranking exercise were used to explore views and interpretations of benefits, harms, and potential life-impacts of anti-epileptic drug treatments (n=41); the feasibility of these findings were evaluated in focus groups of health care professionals responsible for prescribing anti-epileptic drugs (n=8) . Outcomes ranked 1-4 were scored 4-1. For each group, scores were summed and divided by the number of participants. **RESULTS:** Ten recently diagnosed men (mean age 45.9), 13 established (mean age 39.3, 92% male), and 18 women of childbearing age (mean age 34.5) participated. Reduction in seizure frequency was the most highly ranked outcome of drug treatment across all three subgroups (women of childbearing age [score]=2.5, recent=2.4, established=2.23). Adults recently diagnosed were most concerned about feelings of aggression (1.6), depression (1.0) and ability to work (0.9). Adults with established epilepsy were most concerned with ability to work (1.15) negative impacts on relationships (1.0), memory problems (0.69), and social-life (0.69). Women of childbearing age were concerned about memory (1.22), reduced independence (0.78), feeling in control (0.56) and foetal abnormality (0.5). Clinicians considered life-impacts (eg work, relationships, independence) as consequences of benefits and harms of treatment. **CONCLUSIONS:** The importance of remission from seizure was consistent. However, patients' rankings of unfavourable outcomes of drug-treatment varied by subgroup. Selection of outcome measures in clinical trials in epilepsy must consider relevant patient-oriented outcomes which differ by population.

PND48

EVALUATING FATIGUE IN FIBROMYALGIA: DEVELOPMENT AND VALIDATION OF THE DAILY DIARY OF FATIGUE SYMPTOMS IN FIBROMYALGIA (DFS-FIBRO)

Burbridge C[1], Symonds T[1], Humphrey L[2], Arbuckle R[2], Hirsch I[3], Whelan L[1]

[1]*Pfizer Ltd., Surrey, UK,* [2]*Adelphi Values, Bollington, UK,* [3]*Astra Zeneca, Cheshire, UK*

OBJECTIVES: Despite being recognised as an important symptom in Fibromyalgia (FM), existing measures of fatigue are unlikely to meet regulatory standards for clinical trial endpoints. We therefore describe the development and validation of a new, electronically administered patient reported outcome (ePRO) measure of fatigue in FM - the Daily Diary of Fatigue Symptoms-Fibromyalgia (DFS-Fibro). This was developed in accordance with the FDA regulatory guidance and ISPOR good practice recommendations for the development and validation of PROs. **METHODS:** Initial item generation was based on concept elicitation interviews with 40 FM patients (from the US, Germany and France), and clinical relevance of the findings was confirmed by expert clinician review. The draft tool was pilot tested with 20 FM patients for 5-9 days, followed by cognitive debriefing interviews. A methodology study with 145 FM patients then followed, providing data to conduct the psychometric validation of the measure. Both the qualitative and quantitative findings were used to finalise the DFS-Fibro. **RESULTS:** Twenty-three items were generated from concept elicitation interviews, including items focussed on the physical and cognitive impacts of fatigue as well as fatigue 'symptom' items. Some minor wording revisions were made following pilot testing and cognitive debriefing, but none were deleted. All patients found the measure easy to understand and use. Initial psychometric analyses supported removing items previously identified as candidates for deletion in the qualitative work, resulting in a 5-item measure focussed on the core symptom of FM fatigue. The psychometric analyses were then repeated on the final 5-item measure, which had very high internal consistency (alpha = 0.99), strong test-retest reliability (r > 0.84), and met a priori criteria for convergent and known groups validity. **CONCLUSIONS:** The DFS-Fibro development followed accepted guidelines and demonstrates strong psychometric properties and content validity as a measure of the symptom of fatigue in FM.

PND49

EVALUATING PATIENT ADHERENCE RATES TO APPROVED DISEASE MODIFYING THERAPIES (DMT) FOR RELAPSING-REMITTING MS (RRMS): OPERATIONAL SETUP FOR A MULTI-COUNTRY, MULTI-CENTER STUDY

Apecechea de Scheffer M, Faber S, Potthoff P, Eichmann F

Kantar Health Germany, Munich, Germany

OBJECTIVES: DMTs constitute an important backbone of MS treatment. To investigate Health Related Quality of Life (HRQOL) and patient adherence rates to the approved DMTs for RRMS among geographically and culturally diverse patient populations, a multinational study was to be implemented. Operational and scientific outcomes are presented. **METHODS:** The study was designed as an observational, multicenter, multinational post marketing study. Patients and physicians received paper questionnaires evaluating adherence to DMTs approved at the time of the study. HRQOL (MusiQol) and a Neuropsychological Questionnaire (MSNQ) also were applied. **RESULTS:** The study was implemented in 22 countries. Special challenges: cross-cultural CRF design, country-specific recruitment procedures for sites and patients, country/site specific contractual arrangements. Ethical approval was collected from 70 local and 15 central institutions. Patient recruitment was performed via 176 neurologists (hospital and office based). In total, 2.566 patients were enrolled within 6 months. Average treatment duration / observational period covered 31 months. The study findings revealed that 75% of the patients were adherent (i.e. not missing an injection or changing dose). 12.6% of all patients forgot to administer injections compared to 50% of non-adherent patients. Compared to non-adherent patients, adherent patients showed shorter disease duration (adherent: median 6.0 yrs; non-adherent: Median 7.0 yrs.), significant shorter treatment time (30.0 months vs. 36.0 months; p<0,001) and a better MSNQ score (18.0 vs. 22.0; p<0,001). **CONCLUSIONS:** For implementing a global multicenter center important issues include: linguistic specifics for CRF development, availability of medical centers for site recruitment, country specific legal and ethical requirements, careful organization and sharing of responsibilities between the study coordination center and local affiliates. Non-adherence to DMT in RRMS was demonstrated to be mainly caused by injection problems; adherent patients showed better clinical and HRQOL outcomes.

PND50

WELLBEING, LIFE SATISFACTION AND PROGRESSION IN ALZHEIMER'S DISEASE – AN ALSOVA FOLLOW-UP STUDY

Väätäinen S, Hongisto K, Hallikainen I, Välimäki T, Martikainen JA, Koivisto A
University of Eastern Finland, Kuopio, Finland

OBJECTIVES: To examine the quality of life (QoL) of the Alzheimer's Disease (AD) patients in relation to disease progression during the five-year ALSOVA follow-up study. **METHODS:** The baseline sample consisted of 240 subjects with very mild or mild AD, 65 years or older, from three Finnish hospital districts. The subjects were recruited between 2002 and 2006, and were followed-up for five years. Three separate patient-reported wellbeing and life satisfaction instruments were used as proxy variables for QoL: a generic, preference-based health-related quality-of-life instrument, 15D; an AD -specific wellbeing measure, AD-QOL; and a VAS-based life satisfaction scale. AD progression was evaluated with the Clinical Dementia Rating (CDR). Both CDR Sum-of-Boxes (CDR-SOB) and global rating were used in the analysis. Generalized linear mixed models with hierarchical structure were applied to account for repeated measures and possible clustering by the hospital district. Data were adjusted for age, sex and years of education. **RESULTS:** On average, none of the three outcome measures demonstrated statistically significant changes over time during the five year follow-up. However, when the outcomes were examined in relation to AD progression, both CDR-SOB and CDR global rating demonstrated statistically significant association between the severity of AD and lower QoL on all three outcome measures. However, when using CDR global rating to define disease progression, we observed meaningful impairments in QoL variables only in the patients with severe AD (CDR 3). **CONCLUSIONS:** Severe AD has a considerable impact on patients' QOL through substantial impairments in wellbeing and life satisfaction. Evidence suggest that CDR-SOB is a potential continuous measure of AD severity. While CDR-SOB is strongly associated with decrease QoL measures, our observations indicate that it is unlikely to be linearly correlated with QoL. Thus, the use of CDR-SOB as a determinant of QoL needs to be examined further.

LONG-TERM PROLONGED-RELEASE FAMPRIDINE TREATMENT AND HEALTH-RELATED QUALITY OF LIFE OUTCOMES: INTERIM RESULTS OF THE ENABLE STUDY

Nagels G[1], Macdonell R[2], Soelberg Sorensen P[3], Pozzilli C[4], Laplaud D[5], de Jong B[6], Silva AM[7], Nicholas R[8], Gaebler JA[9], Sun J[9], Agarwal SS[9]
[1]*National MS Centre Melsbroek and Vrije Universiteit Brussel, Melsbroek, Belgium,* [2]*Austin Health, University of Melbourne, Heidelberg, Victoria, Australia,* [3]*Danish MS Center, Copenhagen University Hospital Rigshospitalet, Copenhagen, Denmark,* [4]*Sapienza University, Rome, Italy,* [5]*CHU de Nantes, Hôpital G. et R. Laennec, Nantes, France,* [6]*Radboud University Nijmegen Med Center, Nijmegen, The Netherlands,* [7]*Hospital Santo António-Centro Hospitalar do Porto, Porto, Portugal,* [8]*Imperial College, London, UK,* [9]*Biogen Idec, Weston, MA, USA*

OBJECTIVES: Prolonged-release (PR) fampridine tablets (dalfampridine extended release in US) improve walking in some patients with multiple sclerosis (MS). The ENABLE study assessed the effect of long-term PR-fampridine treatment on health-related quality of life (HRQoL) in MS patients with walking impairment. **METHODS:** ENABLE is an open-label, 48-week study to evaluate the effect of PR-fampridine 10 mg twice daily on HRQoL in MS patients. Patients completed the Timed 25-Foot Walk (T25FW) at baseline and Weeks 2 and 4, and the 12-item MS Walking Scale (MSWS-12) at baseline and Week 4. Patients with any improvement in T25FW speed at both Weeks 2 and 4, and any improvement in MSWS-12 score at Week 4 remained on treatment. HRQoL measures are assessed at baseline and Weeks 12, 24, 36, and 48, and include the Short-Form Health Survey (SF-36), Multiple Sclerosis Impact Scale (MSIS-29), and the Patient Reported Indices for MS Activity Limitations Scale (PRIMUS ALS). The primary endpoint is the change from baseline in the SF-36 physical component summary (PCS) score at each visit in patients on treatment. **RESULTS:** At Week 4, 704 patients (78.1% of total enrollment [N=901]) met the criteria to remain on treatment. Interim results at 36 weeks in patients on treatment show improvement from baseline (mean change [95% CI]) in MSIS-29 Physical scores to Week 12 (-12.99 [-14.24, -11.74; P<0.0001], n=672) and Week 36 (-9.50 [-10.97, -8.04; P<0.0001], n=584). PRIMUS ALS scores also improved from baseline (mean change [95% CI]) to Week 12 (-2.47 [-2.83, -2.11; P<0.0001], n=501) and Week 36 (-1.53 [-1.96, -1.10; P<0.0001], n=437) in patients on treatment. Results for the change from baseline to Week 48 for outcomes, including the SF-36 PCS, in patients on treatment will be presented. **CONCLUSIONS:** PR-fampridine, which improves walking in MS, shows benefits on HRQoL through 36 weeks of treatment.

PND52

QUALITY OF LIFE IN PATIENTS WITH MULTIPLE SCLEROSIS IN SLOVAKIA

Bielik J[1], Tomek D[2], Tomekova K[3], Novak I[4], Andrasova E[4]
[1]*Trencin University, Trencin, Slovak Republic,* [2]*Pharmaceutical Faculty at Comenius University, Bratislava, Slovak Republic,* [3]*Slovak Society for Pharmacoeconomics, Bratislava, Slovak Republic,* [4]*Novartis Slovakia, Bratislava, Slovak Republic*

OBJECTIVES: The current prevalence of Multiple Sclerosis (MS) in Slovakia ranges from 100 till 150 cases per 100 000 population Being a typical chronic disease with tendency of progression, MS can have a great impact on quality of life (QoL). The objective of this paper was to find out the level of QoL in patients with MS in Slovakia. **METHODS:** The primary method used for the analysis of QoL was the presence of disability period and combined questionnaire consisting of 4 parts: A. Demography and socioeconomics (13 items), B. Generic questionnaire (SF-36), C. Visual scale (4 items), D. Complementary (information and habits, 13 items). There were 2 groups of patients. Group A: 41 (29 women, 12 men) patients were treated by conventional therapy. Group B: the 41 (32 women, 9 men) patients were treated by moderns disease modifying treatment and biological therapy (Betaferon, Avonex, Rebif, Tysabri, Gilenya, Copaxone). The average age in the group A was 50.59 vs 41.82 years in the group B. **RESULTS:** Disability was 9,39 months per one patient per year in group A vs 5,02 in group B, loss of income was 123 vs 165 € per person, the expectations of the future was 2,39 vs 2,41 (in the five degrees scale). Present level of QoL was identified as 5.29 vs 4,34 on the scale of 10, while in the time of the MS diagnosis it was 3,29 vs 2,15. QoL was 8.68 vs 8,17 in the time without SM and 9,24 vs 8,29 in the total optimal state of health. **CONCLUSIONS:** The treatment of MS by conventional or disease modifying therapy (DMT) had a significant impact on QoL. The modern DMT had the higher statistical influence as on physical health (45,65 vs 28,23) so on mental health (51,65 vs 33,01) in comparison with the patients treated by conventional therapy.

PND53

CORRELATION BETWEEN MONTGOMERY-ASBERG DEPRESSION RATING SCALE (MADRS) AND THE BECK DEPRESSION INVENTORY II (BDI-II) IN PATIENTS WITH FOCAL EPILEPSY

Garcia ME[1], García I[1], Gil-Nagel A[1], Garcia M[2], Lara N[2]
[1]*Hospital Clínico San Carlos., Madrid, Spain,* [2]*IMS Health, Barcelona, Spain*

OBJECTIVES: To determine the correlation between the Montgomery-Asberg Depression Rating Scale (MADRS) and the Beck Depression Inventory II (BDI-II) scores in patients with drug-resistant focal epilepsy (DRE) in comparison with patients with controlled focal epilepsy (CFE). **METHODS:** Observational, cross-sectional study performed in patients with focal epilepsy (FE) with and without DRE, ≥18 years. Presence and severity of depression were measured using validated Spanish versions of the Montgomery-Asberg Depression Rating Scale (MADRS) and the Beck Depression Inventory (BDI-II). In order to know the correlation between MADRS and BDI-II, two different criteria were used; degree of association obtained on prevalence of depression and correlation between scores from both scales, using Pearson correlation coefficient. **RESULTS:** 515 patients (DRE=248) were included. Using the MADRS scale, prevalence of depression in the DRE group was almost double than in the CFE group (59.3% vs. 30.3% using unadjusted data and 62.1% vs. 32.6% using adjusted data; p<0.001). Similar results were seen with the BDI, with an overall depression rate of 48.1% using the ≥10 point threshold, and considerably higher rates of depression in the DRE group compared to CFE patients (61.9 % vs. 35.3% using unadjusted data, and 64.8% vs. 37.2% using adjusted data; p<0.001). Correlation between MADRS and BDI-II was 24,4 % (65/266) in CFE and 51,0% (126/247) in DRE patients, according to the degree of association; while the Pearson correlation coefficient between the two scales was high, at r=0.80. **CONCLUSIONS:** MADRS and BDI-II showed a positive correlation; the score increment of one scale is directly proportional to the increase of the other scale. In both cases, the strongest contributor to higher MADRS and BDI-II scores was having a previous clinical diagnosis of depression but being untreated for the condition.

NEUROLOGICAL DISORDERS – Health Care Use & Policy Studies

PND54

ADDITIONAL CLINICAL BENEFIT FOR PATIENT RELEVANT ENDPOINTS: INVESTMENT DISINCENTIVES BY AMNOG IN THE EXAMPLE OF PARKINSON'S DISEASE

Walzer S[1], Holbein B[2]
[1]*MArS Market Access & Pricing Strategy UG (h.b.), Weil am Rhein, Germany,* [2]*University of Bremen, Bremen, Germany*

OBJECTIVES: After the introduction of the new German law AMNOG a statistically significant and clinically meaningful difference in patient relevant endpoints are required in order to achieve a (significant) clinical benefit for a new (drug) therapy. The question remains if such an incentive is sufficient in all disease areas for positive investment decisions for the pharmaceutical industry. **METHODS:** In Parkinson's disease motor fluctuations and dyskinesias are two major patient relevant outcomes. Different target profiles for a clinical development programme of a theoretical new treatment were developed including scenarios following the regulatory guidelines only, an efficacy-driven programme and one including the above mentioned key patient relevant endpoints. An investment decision model was developed based on these profiles with respect to additional clinical benefit by the joint federal committee and premium pricing in Germany were assessed. **RESULTS:** Positive investment decisions were possible for the regulatory and efficacy-driven

scenarios even though that the additional clinical benefit profile was uncertain and pricing not optimal. When developing potential budget estimates based on sample size and complexity of a clinical trial for motor fluctuations or dyskinesias as primary endpoint a significant clinical benefit was highly likely and premium pricing possible. However, a positive investment decision was uncertain due to the high development cost. **CONCLUSIONS:** Even though there are incentives to add patient relevant endpoints in the development programmes the return on investment could potentially not be high enough for a positive investment decision. Target profiling including market access and pricing outcomes could optimize investment decisions.

PND55

DISEASE BURDEN AMONG PATIENTS WITH MULTIPLE SCLEROSIS NOT RECEIVING DISEASE MODIFYING TREATMENTS IN EUROPE AND THE UNITED STATES

Narayanan S[1], Khan H[2], Gabriele S[2], White J[2]
[1]*Ipsos Healthcare, Gaithersburg, MD, USA,* [2]*Ipsos Healthcare, London, UK*

OBJECTIVES: To assess clinical characteristics of MS patients not on any DMTs in key countries in European Union (EU) and the U.S. **METHODS:** A multi-country multi-center medical chart-review study of MS patients was conducted in 4Q2012 among Health care providers (HCPs; >85% neurologists) in hospitals and private practices to collect de-identified data. HCPs from UK, Germany, France, Italy and Spain (5EU) and the US were screened for duration of practice (>=3yrs) and patient volume (>=15 MS patients/month) and recruited from a large panel to be geographically representative in each country. Medical charts of next 10 consecutive MS patients were completed by each physician. HCPs abstracted patient diagnosis, treatment patterns and patient symptomatology/disease status. MS patients not on any DMTs were analyzed. **RESULTS:** A total of 967 eligible MS patients were included in the analysis (5EU:749; US:218). Mean age (yrs) – 5EU:39.0yrs, US:42.2yrs; Female – 5EU:69%; US:67%. Key reasons for not receiving DMTs were (5EU/US): mild/early-MS (35%/36%), patient refusal (26%/44%), progressive/severe/advanced-MS (20%/17%), lack of efficacy of current treatment options (10%/14%), side-effects/tolerance/co-morbidities (6%/12%), waiting for DMTs to become available (5%/12%) and funding/authorization/guidelines (4%/7%). Among patients who refused DMTs, more than half were not convinced of therapy benefits. Distribution of MS type was (5EU/US): Clinically Isolated Syndrome (CIS)-26%/25%, Relapse Remitting MS (RRMS)-44%/49% and Secondary Progressive MS (SPMS)-30%/26%. Patients with moderate/severe disease and those with active/highly active disease (both, per physician judgment) were (5EU/US): CIS:10%/11%, RRMS:25%/40%, SPMS:95%/86%, and CIS:31%/44%, RRMS:39%/37%, SPMS:36%/32% respectively. Mean Expanded Disability Status Scale score were (5EU/US): CIS:0.8/0.7, RRMS:1.8/2.2, SPMS:6.5/5.6); % patients currently suffering a relapse were (5EU/US): CIS:20%/29%, RRMS:21%/15%, SPMS:6%/16%; % patients with >=1 relapses in last 12months were (5EU/US): CIS:69%/69%, RRMS:52%/58%, SPMS:18%/32%. **CONCLUSIONS:** Among MS patients not on any DMTs, disease burden seems substantial. Further research is warranted to scrutinize the observed patient management practices to alleviate patient burden.

PND56

DISEASE BURDEN AMONG PATIENTS WITH SECONDARY PROGRESSIVE MULTIPLE SCLEROSIS CURRENTLY USING DISEASE MODIFYING TREATMENTS IN EUROPE UNION AND THE UNITED STATES

Narayanan S[1], Khan H[2], Gabriele S[2], White J[2]
[1]*Ipsos Healthcare, Gaithersburg, MD, USA,* [2]*Ipsos Healthcare, London, UK*

OBJECTIVES: To assess disease burden of SPMS patients treated with DMTs in EU and the U.S. **METHODS:** A multi-country chart-review study of SPMS patients was conducted among neurologists in hospitals/private practices to collect de-identified data. Neurologists from UK/Germany/France/Italy/Spain (5EU) and US were screened for practice-duration (>=3yrs) and patient-volume (>=15MS patients/month) and recruited from a large panel to be geographically representative in each country. Charts of next 2 consecutive SPMS patients were selected by each neurologist. Neurologists abstracted patient diagnosis, treatment patterns and patient symptomatology/disease status. SPMS patients on DMTs were analyzed. **RESULTS:** In 4Q2012, 360 Neurologists (5EU:259; US:101) abstracted 699 eligible SPMS patient charts (5EU:497; US:202); 420 (5EU:274; US:146) patients were managed with DMTs. Mean age – 5EU:46.5yrs, US:49.2yrs; Female – 5EU:58%; US:66%. Mean time-to-1st DMT initiation (5EU/US; months) from diagnosis was 21/27; current DMT patterns (5EU/US) were: 1st line (25%/34%), 2nd line (39%/38%) & 3rd+ line (36%/28%). Interferon beta-1b (5EU) and glatiramer acetate (US) were predominantly observed in 1st/2nd line; fingolimod and natalizumab use was observed in 2nd-line but they dominated later lines. Mean time-to-1stDMT initiation (5EU/US: months) from diagnosis (1st:45/35, 2nd:13/30, 3rd+:12/10) and mean treatment time (5EU/US: months) on current 1st (85/91), 2nd (38/35; prior 1st line: 57/48) and 3rd+ line (19/24; prior 2nd line: 35/46) differed. Patients with severe disease and those with active/highly active disease (both, per physician judgment) were (5EU/US): 1st:15%/20%, 2nd:20%/18%, 3rd+:35%/37% and 1st:45%/61%, 2nd:63%/73%, 3rd+:57%/68% respectively; mean Expanded Disability Status Scale scores also differed (5EU/US): 1st:5.1/5.0, 2nd:5.6/5.5, 3rd+:5.8/6.1. **CONCLUSIONS:** Among SPMS patients currently managed with DMTs, the disease burden increased as the line of treatment increased, both in 5EU and the US. Patients in 2nd/3rd+line of treatments had progressed through earlier line(s) of treatment quickly. Further research is warranted to scrutinize the effectiveness of therapeutic options and sequencing strategies to alleviate patient burden.

PND57

PATTERNS OF USE OF TESTS TO DIAGNOSE AND ASSESS DISEASE PROGRESSION IN MULTIPLE SCLEROSIS (MS): A MULTICOUNTRY COMPARISON

Narayanan S[1], Khan H[2], Gabriele S[2], White J[2]
[1]*Ipsos Healthcare, Gaithersburg, MD, USA,* [2]*Ipsos Healthcare, London, UK*

OBJECTIVES: To assess the patterns of use of tests to diagnose and assess disease progression/activity in MS in the European Union and United States (US). **METHODS:** A multi-center retrospective chart-review study of MS patients conducted in United Kingdom (UK), France (FR), Germany (DE), Italy (IT), Spain (SP) and US to collect de-identified data on diagnosis, clinical status and DM approaches. Health care providers (HCPs; 95% neurologists) were screened for duration of practice (>=3yrs) and patient volume (>=15 MS patients/month) and recruited from a large panel to be geographically representative in each country. Medical charts of next 10 consecutive MS patients were selected by each physician. **RESULTS:** A total of 3490 eligible MS patient charts were abstracted by 360 HCPs (mean age:47yrs; female: 31%; mean practice duration:18yrs; mean # of patients seen per month:63; % working in specialty MS clinic:45%). Patient mean age: 39yrs; female: 66%; top-5 comorbidities: depression (14%), anxiety (10%), hypertension (8%), obesity (7%), migraine/headache (6%). Tests used by physicians to diagnose MS varied between the countries (UK/FR/DE/IT/SP/US: %): History/Neurological exam – 79/88/99/95/97/88, Gadolinium MRI – 56/93/66/93/96/89, T1 MRI – 49/89/80/84/93/74, T2 MRI – 65/89/66/91/94/82, CSF analysis – 51/82/71/3/90/56, Evoked potentials – 34/48/65/77/80/29. Patients with moderate/severe disease and currently on disease modifying treatments (DMTs) varied (UK/FR/DE/IT/SP/US: %): 50/45/37/58/50/47 & 52/71/75/77/73/78; correspondingly, tests used by physicians to assess MS disease progression/activity also varied between the countries (UK/FR/DE/IT/SP/US: %): EDSS–63/83/84/91/92/40, Neurological exam–81/91/88/89/84/86, Gadolinium MRI–33/69/36/90/68/70, T1 MRI–21/53/53/76/54/54, T2 MRI–29/62/41/89/63/65, Ambulation index–9/13/9/24/16/19, Brain atrophy–4/14/6/23/15/18, Nine hole peg test–6/3/10/5/3/1 and PASAT–1/0/12/5/4/1. **CONCLUSIONS:** UK physicians appear to under-utilize the tests to diagnose/manage MS patients, whereas physicians in Spain often used them more frequently. Observed trends were not correlated to the patient disease severity observed in these settings, warranting further scrutiny of observed patterns to optimize MS management.

DRUG COMPLIANCE AND PERSISTENCE IN PATIENTS WITH PARKINSON'S DISEASE TREATED IN PRIMARY CARE IN THE UNITED KINGDOM: A CPRD-BASED STUDY

Bineau S[1], Guelfucci F[2], Neine M[3], Aballea S[3], Milea D[1]
[1]*Lundbeck S.A.S., Issy-Les-Moulineaux, France,* [2]*EPHE Sorbonne, Paris, France,* [3]*Creativ-Ceutical, Paris, France*

OBJECTIVES: Differences in compliance and persistence between Parkinson's disease (PD) drugs were found in a previous US claim database analysis. The objective was to apply the same methodology in another setting using the Clinical Practice Research Datalink (CPRD) in the UK. **METHODS:** A retrospective analysis of patients starting a new PD drug (rasagiline, selegiline, pramipexole, ropinirole, entacapone, tolcapone, levodopa) between January 2009 and January 2012 was conducted using CPRD. Patients were categorized as naive to PD therapy (NT) or having prior PD therapy (PT), depending on the prescription of other PD drugs within a 12-month look-back period. The observation period was 12 months. Compliance was measured using the medication possession ratio (MPR) and non-compliance was defined as an MPR≤80%. Persistence was measured as the duration (days) of uninterrupted therapy without gap higher than 45 days. **RESULTS:** Of the 4,784 patients included in the compliance analysis, 3,675 patients (76.8%) had compliance rates >80%. Mean MPRs were generally comparable across PD products (range:84%-90%, all pairwise p=NS). Percentage of patients with MPR>80% was significantly greater with rasagiline (85.6%, all p<0.05 except vs. ropinirole p=NS). Of the 5,266 patients included in the persistence analysis, the highest mean number of persistent days of treatment was reported for rasagiline (284 days; all p<0.05 vs others, except vs. ropinirole p=0.14 and levodopa p=0.06). Patient persistence at 12 months was significantly greater with rasagiline compared with others in NT patients (66.5%, all p<0.05)

and with levodopa in PT patients (72.7%, all p<0.05). **CONCLUSIONS:** A high and comparable level of compliance was observed across PD drugs. Persistence was significantly higher than other drugs with rasagiline in treatment-naïve patients and with levodopa in previously treated patients.

PND60

DISEASE-MODIFYING THERAPIES (DMT) FOR MULTIPLE SCLEROSIS (MS): ANALYSIS OF ITS EVOLUTION IN SPAIN BETWEEN 2004 AND 2012

Villoro R[1], Hidalgo A[2]
[1]*Instituto Max Weber, Madrid, Spain,* [2]*University of Castilla La Mancha, Toledo, Spain*

OBJECTIVES: To analyze determinants of recent evolution of DMT consumption for MS in Spain. **METHODS:** Available DMT market data comprised monthly figures for the period 2004-2012. Monthly and annual evolution of consumption, treated patients and annual cost of treatment were calculated for each DMT. This analysis was replicated for first-line (intramuscular and subcutaneous interferon (IFN) β-1a, subcutaneous IFN β-1b, and glatiramer acetate) and second-line therapies (natalizumab and fingolimod). Evolution of these variables was analyzed for both the whole period 2004-2012 and since 2007 (when second-line therapies become available in Spain). **RESULTS:** DMT expenditure in Spain increased by 147% in 2004-2012 (from €115.5M to €284.9M, 11.95% annually). This evolution can be decomposed into: the growth in the figure treated patients (126%; 10.70% annually) and the increase in the average annual cost per patient (9%, from €11,739 to €12,839; 1.13% annually). For 2007-2012 subperiod, DMT spending increased by 73% (11.57% annually) is attributable to 59% more treated patients (9.73% annually) and an increase of 9% (1.68%) in annual cost per patient. Cost per patient in second-line is 70% higher (average 2007-2012) than average cost per treated patient (€ 21,074 vs. € 12,372) and 82% higher than annual cost of first-line therapy (€ 21,074 vs. € 11,549). Between 2007 and 2012, second-line therapies accounted 32% of new treatments and 48% of incremental cost per patient. By omitting year 2007 from analysis (68 second-line treatments and €1.44M associated consumption), second-line therapies account for 38% of new treatments and 55% of incremental cost per patient. By 2012 second-line therapies already represent 50% of new treatments and 67% of DMT cost increase. **CONCLUSIONS:** The increase of patients treated with DMT in Spain (10.70% annually in 2004-2012), more costly new therapies incorporation and its growing consumption are crucial factors in handling hospital pharmacy budgets for prevalent diseases such as MS.

PND61

ASSOCIATION BETWEEN NON-MOTOR SYMPTOMS AND HEALTH CARE UTILIZATION AMONG PATIENTS WITH PARKINSON'S DISEASE IN THE UNITED STATES

Makaroff L[1], Senior E[1], Moran K[2], Kiri V[3], Thieffry S[1]
[1]*UCB Pharma, Brussels, Belgium,* [2]*UCB Pharma, Smyrna, GA, USA,* [3]*FV & JK Consulting Ltd., Guildford, UK*

OBJECTIVES: To investigate the characteristics and extent of health care utilization among patients with Parkinson's disease (PD) with and without non-motor symptoms (NMS). **METHODS:** Data were obtained from a US administrative claims database (SDI/IMS). Index date was 1 June 2010, and study duration was 12 months. Patients were required to have at least two PD diagnoses before the index date. They were subsequently matched 1:1 to control patients (no PD diagnoses) based on propensity scores derived from age and pre-index Charlson comorbidity index for each gender. **RESULTS:** In total, 127,630 patients with PD were matched to controls. Patients with PD had higher annual mean numbers of primary care (16.4 vs 12.3; p ≤0.0001) and neurologist visits (6.7 vs 0.4; p ≤0.0001) compared with matched controls. In the PD group, 48,823 patients (38.3%) had a diagnosis for at least one NMS, of whom 15,242 (31.2 %) were also treated for at least one NMS. Most frequently reported NMS were pain (27.2%), mood disturbance (depression, anxiety or nervousness; 12.7%) and sleep disorder (7.4%). Patients with pain, mood and sleep disorders (n=1,159), had higher total annual primary care and neurologist visits than patients with no NMS (50.7 vs. 17.2). Patients who received treatment for pain, mood and sleep disorders (n=118), had a higher total number of annual primary care and neurologist visits (66.6) compared with patients treated only for mood (26.0; n=3,233) only for pain (35.6; n=9,432), or only for sleep (30.6; n=676). **CONCLUSIONS:** Results of the study demonstrate that treatment of NMS increases health care utilization – patients with PD suffering from NMS had a substantially greater number of health care visits than those with no NMS. Results also indicate that there are substantial levels of undertreatment of NMS among patients with PD, with less than a third being treated.

PND62

NATALIZUMAB TREATMENT IS ASSOCIATED WITH REDUCED NEUROLOGY OUTPATIENT APPOINTMENTS, UNPLANNED HOSPITAL ADMISSIONS AND LENGTH OF STAY

Beadman A, Hanna J
Biogen Idec Limited, Maidenhead, UK

OBJECTIVES: Global wellbeing of patients is an important outcome in research and clinical practice. Multiple Sclerosis (MS) is a degenerative, neurological condition, characterised by progressive disability, affecting approximately 110 per 100,000 people in England and Wales. Natalizumab is a humanised monoclonal antibody, licensed for use in highly active relapsing-remitting MS and administered as an IV infusion every 28 days. The purpose of this study was to explore the impact of natalizumab on both patients and use of health service resource in clinical practice in England. **METHODS:** Health Episode Statistics (HES) data were used to perform a retrospective cohort study. A structured coding search elucidated a comprehensive list of natalizumab users by hospital trust. Analysis of health service usage, including outpatient appointments and admissions, was undertaken. Comparison of use during the year before and after treatment initiation was conducted. **RESULTS:** A total of 2,196 patients with at least 1 year of available HES data after treatment initiation were identified. In this cohort, natalizumab treatment was associated with 38% fewer unplanned admissions (981 vs. 604, X_1^2 = 89.2, p<0.001) and 58% fewer unplanned bed nights (8,817 vs. 3,681, X_1^2 = 2109.8, p<0.001) in the year following treatment initiation compared with the year before. A 14% reduction in all outpatient appointments was also observed, due principally to a 25% reduction in neurological outpatient appointments (from 7,826 to 5,901, X_1^2 = 269.7, p<0.001). Evidence from this study indicates that duration of treatment is a significant factor in this response; patients receiving between 12 and 14 doses (n=1,122) experienced 70% reduction in unplanned admissions and 90% reduction in unplanned bed nights. **CONCLUSIONS:** Our data support the notion that natalizumab treatment significantly reduces unplanned hospital treatment and outpatient attendance.

PND63

PRESCRIBING PATTERNS OF PARKINSON'S DISEASE

Tomita N, Kanatani Y
National Institute of Public Health, Wako, Japan

OBJECTIVES: Parkinson's disease has the second largest number of patients among 56 designated diseases/syndrome of the Specified Disease Treatment Research Programme for rare and intractable disease programme. The purpose of this study were to investigate prescribing patterns of Parkinson's disease and its pharmaceutical expenditures. **METHODS:** We analysed the Social Health Insurance (SHI) claims data processed from February to April 2011 provided by the Planning, Review and Research Institute for Social Insurance and Medical Program. **RESULTS:** During the three months, 52,851 patients in Social Health Insurance programme received medical treatments that cost 9,391,451,520 JPY. Average costs for inpatient care without meal expense and for outpatient care were 263,782 JPY and 33,209 JPY respectively. Except the cases that fell into Diagnosis Procedure Combination (DPC), 37% of the total cost, 3,515,091,420 JPY was for pharmaceutical expenditure including dispensing fee. Only 7,437,873 (23.5%) of 31,699,153 dispensed drugs were generics on a volume basis. If all the pharmaceutical that have generics had been substituted, estimated 899,586,280 JPY would have been saved in the study period by simple arithmetic. Generic usage is fewer in the elderly than in the younger generation in all therapeutic categories. **CONCLUSIONS:** Percentage of pharmaceutical expenditure in total health expenditure for Parkinson's disease is high. Our study find that generic substitution rate is low in general and even lower in the elderly. This might be partly related to the medical expense subsidy under the Specified Disease Treatment Research Programme, which exempts eligible patients from co-payment according to their income. There seems to be a room for prescribing pattern change for cost optimization and further study is expected.

PND64

COSTS OF FORMAL AND INFORMAL HOME CARE AND QUALITY OF LIFE OF PATIENTS WITH MULTIPLE SCLEROSIS IN SWEDEN

Svensson M[1], Fajutrao L[2]
[1]*The Swedish Institute for Health Economics, Lund, Sweden,* [2]*Merck Serono, Solna, Sweden*

OBJECTIVES: To describe and to estimate costs of formal and informal home care and quality of life related to multiple sclerosis. **METHODS:** A random sample of 1500 members of the Swedish organization for patients with neurological diseases (NHR), specifically MS, were mailed a questionnaire between February-March 2012. Collected data included number of hours per month of home care received, type of help, productivity losses, quality of life (EQ-5D) and disease characteristics. The recall period was one month. Using published Swedish unit cost data, the costs for home care were estimated in 2012 euros. A semi-logarithmic linear regression evaluated other factors that may influence the likelihood of getting home care. **RESULTS:** Of 839 respondents, 65.5% had progressive MS, 24.5% had RRMS and 10% had no information. Formal care was given to 27% of respondents at an average of 238.7 hrs/month at a mean cost of €2873 per person with MS per month. Informal care was received by 49% of respondents at an average of 47.3 hrs/month at a mean cost of €389 per person with MS per month. Based on disease severity, the mean total home care costs/patient/month were: mild (EDSS 0-3) = €63, moderate (EDSS 4-6) = €461 and severe (EDSS > 6.5) = €8446. Total home care costs were three-fold higher in persons with moderate MS and seven-fold higher in persons with severe MS versus mild MS. Total home care costs of patients cohabiting with another person were nearly 70% higher compared to people living alone. The reported average utility was 0.513 (sd 0.307). Utilities across disease severity: mild MS=0.709 (sd 0.233), moderate MS=0.562 (sd 0.232) and severe MS=0.284(sd 0.283). **CONCLUSIONS:** Total home care costs, of which formal care costs accounted for a large proportion, increased with increasing disease severity. Informal caregiving contributes significantly to MS home care and is an important complement to formal home care in Sweden.

PND65

A COMPARISON OF DEMOGRAPHIC AND CLINICAL VARIABLES OF DOWN SYNDROME PATIENTS IN UTAH AND THE UNITED STATES

Jiao T, Liou TG, Young D, Brixner D
University of Utah, Salt Lake City, UT, USA

OBJECTIVES: To explore the demographics, comorbidities and medication exposure of Down Syndrome (DS) patients in Utah compared to a national cohort. **METHODS:** National and local data on adult patients with DS were extracted from the General Electric Healthcare National Clinical Data Services Warehouse and the University of Utah Healthcare System Enterprise Data, respectively. The ICD-9 code for Down Syndrome (758.0) was used to identify patients, alive through 2012, and their associated comorbidities and prescribed medications. We used descriptive statistics, *t*-test, test of proportion and Fisher's exact test to examine relationships between demographics, comorbidities and pharmacotherapies and compared results between local and national cohorts. **RESULTS:** Data was extracted on 513 patients in Utah and 11,736 nationally, 98% and 64% of patients are adults in cohorts, respectively. Through 2012, adult DS patients in Utah were younger (37 vs. 39, p<0.005), more likely to be female (54.08% vs. 50.47%, p<0.05)

and more likely to be Caucasian (64.61% vs. 41.53%, p<0.001) than national cohort patients. DS patients in Utah suffered significantly more comorbidities: autism (6.43% vs. 1.12%, p<0.001), heart problems (2.53% vs. 0.57%, p<0.001), blood and blood-forming problems (14.81% vs. 10.05%, p<0.001), epilepsy (7.02% vs. 2.23%, p<0.001) and arthritis (28.46% vs. 10.68%, p<0.001). Higher proportions of Utah patients used ulcer drugs (21.64% vs. 16.83%, p<0.005), majority PPIs (85.6%); antidepressants, (17.93% vs. 11.55%, p<0.001), majority SSRIs (79.3%); analgesics-NSAIDs (15.59 % vs. 11.13%, p<0.005), majority NSAIDs (98.8%); multivitamins (16.18% vs. 9.02%, p<0.001), and fluoroquinolones (10.53% vs. 7.45%, p<0.01) than the national cohort. **CONCLUSIONS:** The Utah DS population differs from the comparative U.S. Cohort in demographics, comorbidities and medications. These results will be incorporated into the development of a Quality of Life scale to value new treatments in Down Syndrome.

PND66

TREATMENT PATTERNS FOR PARKINSON'S DISEASE: REAL-WORLD EVIDENCE FROM THE EU5 (FRANCE, GERMANY, ITALY, SPAIN, AND THE UNITED KINGDOM)

Sung AH[1], Kulkarni A[2], Svarvar P[2]
[1]*St. John's University, Queens, NY, USA,* [2]*Merck & Co., Inc., Whitehouse Station, NJ, USA*

OBJECTIVES: To assess the distribution of initial Parkinson's Disease (PD) treatment, along with time to and reasons for changes in therapy. **METHODS:** Adelphi Real-World Disease-Specific-Programme (DSP) cross-sectional PD data from January 2011 to February 2012 were analyzed. The DSP surveyed 299 physicians in the EU5 who completed PD patient reviews (≥10 each). Kaplan-Meier estimation was used to evaluate times from initial monotherapy to follow-up therapy by treatment. Reasons for adding or switching drug classes were documented as efficacy-related, levodopa-related (dyskinesia or on-off fluctuations), due to side-effects, and/or other reasons. **RESULTS:** Of the 3,351 patients included, 60% were male; mean age at treatment initiation was 65 years; 55% had mild Hoehn & Yahr severity scores (≤2.5); and 59% initiated treatment on monotherapy. Overall, Dopamine Agonists (DA) were the most common first-line monotherapy (45%; mean age 62 years), followed by Levodopa (39%; 71 years), Monoamine-oxidase-B Inhibitors (MAOB) (14%; 62 years), and Other (2%; 64 years). The median time to change from DA monotherapy was 36 months. Levodopa was the first choice add-on (16%) and switch from (5%) DA monotherapy. Reasons for change to Levodopa were efficacy-related (92% add-on; 70% switch patients). The median time to change from Levodopa monotherapy was 54 months. DA was the first choice add-on (13%) and switch from (1.4%) Levodopa monotherapy. Reasons for change to DA were efficacy-related (86% add-on; 82% switch patients). The median time to change from MAOB monotherapy was 12 months. DA was the first choice add-on (32%) and switch from (6%) MAOB monotherapy. Reasons for change to DA were efficacy-related (95% add-on; 94% switch patients). **CONCLUSIONS:** This EU5 sample represents a levodopa-sparing treatment strategy, favoring initiation with DA for younger patients. Initial treatment with Levodopa monotherapy was of longer duration than that with DA or MAOB. Physicians predominantly reported efficacy-related reasons for treatment changes.

ANALYSIS COST EFFECTIVENESS OF PHARMACOLOGICAL PROPHYLAXIS OF CONTRAST-INDUCED NEPHROPATHY

Alonso Herreros J[1], Murcia Murcia C[1], Gonzalez Cuello A[2]
[1]*HOSPITAL GENERAL REINA SOFIA, MURCIA, Spain,* [2]*UNIVERSIDAD DE MURCIA, MURCIA, Spain*

OBJECTIVES: Analyze the cost-effectiveness of the prophylaxis (n-acetylcysteine 1200mg 4 oral-doses+1/6M bicarbonate 500ml IV) of the contrast-induced nephropathy (CIN) at risk patients. The CIN is usually reversible, but may affect 50% of patients with some risk factors (diabetes, age...) and may favor the progressive renal damage. **METHODS:** Retrospective observational study. The population were patients candidates at prophylaxis protocol CIN in a university hospital during 2012 (5142 patients). We calculated a sample size of 115 patients for a confidence level of 90%, an error of 7.5% and a frequency of CIN equal 40% . CIN was considered as the relative elevation of serum creatinine greater than or equal to 25% during the 48 hours after the test. For the economic analysis were used acquisition-costs of drugs, and the hemodialysis costs described by Lorenzo et al (Nephrology2010,30(4):404-412). We consider, according to literature that at least 35% of risk patients affected by NIC would require a hemodialysis session. **RESULTS:** Of the patients who received prophylaxis, 3 had CIN and 93 no. Of those who received no prophylaxis 5 had CIN, and 14 no. We did a Fisher Test being the difference in favor of the protective effect of the protocol statistically significant (p <0.01). The prophylaxis would have prevented 25.26 CIN. The prophylaxis costs per patient were € 2.29 . The cost of a hemodialysis sessions was € 423. Then € 220.42 has been invested to avoid a minimum of € 3739.74 on hemodialysis. (16.9 € savings per euro spent on prophylaxis. Each avoided NIC had cost € 8.73.) **CONCLUSIONS:** The economic analysis is difficult because of the diversity of data about CIN. We chose a cost-minimization model, considering minor treatment needs found in the literature. In any case this prophylaxis is highly cost-effective and should be considered before introducing other methods.

PUK2

COST EFFECTIVE USE OF URINE SAMPLING AND DIPSTICK TESTING TO DIAGNOSE URINARY TRACT INFECTIONS IN PRE-SCHOOL CHILDREN PRESENTING TO PRIMARY CARE

Busby J[1], Hay A[1], Butler C[2], Lawton M[1], Sterne J[1], Little P[3], Hood K[2], Harman K[1], Hollingworth W[1]
[1]*University of Bristol, Bristol, UK,* [2]*Cardiff University, Cardiff, UK,* [3]*University of Southampton, Southampton, UK*

OBJECTIVES: Diagnosis of urinary tract infection (UTI) in young children is difficult. Prompt treatment could alleviate short-term symptoms and prevent serious long-term sequelae, but over-treatment will increase antibiotic resistance. We evaluated the cost-effectiveness of a UTI risk score based on signs, symptoms and dipstick test findings compared to clinical judgement in guiding urine sampling and antibiotic treatment. **METHODS:** We developed a risk score based on urine samples collected (by clean catch or nappy pad) in a multicentre diagnostic cohort study (DUTY) of 7,163 children <5 years presenting to primary care. The diagnostic value of symptoms, signs and dipstick test results were evaluated against a reference standard of urine culture results from a research laboratory. We constructed decision-analytical models comparing the cost-effectiveness of 3 DUTY risk score thresholds (high sensitivity, high specificity or intermediate) versus clinical judgement in younger (nappy pad) and older (clean catch) children. We explored the role of the dipstick in guiding diagnosis. We considered health service costs and patient utilities during the initial diagnosis, acute illness and long-term sequelae. **RESULTS:** The 'high specificity' DUTY threshold resulted in fewer urine samples than clinical judgement (4.8% vs. 9.2%) with similar sensitivity (58.6% vs. 57.1%) and higher specificity (96.1% vs. 91.4%). The difference in short-term net benefits between DUTY thresholds was small (range £1088 'high sensitivity' to £1091 'high specificity'). In younger children (nappy pads) the distinction in cost-effectiveness between the DUTY risk score and clinical judgement was not clear-cut. Dipstick tests could potentially expedite therapy in higher risk children. **CONCLUSIONS:** Clinicians can reduce prescriptions and provide more cost effective care by using the DUTY risk score. Clean catch samples should be obtained whenever practical. Low UTI prevalence, imperfect NHS laboratory tests and an uncertain link between UTI and long-term sequelae mean that conservative sampling strategies may be most appropriate.

PUK3

COMPARISONS OF THE CLINICAL EFFECTIVENESS OF TREATMENTS FOR THE SYMPTOMS ASSOCIATED WITH OVERACTIVE BLADDER (OAB)

Edwards SJ, Karner C, Trevor N, Barton S, Nherera L
BMJ Group, London, UK

OBJECTIVES: This research was carried out during a review of the manufacturer's submission (MS) to the NICE Single Technology Appraisal programme for the selective beta$_3$-adrenoceptor agonist, mirabegron. Antimuscarinics are the mainstay of treatment for the symptoms of OAB. They may be used at different doses and in different formulations (immediate release [IR] or extended release [ER]). However, there is limited evidence on their comparative clinical effectiveness with each other. This research evaluated the available evidence for mirabegron, antimuscarinics, and placebo. **METHODS:** Randomised controlled trials (RCTs) for inclusion were identified using the MS for mirabegron. RCTs were assessed for comparability based on diagnosis, patient population, treatment regimen, and with outcomes reported at 12 weeks. Mixed treatment comparison (MTC) using Bayesian Markov Chain Monte Carlo simulation was used to perform a meta-analysis of a network of RCTs. Summary statistics used were mean difference (MD) for continuous outcomes and odds ratio (OR) for dichotomous outcomes. **RESULTS:** Of the 40 RCTs identified in the MS, 22 met the criteria for inclusion in the analysis. No statistically significant differences in frequency of micturition were identified between any of the active treatments. Compared with mirabegron 50mg, statistically significant differences in the remaining outcomes assessed, were: fewer incontinence episodes, MD (solifenacin 5mg -0.39, 95%CI: -0.72 to -0.06; solifenacin 10mg -0.38, 95%CI: -0.69 to -0.07); increased risk of constipation , OR (fesoterodine 8mg 2.12, 95%CI: 1.13 to 3.64; solifenacin 5mg 2.11, 95%CI: 1.16 to 3.59; solifenacin 10mg 4.52, 95%CI: 2.60 to 7.47; trospium 60mg 7.63, 95%CI: 2.12 to 22.95); increased risk of discontinuation, OR (oxybutynin 15mg IR 2.67, 95%CI: 1.60 to 4.22). Mirabegron was associated with significantly lower risk of dry mouth than all other active treatments. **CONCLUSIONS:** None of the treatments assessed for OAB have a consistently superior efficacy with a reduced risk of adverse events.

PUK4

CONTINUOS RENAL REPLACEMENT THERAPY VERSUS INTERMITTENT HEMODIALYSIS: SYSTEMATIC REVIEW ON PATIENT-ORIENTED OUTCOMES

Nobre MRC[1], Monaco CF[2]
[1]*InCor - HCFMUSP, São Paulo, Brazil,* [2]*Centro Universitário São Camilo, São Paulo, Brazil*

OBJECTIVES: Acute renal failure is responsible for about 1% of hospital admissions, and occurs in up to 7% of hospitalized patients and up to 20% of patients admitted to intensive care units (ICU's). When it is severe enough to require dialysis, in-hospital mortality rate ranges from 50% to 75% and is also increases risk for chronic and terminal kidney diseases. Continuous Renal Replacement Therapy (CRRT) in its various forms has theoretical advantages over conventionally done Intermittent Hemodialysis (IHD) at significantly higher costs, but these advantages attributed to CRRT have not yet been consistently proven in terms of clinical outcomes in controlled trials. **METHODS:** We have made a literature search in PubMed to identify systematic reviews and randomized controlled trials that studied patient-oriented outcomes (mortality and renal recovery). **RESULTS:** We have found five systematic reviews published in 2007 and 2008 and conducted our own metanalysis on six trials published from 2001 to 2009 (no clinical outcomes oriented trial has been published since them). None of the reviews that directly compared CRRT to IHD have shown statistically significant advantages of any of them regarding in-hospital or ICU mortality or renal function recovery We have analyzed six randomized no-blinded clinical trials that met eligibility criteria of evaluating patient-oriented outcomes including 1151 patients. Five of them had high to moderate GRADE scores. None have shown absolute risk reduction of in hospital, ICU or at 60 days mortality or statistically significant renal recovery rates. Overall mortality relative risk of CRRT over IHD was 1,01 (95%CI: 0,92 – 1,11). We found moderate heterogeneity and no publication bias. **CONCLUSIONS:** Clinical trials published until October 2012 have shown no difference in patient-oriented outcomes between the uses of CRRT and IHD techniques in adult patients admitted to intensive care units with acute renal failure and requiring renal replacement therapy.

URINARY/KIDNEY DISORDERS – Cost Studies

PUK5

THE FINANCIAL IMPACT OF INCREASING HOME-BASED HIGH DOSE HAEMODIALYSIS AND PERITONEAL DIALYSIS

Liu FX[1], Treharne C[2], Culleton B[1], Lees L[2], Arici M[3]
[1]*Baxter Healthcare Corporation, Deerfield, IL, USA,* [2]*Abacus International, Bicester, UK,* [3]*Baxter Healthcare UK, Berkshire, UK*

OBJECTIVES: The increasing prevalence of end-stage kidney disease in the UK has resulted in a heavy economic burden. The National Institute of Health and Care Excellence reported that patients receiving dialysis at home have better health outcomes and lower health care resource use. This study aims to assess the financial impact of increasing the use of home-based dialyses vs. UK current practice. **METHODS:** A Markov model was constructed to estimate the financial impact of different dialysis scenarios from the UK payer perspective. We modelled prevalent and incident dialysis patient population over 5 years. The current UK dialysis modality distribution of 15% prevalent and 20% incident peritoneal dialysis (PD), 82% prevalent and 79% incident in-centre haemodialysis (ICHD), 3% prevalent and 1% incident conventional home HD (HHD), and 0% high dose HHD was compared to 3 scenarios: 1) Increase high dose HHD to 10% among prevalent patients; 2) Increase high dose HHD to 10% and PD to 20% among prevalent patients and increase PD to 25% among incident patients; 3) Increase high dose HHD to 10% and PD to 25% among prevalent patients and increase PD to 30% among incident patients. In each scenario, the proportion of patients on ICHD changes accordingly, while conventional HHD is kept constant. Model inputs were from published sources. **RESULTS:** The base case results show that all 3 scenarios result in lower costs versus current UK practice. A prevalent population size of 22,654 patients was modelled, accounting for an annual incident population size of 5,393 in England. Scenario 1 saves £25 million (£559 per patient). Scenario 2 saves £67 million (£1,526 per patient). Scenario 3 saves £110 million (£2,493 per patient). Sensitivity analyses demonstrate consistent results. **CONCLUSIONS:** Under the current UK national tariff, increasing the proportion of patients on home-based dialyses is associated with lower total health care costs.

PUK6

BUDGET IMPACT OF SWITCHING FROM AN IMMEDIATE-RELEASE TO A PROLONGED-RELEASE FORMULATION OF TACROLIMUS IN RENAL TRANSPLANT RECIPIENTS IN THE UK BASED ON DIFFERENCES IN ADHERENCE

Pollock RF[1], Smith-Palmer J[1], Odeyemi IA[2], Muduma G[2]
[1]*Ossian Health Economics and Communications, Basel, Switzerland,* [2]*Astellas Pharma Europe Limited, Chertsey, UK*

OBJECTIVES: Advagraf® is a once-daily prolonged-release formulation of tacrolimus with proven non-inferiority to Prograf®, a twice-daily immediate-release formulation of tacrolimus, in biopsy-proven acute rejection in renal transplant recipients. Advagraf is associated with improved adherence compared with Prograf, which may ultimately improve long-term outcomes. The present study assessed the budget impact of switching patients from Prograf to Advagraf in the UK. **METHODS:** A budget impact model was constructed based on published data on acute rejection, graft failure and mortality in the UK setting. Patients were assumed to convert from Prograf to Advagraf on a 1:1 mg:mg basis. In a study comparing the adherence rates between once-daily versus twice-daily formulations of tacrolimus, the proportion of patients taking the prescribed number of daily doses was 88.2% in Advagraf patients and 78.8% in Prograf patients. The model applied a relative risk of graft failure of 3.47 to non-adherent patients based on data from a 2004 meta-analysis. Cost data were taken from the British National Formulary and 2012–13 NHS tariff information. The analysis was performed over a 5-year time horizon and future costs were not discounted, in line with International Society for Pharmacoeconomic and Outcomes Research guidelines. **RESULTS:** Over a 5-year time horizon, the mean cost per patient (including tacrolimus, concomitant immunosuppressive medications, dialysis after graft failure, and treatment for acute rejection) was GBP 29,290 for Advagraf versus GBP 33,032 for Prograf. The total cost saving of GBP 3,742 was driven by reduced Advagraf pharmacy costs and lower dialysis costs arising from the lower risk of graft failure in the larger proportion of adherent patients in the Advagraf arm. **CONCLUSIONS:** Conversion of renal transplant recipients from Prograf to Advagraf was associated with lower pharmacy and dialysis costs, with the reduction in dialysis costs being driven by improved adherence to Advagraf regimen and the consequent improvement in graft survival.

PUK8

AN ANALYSIS OF THE COST OF SWITCHING RENAL TRANSPLANT PATIENTS FROM AN IMMEDIATE-RELEASE TO A PROLONGED-RELEASE FORMULATION OF TACROLIMUS BASED ON DIFFERENCES IN TROUGH CONCENTRATION VARIABILITY IN THE UNITED KINGDOM

Pollock RF[1], Smith-Palmer J[1], Odeyemi IA[2], Muduma G[2]
[1]*Ossian Health Economics and Communications, Basel, Switzerland,* [2]*Astellas Pharma Europe Limited, Chertsey, UK*

OBJECTIVES: Randomized controlled trials have shown that Advagraf®, a once-daily prolonged-release tacrolimus formulation, is non-inferior to Prograf®, a twice-daily immediate-release tacrolimus formulation, in terms of biopsy-proven acute rejection in renal transplant recipients. However, relative to Prograf, Advagraf exhibits reduced variability in tacrolimus trough concentration, which has been associated with reduced graft failure. Based on these data, the present study evaluated the cost of switching UK renal transplant patients from Prograf to Advagraf. **METHODS:** UK-specific data on acute rejection, graft failure and mortality were used to construct a budget impact model to assess the costs of switching from Prograf to Advagraf on a 1:1 mg:mg basis. The model assumed that 3.1% of patients on Advagraf had high tacrolimus trough concentration variability compared with 17.4% on Prograf, based on a study comparing Advagraf and Prograf pharmacokinetics. The model applied a relative risk of graft failure of 2.38 to high variability patients based on data from a tacrolimus variability study. Cost data were taken primarily from the British National Formulary and 2012–13 NHS tariff information and the analysis was performed over a 5-year time horizon. **RESULTS:** The mean cost per patient (including tacrolimus, concomitant immunosuppressive medications, dialysis after graft failure, and treatment for acute rejection) was GBP 26,958 with Advagraf versus GBP 30,379 for Prograf over a 5-year period. The total cost saving (GBP 3,421) was driven by reduced Advagraf pharmacy costs and lower dialysis costs resulting from the lower proportion of patients with high variability in tacrolimus trough concentrations in the Advagraf arm, leading to lower risk of graft failure. **CONCLUSIONS:** Converting renal transplant recipients from Prograf to Advagraf was associated with lower pharmacy and dialysis costs, with the reduction in dialysis costs being driven by the lower proportion of Advagraf patients with high tacrolimus trough concentration variability and the resultant improvement in graft survival.

PUK9

ECONOMIC EVALUATION OF EPOETIN ALFA HEXAL (BINOCRIT) COMPARED TO DARBEPOETIN ALFA (ARANESP) IN THE TREATMENT OF CHRONIC HAEMODIALYSIS (CKD5) PATIENTS IN GERMANY

Turner M[1], Walsh K[1], Maerz M[2], Whitehouse J[3]
[1]*Sandoz Biopharmaceuticals, Holzkirchen, Germany,* [2]*Hexal, Holzkirchen, Germany,* [3]*GfK Bridgehead, Melton Mowbray, UK*

OBJECTIVES: To compare the CKD5 budget requirements of utilizing epoetin alfa Hexal vs. darbepoetin alfa in the German health care system. **METHODS:** Chronic kidney disease (CKD) is a condition that is prevalent worldwide, and the number of patients affected continues to increase. ESAs and iron are the mainstays of treatment for haemodialysis patients. The purpose of this pharmacoeconomic analysis was to evaluate the cost-effectiveness of the short-acting biosimilar ESA epoetin-alfa Hexal (EA) 6,000-8,000 IU per week (TIW) vs. long-acting erythropoiesis-stimulating agent (ESA) darbepoetin alfa (DA) 30-40 mcg weekly (QW), for treating chronic haemodialysis patients. A budget impact model was constructed employing a payer perspective, per patient with 5 year time horizon. The treatment period considered was based on 52 weeks and was aligned with real world clinical experience data from germany[1]. Model inputs included: medical treatment, outcomes, and health care service utilization from published clinical studies[2]and summary of product characteristics recommendation. Effectiveness of therapeutic alternatives was determined by comparing haemoglobin maintenance rates. Costs presented reflect 2013 prices. The analysis was performed from the perspective of the German health care system. **RESULTS:** The average expected pharmaceutical costs per patient were €3791 to €5002 for DA QW (30-40mcg weekly) versus €2690 to €3520 for EA TIW (6,000-8,000IU weekly). Cost-savings associated with utilizing EA TIW was 41-42% for comparable DA doses. Previous German research has demonstrated that ESA consumption of patients on chronic haemodialysis based on DDD is similar for biosimilar and originator ESAs[1]. **CONCLUSIONS:** In the treatment of chronic haemodialysis patients in Germany, epoetin alfa Hexal is projected to provide substantial savings for the health care system when compared to darbepoetin alfa. German stakeholders could consider the extent that darbepoetin alfa is utilized in haemodialysis patients. [1] Horbrand et al. Eur J Clin Pharmacol 10/2012. [2] Horl et al. Clin. Nephrology 1/2012.

PUK10

ECONOMICS OF DIALYSIS DEPENDENCE FOLLOWING ACUTE KIDNEY INJURY (AKI) IN THE INTENSIVE CARE UNIT (ICU)

Ethgen O[1], Schneider A[2], Bagshaw S[3], Bellomo R[4], Kellum J[5]
[1]*University of Liege, Liege, Belgium,* [2]*University of Lausanne, Lausanne, Switzerland,* [3]*University of Alberta, Alberta, AB, Canada,* [4]*Austin Hospital, Austin, Australia,* [5]*University of Pittsburgh, Pittsburgh, PA, USA*

OBJECTIVES: AKI is common in the ICU and often necessitates the provision of renal replacement therapy (RRT). Two main modalities exist: continuous (CRRT) or intermittent (IRRT) therapy. Neither modality has been found superior in terms of survival. However, dialysis dependence among survivors remains a significant medical and economic issue. A recent meta-analysis showed initial IRRT might be associated with higher rates of dialysis dependence than initial CRRT. We performed a preliminary cost-utility analysis comparing both modalities based on these recent data. **METHODS:** We assumed a pool of patients who would potentially be eligible for either modality and modeled LYG, QALYs gains and costs comparing initial CRRT vs. initial IRRT, all else being the same. Using the US perspective, we designed a 1-year Markov model with daily cycle and 2 health states (dialysis independence/dependence). Survival for both modalities was fitted from published estimates (Weibull regression). The proportion of dialysis independent survivors was fitted from published estimates for CRRT (Weibull regression). IRRT dialysis independence estimates were obtained by applying the meta-analysis risk-ratio to the fitted CRRT estimates. Sensitivity analysis was conducted on the daily implementation cost difference between CRRT and IRRT (from $250 to $1,000; basecase: $500) and the risk-ratio for dialysis dependence for IRRT as compared to CRRT (from 1.20 to 3.00; basecase: 1.99). **RESULTS:** The QALYs gain was slightly better for CRRT as compared to IRRT (0.301 vs. 0.292 respectively). Despite higher hospitalization costs for CRRT ($86,397 vs. $83,309 for IRRT), the one-year cumulative total cost including the cost of dialysis dependence was similar between the two modalities ($94,286 for CRRT vs. $94,118 for IRRT). In the basecase analysis, the ICER of CRRT vs. IRRT was $17,562/QALY. **CONCLUSIONS:** Initial CRRT may actually be cost-effective as compared to initial IRRT by reducing the rate of dialysis dependence among AKI survivors.

PUK11

IN-PATIENT HOSPITALIZATIONS FOR CHRONIC KIDNEY DISEASE IN THE UNITED STATES

Aggarwal S, Topaloglu H
Novel Health Strategies, Bethesda, MD, USA

OBJECTIVES: To understand the trends in rate and cost of hospitalizations due to Chronic Kidney Disease (CKD) in the U.S. **METHODS:** We analyzed the last five years

of hospitalizations with ICD-9 diagnosis codes of CKD and End Stage Renal Disease (ESRD). The annual number of hospitalizations for specific diagnosis was obtained from AHRQ's National In-patient Sample (NIS) databases of 2005-2009. Data was also analyzed for length of stay (LOS), charges and cost of hospitalization. **RESULTS:** During the last five years the number of hospitalizations with diagnosis of CKD and ESRD has increased 4.1 and 4.6 fold, respectively. In 2009, an estimated 1,634,422 and 931,641 hospitalizations were with diagnosis of CKD and ESRD respectively. The mean LOS for patients with CKD increased from 4.9 to 5.5 days between2005-2009. The mean LOS for patients with ESRD has remained steady at ~6 days between 2005-2009. The cost of hospitalization with diagnosis of CKD has increased 31% between 2005-2009. The cost of hospitalization with diagnosis of ESRD has increased 21% between 2005-2009. In 2009, the mean cost of hospitalization for patients with CKD and ESRD was $11,209 and $21,358, respectively. **CONCLUSIONS:** Hospitalizations due to CKD and ESRD have significantly increased during the last five years. There is a need for prevention, treatment, and disease management programs to lower the medical and socioeconomic burden of this disease.

PUK12

ASSESSING THE ECONOMIC BURDEN AND HEALTH CARE UTILIZATIONS OF VETERAN PATIENTS DIAGNOSED WITH CHRONIC KIDNEY DISEASE IN THE UNITED STATES

Wang L[1], Xie L[2], Du J[2], Huang A[1], Baser O[3]
[1]*STATinMED Research, Dallas, TX, USA,* [2]*STATinMED Research, Ann Arbor, MI, USA,* [3]*STATinMED Research/The University of Michigan, Ann Arbor, Michigan, MI, USA*

OBJECTIVES: To examine the economic burden and health care utilizations of patients diagnosed with chronic kidney disease (CKD) in the U.S. veteran population. **METHODS:** A retrospective database analysis was performed using the Veterans Health Administration (VHA) Medical SAS datasets (01OCT2008-30SEP2012). Patients diagnosed with CKD were identified using International Classification of Disease 9th Revision Clinical Modification (ICD-9-CM) diagnosis codes 585.xx, 250.4xx, 791.0x, 583.xx, and 403.xx. The first diagnosis date was designated as the index date. A group of non-CKD patients of the same age, region, gender and index year were identified and matched on baseline Charlson Comorbidity Index (CCI) as the comparison group with a randomly chosen index date to minimize selection bias. Patients in both groups were required to be at least 18 years old, and have continuous health plan benefits 1 year before and 1 year after the index date. One-to-one propensity score matching was used to compare the health care costs and utilizations during the follow-up period between the CKD and comparison groups, adjusted for baseline demographic and clinical characteristics. **RESULTS:** A total of 477,078 patients were identified for the CKD cohort and the comparison cohort. After 1:1 matching, 155,324 of patients were matched from each group, and the baseline characteristics were well-balanced. CKD Patients incurred higher health care utilizations in inpatient (17.00% vs. 2.84%, p<0.01), emergency room (17.81% vs. 6.64%, p<0.01), physician office (99.28% vs. 67.92%, p<0.01), outpatient (99.36% vs. 68.69%, p<0.01), and pharmacy visits (91.16% vs. 72.61%, p<0.01). The CKD group also had higher patient expenditures in inpatient ($6,228 vs. $802, p<0.01), emergency room ($194 vs. $62, p<0.01), physician office ($3,287 vs. $1,516, p<0.01), outpatient ($3,788 vs. $1,715) and pharmacy ($848 vs. $490, p<0.01) than patients in the comparison group. **CONCLUSIONS:** CKD patients had a significantly higher burden of illness compared to a similar comparison group of non-CKD patients.

PUK13

ECONOMIC IMPACT OF PRURITUS AMONG END-STAGE RENAL DISEASE PATIENTS RECEIVING HEMODIALYSIS

Ramakrishnan K[1], Sood V[2], Sibbel SP[3]
[1]*DaVita Clinical Research, Minneapolis, MN, USA,* [2]*Mitsubishi Tanabe Pharma Corporation, Jersey City, NJ, USA,* [3]*DaVita Labs, Ft Lauderdale, FL, USA*

OBJECTIVES: Itchy and dry skin, symptoms of pruritus, are commonly reported by patients with end-stage renal disease (ESRD). Previous analyses of a large dialysis organization (LDO) suggested that these symptoms are associated with decreased quality of life and poorer health outcomes. As a result, these patients may represent a higher economic burden to payers. This retrospective cohort study compared direct health care resource utilization (HRU) and costs associated with varying degrees of self-reported itchiness/dryness skin severity. **METHODS:** Adult patient data (≥ 18 years old) from the 2009 United States Renal Disease System (USRDS) dataset were combined with corresponding Kidney Disease Quality of Life (KDQOL) survey data obtained between January to September 2009, at an LDO. Patients were included if they had answered KDQOL itchiness/dryness questions, had KDQOL assessments ≥ 3 months after starting dialysis, and had Medicare as their primary payer. Patients were grouped by their itchiness/dryness severity. All HRU and cost outcomes were described over a 3-6 month follow-up period post-KDQOL survey. Patients were censored for death, transplant, change in treatment modality, discontinued treatment, or loss of observation during the follow-up period. **RESULTS:** Study population included 1,387 patients. HRU analyses of itchiness showed increased rate of hospitalizations (42.5% vs. 28.4%) for patients who were extremely bothered versus not bothered by itch. Similar results were observed for dryness (34.3% vs. 27.5%) and combined itchiness and dryness (34.2% vs. 28.0%). Extremely bothered patients had higher overall health care costs: $33,755 vs. $26,933 for itchiness; $29,801 versus $26,321 for dryness; and $29,249 vs. $26,736 for combined itchiness and dryness. Dialysis and hospitalization costs contributed the most toward overall health care costs. **CONCLUSIONS:** These results suggest an association between increased skin itchiness/dryness and increased hospitalizations and health care costs. Additional research, adjusting for patient characteristics, is needed to provide more evidence for the burden of skin itchiness/dryness in ESRD patients.

PUK14

COST OF TREATMENT AFTER RENAL TRANSPLANTATION IN IRAN: SHOULD GOVERNMENT CONTINUE PAYING FOR NEW EXPENSIVE IMMUNOSUPPRESSIVE DRUGS?

Foroutan N[1], Salamzadeh J[1], Foroutan A[2], Jamshidi HR[1], Rasekh H[1]
[1]*Shahid Beheshti University of Medical Sciences, Tehran, Iran,* [2]*Tehran University of Medical Sciences, Tehran, Iran*

OBJECTIVES: The primary aim of the study was to estimate costs of treatment for the first year after renal transplantation from the perspective of health insurance organizations in Iran. **METHODS:** An Excel-based and a Monte Carlo model were developed to determine the treatment costs of current clinical practice in renal transplantation therapy (RTT). Inputs were derived from Ministry of Health and insurance organizations' database, hospital and pharmacy records, clinical trials and local and international literature. According to the model, there were almost 17,000 patients receiving RTT in Iran, out of which about 2,200 patients underwent the operation within the study year (2011- 2012; n= 2200). **RESULTS:** The estimated first year total treatment cost after renal transplantation was almost $14,000,000. These costs corresponded to annual total cost per patient of almost $6500 for the payers. **CONCLUSIONS:** Renal transplantation therapy is almost fully reimbursed by government in Iran. However, regarding new expensive medicines, cost of medical expenditure is rapidly growing and becoming quite unaffordable for the government; therefore, out-of-pocket (OOP) payments are dramatically increasing over time. In order to improve reimbursement policy making under pressure of current budget constraints, the present study is providing decision makers with practical tools make them possible to easily compare budgetary impact of the current therapy strategy with the future financial consequences of purchasing newly proposed medicines. In other words having estimation of the current budget spending on RTT would help policy makers in making efficient resource allocation and decrease quite high OOP expenditures.

PUK15

A NON-INTERVENTIONAL RETROSPECTIVE EVALUATION OF RESOURCES CONSUMED DURING THE PROVISION OF CARE FOR OVERACTIVE BLADDER SYNDROME: A REAL WORLD EVALUATION: GERMAN PERSPECTIVE (THE REDUCE STUDY)

Indig M[1], Purdy C[2], Magar R[3], Dalfonso L[3], Walters C[4], Nazir J[4]
[1]*Dr. Mark Indig, Trier, Germany,* [2]*AHRM Inc., Buffalo, NY, USA,* [3]*AHRM Inc., Raleigh, NC, USA,* [4]*Astellas Pharma Europe Ltd., Chertsey, UK*

OBJECTIVES: To evaluate resource utilisation for subjects with overactive bladder (OAB) syndrome who are managed with the commonly prescribed oral medications: solifenacin succinate, tolterodine tartrate, or trospium chloride from the payer perspective. **METHODS:** Data were abstracted from medical records for qualified subjects who were ≥ 18 years, with a diagnosis for OAB (at least one of the following: urgency, frequency with or without urgency incontinence) on or before December 31, 2010. Subjects must have been on one of the study medications for at least 3 months and have at least 12 months of medical records available. The study was approved by local ethics committees and all data provided was anonymised. Medication costs for Germany are reported for 2013 €. **RESULTS:** A total of 136 of 229 subjects were included for the German analysis. The remaining subjects were from the Czech Republic to be reported elsewhere. Top 3 reasons for exclusion from Germany include: primary diagnosis of urinary tract infection, urologic surgery within 6 months of the data collection, and diabetic neuropathy. The annual overall mean cost for office visits, specialist visits, investigations, other treatments, medications and incontinence pad use with solifenacin (5,10mg/day) (N=60), trospium (IR and ER maximum dose of 60mg/day) (N=51), and tolterodine (IR 2, 4mg/day and ER 4mg/day) (N=25), were €1,059.31, €1,247.76, and €1,626.01, respectively. Incontinence pad use for weekly frequency with solifenacin, trospium, and tolterodine was, 17.34, 19.51 and 20.35, respectively. Overall satisfaction with medication as perceived by the clinician (very satisfied, satisfied, neutral, dissatisfied, very dissatisfied) for very satisfied and satisfied was 97%, 86%, 100%, for solifenacin, trospium, tolterodine, respectively. **CONCLUSIONS:** Solifenacin had the lowest annual cost-in-use compared to other study drug annual cost. This was corroborated in part by the lowest incontinence pad use for solifenacin compared to trospium and tolterodine and the high treatment satisfaction.

PUK16

COST AND COST-EFFECTIVENESS OF TREATING URGENCY STRESS INCONTINENCE-RESULTS FROM A RANDOMIZED CONTROLLED TRIAL

Kafri R[1], Greenberg D[2], Shames J[3], Novack L[1], Melzer I[1]
[1]*Ben Gurion University of the Negev, Beer-Sheva, Israel,* [2]*Ben-Gurion University of the Negev, Beer-Sheva, Israel,* [3]*Maccabi Healthcare Services, Rishon LeZion, Israel*

OBJECTIVES: Urgency urinary incontinence (UUI) has a substantial impact on patients' QOL and well-being, and may pose a substantial economic burden on patients and health insurers. We assessed the cost and cost-effectiveness of four conservative treatment modalities for UUI in Israel. **METHODS:** A total of 164 women were randomly allocated to one of four interventions: drug therapy (DT), bladder training (BT), pelvic floor muscle-training (PFMT), and combined pelvic floor rehabilitation (CPFR) and were followed over a period of 12-months. Resource utilization including physician encounters, dispensed prescriptions, physical therapist treatment and any other medical services was estimated for each study participant. We also estimated the women's self-reported utilizations of pads, laundry and new underwear. Total costs were calculated by multiplying the volumes of resource utilization by the corresponding unit-prices. We used the bootstrap method to report bias-corrected confidence-intervals of cost estimates. Utility weights were elicited using the EQ-5D questionnaire at baseline, 3-months and 12-months of follow-up. **RESULTS:** Women in all four treatment groups showed improvements in QOL from baseline to 12-months (DT:0.87 - 0.93, BT:0.85 to 0.89, PFMT:0.82 - 0.84, CPFR: 0.82 to 0.86). Changes in QOL summary scores from study enrollment and end of follow-up were estimated after correction for potential baseline differences, and were not statistically different among study groups. The mean total cost was somewhat lower for the DT group participants ($1,460), as compared with the three other interventions (range: $1,760-$1,990). These differences, however, were not statistically significant. The mean monthly personal costs were significantly reduced from baseline to 12-months of follow-up in all treatment groups. **CONCLUSIONS:** The four treatment modalities for treating UUI were equally effective and associated

with comparable costs. Therefore, an incremental cost-effectiveness ratio was calculated. Due to the possibility of declining adherence to drug therapy over time, pelvic floor physical therapy can be considered as the first line treatment for UUI.

PUK17

THE COST IMPLICATIONS OF RENAL DENERVATION THERAPY AT THE HOSPITAL LEVEL IN THE UNITED KINGDOM

Smith TA[1], de Silva SU[1], Firth ZA[1], Cuche MR[2], Bending MW[1]
[1]*Mapi, London, UK,* [2]*Covidien AG, Zürich, Switzerland*

OBJECTIVES: Hypertension is a chronic medical condition and an important risk factor in several fatal and debilitating diseases. NICE estimates the cost of pharmacologic intervention in the UK for hypertension at £409.8 million. Resistant hypertension arises when blood pressure remains uncontrolled despite antihypertensive treatment. Renal denervation is a new procedure aimed at reducing blood pressure in resistant hypertension patients by decreasing efferent sympathetic signalling to the kidneys. The objective of this research was to review the evidence on the cost of renal denervation and to provide a costing model for the procedure. **METHODS:** A targeted review of costing data was performed and information gathered from renal denervation experts to establish relevant procedure costs. Once specific health care resource use (HRU) and equipment costs were identified, an Excel™ costing model was constructed. A further search of NHS costing documents, academic literature, and expert consultation provided GBP figures for each cost and identified those that were time dependent (e.g. hourly staff costs). **RESULTS:** The required in-patient HRU was identified as staff costs per hour including surgeon costs, nurse costs, technician costs and anaesthesiologist costs, all of which vary with procedure time depending on the device used (ranging from 20-60 minutes). Catheter lab overhead costs per hour and recovery costs (bed days) were also identified. Total HRU costs vary between £923.02 and £991.62 (for 20 and 60 minute procedure times respectively). An additional in-hospital recovery day adds £680. Equipment costs were for 12 items including from syringes to catheters to valves, totaling £281.70 plus the cost of the renal denervation therapy device. **CONCLUSIONS:** It is essential the cost of the procedure is estimated to fully inform payers and health care providers. HRU costs are dependent on procedure time and length of recovery in hospital, thus devices that reduce these factors are best for cost savings.

PUK18

LONG-TERM COSTS AND SURVIVAL ASSOCIATED WITH IMMUNOSUPPRESSANT FOLLOWING LIVER TRANSPLANTATION: A MARKOV MODEL

Bianic F[1], Ricci JF[2], Damera V[3], Bhattacharyya S[4], Irish W[5]
[1]*OptumInsight, Nanterre, France,* [2]*WELLMERA AG, Basel, France,* [3]*OptumInsight, Uxbridge, UK,* [4]*Novartis Healthcare Pvt. Ltd., Hyderabad, India,* [5]*CTI Clinical Trial and Consulting Services, Raleigh, NC, USA*

OBJECTIVES: Despite significant improvements in survival and quality of life (QoL) of liver transplant (LTx) recipients, patients remain at risk from complications related to disease recurrence and long-term use of immunosuppressant (IS). The objective was to assess cost, survival, and QoL outcomes of LTx recipients and the impact of renal dysfunction on LTx outcomes. **METHODS:** A *de novo* cohort Markov model was developed to predict long-term outcomes post LTx along two independent pathways: 1) liver-related (acute rejection, hepatocellular carcinoma, hepatitis C (HCV) recurrence, graft loss), 2) kidney-related (chronic kidney disease, dialysis, renal transplantation) and death. All patients, stratified by liver diagnosis, entered the model at time of LTx and followed both pathways, allowing for multiple combinations of liver and kidney health states. Costs and utilities were assigned to each health renal and liver state. Renal complications costs and utility decrements were added to those accrued in the liver pathway. The lifetime model used an annual cycle length except for the 1st year post LTx (quarterly). Choice of immunosuppressant strategy could impact the risk of acute rejection, change in renal function and HCV fibrosis progression. A 3% discount rate was applied to costs and outcomes. **RESULTS:** On average, life expectancy post LTx was 13.3 years with 10.2 QALYs. Lifetime cost of managing post LTx recipients was USD 550,000 (excluding LTx procedure): >50% was related to IS regimen, monitoring and adverse events; around 40% to renal complications and 2-7% to liver complications. Patients developing renal dysfunction lost 5.2 life-years and 1.5 QALYs. **CONCLUSIONS:** To our knowledge, this is the first Markov model simulating lifetime costs and outcomes post-LTx and the impact of change in renal function on patient survival. A health care intervention that could improve or maintain renal function would have significant impact on survival and costs.

PUK19

COST-EFFECTIVENESS OF FESOTERODINE AND TOLTERODINE FOR THE TREATMENT OF OVERACTIVE BLADDER WITH URGE URINARY INCONTINENCE IN SPAIN AND FINLAND

Angulo J[1], Rejas J[2], Linden K[3], Kvasz MG[4], Snedecor SJ[5]
[1]*Hospital Universitario de Getafe, Getafe, Spain,* [2]*Pfizer S.L.U., Alcobendas/Madrid, Spain,* [3]*Pfizer, Helsinki, Finland,* [4]*Pfizer, Paris, France,* [5]*Pharmerit International, Bethesda, MD, USA*

OBJECTIVES: To assess the economic value of fesoterodine compared to tolterodine for the treatment of overactive bladder (OAB) with urgency urinary incontinence (UUI) in Spain and Finland. **METHODS:** A decision-tree economic model estimated the 52-week costs and quality-adjusted life years (QALYs) of OAB/UUI patients initiating treatment with fesoterodine 4mg/day or extended-release (ER) tolterodine. Treatment response (UUI <1 episode/day) and persistence were evaluated at weeks 4, 12, and 24. Titration from fesoterodine 4mg/day to 8mg/day was permitted at week 4. At week 12, non-responders discontinued treatment permanently. Efficacy, discontinuation, and utility data were derived from four clinical trials of fesoterodine. OAB-related costs including physician visits, laboratory tests, incontinence pads, and comorbidities (fracture, skin infection, urinary tract infections, depression, and nursing home) were also included. The perspective was that of the National Health Systems (2012€). Uncertainty surrounding the model parameters was assessed by univariate and probabilistic sensitivity analysis (PSA). **RESULTS:** A total of 19.5% and 18.0% of fesoterodine and ER tolterodine patients remained on treatment until week 52, respectively. QALYs were higher with fesoterodine than tolterodine (0.762 vs. 0.760). In Spain, fesoterodine treatment had higher costs than (generic) ER tolterodine (€6 697 vs. €6 597), resulting in a cost of €15 600/QALY gained. In Finland, fesoterodine was cost-saving relative to (non-generic) ER tolterodine (€7 885 vs. €8 024). Sensitivity analysis confirmed these findings were robust to the expected price decrease for generic ER tolterodine in Finland. In the PSA, fesoterodine was consistently the preferred therapy in Finland regardless of the value of a QALY and in Spain for QALY valuations greater than €15 000. **CONCLUSIONS:** Fesoterodine is cost-effective or cost-saving relative to ER tolterodine for the treatment of OAB with UUI in two European countries. Payers and prescribers should consider a broad scope of costs in order to make informed cost-conscious choices of antimuscarinic treatment.

PUK20

ECONOMIC EVALUATION OF PHARMACOLOGICAL TREATMENTS FOR OVERACTIVE BLADDER

Posnett J[1], Walker A[1], Nazir J[2], Odeyemi IAO[3], Hakimi Z[4], Garnham A[3]
[1]*Heron Evidence Development, Ltd., London, UK,* [2]*Astellas Pharma Europe Ltd., Chertsey, UK,* [3]*Astellas Pharma Europe Ltd., Chertsey, UK,* [4]*Astellas Pharma Global Development, Leiden, The Netherlands*

OBJECTIVES: Overactive bladder (OAB) is a chronic condition which affects quality of life through the main symptoms of urinary urgency, urinary frequency, and urinary incontinence. Treatments include behavioural therapy, antimuscarinics (AM), β_3-adrenoceptor agonsits (mirabegron), botulinum toxin (botox) and sacral nerve stimulation (SNS). The aim of this analysis was to evaluate the costs and outcomes associated with different sequences of oral treatments (AM and mirabegron). **METHODS:** A Markov model with monthly cycle length and a time horizon up to 3 years compared two different sequences of up to three lines of oral treatments. Patients who discontinue one oral medication may switch to another oral medication, or may discontinue treatment. Patients whose symptoms are not improved are considered for botox or SNS. Outcomes are measured by (a) number of patients with improved symptoms (< 2 incontinence episodes and < 8 micturitions per 24-hours); (b) patients with < 2 incontinence episodes per 24-hours; and (c) patients with < 8 micturitions per 24-hours. **RESULTS:** Including a third-line oral medication before considering other treatment options improved all patient outcomes, irrespective of the particular drugs used. A three-line sequence including two generics (oxybutynin (1st line), and tolterodine ER (2nd line)), and one branded drug (solifenacin 5mg (3rd line)) resulted in inferior patient outcomes and higher cost compared with a sequence of branded drugs (mirabegron (1st line), solifenacin 5mg (2nd line), solifenacin 10mg (3rd line)): improved patients (70/1000 vs. 92/1000); patients with < 2 incontinence episodes (181/1000 vs. 217/1000); patients with < 8 micturitions (248/1000 vs. 299/1000). Annual treatment costs were higher in the generic sequence (£2659 per patient vs. £2479). **CONCLUSIONS:** Low-cost generic treatments are not necessarily more cost-effective than branded drugs. The main reason is that a better efficacy and tolerability balance improves symptoms and quality of life, leading to better persistence and lower overall treatment costs.

PUK21

COST-EFFECTIVENESS OF MIRABEGRON COMPARED WITH TOLTERODINE ER 4MG FOR THE TREATMENT OF PATIENTS WITH OVERACTIVE BLADDER IN THE UNITED KINGDOM: RESULTS FROM A TRIAL-BASED MODEL

Aballéa S[1], Maman K[2], Desroziers K[1], Nazir J[3], Odeyemi IAO[3], Hakimi Z[4], Garnham A[3], Toumi M[5]
[1]*Creativ-Ceutical, Paris, France,* [2]*Creativ-Ceutical, London, UK,* [3]*Astellas Pharma Europe Ltd., Chertsey, UK,* [4]*Astellas Pharma Global Development, Leiden, The Netherlands,* [5]*University Claude Bernard Lyon 1, Lyon, France*

OBJECTIVES: Mirabegron is a first-in-class beta-3 adrenoceptor agonist for the treatment of overactive bladder (OAB) that demonstrated superior efficacy compared to placebo in OAB. The cost-effectiveness of mirabegron 50 mg (MGN) was assessed in comparison with tolterodine ER 4 mg (TOL) in the UK. **METHODS:** A Markov model was developed to simulate the therapeutic management, the changes in symptoms (micturitions and incontinence), and complications in OAB patients. The model was used to predict costs and QALYs over 5 years in cohorts initially treated with MGN or TOL, followed by antimuscarinics in case of lack of efficacy or adverse events. Transition probabilities and EQ-5D utilities were obtained from regression models, estimated from a P3 randomized controlled trial of mirabegron. Costs were evaluated from the UK National Health Service (NHS) perspective and included drug acquisition, physician visits, pads and botulinum toxin injections. Subgroup analyses were performed for previously treated, treatment naïve, incontinent, female and elderly patients. **RESULTS:** The MGN strategy was more expensive compared to TOL, with a difference of £37.88 per patient, and produced more QALYs (+0.009 per patient). The incremental cost-effectiveness ratio (ICER) was estimated at £4,386/QALY gained. Results of one-way sensitivity analyses showed that in all scenarios, except one (the transition probabilities between symptom levels of micturition for mirabegron), MGN remained cost-effective or was dominant compared to TOL. Key cost-effectiveness drivers included parameters related to efficacy and treatment discontinuation. Based on the probabilistic sensitivity analysis, the probability of MGN being cost-effective against TOL was 89.4% at a threshold of £20,000 per QALY gained. ICERs in subgroups ranged from £3,091 (female subgroup) to £5,736 (elderly subgroup). **CONCLUSIONS:** Treatment with mirabegron 50 mg appears to be a cost-effective strategy compared with tolterodine ER 4 mg for the general OAB population and the specified subgroups, from a UK NHS perspective.

PUK22

COST-EFFECTIVENESS OF MIRABEGRON COMPARED WITH ANTIMUSCARINICS FOR THE TREATMENT OF PATIENTS WITH OVERACTIVE BLADDER IN THE UNITED KINGDOM

Maman K[1], Neine M[2], Briquet B[2], Nazir J[3], Odeyemi IAO[3], Hakimi Z[4], Garnham A[3], Aballéa S[2]
[1]*Creativ-Ceutical, London, UK,* [2]*Creativ-Ceutical, Paris, France,* [3]*Astellas Pharma Europe Ltd., Chertsey, UK,* [4]*Astellas Pharma Global Development, Leiden, The Netherlands*

OBJECTIVES: Mirabegron is a first-in-class beta-3 adrenoceptor agonist for the treatment of overactive bladder (OAB) that demonstrated superior efficacy compared to placebo by reducing OAB symptoms and improving HRQoL. We sought to assess the cost-effectiveness of mirabegron 50 mg in comparison with current antimuscarinics for the treatment of patients with OAB in the UK. **METHODS:** A Markov model was developed to simulate the therapeutic management, the changes in symptoms (micturitions and incontinence), and complications in hypothetical cohorts of OAB patients. The model was used to predict costs and QALYs over 5 years in cohorts initially treated with antimuscarinics or mirabegron 50mg. Effectiveness and safety data were based on the results from a mixed treatment comparison (MTC). A calibration approach was used to derive transition probabilities from mean changes in frequency of micturitions and incontinence episodes. Other input data were obtained from several sources, including scientific literature and expert opinions. Costs were evaluated from the UK National Health Service (NHS) perspective and included costs of drug acquisition, GP visits, specialist visit, incontinence pad use and botox injections. Utilities were obtained from equations predicting EQ-5D index scores according to symptom severity, estimated from a clinical trial of Mirabegron. **RESULTS:** The Mirabegron strategy was slightly more expensive and associated with a greater number of QALYs, as a result of improved persistence, related to a lower risk of adverse event compared to each antimuscarinic. Mirabegron 50mg was found to be cost-effective compared to each antimuscarinic, with an ICER of £340 vs. solifenacin 10mg, £3,607 versus fesoterodine 4mg, £3,715 vs. tolterodine ER 4mg, £3,878 vs. oxybutynin ER 10mg, £8,881 versus trospium chloride MR 60 mg, £12,493 versus solifenacin 5mg, and £14,234 oxybutynin IR 10mg. **CONCLUSIONS:** Treatment with mirabegron appears to be a cost-effective strategy compared with antimuscarinics from a UK NHS perspective.

PUK23

COST-MINIMIZATION ANALYSIS OF FERUMOXYTOL IN THE MANAGEMENT OF ANEMIA IN PATIENTS WITH CHRONIC KIDNEY DISEASE IN BELGIUM

Vandekerckhove S[1], Lamotte M[1], Petit C[2]
[1]*IMS Health HEOR, Vilvoorde, Belgium,* [2]*Takeda Belgium SA, Brussels, Belgium*

OBJECTIVES: Intravenous (IV) irons are second line treatments for iron deficiencies in severe chronic kidney disease (CKD) patients with iron deficiency anaemia. Aim of this study was to compare ferumoxytol, a new agent, against IV ferric carboxymaltose (FC) and IV iron sucrose (IS), from a Belgian health care payer (BP) and hospital perspective (HP). **METHODS:** The CKD patients were categorized in haemodialysis (HD), peritoneal dialysis (PD), non-dialysis (post-renal transplant and non-dialysis) and all patients combined. The available IV irons have a similar efficacy. Adverse events were not included due to missing comparative data and low rates. However, the administration time and number of administrations differ among treatments. So a cost-minimization analysis was conducted (time horizon: 1 year). The average annual need of IV Iron is 3,500 mg in HD, 2,500 mg in PD and 1,500 mg in non-dialysis patients. The hospital perspective was modelled by deducting the nurse time cost from the hospital fee per administration (HP). For the health care payer the administration cost (hospital fee) and the drug costs are included (BP). Other costs were excluded because they did not affect the incremental cost of treatment. **RESULTS:** The total cost (euro 2012) for all patients was € 676.57, € 819.82 and € 617.34 for ferumoxytol, FC and IS, respectively (BP). In the renal transplant and non-dialysis subgroups, ferumoxytol is less costly than FC and IS (BP). In the HD subgroup (86.77% of all eligible patients), IS is the least costly option (BP). The hospital cost in all patients is higher with IS due to more nurse time (€ 101.31, € 7.58 and € 144.19 for ferumoxytol, FC and IS) (HP). **CONCLUSIONS:** Hospitals benefit from lower administration costs with ferumoxytol and FC (HP). From a Belgian payer perspective, ferumoxytol is less costly than FC and more costly than IS.

PUK24

HEALTH CARE RESOURCE UTILIZATION COSTS RELATED TO ANAEMIA MANAGEMENT IN CHRONIC KIDNEY DISEASE NON-DIALYSED PATIENTS: A RETROSPECTIVE CLINICAL AND ADMINISTRATIVE DATABASE ANALYSIS

Degli Esposti L[1], Pelosi C[2], Saragoni S[1], Buda S[1]
[1]*CliCon Srl, Ravenna, Italy,* [2]*Amgen Dompè SpA, Milano, Italy*

OBJECTIVES: Anaemia is a frequent complication among patients with Chronic Kidney Disease (CKD) and is associated with poor outcomes. European data on the patterns of treatment of anaemia in non-dialysed (ND) CKD patients are scarce. The aim of this study was to describe the anaemia-associated Health Resource Utilization (HRU) in an Italian cohort of ND-CKD patients. **METHODS:** The administrative data and clinical laboratory files of 5 Italian Local Health Units from 2006 to 2011 were used to identify ND patients with CKD (stage3b, 4, 5) and anemia. Anaemia-related HRU and associated costs were investigated. **RESULTS:** A total of 1175 patients were included; 790 in CKD stage 3b; 331 in stage 4; 54 in stage 5. Anaemia-related medications were prescribed to 31.9% of patients and the percentage increased along the CKD stages from 28.9% for stage 3b to 42.6% for stage 5. Among the drug-treated patients Erythropoiesis-stimulating agents were prescribed to 82.6% of CKD stage 5 patients whereas CKD stage 3b patients received mostly oral iron (59.6%). Patients receiving any anaemia-related medications had lower per patient-per year cost for almost all studied resources compared to patients not receiving any medications. For anaemia-related outpatient services [drug-treated and not drug-treated]: stage 3b costs per patient year were €62.12 and €62.32 respectively; stage 4 costs were €52.23 and €72.76; stage 5 costs were €55.83 and €83.08. For general visits: stage 3b costs were €168.51 and €170.28; stage 4 costs were €124.17 and €173.79; stage 5 costs were €134.49 and €343.63. For CV hospitalizations: stage 3b costs were €1378.63 and €1828.60; stage 4 costs were €1185.17 and €2155.82; stage 5 costs were €521.61 and €514.63. **CONCLUSIONS:** Among ND CKD patients drug treatment may help control anaemia-related outpatient services and contain CV hospitalization costs and represents an opportunity for health care improvement.

URINARY/KIDNEY DISORDERS – Patient-Reported Outcomes & Patient Preference Studies

PUK25

IMPLICATIONS OF NON-ADHERENCE TO PHOSPHATE BINDERS ON PATIENTS' PHOSPHATE LEVELS

Furniss SJ[1], Lim A[2], Phillips Z[3]
[1]*GfK Bridgehead, Melton Mowbray, UK,* [2]*GfK Bridgehead, London, UK,* [3]*Mitsubishi Pharma Europe, London, UK*

OBJECTIVES: Elevated serum phosphate (hyperphosphataemia) usually accompanies end-stage renal disease and results from the inability of damaged kidneys to effectively regulate phosphate levels. Failure to maintain adequate phosphate balance has important clinical consequences, with an increased morbidity and risk of mortality. When dietary phosphate restriction is inadequate for control, administration of phosphate binders may be required. A number of phosphate binders are currently available; however, these often require high doses to control serum phosphate levels and this may result in lowered patient compliance. The objectives of this research were to assess the pill burden associated with phosphate binders and highlight any links between pill burden, patient adherence and outcomes in terms of serum phosphate levels. **METHODS:** A literature review was performed using the PubMed database using the search term "phosphate binders AND adherence". Twenty six articles were identified in total, with ten relevant articles. **RESULTS:** Six of the ten relevant articles (60%) found that low patient adherence or high pill burden were associated with higher mean serum phosphate level, whereas only one article (10%) concluded that no link existed. Seven articles reported dose increases with phosphate binder treatment or an increased number of pills per patient per day over the treatment course, with two reporting that the actual dose of phosphate binders in clinical practice was higher than those recommended in clinical guidelines. A high pill burden was found to lead to low adherence by three of the articles identified (30%), whereas only one of the papers identified did not support this hypothesis (10%). **CONCLUSIONS:** This research indicates that there is a high pill burden associated with phosphate binders, as well as a requirement in clinical practice for high dosages. There is a suggestion that these factors are linked to low patient adherence and poorer control of serum phosphate levels.

PUK26

IMPACT OF MAJOR CLINICAL EVENTS ON UTILITIES IN THE CONTEXT OF SECONDARY HYPERPARATHYROIDISM (SHPT) AND CHRONIC KIDNEY DISEASE (CKD) TREATED WITH DIALYSIS

Davies EW[1], Matza LS[2], Worth G[3], Feeny DH[4], Kostelec J[2], Soroka SD[5], Mendelssohn DC[6], McFarlane PA[7], Belozeroff V[8]
[1]*Evidera, London, UK,* [2]*Evidera, Bethesda, MD, USA,* [3]*Amgen (Europe) GmbH, Zug, Switzerland,* [4]*University of Alberta, Portland, OR, USA,* [5]*Dalhousie University, Halifax, NS, Canada,* [6]*Humber River Hospital, Toronto, ON, Canada,* [7]*St. Michael's Hospital, Toronto, ON, Canada,* [8]*Amgen, Inc., Thousand Oaks, CA, USA*

OBJECTIVES: Health economic evaluations of therapeutic interventions in patients with CKD and SHPT requiring dialysis (CKD-SHPT) should incorporate the impact of major clinical events related to their disease. However, little is known about the disutility (i.e, utility decrease) associated with cardiovascular (CV) and fracture events in the context of CKD-SHPT. The purpose of this study was to estimate, via preference-based valuation completed by general population respondents, the added disutility of these events beyond the impact of CKD-SHPT. **METHODS:** One-year health states were developed describing CKD-SHPT and related CV/fracture acute events/procedures. Events with long-term effects (post one year) were also captured in chronic health states. General population participants in Canada completed time trade-off (TTO) interviews to assess health state utilities. Respondents initially rated the CKD-SHPT health state. Then, events and procedures were added to this health state: myocardial infarction (MI); unstable angina (UA); heart failure exacerbation; peripheral vascular disease (PVD) ± amputation; stable angina (SA); stroke; hip/arm fractures; parathyroidectomy; kidney transplant. Each participant was randomly-assigned 11 of 16 health states to rate. **RESULTS:** A total of 199 participants (54.8% female; mean age = 46.3 years) completed interviews. Each health state had ≥130 valuations. CKD-SHPT had a mean utility of 0.60 (SD=0.34). For acute events, mean utility decrements additional to CKD-SHPT were: MI, -0.06; UA, -0.05; PVD with amputation, -0.33; PVD without amputation, -0.11; heart failure, -0.14; stroke -0.30; hip fracture, -0.14; arm fracture, -0.04; parathyroidectomy, +0.02; kidney transplant, +0.06. Disutilities for chronic effects were: SA, -0.09; stroke -0.27; PVD with amputation -0.30; PVD without amputation, -0.12; heart failure, -0.14. **CONCLUSIONS:** Valuation of health states representing CKD-SHPT plus major clinical events was feasible using TTO with a one-year time horizon. These data will assist investigators in applying appropriate disutilities to clinical events in economic evaluations of treatments for patients with CKD-SHPT requiring dialysis.

PUK27

THE IMPACT OF SACRAL NEUROMODULATION ON EQ-5D INDEX SCORES AND COSTS TO MANAGE OVERACTIVE BLADDER

Hinnenthal J[1], Siegel S[2], Noblett K[3], Mangel J[4], Bird ET[5], Griebling TL[6], Comiter C[7]
[1]*Medtronic, Minneapolis, MN, USA,* [2]*Metro Urology, Woodbury, MN, USA,* [3]*University of California, Irvine, Orange, CA, USA,* [4]*MetroHealth Medical Center, Cleveland, OH, USA,* [5]*Scott and White Hospital, Temple, TX, USA,* [6]*University of Kansas, Kansas City, KS, USA,* [7]*Stanford University, Palo Alto, CA, USA*

OBJECTIVES: To determine the impact of sacral neuromodulation (SNM) on EQ-5D index scores and OAB management costs using an Economic Impact Questionnaire (EIQ) in patients who failed at least one anticholinergic medication enrolled in the InSite study, an ongoing, prospective, multicenter trial of SNM. **METHODS:** EQ-5D and EIQ were administered at baseline, 3-, 6- and 12-months post-implant. OAB-related expenses included durable and disposable medical supplies and health service utilization (emergency room, hospitalizations and outpatient). A total of 340

patients completed the SNM pre-implant evaluation; data from 265 subjects were included in EQ-5D or EIQ analyses. Matched paired t-tests compared EQ-5D scores and costs from baseline to each follow-up. **RESULTS:** Baseline mean EQ-5D index score (n=265) was 0.777. Index scores significantly improved (p<0.05) from baseline at each follow-up period [3-months (n=247)=0.850, 6-months (n=246)=0.828, and 12-months (n=232)=0.839]; the largest improvement in scores (0.073) was at 3 months. The proportion of patients reporting no problems on the EQ-5D dimensions of Usual Activities, Anxiety/Depression and Pain/Discomfort and Self-Care increased from 61.2% (baseline) to 72.0% (12 months); 57.3% to 69.4%; 40.9% to 50.9%, and 93.1% to 95.3%, respectively; the Mobility dimension had a non-significant decline (68.5% to 66.4%). At baseline, study subjects reported a 3-month average expenditure of $228 (US) for durable and disposable medical supplies and health service utilization; 74% of the expenditure was attributed to ER, hospitalization and outpatient health services use. Expenditures significantly declined (p<0.05) by an average of $163 per 3-month period post-implant. **CONCLUSIONS:** After receiving SNM implant, EQ-5D index scores were significantly improved and self-reported durable and disposable medical supplies and health service expenses to manage OAB were significantly reduced.

PUK28

THE MINIMAL IMPORTANT DECREASE OF HEALTH UTILITY IN LIVING KIDNEY DONORS

Hosseini K[1], Hubert J[2], Ladrière M[3], Guillemin F[1]
[1]*CHU Nancy, Clinical Epidemiology and Evaluation; Université de Lorraine, Paris Descartes University, APEMAC, EA 4360, Nancy, France,* [2]*Department of Urology, Nancy, France,* [3]*Department of Nephrology, Nancy, France*

OBJECTIVES: 1) To determine what is the utility change for kidney donors from before to 3 months after donation; 2) To determine the minimal important difference (MID) of a decrease (MIDe) in utility for kidney donors. **METHODS:** We used data from a prospective multicenter observational study, measuring the Health Related Quality of Life (HRQoL) of kidney donors before and three months after transplantation. Utility scores were estimated using the SF-6D and EQ5D. Two methods were used to estimate the MIDe: i) the anchor-based method by the Global Rating of Change (GRoC) for donors rating their global health "somewhat worse" 3 months after donation; ii) the distribution-based method by the standard error of measurement (SEM). **RESULTS:** In total, 211 donors for the EQ-5D and 192 for the SF-6D completed the questionnaire. Results showed a significant (p<.0001) decrease in utility score at three months. The mean (SD) utility score before transplantation was 0.932 (±0.091) with the EQ5D, and 0.834 (±0.085) using the SF-6D, and 0.882 (±0.151) and 0.757 (±0.118) respectively at three months with a significant decrease (<.0001). Half of donors (53.9%) rated their global health "about the same" and 35 (15.4%) "somewhat worse" at follow up. Using the GRoC method, the MIDe was -0.113 units for the EQ-5D and -0.128 units for the SF-6D. By the SEM method, MIDe was -0.076 for the EQ5D and -0.073 for the SF6D. More than third of patient rechead the MIDe using the SEM method. **CONCLUSIONS:** This study showed a significant descrease in utility score three months after donation in most donors while reporting their global health "about the same". The MIDe can be used by clinician as a threshold to identify donors with a meaningful decrease in utility score in a short run after donation.

PUK29

FREQUENCY OF LOWER URINARY TRACT SYMPTOMS IN MEN AND WOMEN IN HUNGARY – RESULTS OF AN OPEN LABEL QUESTIONNAIRE STUDY FROM 2012

Brodszky V[1], Rencz F[1], V Hevér N[1], Tóth A[2], Gulácsi L[1], Péntek M[1]
[1]*Corvinus University of Budapest, Budapest, Hungary,* [2]*Adherencia.net Kft, Budapest, Hungary*

OBJECTIVES: Urinary incontinence (UI) is a public health issue with a considerable social and economic impact. It affects temporarily or permanently about 400 000-500 000 adults in Hungary. The purpose of our study was to estimate the prevalence, consultation rates and treatment behaviour of the adult population. **METHODS:** In 2012 a 15-item questionnaire survey was performed as a part of a mobile health unit screening "The comprehensive health test program of Hungary 2010-2020". **RESULTS:** Altogether 13 355 respondents (60.4% female) completed the questionnaire, the mean age was 40.2 years (SD 12.2). The prevalence rate of UI was 9.7% (n=786) of women and 3.8% (n=200) of men. Consultation rates were 22.9% (n=180) for women and 32.5% (n=65) for men. Seventy-three women (40.6%) consulted a gynaecologist, 37 (20.5%) a GP, 46 (25.6%) an urologist and 24 (13.3%) consulted more than one physicians. Five men (7.7%) consulted a GP, 44 (67.7%) an urologist and 16 (24.6%) didn't answer. Among those who consulted a physician 52.2% (n=94) of women and 66.2% (n=43) of men found solution for their urinary symptoms. In the group of respondents who consulted a doctor (n=245) the most common therapies were medications, surgical treatment, absorbent pads or any combination of the foregoing. In the group who self-managed their symptoms without consulting a doctor (n=741) absorbent products and/or pelvic muscle training were the most frequently applied therapies. **CONCLUSIONS:** Our prevalence results are in line with the international UI screenings. We found low medical consulting rates and the majority of the respondents having symptoms used self-management techniques for UI.

PUK30

ELICITATION OF HEALTH-RELATED QUALITY OF LIFE CONCEPTS ASSOCIATED WITH OVERACTIVE BLADDER

Hawken NA[1], Aballea S[2], Hakimi Z[3], Nazir J[4], Odeyemi IA[5], Toumi M[2]
[1]*Creativ-Ceutical, Luxembourg, Luxembourg,* [2]*Creativ Ceutical, Paris, France,* [3]*Astellas Pharma Global Development, Leiden, The Netherlands,* [4]*Astellas Pharma Europe Ltd., Chertsey, UK,* [5]*Astellas Pharma Europe Limited, Chertsey, UK*

OBJECTIVES: To review and identify HRQL dimensions in dry and wet OAB patients through literature review and patient interviews. **METHODS:** A literature review on OAB HRQL was performed using the EMBASE database. Specialized forums were also searched for relevant HRQL issues reported by OAB patients. A trained psychologist conducted semi-structured individual interviews with 2 clinical experts and 30 patients in the UK recruited through general practitioners. Clinical experts were asked to identify key concepts attributable to the overactive bladder (symptoms). Patients were asked to describe their symptoms and impact on HRQL and rate them. All patient responses were coded using code frequency and bother ratings. **RESULTS:** Seven men, 23 women were interviewed; the majority of patients were older than 65 years. 50% of the patients were incontinent. Preliminary analysis suggests that OAB affects the patient's quality of life on several aspect of their life: psychological (embarrassment and worry), occupational limitations, domestic (usual activities) and limitations in leisure activities. All patients reported that feeling the need to go "too often" to the bathroom (urgency and frequency) led to significant limitations such as avoidance of any unplanned activities. HRQL concepts were similar across the different age group. As expected, patients suffering from urgency incontinence reported this symptom as being the most impactful, especially in terms of embarrassment and worry. **CONCLUSIONS:** Although the impact of all OAB symptoms was found to be significant and similar across all patients regardless of their age, the greatest impact or burden of OAB was felt and reported by wet patients compared to dry patients.

PUK31

HEALTH RELATED QUALITY OF LIFE OF PATIENTS WITH BLADDER CANCER IN HUNGARY

Brodszky V[1], Szantó Á[2], Balló A[2], V Hevér N[1], Gulácsi L[1], Tóth G[3], Buzogány I[4], Péntek M[1]
[1]*Corvinus University of Budapest, Budapest, Hungary,* [2]*University of Pécs Medical School, Pécs, Hungary,* [3]*Jósa András Hospital, Nyíregyháza, Hungary,* [4]*Péterfy Hospital, Budapest, Hungary*

OBJECTIVES: Bladder cancer (BC) is the fourth most common malignancies among men and it has high medical costs per-patient from diagnosis until death. Generally little is known about the burden BC imposes on patients' health-related quality of life (HRQL) and the literature lacks detailed utility data for economic evaluations in BC. The authors' goal was to assess the HRQL and health status utility of BC patients. **METHODS:** A cross sectional survey was performed in three hospital based urology centres. Adult patients with BC attending routine care were invited to participate in the study. Data on demographics, disease history and co-morbidities were obtained, validated versions of the EQ-5D and SF-36 generic questionnaires were applied. The UK tarrifs were used to calculate EQ-5D score and the SF-36 was converted to SF-6D utilities. Disease-specific HRQL was assessed by the FACT-BL questionnaire. **RESULTS:** Altogether 98 patients (males 63.3%) were involved with mean age of 66.4 (SD=8.6) and disease duration of 3.4 (SD=3.0) years. The SF-36 physical and mental health summary measures were 62 (SD=24), 65 (SD=24), respectively, the scores of the 8 domains were comparable to the >65 years old general population's results. The average SF-6D, EQ-5D and EQ VAS utility scores were 0.705 (SD=0.145), 0.772 (SD=0.252) and 68.8 (SD=19.0). The difference of EQ-5D score compared to the age-matched population norm was not significant (p=0.65). The FACT-BL physical, social, emotional and functional well-being scores were mean 23.1 (SD=5.4), 20.6 (SD=5.7), 18.1 (SD=5.1) and 19.0 (SD=6.7), the total score was 114.0 (SD=23.5). **CONCLUSIONS:** According to our knowledge this study is the first to assess BC patients' HRQL using diverse preference based measures. Further studies involving larger samples might increase our knowledge on the performance of these questionnaires in BC subgroups by disease stage, type of treatment and urinary diversion.

PUK32

THE BURDEN OF UNTREATED PATIENTS EXPERIENCING SYMPTOMS OF OVERACTIVE BLADDER

Pedersini R[1], Isherwood G[2], Vietri J[3]
[1]*Kantar Health, Epsom, UK,* [2]*Kantar Health, Epsom, Surrey, UK,* [3]*Kantar Health, Milan, Italy*

OBJECTIVES: The reluctance of those with overactive bladder OAB to seek medical advice can leave a considerable part of the population untreated, with significant costs for society. The present study investigates the burden of individuals who experience symptoms of OAB but are not treated. **METHODS:** Data were taken from the 5EU (France, Germany, Italy, Spain, and UK) 2013 National Health and Wellness Survey (NHWS), a cross-sectional survey representative of the total adult populations in each 5EU market. 62,000 respondents self-reported physician diagnosis of various health conditions, including 1,347 who reported symptoms compatible with OAB. These respondents were compared to those who didn't report symptoms of OAB. Variables of interest were demographics (age, gender, marital status, education, income and employment status), BMI, alcohol and smoke behaviour, health-related quality of life (HR-QoL), work productivity and activity impairment (WPAI). **RESULTS:** The OAB group, compared to the controls, was older (57 vs. 47 years), with a lower education level (49.14% went to college vs. 54.49%), less were in a relationship (26.43% vs. 31.82%), less were employed (35.04% vs. 58.15%), more were obese (31.11% vs. 17.22%), they had lower HR-QoL (SF-36v2, PCS: 42.09 vs. 51.36; MCS: 42.55 vs. 46.25; Utility: 0.62 vs. 0.73), had lower work productivity (overall work impairment of 34.46 vs. 20.03) and higher activity impairment (46.07 vs. 24.35). All differences were significant (p<0.001). **CONCLUSIONS:** Respondents reporting symptoms compatible with OAB but are not treated and would not be captured by clinical studies, are significantly worse-off than the rest of the population, e.g. in their quality of life, income and work productivity. It is likely that undergoing treatment would benefit them and decrease health care costs.

URINARY/KIDNEY DISORDERS – Health Care Use & Policy Studies

PUK33

ANTIBIOTIC UTILIZATION IN COMPLICATED URINARY TRACT INFECTION IN A TERTIARY CARE TEACHING HOSPITAL IN SOUTH INDIA

Nair S[1], Mathew J[1], Palaye M[1], Faryabi R[1], Shetty P[1], Shivshankar K[2], Thunga G[1], Vijayanarayana K[1]
[1]*Manipal College of Pharmaceutical Sciences, Manipal University, Manipal, India,* [2]*Kasturba Medical College, Manipal, India*

OBJECTIVES: To identify and analyze the sensitivity pattern of microorganisms isolated and to study the antibiotic utilization pattern in complicated urinary tract infection (cUTI) and the outcome of the therapy. **METHODS:** Retrospective, observational study conducted in the medicine units of a tertiary care teaching hospital from January 2011 to December 2011. Patients who met the inclusion criteria were include in the study and patient details like demography, clinical diagnosis, microbiological data, antibiotic regimen used and patient outcome were recorded from the medical records. Data were analyzed using SPSS 20.0 **RESULTS:** Out of 297 patients included in the study, majority of them were in the age group of 48-59 years. ESBL E. coli (61.4%) was the most common causative microorganism isolated, followed by *E.coli* (23.9%). The antibiotic sensitivity profile of microorganisms causing cUTI showed that E coli was sensitive to majority of the antibiotics and ESBL producing *E. coli* was most sensitive to cefoperazone-sulbactum followed by amikacin and carbapenems. Dual drug regimen was the most preferred choice for the treatment of cUTI compared to single or triple or more drug regimens. Among the different category of antibiotics used, cephalosporins was the most commonly prescribed while macrolides were the least preferred antibiotics. **CONCLUSIONS:** The treatment of ESBL E. coli with dual drug regimen showed maximum improvement in outcome (97.2%) followed by single drug regimen (89.7%). The organisms isolated were found to be more sensitive to cephalosporins, amikacin and carbapenems. Cephalosporins were the most effective antibiotic for the treatment of cUTI. The broader outcome of this study would be the potential utility of this data in designing strategies both at the level of physicians and the administrators for rational prescribing and policy decisions respectively.

PUK34

DIFFERENCE IN INTERDIALYTIC INTERVALS LEADING TO HOSPITAL ADMISSION AND MORTALITY IN HEMODIALYSIS PATIENTS

Kumar P, Prabhu A R, Bairy M
Manipal University, Manipal, India

OBJECTIVES: To determine the importance of long and short interdialytic interval leading to hospital readmission and mortality in hemodialysis patients. **METHODS:** Reviewed data of 240 patients with 182 male and 58 female patients receiving maintenance hemodialysis (HD) twice weekly on a Mon/Thu, Tue/Fri, Wed/Sat schedule with prevalent adult's HD patients on period from 2010 through2012. Eligible patients were actively recruited who were on chronic HD fulfilling the inclusion criteria. Analyzed the patients getting frequent hospitalized for Infectious and cardiovascular (CV) admissions were determined by principal ICD-9-CM diagnosis codes. **RESULTS:** A total of 240 patients with End-stage renal disease (ESRD) on long term hemodialysis were included the study cohort. The mean age was 50.4±13.6 years; 24.2% were women with a mean year of patients on hemodialysis of 4.2±2.6. Hypertension was the leading cause of end-stage renal disease in 28.8% of the patients, 27.1% of patients with hypertension and diabetes, 12% with diabetes and rest were due to Glomerulonephritis, *Interstitial nephritis*, Cystic kidney disease. Over the study period, mortality was 39.6% (95) , Cardiac cause 19.2 (46) were high on the day after 3 day interdialytic interval (31 death vs. 15), Vascular cause 2.5% (6), Infection 7.5% (18), other cause 10.4% (25) and readmission was more both on the day after long interdialytic interval and day after short interdialytic interval for IHD, stroke, infection. **CONCLUSIONS:** Interdialytic interval does not influence mortality and readmission rates for all cause cardiovascular and infectious causes.

PUK35

TIME SAVINGS WITH ONCE-MONTHLY C.E.R.A.: A TIME AND MOTION STUDY CONDUCTED IN 13 HEMODIALYSIS CENTRES IN ITALY

De Cock E[1], Kritikou P[2], Proskorovsky I[3], Tomic R[4]
[1]*Evidera, Barcelona, Spain,* [2]*Evidera, London, UK,* [3]*Evidera, Dorval, QC, Canada,* [4]*Roche S.p.A., Monza, Italy*

OBJECTIVES: A major challenge for haemodialysis (HD) centres is to maximise efficiency in care provision while maintaining high standards of care. Our objective was to document health care professional (HCP) time for renal anaemia management for both shorter-acting erythropoiesis-stimulating agents (ESA) and Mircera, a continuous erythropoiesis receptor activator (C.E.R.A.) once monthly (Q4W), and model time savings with the use of Q4W C.E.R.A. **METHODS:** This descriptive multi-centre Time and Motion (T&M) study was conducted in 13 centres in Italy. The time spent on frequent anaemia management-related tasks (preparation, distribution, and injection) was recorded for both ESA and C.E.R.A. groups in each centre by trained observers. Time/patient/session was used to calculate time/patient/year, time/centre/year and modelling of potential time savings of a 100% uptake of C.E.R.A. A Random intercept generalized linear mixed effect model assuming gamma distribution with log link function to account for the centre clustering effect was fitted for each task separately. **RESULTS:** In all centres, more than 80% of an average 86 ESRD patients received ESA treatment. The average number of ESA injections/patient/year, weighted by type of ESA, frequency and route of administration, was 89 (range: 33-150). The average uptake of C.E.R.A. was 26% (range 11-41%). The mean annual reduction in the number of ESA administrations following conversion to C.E.R.A. was 77 (21-138). Average time per patient HD session was 1.54 minutes for ESA (95% CI: 1.17-1.90) vs. 1.64 minutes for C.E.R.A. (95% CI: 1.57-2.02). Estimated time/patient/year was 137 min (range: 65-277) for ESA and 20 min for C.E.R.A. (range: 5-51). Assuming a 100% uptake of Q4W C.E.R.A. maintenance therapy, annual time savings/centre for frequent anaemia management tasks would be 86% (range: 62-95%). **CONCLUSIONS:** Substantial annual time savings on frequent anaemia management-related tasks were found in HD centres in Italy with 100% uptake of Q4W C.E.R.A. maintenance therapy.

PUK36

EVALUATION OF A PROCESS OF CARE MODEL FOR OPEN INTRAVESICAL URETERAL REIMPLANTATION FROM A CONTEMPORARY HEALTH CARE PERSPECTIVE

Ellsworth P, Butler C
Brown University, Providence, RI, USA

OBJECTIVES: The surgical management of vesicoureteral reflux consists of open and minimally invasive approaches. Open approaches are associated with post-operative hospitalization rates of stay typically 2 to 3 days, varying with the type of procedure. We evaluated the impact of a "one night cost-saving stay process of care" model for open surgical correction of vesicoureteral reflux on quality of care, as defined by return to emergency room or office and/or readmission to the hospital within 2 days of discharge. **METHODS:** An IRB-approved chart review of all open uncomplicated ureteral reimplantations for vesicoureteral reflux from the January 2009 through January 2013 was performed. Length of postoperative stay, emergency room records, hospitalizations and office records were reviewed to assess for presentation to the emergency room/office and/or readmission to the hospital within 2 days of discharge from the ureteral reimplantation. **RESULTS:** Ninety-five children (17 males, 78 females) underwent open ureteral reimplantation. Eighty-four (88.4%) were discharged POD #1 , 8 (8.4%) on POD #2 and 3 (3.2%) on the POD #3. Two patients presented to the ER within 2 days of discharge, one in the one night stay group and one in the three night stay group. No child required readmission within 2 days of discharge. Transient ureteral obstruction requiring stent placement occurred in 1 patient (1.05%) 3 days after discharge. Presentation to the ER > 2 days post-discharge was more frequent in those discharged from home POD #1. **CONCLUSIONS:** A process of care model decreased the length of stay to one night in 84 of the 95 patients (88.4%) and did not appear to increase the risk of early (within 2 days of discharge) presentation to the ER/office or readmission. ER/office presentations > 2 days after discharge were increased in the POD #1 group.

COSTS OF MANAGEMENT OF PREGNANCY IN OBESE WOMEN ACROSS EUROPE: THE DALI EXPERIENCE

Diaz-Cuervo H[1], Callejo D[1], Cuervo J[1], Rebollo P[1], Simmons D[2], Corcoy R[3]
[1]*LASER Analytica, Oviedo, Spain,* [2]*Addenbrooke's Hospital, Cambridge, UK,* [3]*Hospital Sant Pau, Barcelona, Spain*

OBJECTIVES: To assess resource use and costs in the usual clinical management of pregnant obese women, considered at high risk for developing GDM. **METHODS:** Information was collected in the framework of the DALI project by means of a structured survey about usual clinical practice in the management of obese women from week 12 of pregnancy until delivery and a second survey about unit costs of related tests and interventions including analytics, imaging tests, follow-up visits and delivery. 9 centers in 8 EU countries were included (Austria, Belgium, Denmark, Ireland, Italy, The Netherlands, Spain, UK) Unit costs were inflated, using consumer price index when needed to 2012 prices and exchanged to US$ using power purchase parities. **RESULTS:** According to the reported data, resource utilization according to usual practice in management of obese women differed across countries: number of ultrasound scans ranged 2-6, OGTT 0-3, obstetrician visits 2-10, GP visits 0-6, nurse/midwife visits 0-12. Follow-up involved different professionals depending on the country (GPs, obstetricians, nurses, midwives, diabetes educators and endocrinologists). Mean costs were 4,624 US$ (SD 2,034), ranging from 2,571 US$ in Belgium to 7,682 US$ in Denmark. The main drivers for costs were delivery, health care professionals' follow-up visits and ultrasound scans. When delivery costs were excluded mean costs dropped to 722 US$ (SD 226), ranging from 340 US$ in the UK to 1052 US$ in Spain. **CONCLUSIONS:** A high heterogeneity in the management of obese women during pregnancy and in the unitary costs reported, are observed among the centers included in the study, associated with a threefold difference in costs across hospitals.

TREATMENT OF TYPE 2 DIABETES WITH SAXAGLIPTIN/METFORMIN EXTENDED-RELEASE (XR): BUDGET IMPACT ANALYSIS IN ARGENTINA

Elgart J[1], Gonzalez L[1], Aiello EC[2], Gagliardino JJ[1]

[1]*CENEXA. Centro de Endocrinología Experimental y Aplicada (UNLP-CONICET La Plata), La Plata, Argentina, Buenos Aires, Argentina,* [2]*Bristol-Myers Squibb, Buenos Aires, Argentina*

OBJECTIVES: To estimate the budget impact of adopting the saxagliptin/metformin XR fixed-dose combination, to treat type 2 diabetes (T2DM) in the Social Security System of Argentina, compared to the current standard treatment. **METHODS:** We used an Excel-based budget impact model assuming coverage for one million people. The time horizon was three years from the perspective of a social security organization in Argentina. T2DM prevalence data was obtained from the national risk factor survey conducted by the Ministry of Health. Only pharmaceutical expenditures of oral antidiabetic agents (OAAs) were analyzed. The cost of OAAs was obtained from the prices list adjusted to co-payments, and expressed in 2012 Argentinean pesos. Asset market-share was taken from the QUALIDIAB Database, market studies and data provided by Bristol Myers Squibb. The analysis reported findings in terms of budget impact, per-member per-month (PMPM) and per-patient per-month (PPPM). Probabilistic Sensitivity Analysis (PSA) was performed using Monte-Carlo simulations (10,000 iterations) and included parameters of demographic characteristics, price and market-shares. **RESULTS:** The net budget impact estimated that the introduction of saxagliptin/metformin XR was $32,930 for the first year, $58,768 for the second year and $85,584 for the third year. The cumulative net budget impact was $177,282. PMPM was $0.0027, $0.0049 and $0.0071 for the first, second and third year, respectively. PPPM was $0.107, $ 0.198 and $0.299 each year, respectively. The cumulative impact in the total annual budget for OAAs represented an increase of 0.27%. Monte Carlo simulation showed that cumulative budget impact varied from 0.08 to 0.30%. **CONCLUSIONS:** The introduction of saxagliptin/metformin XR in a social security organization as a treatment option for patients with T2DM, has a minimal budgetary impact.

BU2

ANÁLISE DE IMPACTO ORÇAMENTÁRIO: QUANTO CUSTARIA AO SISTEMA PÚBLICO DE SAÚDE BRASILEIRO INCREMENTAR, POR MEIO DE TRANSPLANTES, O TRATAMENTO DA DOENÇA RENAL CRÔNICA TERMINAL?

Alvares J, Falleiros DR, Barbosa MM, Almeida AM, Araujo VE, Guerra Junior AA, Cherchiglia ML, Acurcio FDA

Universidade Federal de Minas Gerais, Belo Horizonte, Brazil

INTRODUÇÃO: O transplante renal é apontado na literatura como a terapia de substituição renal mais custo-efetiva, permitindo reintegração do paciente as atividades cotidianas, aumentando expectativa e qualidade de vida. Entretanto, os sistemas públicos de saúde deparam-se com necessidades infinitas, recursos finitos, imperativo da qualidade na assistência e gasto e adequação das novas tecnologias aos recursos disponíveis. **OBJETIVOS:** Conhecer o impacto orçamentário no Sistema Único de Saúde (SUS)- no âmbito das avaliações de tecnologia em saúde - gerado por uma possível ampliação da utilização de transplantes como tratamento de pacientes portadores de insuficiência renal crônica. **MÉTODOS:** Foram utilizadas informações metodológicas para desenvolvimento de estudos de impacto orçamentário voltados ao SUS disponibilizado pela publicação: DIRETRIZES METODOLÓGICAS - Análise de Impacto Orçamentário: Manual para o Sistema de Saúde do Brasil. **RESULTADOS:** Em análise temporal de cinco anos, considerando-se cenários alternativos que ampliam a utilização de transplante frente a hemodiálise(HD) e diálise peritoneal(DP), dos atuais 3% para 10%; 20%; 30%, com crescimento esperado de utilização que variam de 20% a 100% no período.Considerando a população brasileira, com prevalência da doença de 0,047%, incidência de 32% e taxa de mortalidade de 22% para HD+DP e 4,5% para transplante, temos que: no Cenário01 (10%)haverá uma queda de 1,2% na taxa de mortalidade e em cinco anos um incremento de gasto de R$7bilhões; Cenário02(20%) 2,9% e R$6,5bilhões; Cenário03(30%) 4,7% e R$6bilhões. Nesse cenário a queda na taxa de mortalidade representa a manutenção de 4.374 vidas, mediante um incremento de gasto médio anual da ordem de R$1,2bilhões, já considerando a inflação. **CONCLUSÕES:** O transplante, apesar de ter menor custo que HD e DP, por resultar em redução significativa na mortalidade gera impacto orçamentário em cinco anos de R1,2bilhões. Esse é o preço a se pagar por aumento na sobrevida e na qualidade de vida. Então, quanto vale a vida?

BU3

COSTO E IMPACTO PRESUPUESTAL DEL TRATAMIENTO DE LA ARTRITIS REUMATOIDE MODERADA Y SEVERA CONSIDERANDO EL USO DE TERAPIAS BIOLÓGICAS EN MÉXICO

Aguirre A[1], Peniche-Otero G[2], Jiménez I[2], Baeza G[2], Muciño-Ortega E[3], Galindo-Suárez RM[3]

[1]*UCB de Mexico, S.A. de C.V., Mexico, D.F., Mexico,* [2]*Customized Premium Products S.A. de C.V., México D.F., Mexico,* [3]*Pfizer S.A. de C.V., Ciudad de México, Mexico*

OBJECTIVOS: El impacto económico del potencial uso de terapias biológicas (TB) en el tratamiento de la artritis reumatoide moderada y severa (AR-MS) en el Seguro Popular (SP) de México no se ha estimado. Este estudio estuvo enfocado a estimar este impacto. **METODOLOGÍAS:** Con datos de la Community Oriented Program for Control of Rheumatic Diseases (COPCORD) y registros de casos nuevos en la base de datos del Sistema de Información en Salud (Secretaría de Salud), se estimó la prevalencia de AR-MS para el 2012. Se estimó la cantidad de pacientes con AR-MS candidatos a recibir TB. La estimación de los costos de tratamiento de AR-MS se realizó mediante la metodología *bottom-up* y se expresan en US$ de 2013. Un panel de 10 expertos determinó el perfil de uso de recursos: consultas, medicamentos, pruebas de laboratorio y gabinete, rehabilitación y manejo de eventos adversos. Los costos unitarios se extrajeron de fuentes institucionales. Se realizó un análisis de impacto presupuestal en base al Presupuesto de Egresos de la Federación (PEF) para 2012. **RESULTADOS:** Se estimó que en 2012 había 115,827 pacientes con AR-MS con posibilidad de ser tratados con TB en el SP. El costo esperado (anual) de tratamiento con TB fue de US$16,880, mientras que sin TB fue de $10,883 (64.5%). El costo de la TB está determinado por el costo de adquisición del biológico, mientras que el costo de manejo de complicaciones es el rubro más importante en los pacientes sin TB. Si se tratase con TB al 5% (5,791) de los pacientes candidatos, el impacto presupuestal sería del 0.95% del PEF. **CONCLUSIONES:** El tratamiento de AR-MS con terapias no biológicas representa alrededor de dos terceras partes del costo de tratamiento con TB. La introducción progresiva de TB en el SP permitiría controlar el impacto presupuestal acorde a la disponibilidad de recursos.

BU4

BUDGET IMPACT ANALYSIS OF ABIRATERONE ACETATE IN METASTATIC CASTRATION-RESISTANT PROSTATE CANCER PATIENTS PREVIOUSLY TREATED WITH DOCETAXEL FROM THE PERSPECTIVE OF THE BRAZILIAN PRIVATE HEALTH CARE SYSTEM

Vitale V[1], Asano E[2], Pereira ML[1]

[1]*Janssen Cilag Farmaceutica, São Paulo, Brazil,* [2]*Janssen-Cilag Farmaceutica, Sao Paulo, Brazil*

OBJECTIVES: To evaluate the Budget Impact from the perspective of the Brazilian Private Health Care System after the introduction of abiraterone acetate (AA) for the treatment of metastatic castration-resistant prostate cancer (mCRPC) patients previously treated with docetaxel. **METHODS:** An epidemiological model based on reports of Brazilian National Cancer Institute and published literature was developed to estimate the incidence of mCRPC patients in the next three years. Budget impact was simulated comparing current scenario, where all patients undergo treatment with cabazitaxel, and a new scenario with the introduction of AA from the perspectives of the payers (HMOs) and service provider (infusion clinics). Pharmaceutical costs were based on official list price applying reimbursement inflators. Costs with adverse events and drug administration were obtained from published literature. Deterministic sensitivity analysis (DSA) was conducted to determine the impact of parameters on results. **RESULTS:** According to the model, a total of 5,098 patients were eligible for treatment with either cabazitaxel or AA over the three years of analysis. In the base case scenario, from the payers' perspective the introduction of AA decreased total treatment costs of the target population by R$47,516,469. If reinvested on the treatment of mCRPC patients, these economic savings could allow for the treatment of 692 more patients with AA. For the service provider, assuming reimbursement inflator of 10% in cabazitaxel factory price, better financial results per patient are achieved in a scenario where reimbursement inflator of AA is set at 15% of factory price. In DSA, economic savings from the payers perspective ranged from R$12,454,979 (assuming mean duration of treatment with AA of 10 months) and R$118,637,890 (assuming 100% of market share for AA). **CONCLUSIONS:** The introduction of AA may generate economic savings for both HMOs and infusion clinics, possibly allowing treatment of more patients with mCRPC previously treated with docetaxel.

CARDIOVASCULAR DISEASE OUTCOMES RESEARCH

CV1

UTILIDAD DE BIOMARCADORES CARDIACOS (POINT OF CARE TESTING) EN EL AREA DE URGENCIAS Y SU IMPACTO ECONÓMICO

Contreras I[1], Lopez-Perez A[2], Mendez GF[3], Mejia-Arangure E[4]

[1]Instituto Mexicano del Seguro Social, México City, Mexico, [2]Instituto Mexicano del Seguro Social, Los Reyes La Paz, Mexico, [3]Instituto Mexicano del Seguro Social, Jalapa, Mexico, [4]HOS Health Outcomes Solutions S.A de C.V., Mexico, Mexico

OBJECTIVOS: El síndrome coronario agudo (SCA) representa alta carga de la enfermedad para México. Los biomarcadores cardiacos Point of Care Testing (POCT) mejoran la oportunidad diagnóstica, permiten acelerar el tratamiento y reducen la mortalidad. El propósito del estudio fue evaluar, desde la perspectiva del proveedor de servicios de salud, su impacto clínico y económico en los servicios de urgencias en México. **METODOLOGÍAS:** Estudio comparativo, en situaciones habituales, del servicio de urgencias del Hospital General de Zona No. 1-A del Instituto Mexicano del Seguro Social (IMSS) en México, D.F. Los grupos de comparación fueron: sin disponibilidad de biomarcadores POCT, que incluyó pacientes adultos, sin distinción de género, que acudieron al hospital por dolor torácico agudo (DTA) entre marzo y abril de 2012; y con disponibilidad de biomarcadores POCT, que incluyó pacientes que acudieron entre junio y septiembre de 2012. Se realizó seguimiento durante la estancia en urgencias. El resultado de interés fue la identificación de pacientes con SCA. Los costos se calcularon con los recursos utilizados durante la estancia en urgencias; se expresaron de dólares norteamericanos (tasa de cambio 12.65 pesos/dólar). **RESULTADOS:** Se incluyeron 336 pacientes, edad promedio 55±18 años, 52% hombres. El grupo sin POCT incluyó 148 pacientes y con POCT 188. Con POCT se identificaron 50 pacientes con SCA (0.27, IC95% 0.20–0.33) vs 21 sin POCT (0.14, IC95% 0.08–0.19), p=0.006. El costo promedio de la atención en urgencias con POCT fue US$178 (IC95% US$161-US$ 340) y sin POCT fue de US$168 (IC95% US$152-US$320), p=0.93. El costo-efectividad promedio para identificar un paciente con SCA sin POCT fue US$1,206 y con POCT fue US$661. **CONCLUSIONES:** La disponibilidad de biomarcadores POCT en urgencias es costo-efectivo, ya que mejora la probabilidad de identificar SCA en pacientes con DTA y no existe diferencia en el costo de su implementación para el IMSS.

CV2

ESTIMATION OF THE COST-EFFECTIVENESS OF APIXABAN IN NON-VALVULAR ATRIAL FIBRILLATION IN ARGENTINA

Giorgi MA[1], Caroli C[2], Micone P[3], Giglio ND[4], Aiello EC[5], Donato BMK[6], Mould JF[7], Radero G[8], Casas M[9]

[1]CEMIC, Buenos Aires, Argentina, [2]FLENI, Buenos Aires, Argentina, [3]universidad austral, Buenos Aires, Argentina, [4]hospital de niños ricardo gutierrez, Buenos Aires, Argentina, [5]Bristol-Myers Squibb, Buenos Aires, Argentina, [6]Bristol-Myers Squibb Company, Wallingford, CT, USA, [7]Pfizer, New York, NY, USA, [8]Pfizer, Buenos Aires, Argentina, [9]Pfizer, buenos aires, Argentina

OBJECTIVES: Atrial Fibrillation (AF) affects about 2% of the population and increases 5-fold the risk of stroke and systemic embolism. This risk is managed with vitamin K antagonists (VKA) or aspirin for patients according to their suitability to receive oral anticoagulants (OA) but with several limitations. Therefore, novel OAs have become a treatment option. Apixaban is the most recent drug approved for thrombotic prevention in AF. Our aim is to estimate the cost-effectiveness (CE) of apixaban in AF in Argentina. **METHODS:** We conducted a literature review of published epidemiological AF, and stroke data from Argentina. Data about apixaban, warfarin, rivaroxaban, dabigatran and aspirin were obtained from published trials and indirect comparisons. Two Delphi Panels, with local experts representing private, public and social security health subsectors were held and reviewed and validated data collected and provided information on local treatment patterns. Costs, expressed in 2012U$S, were gathered from published reports and a local database. Apixaban was compared with each available AF treatment option allocating them into a simulated cohort of 1,000 patients per treatment group (according with their suitability for OA) over a lifetime horizon using an MS EXCEL based Markov model. We adopted payer's perspective reporting weighted mean costs for QALY gained. CE threshold for Argentina was considered as per WHO-CHOICE and World Bank data (ranging from 9740 to 29220U$S). **RESULTS:** For the suitable population, the cost per QALY gained with apixaban was U$S 9938 and 1131 versus warfarin and dabigatran 150 mg respectively, and dominant compared to dabigatran 110 mg and rivaroxaban. For the unsuitable population, apixaban was dominant compared to available alternatives: aspirin, dabigatran 110 mg, dabigatran 150 mg, and rivaroxaban. **CONCLUSIONS:** on the model using local inputs, apixaban is dominant or cost-effective according to local CE thresholds becoming the treatment choice in Argentina both in the suitable and unsuitable populations

CV3

PULSE PRESSURE AND STROKE RISK: DEVELOPMENT AND VALIDATION OF A STROKE RISK EQUATION

Ayyagari R[1], Vekeman F[2], Lefebvre P[2], Ong SH[3], Faust E[1], Trahey A[1], Machnicki G[4], Duh MS[1]

[1]Analysis Group, Inc., Boston, MA, USA, [2]Groupe d'analyse, Ltée, Montréal, QC, Canada, [3]Novartis Pharma AG, Basel, Switzerland, [4]Novartis Latin America & Canada, Buenos Aires, Argentina

OBJECTIVES: Previous stroke risk equations identified systolic blood pressure (SBP) as a key predictive factor. Recent evidence suggests that pulse pressure (PP), defined as the difference between SBP and diastolic blood pressure, could be a new risk factor. This project aims at developing and validating a new stroke risk equation incorporating PP as a potential risk factor. **METHODS:** Electronic medical records including laboratory data of a random sample of 97,237 hypertensive patients from a US integrated health delivery system were analyzed (01/2004-05/2012). Patients with ≥1 peripheral PP (PPP) reading and ≥6 months of observation (baseline period) prior to the first evidence of hypertension were randomly split into the development (two-thirds of sample) and validation (one-third of sample) datasets. Stroke events were identified using ICD-9-CM 433.xx-436.xx. Cox proportional hazards models assessed time to first stroke event based on baseline risk factors, including PPP, age, gender, SBP, smoking status, BMI, diabetes, and cardiac comorbidities. The optimal risk equation was selected using the least absolute shrinkage and selection operator (LASSO); performance was evaluated by the c-statistic. **RESULTS:** A total of 30,525 patients without stroke (mean age 58.2, 48% male) and 4,272 patients with stroke (mean age 67.3, 48% male) were selected. Average observation was 3.89 years. PPP was higher among patients who developed stroke (mean [SD] PPP, stroke: 62.0 [15.3] mmHg; non-stroke: 58.1 [14.0] mmHg, p<.001). The best performing risk equation (c-statistic, development: 0.732; validation: 0.722) included PPP (hazard ratio per 10 mmHg increase: 1.0676, p<.001) as a significant risk factor for stroke in addition to age and diabetes, among others. **CONCLUSIONS:** This stroke risk equation shows that greater PP is a significant predictive factor for increased stroke risk, even in the presence of known risk factors, including SBP. PP should be considered by practitioners along with traditional risk factors in treatment strategies to prevent stroke.

CV4

ANÁLISIS DE COSTO-EFECTIVIDAD DEL USO DE ESTATINAS EN LA PREVENCIÓN DE EVENTOS CARDIOVASCULARES EN COLOMBIA

Mould J[1], Ordoñez J[2], Gutierrez-Ardila MV[3], Vargas Zea N[3]

[1]Pfizer, New York, NY, USA, [2]Universidad CES, Medellin, Colombia, [3]Pfizer S.A.S., Bogotá, Colombia

OBJECTIVOS: Las enfermedades cardiovasculares (ECV) son una de las principales causas de muerte precoz en los países occidentales, los fármacos hipolipemiantes están indicados para disminuir el riesgo cardiovascular V. El objetivo de este análisis es evaluar la costo-efectividad del uso de estatinas en prevención primaria de ECV en Colombia. **METODOLOGÍAS:** Se utilizó un modelo compuesto por un árbol de decisión y un Markov. El horizonte de tiempo fue la expectativa de vida. Los comparadores fueron: atorvastatina (20mg/día) vs. rosuvastatina (20 mg/día). Se simuló una cohorte de 100 pacientes de 62 años con valor inicial de colesterol LDL de 137.28mg/dL y riesgo anual basal de ECV ≤3.5%. Se utilizó una tasa de descuento de 3%. Los datos de utilidad, eficacia y mortalidad por los eventos fueron tomados de la literatura, ajustados por información local. La medida de efectividad empleada fueron los años de vida ganados (AVG), los años de vida ajustados por calidad (AVACs) y los casos de ECV evitados. Los precios de los medicamentos fueron tomados del SISMED y los costos de una EPS de presencia nacional. Se utilizó como umbral de disposición a pagar, el equivalente a 3 PIB per cápita ≈ US$40,000. **RESULTADOS:** En el horizonte de la expectativa de vida, el ahorro total esperado por persona con atorvastatina fue de US$6374 en comparación con rosuvastatina (costos totales: US$8,802 y US$15,176, respectivamente); rosuvastatina obtuvo 0.0108 AVACs, 0.0127 AVG y 0.0023 casos evitados más que atorvastatina por persona; el ICER de rosuvastatina fue de US$507,266/AVAC, US$426,320/AVG y US$2,624,876/casos evitados de ECV. **CONCLUSIONES:** Atorvastatina sería la alternativa de elección en la prevención de ECV. El diferencial de AVG, AVACs y casos de ECV de rosuvastatina es muy bajo para su costo incremental y su ICER se encuentra por encima del umbral definido, por lo que no es una opción costo-efectiva.

HEALTH CARE EXPENDITURE STUDIES

ADDRESSING CHILDHOOD-OBESITY IN MEXICO: SAVINGS ON HEALTH CARE EXPENDITURES FROM REGULATING FOOD AND BEVERAGE SALES IN BASIC EDUCATION SCHOOLS

Guajardo V[1], Gutierrez C[1], Rivera G[2]

[1]Instituto Mexicano del Seguro Social, Mexico, Mexico, [2]Secretaría de Salud, Mexico, Mexico

OBJECTIVES: Estimate potential direct savings for the Mexican Healthcare System generated by the operation of the "Technical Guidelines for the Sale or Distribution of Food and Beverages in Establishments of Basic Education". **METHODS:** The microsimulation model "Chronic Disease Prevention (CDP)" developed by OECD-WHO was used for projecting health gains and costs of treatment in a period of 100 years. The model was adjusted to accommodate the range 6-14 years old stated in the Guidelines. Mexican data on incidence, prevalence, mortality, population at risk, annual unit costs and relative risk of selected chronic diseases (diabetes mellitus type 2, hypertension, cardiovascular, hypercholesterolemia) attributable to obesity and the treatment of obesity as disease itself was used. Sensitivity analyses were developed for most variables used in the model. **RESULTS:** Under a base case scenario present value of potential savings in total spending on medical care associated with the implementation of the Guidelines amount to USD$1052.2 million in 2008. Most savings are derived from averted cases of hypertension (32.7%), obesity-overweight (28.6%) and diabetes mellitus type II (17.8%). Results are robust to changes in all parameters analyzed. Amounts obtained are an underestimation of potential savings as neither expensive complications as renal failure nor other chronic diseases attributable to obesity as arthritis, colorectal or breast cancer were included. **CONCLUSIONS:** The Guidelines, —developed by the Ministry of Public Education in coordination with the Ministry of Health—, represent a good example of cooperation among different sectors to solve a complex public health problem. Results shows the importance of implementing preventive interventions aimed at reducing the prevalence of chronic diseases related to poor eating habits, inadequate physical activity and obesity in Mexico. Implementation of the Guidelines involves significant direct savings that can be assigned to other health needs of the Mexican population.

HC2

EFFECT OF HEALTH SPENDING, INCOME INEQUALITY AND MARGINATION INDEX ON THE EFFICIENCY OF THE HEALTH SYSTEM IN MEXICO

Pinzon Florez CE[1], Reveiz L[2], Idrovo AJ[3], Reyes H[4], Diaz de Leon C[4]

[1]Instituto Nacional de Salud Pública, Cuernavaca, Mexico, [2]Organización Panamericana de la Salud, Washington, Mexico, [3]Fundacion Cardiovascular de Colombia, Bucaramanga, Colombia, [4]Instituto Nacional de Salud Publica, Cuernavaca, Mexico

OBJECTIVES: To explore the effect of health spending, income inequality and margination on maternal and child health care in México. **METHODS:** With the 32 Mexican states an ecological multi spatial study was performed. Correlations between maternal and infant mortalities in the total per capita spending (central and state governments from 2000 to 2010), Gini and margination indexes were computed. Conventional and robust multiple linear regressions were used to explore the effects on the technical efficiency of these indicators in the State's health systems. **RESULTS:** Negative correlations with Spearman rho -0.62 and -0.28 near to the margination and Gini indexes respectively (p <0.05), and higher than 0.59 for the margination index (p <0.05) between life expectancy at birth for the first and the last infant mortality. The multiple linear regression models established the relationship between the deprivation and Gini indexes in health indicators. It showed the positive effect of funding from central gov-

ernment in better health system performance, as well as the positive effect of increased public investment in health over the decade in health indicators and process insurance in the last 5 years. **CONCLUSIONS:** The results suggest a positive effect of central government spending on health and a negative effect of income inequality and margination index on maternal and infant mortalities, clearly mediated by socioeconomic factors characteristic of each state. This methodological approach is proposed to evaluate the relationships of the different levels of functioning of a health system and the dynamics with the social determinants of these levels.

HC3

PAYER AND PHYSICIANS EVIDENCE AND DISCOUNT EXPECTATIONS FOR BIOSIMILARS IN SIX LATIN AMERICAN COUNTRIES

Sandorff E[1], Severi Bruni D[2], Halbert R[3]
[1]*ICON, Blue Bell, PA, USA,* [2]*ICON, El Segundo, CA, USA,* [3]*ICON, PriceSpective LLC, El Segundo, CA, USA*

OBJECTIVES: As follow-up to prior work, investigate what evidence is required for reimbursement and prescribing of biosimilar drugs from four key therapy areas in six Latin American countries (Argentina, Brazil, Chile, Colombia, Mexico and Venezuela). Explore how these requirements may correspond to the regulatory pathways across the different countries. **METHODS:** Conduct secondary research to determine any recent changes to biosimilar regulation in the six studied countries. Conduct targeted primary research with payers and physicians in the six counties exploring: 1) The therapy areas that payers and physicians consider most attractive for biosimilars; 2) The baseline evidence (bioequivalence, comparative trial data, extrapolation of indications, etc.) that stakeholders require across the key therapy areas and across countries; 3) The level of discount, below the branded equivalent, that payers and physicians would require to consider biosimilars for access or to prescribe to their patients; 4) The expected access level and prescribing decisions for those biosimilars that meet these evidence and discount criteria; and 5) The degree to which payer and physician evidence expectations for biosimilars map to our understanding of the evolution of biosimilar regulatory environment. **RESULTS:** Public payers across the region see biosimilars as an opportunity to provide broader access to needed medications, although some stakeholders are more receptive than others and have lower requirements to prove comparability. Clinicians in general have concerns about safety and efficacy, however, their willingness to prescribe biosimilars correlates inversely with the degree of access and affordability of the branded agents. **CONCLUSIONS:** The regulatory and access environment for biosimilars in Latin America can be expected to be more favorable than in the US but not too dissimilar from Europe. However there are systematic differences across countries and therapy areas.

HC4

ANÁLISIS DE COSTO-EFECTIVIDAD DE LAS VACUNAS NEUMOCÓCICAS 13-VALENTE Y 23-VALENTE PARA ADULTOS DE ALTO RIESGO EN COLOMBIA

Ordoñez Molina JE[1], Gutierrez-Ardila MV[2], Vargas Zea N[2]
[1]*CES University, Medellin, Colombia,* [2]*Pfizer S.A.S., Bogotá, Colombia*

OBJECTIVOS: El *Streptococcus pneumoniae* causa una importante morbilidad y mortalidad a nivel mundial, tanto en niños como en adultos. El objetivo de este análisis es estimar la costo-efectividad de la vacuna conjugada 13-valente (PCV13) vs la vacuna neumocócica polisacárida 23-valente (PPSV23) y vs no vacunación en los adultos de alto riesgo (inmunocomprometidos) >50 años en Colombia, desde la perspectiva del tercero pagador. **METODOLOGÍAS:** Se adaptó un modelo de Markov con horizonte de tiempo de la expectativa de vida y tasa de descuento 3% anual. Los comparadores fueron PCV13, PPSV23 y no vacunación (NV), cobertura estimada del 70%; revacunación a los 5 años con PPSV23 para >65 años según criterios del CDC. Se utilizó la población >50 años de alto riesgo en Colombia. Las probabilidades de transición, incidencia de enfermedades y efectividades de las vacunas fueron extraídas de la literatura (para PCV13 se utilizaron datos de PCV7 ajustados por inmunosenescencia), los costos médicos fueron proveídos por una EPS de cobertura nacional; los precios de las vacunas fueron tomados de la OPS para 2013. Los costos se presentan en US$ 2013. Las medidas de efectividad fueron número de casos evitados de enfermedad neumocócica invasiva – ENI (meningitis y bacteremia), neumonía invasiva, muertes y años de vida ganados (AVG). **RESULTADOS:** Vacunar con PCV13 vs NV y PPSV23 previene 4.389 y 4.134 casos de ENI; 2594 casos de neumonía invasiva y 550 y 536 muertes respectivamente. PCV13 genera 199 AVG más que PPSV23 y 4.712 AVG más que NV. El ahorro total esperado (vacunación + costos médicos) con PCV13 fue US$18,254,171 vs NV y US$26,204,251 vs PPSV23. **CONCLUSIONES:** Vacunar adultos inmunocomprometidos >50 años con PCV13 en Colombia es una alternativa costo-ahorradora en comparación con NV y con PPSV23 (US$12.57 y US$18.08 ahorrados por paciente respectivamente). Los hallazgos de este estudio soportan una toma de decisión a favor de PCV13.

HEALTH TECHNOLOGY ASSESSMENT STUDIES

EFFICACY AND SAFETY OF NEW ANTICOAGULANTS IN THE TREATMENT OF ATRIAL FIBRILLATION: A HEALTH TECHNOLOGY ASSESSMENT

Buehler AM, Suzumura EA, Figueiró MF, Cavalcanti AB, Berwanger O
Hospital do Coração, São Paulo, Brazil

Atrial fibrillation (AF) is the most common sustained cardiac arrhythmia. Patients with AF have a 4-5 times larger risk of stroke than age-matched controls. Anticoagulation with warfarin is currently the standard of care but the requirement for routine monitoring and drug and food interactions, makes its use is suboptimal. New anticoagulants were developed to eliminate these barriers and the results are promising. However, the incorporation of these technologies within the Brazilian Unified Health System (SUS) demands proper consideration. **OBJECTIVES:** To evaluate the efficacy and safety of new anticoagulants in the treatment of AF. **METHODS:** Health Technology Assessment of multiple technologies. We searched the electronic databases Cochrane Library, CRD, Pubmed, Embase and Lilacs, to search for the best available evidence assessing the new oral anticoagulants, compared with warfarin in patients with AF. **RESULTS:** Three randomized controlled trials evaluating dabigatran (110mg e 150mg), rivaroxaban 20mg and apixaban 5mg were included, all of them compared with warfarin. In this regard, dabigatran 110mg was associated with similar rates of stroke or systemic embolism and with a 20% relative risk reduction (RRR) of major hemorrhage compared with warfarin. Dabigatran 150mg was associated with a 34% RRR of stroke or systemic embolism and similar rates of major hemorrhage. Rivaroxaban 20mg was associated with similar rates of the primary efficacy and safety outcomes. Finally, apixaban was associated with a 21% RRR of stroke or systemic embolism and with 31% RRR of major bleeding compared with warfarin. **CONCLUSIONS:** There is strong evidence supporting these new technologies, especially regarding safety. Further studies are needed to support decision making, especially with regards to cost-effectiveness issues.

HT2

HEALTH TECHNOLOGY ASSESSMENT REPORT FOR POSITRON EMISSION TOMOGRAPHY IN PATIENTS WITH CANCER

Alcaraz A[1], Meza V[2], Glujovsky D[3], Romano M[2], Morelli D[2], Comandé D[3], Garcia Marti S[2], Pichon Riviere A[4], Augustovski F[5]
[1]*Institute for Clinical Effectiveness and Health Policy (IECS), Buenos Aires, Argentina,* [2]*Institute for Clinical Effectiveness and Health Policy, Buenos Aires, Argentina,* [3]*Institute for Clinical Effectiveness and Health Policy (IECS), Buenos Aires, Buenos Aires, Argentina,* [4]*IECS - Institute for Clinical Effectiveness and Health Policy, Buenos Aires, Argentina,* [5]*IECS - Instituto de Efectividad Clinica y Sanitaria, Buenos Aires, Argentina*

OBJECTIVES: Positron Emission Tomography (PET) might be useful for cancer staging and follow-up. The objetive was to assess the available evidence on efficacy, safety and coverage policies for use of PET in oncology. **METHODS:** A bibliographic search was carried in PubMed, DARE, NHS EED, in health technology assessment (HTA) agencies and health insurers. Priority was given to systematic reviews; randomized clinical trials (RCTs); HTA; clinical practice guidelines (CPGs) and coverage policies (CPs). **RESULTS:** Thirty-seven systematic reviews, 3 RCTs and 32 observational studies, 51 CPGs, 15 HTAs and 28 CPs were included. Breast Cancer (17 studies):There is no evidence of its use as routine practice. Some CPGs and CPs recommend it for suspicious images that could not be clarified through conventional studies. PET is not recommended for axillary staging or neodadyuvant response prediction. Lung Cancer (44 studies):The accuracy for lung nodule is similar to conventional methods. Most CPGs do not recommend the use of PET for lung cancer staging except in some non-small cell lung cancer with previous negative tests for metastasis. Colorectal Cancer (20 studies): There is no evidence of its use as routine practice. It might be used in patients with suspected recurrence and non-conclusive images. Genitourinary Tumors (70 studies): PET might be associated with changes in diagnosis or therapeutic only in specific cases, such as ovarian cancer with suspected recurrence and normal conventional images, in residual tumors due to seminoma and cervical cancer recurrence eligible for curative treatment. Primary Tumors of the Central Nervous System (15 studies):PET is not recommended as routine practice. CPGs, RCTs and CPs recognize its usefulness for differential diagnosis between relapse and radionecrosis. **CONCLUSIONS:** There is no evidence to support the use of PET in cancer patients as routine practice. At present, its use should be restricted to specific patients.

HT3

FORMULATIONS OF AMPHOTERICIN B FOR THE TREATMENT OF FUNGAL INFECTIONS IN PATIENTS WITH HIV/AIDS

Costa JO, Lemos LLP, Gomes RM, Guerra Junior AA, Acurcio FA
Universidade Federal de Minas Gerais, Belo Horizonte, Brazil

OBJECTIVES: To evaluate the efficacy, safety and cost-effectiveness data of lipid formulations of amphotericin B to establish which should be used for the treatment of systemic fungal infections in patients with HIV/AIDS in Brazil. **METHODS:** We searched The Cochrane Library, Centre for Reviews and Dissemination, Tripdatabase, Medline and LILACS databases aiming to find systematic reviews (SRs) and economic evaluations (EE) comparing liposomal amphotericin B (L-AmB) or amphotericin B lipid complex (ABLC). Health Technology Assessments (HTA) were searched on agencies websites. Quality of the evidence and strength of recommendation were evaluated using the GRADE system. **RESULTS:** We selected five SRs, in which one evaluated only safety data, and two economic evaluations. Four SRs were classified as poor quality and the strength of recommendation was considered weak in favor of L-AmB in all studies. In general there were no statistically significant differences in terms of survival and response to treatment ($p<0,05$). However, L-AmB was associated with a lower risk of nephrotoxicity and increased serum creatinine. The two economic studies included had conflicting results. In the cost-minimization study there was no difference in total costs of the therapies, but the daily cost of acquisition and concomitant antifungal therapy and adverse events were lower for ABLC (0,002 and 0,027). The incremental cost-effectiveness analysis favored the L-AmB (€41734 *vs.* €51724). Both studies showed important limitations and there were no studies considering the Brazilian context. **CONCLUSIONS:** Considering all the studies found, as well as their limitations, there is a lack of evidence to support the spread use of L-amB in patients with HIV/AIDS affected by fungal infections, unless strictly in cases where patients have abnormal renal function. Also, L-AmB could be used in case of intolerance to conventional amphotericin B.

HT4

EFICÁCIA E SEGURANÇA DE RANIBIZUMABE E BEVACIZUMABE NO TRATAMENTO DE DEGENERAÇÃO MACULAR RELACIONADA A IDADE

Saturnino LTM[1], Silveira MR[2], Guerra Junior AA[3], Acurcio FDA[3]
[1]*Instituto Nacional de Cardiologia, Rio de Janeiro, Brazil,* [2]*Faculdade de Farmácia daUniversidade Federal de Minas Gerais, Belo Horizonte, Brazil,* [3]*Universidade Federal de Minas Gerais, Belo Horizonte, Brazil*

OBJETIVOS: Avaliar e comparar a eficácia e a segurança do ranibizumabe e do bevacizumabe para o tratamento da Degeneração Macular Relacionada a Idade (DMRI). **MÉTODOS:** Realizou-se uma revisão sistemática / *overview* utilizando as bases *The Cochrane Library, Centre for Reviews and Dissemination, Medline* e LILACS com o objetivo de encontrar estudos que comparassem ranibizumabe ou bevacizumabe com qualquer outra opção terapêutica para o tratamento da DMRI. Os estudos de avaliações econômicas foram buscados em sites da Rede Brasileira de Avaliação de Tecnologias e Saúde (REBRATS), no *National Institute for Clinical Excellence and Health, Health Technology Assessment Programme* e*Canadian Agency for Drugs and Technologies in Health*. **RESULTADOS:** Foram identificados 643 títulos e destes, 14 foram incluídos sendo 5 revisões sistemáticas e 9 avaliações econômicas. A síntese dos resultados das revisões sistemáticas mostrou que ambos os medicamentos são eficazes, isso é, evitam a perda progressiva da visão e/ou aumentam a acuidade visual sobretudo quando comparados aos demais tratamentos disponíveis para a DMRI. Não foram encontrados estudos que comparassem diretamente a eficácia do ranibizumabe versus o bevacizumabe o que comprometeu uma possível avaliação da superioridade clínica entre eles. Por outro lado, as avaliações econômicas apontaram que a vantagem de um medicamento em relação ao outro está na diferença dos custos. O ranibizumabe em todos os cenários estudados foi mais caro e para torná-lo custo-efetivo é necessário que seu preço diminua. Já o bevacizumabe, possui eficácia equivalente e um custo inferior que provavelmente está relacionado a sua forma de administração - uma ampola para mais de um paciente - o que tem ocasionado uma discussão quanto à sua utilização *off label* no Brasil. **CONCLUSÕES:** Recomenda-se a utilização do ranibizumabe ou do bevacizumabe para a forma úmida da DMRI em pacientes maiores de 50 anos de idade.

ASSESSMENT OF BURDEN OF ILLNESS DUE TO HERPES ZOSTER IN ARGENTINA: A PROSPECTIVE OBSERVATIONAL STUDY

Vujacich C[1], de Wouters L[2], Margari A[3], Gordóvil M[2], Kawai K[4], Lemos E[5], Rampakakis E[6], Pollock C[7], White R[8], Acosta CJ[8], Sampalis JS[6]

[1]*Fundación Centro de Estudios Infectológicos (FUNCEI), Buenos Aires, Argentina,* [2]*Hospital Privado de la Comunidad, Mar del Plata, Argentina,* [3]*Hospital Naval, Buenos Aires, Argentina,* [4]*Merck & Co., Inc, West Point, PA, USA,* [5]*MSD Colombia, Bogota, Colombia,* [6]*McGill University & JSS Medical Research, St. Laurent, QC, Canada,* [7]*JSS Medical Research, St. Laurent, QC, Canada,* [8]*Merck & Co., West Point, PA, USA*

OBJECTIVES: Herpes zoster (HZ) is caused by the re-activation of latent varicella-zoster virus (VZV) and is characterized by unilateral, vesicular cutaneous eruptions, acute neuritis and post-herpetic neuralgia (PHN). To date, data on HZ associated pain (ZAP) and its impact on quality of life (QoL) in Argentina are scarce. This study assesses the burden of illness associated with HZ in Argentina in a real-life clinical setting. **METHODS:** This was a prospective, observational, single-cohort study. Patients were enrolled at various time points during the course of a zoster episode and were followed for ≤6 months. ZAP was assessed with the Initial Zoster Impact Questionnaire and the Zoster Brief Pain Inventory, while QoL was assessed with the EQ-5D instrument using the Hispanic preference weights. **RESULTS:** A total of 96 HZ patients were enrolled with a mean (SD) age of 70.14 (10.7) years and 64 (66.7%) being females. At baseline, mean (SD) time since rash onset was 15.92 (16.9) days. Prior to rash onset (prodrome phase), a significant proportion (59.4%) of patients experienced a worst pain score of ≥5. ZAP was reported by 92 (95.8%) patients at baseline. Mean (SD) worst pain score decreased from 5.47 (3.1) at baseline to 2.94 (3.0) at 30 days and 0.21 (0.7) at 180 days. PHN (worst pain ≥3 after ≥90 days since rash onset) was experienced by 11 (11.5%) patients. The mean (SD) EQ-5D score significantly decreased (P<0.001) from 0.84 (0.10) before rash onset to 0.63 (0.20) after rash onset, increasing thereafter, showing significant (P<0.05) QoL deterioration up to 60 days of follow-up. **CONCLUSIONS:** HZ pain can significantly reduce QoL and ability to perform daily activities of people living in Argentina highlighting the importance of early intervention or prevention. These findings are consistent with observational studies in other countries.

COSTO-EFECTIVIDAD DEL USO DE PRUEBAS TREPONÉMICAS RÁPIDAS PARA LA DETECCIÓN Y TRATAMIENTO TEMPRANO DE SÍFILIS GESTACIONAL EN COLOMBIA

Castañeda Guerrero C[1], Eslava J[1], Ruiz A[1], Diaz J[1], Prieto V[1], Lemos EV[2]

[1]*National University of Colombia, Bogota, Colombia,* [2]*Fundacion para el Desarrollo y Apoyo en Salud Internacional (FUDASAI), Bogotá, Colombia*

OBJECTIVOS: Evaluar la costo-efectividad del uso de pruebas treponémicas rápidas inmunocromatográficas (PTRI) para el tamizaje de Sífilis gestacional en Colombia. **METODOLOGÍAS:** Se desarrolló un árbol de decisiones en una cohorte hipotética de pacientes gestantes, las alternativas consideradas fueron: manejo convencional usando prueba no treponémica (VDRL) seguida de treponémica (FTA-ABS) frente a una propuesta usando PTRI, Inicio de tratamiento a gestantes positivas y prueba confirmatoria con VDRL. Se consideraron varios escenarios: Gestantes tamizadas antes de las 24 semanas y a contactos (GT1); Gestantes tamizadas antes de las 24 semanas sin contactos (GT2); Gestantes tamizadas antes de las 34 semanas con y sin contactos respectivamente (GT3), (GT4). La perspectiva fue la del tercer pagador y el horizonte temporal 10 meses. Se incluyeron los costos de los medicamentos, la estancia hospitalaria, los eventos adversos secundarios al uso de los medicamentos, las valoraciones médicas y paraclínicos en su seguimiento. Se realizó análisis de sensibilidad determinístico de las variables con mayor incertidumbre. El modelo fue desarrollado por un equipo de profesionales de la salud Epidemiólogos, Ginecólogos, con asesoría de especialistas en Economía de la Salud en el año 2012. **RESULTADOS:** La estrategia propuesta PRTI-VDRL presenta una dominancia absoluta sobre el manejo convencional VDRL-FTABS con una disminución de costos de US 210 y un aumento de efectividad del 0.18 (18% más de casos evitados de sífilis congénita) en el escenario GT1. Esta dominancia absoluta se observó también en los otros escenarios estudiados (GT2, GT3, GT4). El resultado de dominancia se mantuvo al realizar el análisis de sensibilidad en los escenarios incluidos, demostrando robustez de los resultados del modelo planteado. **CONCLUSIONES:** El uso de las PTRI como prueba inicial de tamizaje para detectar y tratar gestantes con sífilis es costo-efectivo en Colombia, evitando casos de sífilis congénita y sus consecuencias.

IN3
ANÁLISIS COSTO-EFECTIVIDAD DE INTERVENCIONES PARA EL MANEJO DEL TRASTORNO DEPRESIVO MAYOR (TDM) EN PACIENTES CON VIRUS DE LA INMUNODEFICIENCIA HUMANA (VIH+) QUE INICIAN TRATAMIENTO ANTIRRETROVIRAL DE GRAN ACTIVIDAD (TARGA)

Lemus F

National Institute of Public Health, Naucalpan, Estado de Mexico, Mexico

INTRODUCCIÓN: El Trastorno Depresivo Mayor (TDM) es la comorbilidad psiquiátrica de mayor prevalencia en personas con VIH y ocasiona menor adherencia al TARGA, lo que a su vez repercute en una mayor progresión de la enfermedad e incrementa los costos de atención para el sistema. **OBJECTIVOS:** Realizar un estudio de costo-efectividad de intervenciones para el manejo TDM en una cohorte hipotética de pacientes mexicanos con VIH bajo TARGA, desde el punto de vista del Sistema de Salud público en México. **METODOLOGÍAS:** Estudio de costo-efectividad mediante un modelo Markov, ciclosmensuales, para estimar la esperanza de vida por alternativa evaluada, la ocurrencia de sucesos y costos asociados, en pacientes que se encuentran por iniciar TARGA. El modelo está compuesto por los siguientes estados de salud: padecer VIH, estar bajo TARGA y presentar TDM; padecer VIH, estar bajo TARGA y no presentar TDM; muerte. Los comparadores incluidos son el uso de antidepresivos, la Terapia Cognitivo Conductual (TCC), combinación de ambas, ninguna intervención. Las probabilidades para la matriz de transición se obtuvieron de la literatura; y los costos médicos directos institucionales que se midieron son: antidepresivos, consultas especialistas, tratamiento de VIH/SIDA. Se corroboró la información con opinión de expertos. El horizonte temporal evaluado es la sobrevida del paciente. La tasa de descuento es 5%. Se realizó un análisis de costo efectividad incremental y un análisis de sensibilidad. **RESULTADOS:** La TCC fue la intervención más costo-efectiva. Las 3 alternativas resultan en un costo por año de vida ganado menor a un PIB per cápita y presentan una ganancia en salud similar (2.77 años). Costos: TCC ($ 22,622.412); antidepresivos ($24,659.7538) y para la combinación de tratamientos ($24,790.722). El análisis de sensibilidad demostró la robustez del modelo. **CONCLUSIONES:** El proporcionar tratamiento contra el TDM en pacientes con VIH bajo TARGA ofrece una ganancia en salud y resulta costo-efectivo para el sistema.

IN4
COSTO-EFECTIVIDAD DE TRES ESTRATEGIAS DIAGNOSTICAS PARA LA IDENTIFICACIÓN DE INFECCIÓN BACTERIANA SEVERA EN LACTANTES FEBRILES SIN FOCO

Buendia JA[1], Urman G[2], Urman E[2], Grosman A[2]

[1]*Universidad de Antioquia, Medellin, Colombia,* [2]*Universidad Maimonides, Buenos Aires, Argentina*

OBJECTIVOS: Aun sigue siendo controversial el manejo del lactante febril (LFSF) sin foco entre uno a tres meses. La introducción de la vacunación contra neumococo ha reducido las tasas de bacteriemia oculta y alterado la utilidad de los tests disponibles para detección de infección bacteriana severa (IBS) en LFSF. El objetivo de este estudio fue determinar la costo-efectividad de tres pruebas para la detección de IBS en LFSF. **METODOLOGÍAS:** Se diseñó un modelo de costo-efectividad utilizando la técnica de análisis de decisiones, bajo la perspectiva del financiador (Obra Social) e incorporando los costos directos del tratamiento, hospitalización y diagnóstico; para comparar la razón de costo efectividad incremental entre la procalcitonina, proteína C reactiva y la escala de Rochester en una cohorte hipotética de 10.000 niños entre 1 a 3 meses con diagnóstico de LFSF. **RESULTADOS:** La proteína C reactiva resulta en un costo de AR$5341 por caso correctamente diagnosticado, frente a AR$5376. El costo por cada caso correctamente diagnosticado con la procalcitonina frente a la proteína C reactiva fue de AR$6127. La proteína C reactiva permanece siendo la estrategia más costo efectiva independiente de los valores dentro de los rangos declarados que puedan tomar los costos de internación y costo de la proteína C reactiva; así como los valores dentro del rango establecido de probabilidad de IBS, IBS por neumococo y efectividad vacunal. **CONCLUSIONES:** La proteína C reactiva constituye la estrategia más costo efectiva en la Argentina para la detección de la IBS en lactantes que acuden con SFSF. Sin embargo dado las moderadas proporciones de casos correctamente diagnosticados (<80%) aun existentes; estas pruebas deben ser interpretadas dentro del contexto clínico del paciente y no como método único para la toma de decisiones terapéuticas.

IMPLICATIONS OF GLOBAL PRICING POLICIES OF PHARMACEUTICALS FOR ACCESS THE INNOVATIVE DRUGS: THE CASE OF TRASTUZUMAB IN SEVEN LATIN AMERICAN COUNTRIES

Pichon Riviere A[1], Garay U[1], Augustovski F[2], Vallejos C[3], Huayanay L[4], Navia MDP[5], Rodríguez A[6], Oliveira C[7], Andrade CJ[8], Buendia JA[9]

[1]*IECS Institute for Clinical Effectiveness and Health Policy, Buenos Aires, Argentina,* [2]*Institute for Clinical Effectiveness and Health Policy (IECS), Buenos Aires, Argentina,* [3]*Universidad de La Frontera, Temuco, Chile,* [4]*Universidad Peruana Cayetano Heredia, Lima, Peru,* [5]*Universidad de San Andres, La Paz, Bolivia,* [6]*Fondo Nacional de Recursos, Montevideo, Uruguay,* [7]*ANVISA, Brasilia, Brazil,* [8]*INC, Rio de Janeiro, Brazil,* [9]*Department of Pharmacology .School of Medicine, University of Antioquia, Medellin, Colombia*

OBJECTIVES: Differential pricing (DP) on the basis of countries' purchasing power has been recommended by the WHO to secure more affordably priced medicines. However, in developing counties (DC) many innovative drugs have similar or even higher prices than in high-income countries (HIC). We conducted a cost-effectiveness

(CE) analysis to estimate the impact of this pricing policy on the CE of trastuzumab in Latin-America (LA). **METHODS:** Model structure and a common methodology for identifying costs and resource use were agreed with country teams. A Markov model was designed to evaluate life years (LY), quality adjusted life years (QALYs) and costs from a health care sector perspective. A systematic search on effectiveness, local epidemiology and costs studies was undertaken to populate the model. A base case scenario using transition probabilities from trastuzumab clinical trials, and two alternative scenarios with transition probabilities adjusted to reflect breast cancer epidemiology in each country, were built to better fit local cancer prognosis. **RESULTS:** Incremental discounted benefits and costs of the trastuzumab strategy ranged from 0·87 to 1·00 LY, 0·51 to 0·60 QALY and $24,683 to $60,835 (2012 US dollars). Incremental CE ratios ranged from $42,104 to $110,283 per QALY, equivalent to 3·6 gross domestic products per capita (GDPc) per QALY in Uruguay to up to 35·5 GDPc per QALY in Bolivia. The probabilistic sensitivity analysis showed a 0% probability that trastuzumab is CE if the willingness-to-pay (WTP) threshold is one GDPpc per QALY, and remains 0% at a WTP threshold of three GDPc except in Chile and Uruguay (probability 4·3% and 26·6% respectively). **CONCLUSIONS:** Despite its proven CE in other settings, trastuzumab was not CE in LA at its current price. Better cooperation between the public and private sectors is still needed to make innovative drugs available and affordable in DC.

NATIONAL SPENDING WITH SCREENING, DIAGNOSIS AND TREATMENT OF CERVICAL CANCER: ESTIMATES BASED ON HEALTH INFORMATION SYSTEMS, BRAZIL, 2006

Novaes HMD[1], De Soarez PC[1], Itria A[2], azevedo e Silva G[3], Sartori AMC[4], Rama C[5]
[1]*University of Sao Paulo, Sao Paulo, Brazil,* [2]*Departamento de Saúde Coletiva do Instituto de Patologia Tropical e Saúde Pública, Universidade Federal de Goiás. Pesquisador do Instituto de Avaliação de Tecnologia em Saúde (IATS), Goiânia - Goiás, Brazil,* [3]*Universidade Estadual do Rio de Janeiro, Rio de Janeiro, Brazil,* [4]*University of Sao Paulo, Sao Paulo, SP, Brazil,* [5]*Secretaria do Estado de Saúde de São Paulo, São Paulo, AL, Brazil*

OBJECTIVES: To estimate national expenditure with procedures of the National Cervical Cancer Control Program. **METHODS:** A cost description study was conducted to develop estimates of expenditures related to care held under the National Cervical Cancer Control Program in Brazil. Health Information Systems of the Public Health System, SUS (SIH, SIA, APAC, SIAB, and SIGTAP SISCOLO), national survey (PNAD 2008), and guidelines of INCA / MS, and reference systems for payments of the private system were consulted to construct estimates of direct and indirect costs. The estimates were grouped by sets of procedures of the stages of cervical cancer care (screening, diagnosis, treatment of precancerous lesions of the cervix - CIN I and CIN II / III and treatment of cervical cancer). The study was conducted from the perspectives of the health care system and society. **RESULTS:** The total direct cost of SUS in 2006 was estimated at R$ 227,167,515, ambulatory visits were responsible for 27% of spending. Screening represented the highest spending. The estimated total direct spending to the private sector in 2006 was R$ 938,707,221, ambulatory visits were responsible for 68% of spending. The transport costs were estimated at R$ 230,533,910. Lost productivity was based on the human capital approach and was estimated at R$ 1,463,977,777. The final value of the direct and indirect costs estimated and adjusted for the year 2008 was R$ 3,193,335,402. **CONCLUSIONS:** Spending with National Cervical Cancer Control Program is very significant. There is need for more costing studies in the country, alongside a greater structuring of official systems cost data available in order to contribute to the standardization and accuracy of the estimates of national costs.

CA3

ANÁLISIS DE COSTO-EFECTIVIDAD DE ESTRATEGIAS DE PREVENCIÓN PRIMARIA Y SECUNDARIA PARA CÁNCER DE CUELLO UTERINO EN COLOMBIA

Gamboa OA, Murillo RH, González M
Instituto Nacional de Cancerología, Bogotá, DC, Colombia

OBJECTIVOS: Evaluar la costo-efectividad de estrategias de prevención primaria (vacunación) y secundaria (tamización) para la prevención del cáncer de cuello uterino en Colombia. **METODOLOGÍAS:** Un modelo de Markov de la historia natural del cáncer de cuello uterino fue desarrollado para evaluar las siguientes estrategias: no tamización, tamización (citología convencional y en base líquida, pruebas ADN VPH, pruebas rápidas de ADN VPH y via vili), vacunación y tamización + vacunación. Las estrategias se evaluaron solas o combinadas, para un total de 32 estrategias evaluadas. Los años de vida ganados (AVG) fueron usados como medida de efectividad. El estudio tuvo la perspectiva del tercero pagador, solo se incluyeron costos directos. Se calcularon razones de costo-efectividad y costo-efectividad incremental, se condujeron análisis de sensibilidad determinísticos y probabilísticos. Se aplicó tasa de descuento del 3% a los costos y resultados en salud. **RESULTADOS:** Las estrategias que quedaron sobre la frontera eficiente fueron: la vacunación, la vacunación más las pruebas rápidas de ADN VPH cada 10 años desde los 35 - 50 años, la vacunación más la prueba de ADN VPH cada 3 años desde los 30-69 años con triage (via vili) y sin triage de las mujeres positivas a la prueba y la vacunación más la citología en base líquida en el esquema 1-1-1-3 desde 25-69 años. El costo por año de vida ganado para las estrategias arriba mencionadas fue de $US 1.288, $US 6.447, $ US 8.875, $US 14.186 y $US 94.503 respectivamente. El análisis probabilístico mostró que para umbrales de disponibilidad a pagar superiores a $US 13.000 la tamización con prueba de ADN-VPH cada 3 años más vacunación es la estrategia más costo-efectiva. **CONCLUSIONES:** La tamización con prueba ADN-VPH cada 3 años más vacunación en mujeres de 12 años sería una alternativa costo-efectiva para Colombia.

CA4

EMERGING CARDIOVASCULAR EVENTS ASSOCIATED WITH TARGETED ANTICANCER DRUGS. PRELIMINARY RESULTS OF A CARE LINE'S PROGRAM BASED ON AUDIT VIGILANCE IN A PRIVATE HEALTH CARE IN BRAZIL

Tanaka E[1], Da Costa ESM[2], Santos GL[2], Michaelis W[2], Miguel Neto C[2], Ribas KMDG[2], Mischiatti E[2], Kotze OH[2]
[1]*Curitiba City Health Institute, Curitiba, Brazil,* [2]*ICS, CURITIBA, Brazil*

OBJECTIVES: Retrospective study of oncology patients with cardiovascular event, in order to help an decision. There is evidence regarding the prognosis of cancer patients, which is seen as a carrier of a chronic disease that throughout its evolution may have acute decompensation, as cardiovascular manifestations. Progress in cancer treatment also resulted in increased exposure of patients to cardiovascular risk factors and chemotherapy with potential cardiotoxicity and sure for expenses in terms of adding costs of care. **METHODS:** We analised 68 cases collected and registered by the time of cardiology and oncology audit, in 2012. Outocmes items used: Costs, cardiovascular events associated with cancer. **RESULTS:** Among 68 cases, Breast Cancer is the majority accounting 32 (47%). All of them were seen by cardiologist and the total amount spent were US$15.000,00 . Thirty one patients were caracterized having a cardio - vascular event and the costs were comprise by echocardio, ergo-cardio test, angio tomography and coronary cardiac catheterization. The costs of oncology treatment range from $1.500,00 to $ 6.800,00 USD per cicle, each 21 or 28 days, that means $18.000,00 to $ 120.000,00 USD a year . It means that the provisional budget will range from $ 1.224.000,00 to $ 8.160.000,00 USD a year for the cohort of 68 patients in our institution. So, we will spend 0.18 % to 1.22 % in cardiac vigilance for the oncologic patients describe above. **CONCLUSIONS:** The costs still low, the price of the oncologic cure with an cardiologic event needs more studies, details need for further recomendations.

RESULTADOS DE LA ENCUESTA "CHANGE PAIN" LATINOAMERICANA: DIAGNOSTICO Y TRATAMIENTO ACTUAL DE LOS PACIENTES CON DOLOR CRÓNICO

Amescua C[1], Berenguel M[1], Silvan R[2]
[1]*Grunenthal, Latinoamérica, Distrito federal, Mexico,* [2]*Independent Consultant, Distrito federal, Mexico*

OBJECTIVOS: La "Change Pain Survey at EFIC 2009- Physian's perception on management of severe chronic non-cancer pain" realizada en países europeos, confirma la falta de conocimiento para el dolor neuropático y las variedades de enfoques del tratamiento del dolor crónico sin utilizar una guía consistentemente. Aplicando la misma encuesta a médicos generales y especialistas en países de América Latina, se exploró la percepción y comprensión de la forma de manejo del dolor crónico en América Latina. **METODOLOGÍAS:** Se realizaron 2130 encuestas vía electrónica de octubre 2012 a marzo 2013, en forma aleatoria a médicos generales y especialistas a través de sociedades médicas, fuerza de ventas o aplicadas en congresos médicos de 15 países de América Latina, poniendo énfasis en la percepción del tipo de dolor para elección del tratamiento. **RESULTADOS:** El porcentaje por especialidad fue: 18% traumatólogos, 12% médicos generales, 12% de rehabilitación, 13% anestesiólogos, 10% algólogos, y otras especialidades menores a 5%. Clasifican el dolor crónico muy heterogéneamente, desde nivel 4 al 9, en una escala del 1-10. Sus objetivos del tratamiento del dolor son reducción del dolor (30%) y calidad de vida (27%). La elección terapéutica para el dolor la deciden por eficacia (19.28%), tolerabilidad (21.83%), eficacia/equilibrio de efectos adversos (24.69), calidad de vida (18.19%) y costo (15.99%). Perciben un conocimiento limitado de las opciones terapéuticas y sobre la diferencia fisiológica entre dolor nociceptivo y dolor neuropático. **CONCLUSIONES:** La encuesta muestra una ausencia de estandarización en el tratamiento de dolor crónico y desconocimiento de las opciones terapéuticas ideales para el dolor crónico. Existe una necesidad de contar con un mejor conocimiento sobre el dolor crónico para lograr un adecuado manejo multimodal para su seguimiento y control.

FD2

ESSENTIAL MEDICINE LIST (CUADRO BÁSICO) IN MÉXICO. IS IT A GUIDELINE FOR DECISION MAKING ON THE CURRENT AND FUTURE HEALTH NEEDS?

Lemus A[1], Marquez R[1], Jimenez P[2]
[1]*Universidad de la Salle, MÉXICO D.F., Mexico,* [2]*independent, MÉXICO D.F., Mexico*

OBJECTIVES: Cuadro Básico is a list of minimum medicines needed for a basic health care system, listing the most efficacious, safety and cost-effective medicines for priority conditions. The importance is to ensure availability of drugs for current and future public health relevant diseases. The objective is to describe the characteristics of National List in Mexico and compare it with the Instituto Mexicano Seguro Social (IMSS) List in order to hypothesize the relevance of the drugs included on both Lists versus current and future health needs in the country. **METHODS:** It was performed a descriptive analysis of the two lists organized by therapeutic area. The description includes number of total codes, and number per therapeutic area. The information was compared to find the gaps on the number of codes between the two Lists. In addition it was identified the top health priorities and prevalence. **RESULTS:** National list has 1631 codes; the therapeutic areas with the majority of codes are infectious diseases (222) and Oncology (150). IMSS List has 1145 codes. The biggest relative difference between the two lists come from codes available for neurology, dermatology and ophthalmology; 57%, 56% and 45% codes are not available at IMSS, respectively. The top mortality causes in Mexico are heart disease, diabetes, cancer, accidents, liver diseases, stroke and COPD. If the analysis is made by disease, it worth mention that COPD only have 3 codes at IMSS and 7 codes at National Listing, while Alzheimer disease do not have any code at IMSS. **CONCLUSIONS:** A more extensive analysis (already available) brings information about the gaps between health needs and the drugs available. Mexico has an increased number of an aging population, which requires access to different drugs. The Essential list of WHO has 315 compounds versus Mexican which has 1631 codes. Is it a good guideline for decision makers?

FD3

¿PUEDE UN CAMBIO DEL 2003 EN EL REGLAMENTO EN EL CUADRO BÁSICO (CBM) EN MÉXICO IMPACTAR LA CANTIDAD DE ESTUDIOS CIENTÍFICOS PUBLICADOS DE EVALUACIÓN ECONÓMICA COMPLETOS DE MEDICAMENTOS (EECM) EN LOS ÚLTIMOS 10 AÑOS?

Márquez Cruz M[1], Peralta Bácenas LA[1], Ibarra Cázares AE[1], Rodriguez Mendoza MM[1], Pizarro Castellanos M[2], Soto Molina H[1]

[1]*Universidad Autónoma Metropolitana, Distrito Federal, Mexico,* [2]*Hospital Infantil Federico Gomez, Distrito Federal, Mexico*

OBJECTIVOS: Efectuar una revisión sistemática de los EECM realizados en México de 1983 a 2012 y evaluar el impacto que tuvo con la adición del reglamento del 2003 en CBM. **METODOLOGÍAS:** Se realizó revisión sistemática de artículos publicados entre 1983 a 2012 de EECM que cumpliera los siguientes requisitos: humanos, idioma español e inglés, realizados en México, no se tomó en cuenta resúmenes presentados en congresos. La búsqueda se realizó en Pub Med, CRD, ScienceDirect, Imbiomed, Medigraphics y la BSV (OMS). Los estudios EECM fueron clasificados de acuerdo a Drummond (2005). Se realizó un análisis de estadística descriptivo, por año de publicación, tipo de estudio, fuente de financiamiento, especialidad. Asimismo, se ejecutó un análisis de comparación de tres períodos continuos (1983/1992, 1993/2002, 2003/2012) para mostrar el crecimiento de EECM por el cambio de reglamento del 2003. **RESULTADOS:** Se identificaron un total de 154 artículos, de esos 68 (44,16%) son EECM. El tipo de estudio más publicado fue costo efectividad (80.88%). Los modelos económicos más utilizados fue el árbol de decisiones (36.66%) y markov (35%). Las especialidades donde se publicó más fueron infectología (14.7%), oncología y ginecología (11.8%). En el período de 1983/1992 se publicaron 1 artículo EECM, 1993/2002 6 y 2003/2012 61. La tasa de crecimiento de 2003/2012 con respecto al 1993/2002 fue del 916.66%, mientras el financiamiento de la industria farmacéutica en ese mismo período creció en 3,095%. **CONCLUSIONES:** Debido al cambio del reglamento en el 2003 en el proceso de inclusión de medicamentos al sector público, impacto de forma positiva en el crecimiento de las publicaciones en EECM en México, siendo su principal fuente de financiamiento la industria farmaceútica.

PRICING STUDIES

PR1

ANÁLISIS DEL IMPACTO EN LA DEMANDA DE TECNOLOGÍAS INCLUIDAS EN EL PLAN DE BENEFICIOS COLOMBIANO (POS) POSTERIOR A SU ACTUALIZACIÓN EN 2012

Romero M[1], Acero G[1], Marrugo R[1], Alvis N[2], Arango C[3]
[1]*Fundacion Salutia, Bogotá, Colombia,* [2]*Universidad de Cartagena, Cartagena de Indias, Bolívar, Colombia,* [3]*Fundacion Salutia, Bogotá, Colombia*

OBJECTIVOS: Analizar el impacto de la demanda de tecnologías, tras la actualización del plan de beneficios colombiano (Plan Obligatorio de Salud POS) en 2012, como indicador del acceso a los servicios de salud. **METODOLOGÍAS:** De una muestra aleatoria de 20 medicamentos (37% de las tecnologías incluidas), se analizaron las unidades despachadas según el registro del Sistema de Información de Precios de Medicamentos (SISMED) para sus canales comerciales e institucionales (farmacias, y aseguradoras u hospitales, respectivamente) de 2010 a 2012; estimando lo cambios porcentuales anuales. Las tecnologías que estaban previamente cubiertas en el plan, en la misma indicación, fueron incluidas en el análisis. Para el análisis se definieron 5 intervalos según el nivel de cambio: <-25%, -25% a 0%, 0% a 50%, 50% a 100% y >100%. No se realizó análisis de precios porque durante ese periodo cambió la legislación que los regula. **RESULTADOS:** El 60% de las tecnologías incorporadas presentó un aumento del doble o más, en sus unidades despachadas; y el 15% presentó crecimientos entre el 50% y 100%, mayormente en el canal institucional. Los comparadores de uso para patologías específicas, presentaron disminución en su participación de mercado, tanto en el canal comercial como institucional. Por ejemplo, aciclovir, disminuyó su uso en más del 25%, frente al 2010. El 10% presentó disminución de uso con el ingreso al plan. **CONCLUSIONES:** Aunque los usuarios podían acceder a las tecnologías por vías de carácter legal o administrativo, la incorporación de las nuevas tecnologías en 2012 mejoró el acceso a los servicios de salud entendido como un mayor consumo de tecnologías y se reemplazaron tecnologías en uso desde hace más de 10 años. Si bien esto podría ser un efecto del aseguramiento, al ser los medicamentos resultado de una atención médica, este incremento podría entenderse como pacientes efectivos con mayor acceso.

PR2

ECONOMIC EVALUATION OF AN URINE CLOSED COLLECTION SYSTEM VERSUS A TRADITIONAL OPEN DEVICE IN NON-PREGNANT WOMEN

Cardona DP[1], Burbano-Levy X[2], Palacios E[3], Zapata L[3]
[1]*Universidad de Antioquia- Facultad De Quimica Farmaceutica, Medellín, Colombia,* [2]*Zilonis Health, Inc, Boca Raton, FL, USA,* [3]*Guia Mark, S. A. de C. V., Mexico, DF, Mexico*

OBJECTIVES: The study assessed the cost-effectiveness (CE) of a medical device, an urine collection/transportation system containing or not preservative (UCTS) versus the traditional open device (TOD). The evaluated UCTS is used to collect and transport urine specimens, reducing contamination, and providing more accurate test results to establish UTI presence in non-pregnant women from the Mexican Institute of Social Security (IMSS) perspective. **METHODS:** The CE analysis was based in a decision model, considering a time horizon of two weeks after urine samples were collected. The number of correctly diagnosed UTI was the effectiveness measure. Data was obtained from available published studies reporting contamination rates. To calculate the effectiveness measure of the diagnoses process, a hypothetical cohort of 500 patients was simulated and positive/negative predictive values of the laboratory tests involved in the process were considered for adjustment. Direct medical costs were included and obtained from IMSS available data. CER and ICER were calculated to establish the cost-effectiveness of both medical devices. Univariate and multivariate sensitivity analysis, using pricing discounts and effectiveness were performed. **RESULTS:** Costs of UTI diagnosis in the hypothetical cohort using the UCTS were USD1907.40 compared to USD 2163.2 with the TOD. The number of correctly diagnosed UTI for each alternative was 25% and 51% respectively. CER were USD 3742.80/correctly diagnosed UTI and USD 8,597.79/correctly diagnosed UTI with the TOD. ICER analyses suggest that UCTS is a cost effective alternative, saving USD 4854.99 for each correctly diagnosed UTI. The sensitivity analysis confirmed the robustness of the modeled parameter estimates. **CONCLUSIONS:** . The results from the analyses indicates that UCTS (containing or not preservative) provides a highly cost-effective alternative compared with TOD for collecting, transporting and improving the quality of urine specimens in non-pregnant women from the payer perspective in Mexico.

PR3

ANÁLISIS COSTO-EFECTIVIDAD DE LINEZOLID COMPARADO CON VANCOMICINA EN EL MANEJO DE LA NEUMONÍA ASOCIADA A LA VENTILACIÓN MECANICA EN COLOMBIA

Varon FA[1], Londoño D[2], Álvarez C[2], Taborda A[2], Prieto Martinez V[3]
[1]*Fundación Neumológica Colombiana, Bogotá DC, Colombia,* [2]*Pontificia Universidad Javeriana, Bogotá DC, Colombia,* [3]*Pfizer S.A.S., Bogotá DC, Colombia*

OBJECTIVOS: La neumonía asociada a la ventilación mecánica (NAV) es la causa más frecuente de morbi-mortalidad en las unidades de cuidado intensivo. La incidencia de NAV en Colombia oscila entre 7 y 29 casos por cada 1000 días de intubación orotraqueal. Adicionalmente, la ventilación mecánica aumenta el riesgo de infección por *Staphylococcus aureus resistente a meticilina*(SARM). El objetivo de este trabajo es estimar la costo-efectividad del tratamiento con linezolid versus con vancomicina en el manejo de la NAV causado por SARM en Colombia. **METODOLOGÍAS:** Se construyó un árbol de decisión para determinar la razón de costo-efectividad incremental de linezolid (600 mg IV/12h) comparado con vancomicina (1g IV/12h) en el tratamiento de NAV por SARM. El estudió se llevó a cabo desde la perspectiva del tercer pagador incluyendo solo costos directos. Todas las unidades monetarias se expresan en dólares americanos (1 US$ = 1.785 COP). Se empleó un horizonte temporal de 30 días. La unidad de resultado fueron los años de vida ajustados por calidad (AVAC). Los datos de efectividad, seguridad y utilidad se tomaron de la literatura, los costos de los procedimientos se obtuvieron del manual tarifarios ISS, para medicamentos se utilizó el SISMED y la regulación de precios vigente (circular 04 de 2012). Se realizaron análisis de sensibilidad univariados y probabilísticos. **RESULTADOS:** Los costos totales esperados por paciente fueron: linezolid (US$ 1589), vancomicina (US$ 1461). Los resultados en términos de AVAC para cada alternativa fueron: Linezolid 0,91; vancomicina 0,87. La razón de costo-efectividad incremental de Linezolid comparado con vancomicina fue US$ 3090 por AVAC. **CONCLUSIONES:** Asumiendo como umbral el PIB per cápita para Colombia en 2012 (US$ 7104) linezolid es una estrategia costo-efectiva en el tratamiento de NAV por SARM.

PR4

ESTUDIO TRANSVERSAL DEL PROCESO DE ACTUALIZACIÓN DE MEDICAMENTOS EN EL CUADRO BÁSICO Y CATÁLOGO DE INSUMOS DEL SECTOR SALUD

Rizo Ríos P, González Rivera A, Rivas Oropeza I, Rivas Bocanegra R, Melchor Martínez F, Ruíz Pérez LC
Consejo de Salubridad General, Distrito Federal, Mexico

OBJECTIVOS: Los altos costos generados por el actual perfil epidemiológico y la introducción de nuevas tecnologías, impactan en los sistemas públicos, panorama que se complica cuando el gasto en salud es bajo, en especial para medicamentos, donde la mayor parte de este gasto es de bolsillo. Ello hace ineludible el diseño de estrategias para solventar los retos, como fué el fortalecimiento del CBCISS. Este estudio describe los resultados del proceso de actualización de medicamentos al CBCISS para garantizar la eficacia, seguridad y eficiencia de insumos utilizados en las instituciones públicas de salud. **METODOLOGÍAS:** Se realizó un corte transversal del proceso de actualización de medicamentos, de septiembre del 2011 a diciembre del 2012, con un análisis descriptivo para cada etapa (valoración, evaluación y dictamen). **RESULTADOS:** De 394 solicitudes recibidas y valoradas, 244 (62%) correspondieron a medicamentos, de ellas, 151 (62%) cumplieron los requisitos para su evaluación (32% fueron modificaciones y 68% inclusiones), se dictaminaron procedentes el 42% (61% de las modificaciones y 33% de las inclusiones). El 73% de las inclusiones procedentes fueron por consenso, 12% condicionadas a baja de precio y 6% por mayoría de votos, esencialmente. Las principales causas de rechazo fueron: falta de evidencia clínica (31%) y problemas metodológicos en la evidencia económica (27%). **CONCLUSIONES:** El fortalecimiento del proceso se realizo con rigor metodológico basado en análisis crítico de evidencia científica, con transparencia y legitimidad bajo un marco legal para favorecer la optimización de recursos. El mayor porcentaje de solicitudes fueron para medicamentos, que constituyen la tecnología terapéutica más utilizada, que requiere una selección adecuada para garantizar mayor beneficio al menor riesgo y costo posible. La evaluación económica fue herramienta de apoyo para considerar además del precio, el valor de la salud determinado por la calidad de la evidencia, estableciendo un PIB como límite de disposición a pagar.

COST, RISK FACTOR & UNIVERSAL COVERAGE STUDIES

RF1

EFECTO DEL SEGURO POPULAR SALUD SOBRE LA DEMANDA DE SERVICIOS PRENATALES EN EL CONTEXTO DE LA COBERTURA UNIVERSAL, MÉXICO 2012

Servan-Mori E
National Institute of Public Health, Cuernavaca, Mexico

OBJECTIVOS: La atención prenatal oportuna es una estrategia efectiva para reducir el riesgo de mortalidad materna. En 2003, en México, se creó el Seguro Popular de Salud (SP); uno de sus objetivos es contribuir a reducir el riesgo de mortalidad materna, a través de intervenciones como la atención profesional del embarazo/parto, incentivar el acceso efectivo a servicios de salud y su mayor demanda. Así, el objetivo de este estudio fue analizar el efecto del SP sobre la demanda oportuna (*DO*) de servicios prenatales y la demanda de al menos 4 visitas prenatales durante el último embarazo (*4VP*) del mujeres mexicanas. **METODOLOGÍAS:** Se utilizó la Encuesta Nacional de Salud y Nutrición de México 2012. El efecto del *SP* sobre *DO* y *4VP*se estimó a partir de métodos no experimentales de pareamiento. Se exploraron además posibles fuentes de heterogeneidad de dicho efecto atribuibles a elementos individuales (la escolaridad y el nivel socioeconómico, NSE) y de contexto (nivel de desarrollo del lugar de residencia). **RESULTADOS:** El SP incrementó la DO en mujeres de NSE I (RM=1.88, $p<0.05$) y la posibilidad de demandar *4VP* (RM=1.65, $p<0.01$). No obstante, al incluir la *DO* como predictor de *4VP*, el *SP* perdió importancia en la explicación de este indicador; en este modelo la *DO* incrementó los momios de *4VP* (RM=6.2, $p<0.01$). Tanto la DO como

4VP se incrementaron con la escolaridad de las mujeres. **CONCLUSIONES:** Pese a los resultados favorables en salud materna atribuibles al SP; es importante redoblar el esfuerzo del sistema mexicano de salud por lograr la cobertura efectiva en salud de la población más vulnerable de México. El uso eficiente y equitativo de los recursos será indispensable para consolidar el acceso universal a la salud en México.

EPIDEMIOLOGICAL AND ECONOMIC IMPACT OF CHRONIC KIDNEY DISEASE IN PATIENTS WITH HYPERTENSION AND DIABETES IN COLOMBIA

Carrasquilla-Sotomayor M, Santos-Ochoa JJ, Alvis-Zakzuk J, Alvis-Zakzuk N, Paternina-Caicedo A, Alvis-Guzmán N

Universidad de Cartagena, Cartagena de Indias, Colombia

OBJECTIVES: Epidemiologic transition from infectious to noncommunicable diseases (NCDs) in most countries may increase disease and economic burden. Chronic kidney disease (CKD) is a public health problem worldwide. In Colombia, CKD is related to catastrophic health expenses in the overall health care system. The aim of this study is to assess epidemiological and economic impact of CKD in people with risk factors for CKD in Colombia. **METHODS:** A Markov decision model was carried out to estimate the burden of disease of CKD in Colombia. The Markov model have seven states, which followed people with diabetes mellitus (DM) and hypertension from disease onset to 90 years old (in 50 annual cycles). Five states went from CKD stage-1 to CKD stage-5, one transplant state and one absorbing state (death). Parameters were drawn from a literature review. Direct costs were drawn from a sample of patients with end-stage CKD from a large insurer in Colombia between 2009 and 2011. Outcome measures were: cases of CKD, deaths, disability-adjusted life-years (DALYs), and treatment costs. **RESULTS:** In Colombia, of 1,899,572 patients with hypertension and DM (62.9% were women), 1,083,735 (57.1%) developed CKD. Of all cohort deaths, 55% were caused by CKD. 4,413 transplants occurred in the cohort. 6.3 millions DALYs are associated to CKD in women, and 10.9 in men, for a total of 17.3 millions. The mean cost per patient with end-stage CKD is around I$20.6 dollars (PPP adjusted). This burden would represent I$45.8 billions dollars (14.1% of estimated Gross Domestic Product of Colombia) if all cases were attended. **CONCLUSIONS:** Despite limitations, this study shows the increasing economical and disease burden of NCDs in developing countries. This study also highlights the challenge on health systems of increasing aging population and risk factors for NCDs in developing countries such as Colombia.

RF3

FACTORES PREDICTORES DE OBSTRUCCIONES CORONARIAS SIGNIFICATIVAS EN PACIENTES ADULTOS CON CINEANGIOCORONARIOGRAFÍAS REALIZADAS EN URUGUAY FINANCIADAS POR EL FONDO NACIONAL DE RECURSOS

Fernandez G, Morales M, Lombide I, Perna A

Fondo Nacional de Recursos, Montevideo, Uruguay

OBJECTIVOS: La realización de una cineangiocoronariografía (CACG) es el gold Standard para definir la anatomía coronaria. El porcentaje de lesiones coronarias no significativas varía según la magnitud de obstrucción definida; siendo del 9 al 25 % cuando consideramos lesiones menores al 50 %. Existen factores predictores como sexo masculino, edad avanzada, diabetes, dislipemia y tabaquismo. El Fondo Nacional de Recursos (FNR), financia según normativas de cobertura institucionales, prestaciones médicas altamente especializadas en Uruguay, entre ellas las CACG de las cuales reúne un registro único nacional. Objetivos: 1) Conocer el porcentaje de CACG con lesiones coronarias significativas (mayores al 50 %) realizados entre 1/07/2011 y 30/06/2012; 2) Identificar el tratamiento elegido luego de su realización; 3) Describir los factores predictores que permitan identificar pacientes con alto riesgo de tener lesiones coronarias significativas. **METODOLOGÍAS:** Estudio retrospectivo de una cohorte histórica de pacientes consecutivos mayores de 18 años, con CACG realizada en el período establecido . Se excluyeron las solicitadas por enfermedad cardíaca no coronaria. **RESULTADOS:** Se incluyen 6.737 CACG, de los cuales son de sexo masculino 67,2% , con una media de edad de 64,7 años. El total de CACG realizadas con lesiones mayores al 50 % fue 5.737 (85,1%). En 1549 (23 %) se optó por el tratamiento médico. Los factores de riesgo retenidos en el modelo de regresión logística fueron: edad > 50 años, sexo masculino, procedencia geográfica, diabetes, dislipemia, tabaquismo, ausencia de obesidad, oportunidad del procedimiento, y tener un infarto trasmural. **CONCLUSIONES:** El porcentaje de CACG con lesiones significativas se encuentra dentro de lo reportado en la bibliografía internacional lo que traduce un adecuado proceso de toma de decisiones. La identificación de factores de riesgo es de utilidad para este proceso de financiamiento de CACG en aquellos pacientes con mayor riesgo de presentar lesiones coronarias significativas.

COST-EFFECTIVENESS OF VARIOUS COMBINATIONS OF HUMAN PAPILLOMAVIRUS (HPV)-BASED PRIMARY SCREENING TESTING, INCLUDING GENOTYPING FOR HPV 16/18, FOR CERVICAL CANCER SCREENING IN MEXICO

Corro A[1], Ramirez A[1], Williams E[2], Huang J[3], Souza FH[4]

[1]*Roche Diagnostics, Mexico, Mexico,* [2]*Xcenda, Palm Harbor, FL, USA,* [3]*Roche Molecular Diagnostics, Pleasanton, CA, USA,* [4]*Roche Diagnostics, Sao Paulo, Brazil*

OBJECTIVES: To determine the cost-effectiveness of various cervical cancer (CxCa) screening algorithms including the cobas HPV Test in Mexico, which identifies HPV genotypes 16/18 individually while simultaneously detecting the other high-risk HPV types. **METHODS:** A cohort Markov model was developed to compare five CxCa screening strategies: (S1) cytology only, (S2) cytology with reflex HPV; (S3) HPV with reflex cytology, and (S4) cytology and HPV co-testing; (S5) cobas HPV with genotyping and reflex cytology. Screening began at age 30 with a routine screening interval of every 3 years, and was modeled over a time horizon of 40 years. Performance of the overall screening strategies was derived from the ATHENA (Addressing THE Need for Advanced HPV Diagnostics) trial. Trial baseline data were used for the base case, and 1-year follow-up outcomes were estimated for the alternative scenario, assuming all persistent disease is detected in the subsequent visit. The direct costs for screening and treatment of CxCa were estimated using the perspective of Mexican Institute of Social Security (IMSS). Costs were in 2010 US dollars. Costs and quality-adjusted life years (QALYs) were discounted at 3% annually. One-way sensitivity analyses were conducted. **RESULTS:** Using a $20,000/QALY threshold, baseline screening with S5 dominated S3 and S4 by reducing overall cost, annual cancer incidence, and improving QALYs; and was cost-effective compared to S1 and S2. In the 1-year follow-up scenario, S5 was cost-effective compared to all other strategies. Detection of HPV 16/18 with S5 resulted in earlier diagnosis of clinically relevant CIN 2/3 at the initial visit as well as more efficient use of screening tests during follow-up. Sensitivity analyses showed that test sensitivities were the most impactful on model results. **CONCLUSIONS:** Incorporating the cobas HPV test with HPV 16/18 genotyping was cost-effective compared to various CxCa screening strategies, and resulted in improved protection against CxCa.

SELF-REPORTED HEALTH STATUS AND EQ-5D-3L VALUES OF THE ARGENTINE POPULATION: COMPARING 2005 VERSUS 2009 NATIONAL RISK FACTOR SURVEYS

Augustovski F[1], Rey Ares L[2], Gibbons L[2]

[1]*IECS - Instituto de Efectividad Clinica y Sanitaria, Buenos Aires, Argentina,* [2]*Institute for Clinical Effectiveness and Health Policy, Buenos Aires, Argentina*

OBJECTIVES: To describe and compare general population self-reported health and EuroQol EQ-5D-3L values in 2005 and 2009 Argentina national risk factors survey. **METHODS:** The 2005 and 2009 waves included 41,392 and 34,732 adults, randomly selected from all Argentine provinces with a probabilistic multi-stage sample design. We report general population summary data on health status (EQ-5D-3L and the general health question of SF-36) as well as of different sociodemographics subgroups. Argentine time-trade off (TTO) and visual analog scale (VAS) values (V) weights were used. A descriptive analysis was done. 2005 results were compared to 2009 using Rao-Scott chi-square or regression analysis. **RESULTS:** Good or better self reported health was similar in 2005 and 2009 (80.1 vs. 80.7%). More people reported no limitations in all EQ-5D domains in 2009 vs. 2009 (61 vs. 57%; p<0.001). Mean values in 2005 versus 2009 were: VAS 75.3 vs. 75.9; p=<0.001; TTO 0.89 vs. 0.91; p==<0.001; VAS-V 0.86 vs. 0.88; p=<.001. 63 vs. 66% of males and 52 vs. 56% of females; 71 versuss 77% of 18-24y; and 37 versus 36% of 65+y; 63 versus 69% in the higher education category reported no limitations. VAS; TTO; and VAS-V 2005 versus 2009 in subjects without limitations: 82.4; 1; 1 versus 82.4; 1; 1; while in subjects with any limitation figures were 66.5; 0.76; 0.69 versus 66.2; 0.76; 0.69. **CONCLUSIONS:** In this analysis of the first two waves of Argentina National Risk Factors Survey, we found a small secular trend between 2005 and 2009, showing slightly better self reported health in 2009. There are few population surveys in our region that incorporated health status measures and did it in a periodic basis. These results can serve as a benchmark for future population studies and also as inputs for cost-utility analysis of health technologies in Argentina and Latin America.

TR2

ANÁLISIS BIBLIOMÉTRICO DE LA PRODUCCIÓN CIENTÍFICA EN ECONOMÍA DE LA SALUD EN LATINOAMÉRICA

Simbaqueba E, Romero M

Fundacion Salutia, Bogotá, Colombia

OBJETIVO: Analizar el nivel de producción científica en economía de la salud en Latinoamérica aplicando métodos de valoración cuantitativos de recuento y de análisis bibliométrico. **MÉTODO:** La revisión fue hecha a partir de la base de datos Scopus, dada su mayor cobertura de acuerdo a Academic Database Assesment Tool. Los resultados se analizaron a través de indicadores de producción, difusión, colaboración y bibliométricos, en los que se contemplaron tendencias de publicación, autores, tipo de documento, área de trabajo, revistas, país (Latinoamericanos), número de citaciones, factor de impacto, el índice h, y red de difusión. **RESULTADOS:** Se encontraron 860 artículos científicos con autores de afiliación institucional en países latinoamericanos. La función de crecimiento anual presentó una tendencia exponencial en los últimos veinte años. Brasil, México, Argentina, y Chile son los países con mayor impacto y desarrollo en el campo de economía de la salud aportando el 80,6% del total de referencias encontradas. La producción se encuentra vinculada especialmente a instituciones universitarias y grupos de investigación, principalmente la Universidad de Sao Paulo, la Fundación Oswaldo Cruz, Universidad de Chile. Las áreas de mayor presencia son: medicina (64%); ciencias sociales (7,5%); y ciencias biológicas (5,4%). La economía de la salud cuenta con un índice h: 22. **CONCLUSIÓN:** La producción científica en economía de la salud en Latinoamérica muestra un creciente desarrollo y arraigo institucional. Se espera que el entendimiento y posicionamiento de esta materia cuente como herramienta de soporte en la toma de decisiones para los gobiernos de la región y en la asignación de recursos para la salud.

TR3

A MULTI-NATIONAL SURVEY ASSESSING THE RELATIONSHIP BETWEEN PROPHYLAXIS TREATMENT AND HEALTH-RELATED QUALITY OF LIFE AMONG SEVERE HEMOPHILIA A PATIENTS IN LATIN AMERICA

Perez Bianco PR[1], Berges A[2], Linares A[3], Moreno B[4], Arvizu J[5], Brabata C[5], Xiong Y[6], Ito D[6]

[1]*Instituto de Investigaciones Hematologicas - Academia Nacional de Medicina, Buenos Aires, Argentina,* [2]*Instituto Mexicano del Seguro Social. Centro Medico Nacional La Raza Hospital General, Azcapotzalco, Mexico,* [3]*Clinica Infantil Colsubsidio, Bogotá, Colombia,* [4]*Fundacion Panamena de Hemofilia/Hospital del Nino, Panama City, Panama,* [5]*Baxter Healthcare Corporation, Miami, FL, USA,* [6]*Baxter Healthcare Corporation, Westlake Village, CA, USA*

OBJECTIVES: Research has shown that Hemophilia A patients report lower health-related quality of life (HRQOL) compared to the general healthy population. While a primary prophylaxis (PP) treatment regimen reduces bleed rates, it remains unclear if it is associated with improved HRQOL. The objective of this analysis was to determine if treatment regimen was associated with better HRQOL among hemophilia A patients in Latin America based on patient self-report. **METHODS:** This cross-sec-

tional survey of severe hemophilia A patients ≥ 18 or older, or the parent/caregiver of patients aged 2-17 was administered in Argentina, Chile, Colombia, Mexico and Panama. A centralized ethics review board approved the study. Eligible, consenting patients completed a questionnaire: from October-November 2009 (Argentina), June-August 2011 (Chile, Colombia, Mexico) and September-October 2012 (Panama). HRQOL was measured by the Short Form 12 (SF-12) for adults and the Pediatric Quality of Life Inventory (PedsQL) for children. Treatment characteristics were also assessed. **RESULTS:** A total of 435 severe hemophilia A patients participated in this study, 58% of whom were adults. Overall, 238 (48%) patients were either receiving primary or secondary prophylaxis (SP). An ordinary least squares regression was performed with SF-12 Physical Component Score (PCS) as the dependent variable, and PP, and SP as independent variables. Age and country were included as control variables. On average, the PCS score was 8.64 points higher among PP patients compared to on-demand (OD) patients after adjusting for age and country (p=0.0363). A comparable analysis among children using the PedsQL Physical Summary score revealed a similar trend: on average, the physical HRQOL score was 7.15 points higher among PP patients, compared to OD controlling for age and country, however this was not significant. **CONCLUSIONS:** Results suggest that primary prophylaxis treatment may be associated with improved physical HRQOL.

TR4

LA PROTECCIÓN FINANCIERA Y EL GASTO DE BOLSILLO EN SALUD DE LA POBLACIÓN MEXICANA 2002-2010

Rivera G[1], Guajardo V[2], Gutierrez C[2]
[1]*Secretaría de Salud, Mexico, Mexico,* [2]*Instituto Mexicano del Seguro Social, Mexico, Mexico*

OBJECTIVOS: Analizar distintos aspectos del gasto de bolsillo en salud de los hogares mexicanos para estimar el impacto de la protección financiera del aseguramiento público en salud. **METODOLOGÍAS:** Se estima el porcentaje de hogares con gasto catastrófico o empobrecedor en salud y su relación con ingreso, condición de aseguramiento, tipo de localidad y rubro de gasto en salud, usando la Encuesta Nacional de Ingreso y Gasto de los Hogares 2002-2010 y una adaptación de la metodología de la Organización Mundial de la Salud así como la definición oficial mexicana de línea de pobreza alimentaria, de ingresos y gastos corrientes totales en los años respectivos. **RESULTADOS:** El porcentaje de hogares con gastos catastróficos en salud presentó una tendencia decreciente a partir de 2006. Los hogares con gastos empobrecedores en salud experimentaron una tendencia decreciente durante el período analizado. Los hogares con ambos gastos en salud, concentrados en localidades rurales, presentan una tendencia decreciente a partir del 2006. El gasto de bolsillo en salud por rubro se concentra en los medicamentos sin receta y vitaminas, alcanzando un promedio de 57.4% en el periodo analizado, independientemente de la condición de aseguramiento, nivel de ingreso y tipo de localidad. **CONCLUSIONES:** La reducción del gasto catastrófico puede estar vinculada con el importante incremento en la protección financiera de la población a través del Seguro Popular de Salud. Se requiere analizar a mayor detalle la dinámica del gasto de bolsillo en medicamentos para generar políticas públicas que incidan en su reducción procurando una mayor protección financiera a hogares vulnerables.

PERFIL DE ADESÃO AOS PLANOS DE BENEFÍCIO EM MEDICAMENTOS

Santana CFSD[1], Ferreira CN[2], Paloni EDMP[2], Drago S[3], Salles GRD[1], Bonachela F[4], Souza C[3], Abreu AA[3]
[1]*Orizon, Sao Paulo, Brazil,* [2]*ORIZON - Companhia Brasileira de Gestão de Serviços, Sao Paulo, Brazil,* [3]*ORIZON, Sao Paulo, Brazil,* [4]*Orizon, SAO PAULO, SAO PAULO, Brazil*

OBJETIVOS: Analisar o comportamento de consumo após implantação de benefícios farmácia para diferentes clientes com variados percentuais de desconto e reembolso. **MÉTODOS:** Utilizando a base de dados Orizon, que transaciona cerca de 7milhões de medicamentos ano via plano de beneficio medicamentos (PBM), selecionou-se quatro planos com subsídios variados e foram analisados o coeficiente de adesão dos planos mês a mês e definido a média de consumo por plano, após estes dados estudou-se o tempo médio necessário para atingir a atingir adesão linear ao consumo de medicamentos por plano. **RESULTADOS:** Dos quatro planos estudados, o Plano 1 que concede subsídios de 40% e 80% de acordo com o medicamento, alcançou a média de adesão em 6 meses; o Plano 2 que não oferece subsídios aos usuários demorou 13 meses para chegar a média de adesão; os Plano 3 e 4 que fornecem subsídios de 80 a 100% aos usuários alcançaram a marca respectivamente em 5 e 4 meses. **CONCLUSÕES:** Observamos que, desde a implantação até a média de adesão de consumo, o tempo variou de 4 a 13 meses. Um dos fatores que podem explicar esta diferença são os subsídios proporcionados para cada plano, pois o Plano 2 que não oferecia subsídio aos usuários apresentou o maior tempo - 13 meses - e o que apresentava maiores condições aos usuários levaram apenas até 4 meses. Desta forma o subsidio dado aos benefícios faz com que o tratamento seja seguido podendo minimizar os custos com sinistralidade por planos de saúde.

HEALTH CARE USE & POLICY STUDIES – Drug/Device/Diagnostic Use & Policy

PHP2

ARE GENERIC DRUGS DEFINED AND CLASSIFIED CONSISTENTLY AROUND THE WORLD?

Alfonso-Cristancho R[1], Watanabe JH[2], Barbosa T[3]
[1]*University of Washington, Seattle, WA, USA,* [2]*Western University of Health Sciences, Pomona, CA, USA,* [3]*RANDOM Foundation, Bogota, Colombia*

OBJECTIVES: To systematically identify and compare how generic medications, as defined by FDA, WHO, EMA, are classified and defined by regulatory agencies around the world. **METHODS:** We focused on emerging markets and excluded developed countries. For country selection, we identified the 3 most populace countries in each of the WHO regions: Africa, Americas, Eastern Mediterranean, Europe, South-East Asia and Western Pacific. A systematic review of the published literature was performed through December 2012. Direct information from regulatory agencies and Ministries of Heath for each of the countries was extracted. Additionally, key informant interviews were performed for validation purposes. **RESULTS:** Of the 18 countries selected, only 50% provided an official country level definition for Generic drugs. The other 50% were comprised of those devoid of any definition and those that refer to the WHO definition of generics. Most countries acknowledge some form of Generic Drug Policy following the WHO framework. However, only 65% have specific requirements for Generic drugs. The requirements are often associated with clinically viable therapeutic interchangeability. Most countries with requirements mention Bioequivalence but few require Bioavailability explicitly. At least one third of the countries have other terms in their definitions and processes that could be associated with Generics. In countries with Generic Drug Policies there is reference to patent or protection during the Drug Registration Process. Lack of patent protection enforcement appears to hinder Generic drug production and utilization despite the existence of incentives for the use of Generics. 20% of countries do not mention Good Manufacturing Practices as part of the evaluation process. Countries in Africa and Eastern Mediterranean Regions appear to have a less developed regulatory framework. **CONCLUSIONS:** There is significant variability in the definition and classification of generic drugs in emerging markets. Standardization of the definitions is necessary to make international comparisons viable.

PHP4

AÇÕES DE FARMACOVIGILÂNCIA: RELATO DE NOTIFICAÇÕES DE MEDICAMENTOS À AGÊNCIA NACIONAL DE VIGILÂNCIA SANITÁRIA (ANVISA) – BRASIL

Costa Paulo PT[1], Pedrosa MDO[2], Melo RDFCLR[2], Fernandes ADLV[2]
[1]*Universidade Estadual da Paraíba, João Pessoa, Brazil,* [2]*Instituto Cândida Vargas, João Pessoa, Brazil*

OBJETIVOS: Avaliar e quantificar as notificações de medicamentos registradas no setor Rede Sentinela do Hospital Instituto Cândida Vargas e enviadas à ANVISA (Agência Nacional de Vigilância Sanitária), durante o período de três anos. **MÉTODOS:** Realizou-se um estudo descritivo e retrospectivo do período de setembro/2009 a setembro/2012 das notificações recebidas, tanto de queixas técnicas como de eventos adversos, no setor Rede Sentinela do Hospital Instituto Cândida Vargas em João Pessoa-Paraíba. As notificações foram recebidas de forma espontânea (encaminhadas pelos profissionais de saúde) ou provenientes da busca ativa. Estas notificações foram enviadas via internet, através do Sistema de Notificação em Vigilância Sanitária, denominado de NOTIVISA para a ANVISA. **RESULTADOS:** No total, foram realizadas 20 (vinte) notificações, sendo 5% (01) no ano de 2009, 5%(01) no ano de 2010, 45% (09) no ano de 2011 e 45%(09) até setembro do ano de 2012. Em relação a forma de recebimento destas notificações, 14 (70%) foram recebidas de forma espontânea e 06 (30%) através da busca ativa. 80% (16) foram de queixas técnicas e 20% (04) de eventos adversos em relação ao uso dos medicamentos; o número de queixas técnicas notificados de forma espontânea foram 62,5%(10) e de busca ativa 37,5%(06), já o número de eventos adversos notificados foi 100% e de forma espontânea. **CONCLUSÕES:** Observou-se um crescimento ano a ano do número de notificações, sendo isto uma prática importante e propositiva. A forma de notificação espontânea foi a mais freqüente, demonstrando maior envolvimento, conscientização e comprometimento da equipe de saúde com o programa de farmacovigilância. Houve mais notificações de queixas técnicas do que de eventos adversos, o que já era esperado. Conclui-se ainda que o estímulo ao desenvolvimento de programas de educação continuada no ambiente de trabalho, buscando identificar os efeitos adversos e problemas relacionados aos medicamentos é de fundamental importância.

ARGENTINA'S GENERIC DRUG LAW: WAS IT SUCCESSFUL?

Lee B[1], Garay OU[2], Goldhaber-Fiebert J[3], Tang J[1], Lightwood J[1], Wilson LS[1]
[1]*University of California, San Francisco, San Francisco, CA, USA,* [2]*IECS Institute for Clinical Effectiveness and Health Policy, Buenos Aires, Argentina,* [3]*Stanford University, Stanford, CA, USA*

OBJECTIVES: High drug prices present substantial challenges to providing good, affordable health care, especially in resource poor settings. To combat rising drug prices, in 2002, Argentina implemented "The Generic Law" mandating that prescribers write prescriptions with the International Nonproprietary Name instead of brand name to promote generic drug use and lower overall costs. We examined whether this policy was effective in lowering drug prices. **METHODS:** We used IMS price data of 192 drug products from the WHO essential medicines list in Argentina from 1995-2010 along with limited utilization data. The study employed a longitudinal interrupted-time-series analysis of price and drug use before and after The Generic Law was implemented. We estimated a fixed effects regression model both with real price and log of real price as the dependent variable and time, policy, number of drug products on the market, and brand or generic status and brand policy interaction as independent variables, with residual tests for robustness. **RESULTS:** The robust pooled log price trends of 192 drug products show that prices decreased over all years by 1.1% (CI=0.0067-0.0151, p<0.00). We showed a robust interaction effect between policy and brand with the policy causing a 7.9% decrease (CI=-0.1359--0.0221,p=0.006) in generic drugs prices over brand prices (1.5 pesos). The policy by itself did not have a significant effect over all drug prices, nor did density of market share. Brand drugs across all time periods had a 27% increase (CI=0.0895-0.4525,p=0.003) in price (5.13 pesos). Visual inspection of utilization trends indicated that brand utilization decreased while generic use stayed stable or increased. **CONCLUSIONS:** Argentina's generic policy had its intended differential effect between brand and generic prices with generic prices decreasing significantly with respect to brand prices, although this difference was small. These findings provide some evidence supporting implementation of generic drug policies in other countries, but should be validated.

PHP6

UN SEGURO NACIONAL DE ENFERMEDADES CATASTRÓFICAS: FUNDAMENTOS PARA SU IMPLEMENTACIÓN

Tobar F, Olaviaga S, Solano R, Hamilton G
CIPPEC, Ciudad de Buenos Aires, Argentina

OBJECTIVOS: Unas pocas enfermedades que afectan a un número reducido de personas se llevan una parte cada vez mayor de los recursos de los sistemas de salud. Se las denomina enfermedades catastróficas por el impacto económico que generan en quienes las padecen y las financian. En la Argentina coexisten seis modelos diferentes de cobertura y financiación de estas patologías. Sin embargo, constituyen respuestas fragmentadas e inequitativas. La creación de un Seguro Nacional de Enfermedades Catastróficas (SENEC) permitiría alcanzar una cobertura universal y homogeneizar protecciones de calidad a un costo inferior al actual. Esta investigación tiene por objetivo generar evidencia que contribuya a demostrar tanto la viabilidad económica y financiera como la factibilidad técnica del SENEC. **METODOLOGÍAS:** Para eso, se identifican los tipos de cobertura y financiamiento vigentes en el país y se describen algunas experiencias internacionales. Luego se exponen diferentes opciones para resolver la protección frente a estas enfermedades y se justifica por qué el SENEC es la alternativa más adecuada para el contexto argentino. Finalmente, se estiman los costos que conllevaría la creación del seguro y se describen cuatro escenarios alternativos de implementación. **RESULTADOS:** Los resultados del estudio evidencian que a través del SENEC se puede lograr una reducción de hasta el 75% de los costos en cobertura para estas enfermedades. Se demuestra que el SENEC en pleno funcionamiento, es decir brindando una cobertura explícita y de calidad homogénea a toda la población, tendría un costo menor al que hoy deben asumir algunos agentes del seguro (obras sociales nacionales y prepagas). **CONCLUSIONES:** Esta política pública responde a los desafíos de sustentabilidad económica, calidad y equidad que plantea la cobertura de estas patologías al actual sistema sanitario argentino.

PHP7

ANALYSIS OF THE PRICING AND MARKET ACCESS LANDSCAPE OF ORPHAN DRUGS IN LATIN AMERICA

Senan Castellano B[1], Severi Bruni D[2], Ziai Buetas A[1]
[1]*ICON, London, UK,* [2]*ICON, El Segundo, CA, USA*

OBJECTIVES: In Latin America, despite the efforts recently implemented to improve access for rare diseases, funding remains a challenge due to conflicting priorities to ensure sufficient budget for essential medicines. In this research we aim at providing an understanding of the situation in terms of access and funding of orphan drugs in Brazil, Mexico and Argentina as well as defining the drivers for access in the light of an increasing pressure for drug coverage for orphan conditions. **METHODS:** Review approval and funding regulation for orphan drugs in Brazil, Argentina and Mexico. Selection of 8 orphan drugs differing on a pre-defined set of access drivers (Incidence of the disease, severity of the condition, therapeutic alternative, level of innovation, affordability, etc.). Develop case studies based on HTA reviews and level of access. Formulate hypotheses about the main drivers for successful access. Explore and qualitatively validate hypotheses through primary research with local payers. **RESULTS:** 1) Access to orphan drugs is not universal - programs starting to be put in place in some countries but limited to selected conditions; 2) Brazil and Mexico have implemented a policies for orphan drugs expected to facilitate increased access in the future; and 3) Affordability is the main driver of access followed by the severity of the disease, although exceptions to this rule exist. **CONCLUSIONS:** Whereas regulation for orphan drugs is not available in all countries, public funding overall is increasing. Most funding for rare diseases, however, focuses on selective, severe, life-threatening conditions, and affordability remains a major access barrier. In the medium term, proving value will not be enough to obtain access of OD in these markets. Companies seeking access for ODs will need selective programs, designed to improve affordability.

PHP8

VALUE JUDGMENTS IN HEALTH TECHNOLOGY ASSESSMENT PROCESS IN BRAZIL

Santoro Neto L, Ferraz MB
Universidade Federal de São Paulo, Sao Paulo, Brazil

OBJECTIVES: To appraise the value judgments in critical decisions involving resource allocation and use of technologies in Brazilian health system, through the view of health managers and professionals. To evaluate the tendencies of the Brazilians' decision makers when managing the important restriction of financial resources. To analyze the influence of health care sectors in the managers and professionals' decisions. **METHODS:** The research has been conducted through a decision-making questionnaire to incorporate health technologies, applied by internet. 193 respondents fully answered the research. There was presented four scenarios that mimicked real world dilemmas regarding the choice of resource allocation in an environment of severe budget constraint. The decisions should be taken regarding the following trade-offs: 1) disease prevalence and reduction/extinction of current health programs; 2) disease prevalence and creation of new taxes; 3) patients age; and 4) decision among prevention and treatment. **RESULTS:** The results have showed a conservative trend. Most answers were related to lower costs options in every scenario, showing the preference in saving resources instead of incorporating the technologies, in despite of the clinical benefits. The comparison between prevention and treatment demonstrates that health managers and professionals are suited to a preventive though that indicates the long-term strategy of health care policies. It was found different tendencies of answers between the health care sectors considered as players of technology assessment process. **CONCLUSIONS:** The Brazilian health managers and professionals are significantly influenced by economic scarcity when deciding about resource allocation. In search of a paradigm for decision-making, most of them have opted for saving resources rather than incorporating the technology. With a restricted budget, only few demands can be satisfied. Against this background, the cost-effectiveness analysis and the establishment of strategic priorities become essential tools for resource allocation, in order to avoid an undesirable technological gap in the country.

OBJECTIVES: To evaluate appropriateness of prescribing medicines using Beers criteria 2003 and 2012 and determining predictors of potentially inappropriate medications (PIMs) prescribing in elderly in-patients. **METHODS:** Cross-sectional study was conducted at public hospital and baseline data were collected. Elderly in-patients from medicine wards (≥60 years) were included. Multivariate logistic regression analysis was used to determine the predictors of PIMs prescribing. **RESULTS:** A total of 500 patients were recruited during I year of study period;60% were males and 66% were between 60-69 years of age with mean (SD) of 68 (7) years. Mean (SD) number of diagnoses and medications were 3 (1) and 9 (4), respectively. 81 (16%) patients were prescribed with at least ≥1 PIMs according to modified AGS updated Beers criteria 2012, compared to 11% according to Beers criteria 2003. On multivariate regression, important predictors for the PIMs prescribing were found to be age ≥80 years (Odds Ratio (OR) 2.46, 95% CI 1.27-3.12; $p = 0.03$), male gender (OR 1.35, 95% CI 1.06-1.84; $p = 0.03$), more than 3 diagnoses (OR 2.47, 95% CI 1.59-3.39; $p = 0.04$), ≥6 medications prescribed (OR 1.16, 95% CI 1.02-1.35; $p = 0.03$) and ≥10 days of hospital stay (OR 1.59, 95% CI 1.09-2.31; $p = 0.02$). **CONCLUSIONS:** Results indicate that PIMs prescribing is common among hospitalized Indian elderly patients. It is feasible to reduce this practice through provision of appropriate unbiased information to health care professionals. Beers criteria is a well established method for evaluating prescribing appropriateness. Results also show the capture of more number of PIMs through the use of Beers criteria 2012 due to the addition of new medications in the list like spironolactone in heart failure and removal of capping of maximum dose of alprazolam, clonazepam and lorazepam from Beers criteria 2003.

HEALTH CARE USE & POLICY STUDIES – Equity and Access

PHP10

ANALYSING THE ACCESS TO PRIORITY HEALTH SERVICES IN THE ADOLESCENT POPULATION IN SIX PROVINCES IN NORTHERN ARGENTINA

Maceira D
Center for State and Society Studies (CEDES), Buenos Aires, Argentina

OBJECTIVES: Adolescents present particular issues that may condition their health and life, this turns adolescents' health into a priority. To identify the barriers that hinder the access to health by adolescents in order to contribute to the design, orientation and formulation/reformulation of public policies. **METHODS:** We implemented a self-administered to 5200 secondary public school students in the northern provinces of Argentina, Jujuy, Misiones, Tucumán, Santiago del Estero, Catamarca and Chaco. On the other hand, we developed in-depth interviews to local referents (Ministries of Health, Education, Social Development, etc). Descriptive statistics techniques were then applied, together with econometric analysis and qualitative techniques of interviews analysis. **RESULTS:** We identified differences regarding priorities and policies oriented to the adolescent population in the six provinces. With regard to the teen gaze, 87% of students rate their health as "very good or good", only half of those reporting a health problem consulting the system. Their concerns are linked to arguments and emerging problems of their age. "Having to wait long to be attended" and "difficulty to get an appointment" are the main barriers they face when accessing to the system. **CONCLUSIONS:** The definition of access ceases to be necessarily linked with aspects of physical capacity or clinical care, but with the system's ability to orient the question and channel the concerns of young people with social problems related to health.

PHP11

URBAN HEALTH NETWORKS AND PERINATAL HEALTH RISK IN ARGENTINA

Maceira D
Center for State and Society Studies (CEDES), Buenos Aires, Argentina

OBJECTIVES: Urban Health Care Networks become a strong limitation to guarantee efficient and equitable access, especially in developing countries. Lack of formal protocols in referral procedures, insufficient coordination among levels of care and limited coordination in human resources across health care system allows duplication of clinical studies, informality in the decision-making process within the network, and higher-than-expected health risks, affecting existing financial protection mechanisms. In particular, perinatal health care networks involve the analysis not only of clinical performance in hospitals and health care centers, but also the ability to improve mothers' behavior during pregnancy, by applying safe preventive care procedures. This study analyzes two mayor public hospitals in the Province of Buenos Aires, Argentina, searching for quality of referral procedures **METHODS:** The descriptive and logistic analysis identifies three sets of variables: mother's background and risk factors, pregnancy characteristics and supply-side infrastructure. Using an original database on birth attendance at the hospital head-of-network (Perinatal Information System, designed by the World Health Organization) of circa 16,500 births, as well as structured questionnaires distributed among human resources in both hospitals, the study allows to identify hospital ability to manage network risks, failures arising from the health care system and join responsibilities between formal health care system and the family. **RESULTS:** The study allows the definition of two sets of observations based on number of medical controls during pregnancy, offering the chance of additional comparisons of explanatory variables by including test of differences in mean values. **CONCLUSIONS:** Results show the presence of multiple failures in urban health care networks, with specific risk factors teenage pregnancy and distance to formal health services affecting hospitalization rates, newborn risks and counter-reference behavior.

PHP12
¿LOS FORMULARIOS NACIONALES (CUADROS BÁSICOS) PROVOCAN OLIGOPOLIOS E INCENTIVAN A TENER PRECIOS ALTOS?
Lechuga D
ITAM, México D.F., Mexico
OBJECTIVOS: Demostrar en base a un modelo económico de oligopolio que los formularios provoca oligopolios e incentiva a mantener precios altos. **METODOLOGÍAS:** Los formularios son una barrera a la entrada al mercado que desincentiva la competencia. Los medicamentos patentados no son sujetos a competencia directa por precio, por lo tanto son sujetos a competir conforme a un modelo de Cournot. Este modelo se basa en que los competidores pelean el mercado por cantidades. Los productos patentados no son sujetos a licitación si no a adjudicación directa. Se toma como supuesto que hay un "*n*" número de competidores en los formularios nacionales, siendo "N" el número total de competidores, cada una con un producto que vende a un precio "P". Los competidores toman decisiones al mismo tiempo. La demanda del mercado está dada por $P(Q) = a - bQ$, siendo "Q" la sumatoria de todas las producciones. Hay "X" número de competidores que están fuera del formulario nacional. **RESULTADOS:** El precio del productor dependerá, principalmente, de "Q" y de "N". Si incrementa "Q", y "N" constante, entonces se incrementan los precios. Si incrementa "N", y "Q" constante, bajan los precios. Si no existieran los formularios nacionales, no habría barreras a la entrada y la competencia incrementaría en "X" que provocaría un menor precio. Si "N" tiende al infinito, entonces el modelo tiende a la competencia perfecta. En un caso donde solo un producto ha logrado el acceso al formulario nacional formará monopolio. **CONCLUSIONES:** Las barreras a la entrada causada por formularios nacionales mantendrán precios altos hasta que un nuevo competidor sea incorporado al formulario. Entre mayor sea el número de oferentes se incrementará la competencia y menor será el precio. Se recomienda analizar los beneficios de los formularios nacionales y explorar otros métodos de reembolso como pagar por el desenlace en salud y no por el producto en sí.

PHP14
REACHING THE MIDDLE OF THE PYRAMID: IMPLICATIONS FOR THE P&MA OF PHARMACEUTICAL DRUGS WITH THE EXPANDING MIDDLE CLASS IN BRASIL, CHILE AND COLOMBIA
Severi Bruni D[1], Vidal Pinheiro A[2], Senan Castellano B[2]
[1]*ICON, El Segundo, CA, USA,* [2]*ICON, London, UK*
OBJECTIVES: Sustained economic growth in Latin America in the last decade led to an astonishing 50% increase in the middle class. With the empowerment of an increasingly educated and wealthier population, governments have been under pressure to adapt their health care models to growing expectations for US/EU health quality standards. As a result, health care funding balance between patient Out-Of-Pocket, contributions to private health plans and public via taxation pathways is likely to be subjected to sizable shifts in the near/medium future. This work presents an outlook on the current health care financing and an analysis of potential trends and likely implications in terms of P&MA for new drugs in three case study countries (Brazil, Chile and Colombia). **METHODS:** Literature review on health care financing distribution from 2003 to 2010. Review of political and private initiatives for drug coverage. Hypothesis development on the implications in terms drug's P&MA. Primary research with payers/proxy-payers. Analyze and compare trends across countries. **RESULTS:** 1) Chile saw the lowest growth in overall HC expenditure with a clear transfer in the funding distribution from OOP to public sources (39% for both to 33% vs. 48%); 2) Brazil overall HC expenditure greatly increased (4.99 fold), and since 2005 a moderately sustained transfer from OOP to public funding have been occurring (from 38.6% and 40.1% to 31.6% and 47% in 2010); 3) In Colombia, funding is dominated by public spending (74.6%) but OOP expenditure has seen the highest growth; 4) HTAs are increasingly involved in drug P&R decisions. **CONCLUSIONS:** Latin American countries are likely to further accommodate 'hybrid' systems for health care financing. However, as Governments are required to make decisions for funds allocation, there is increasing need for sophisticated tools for drug evaluation and decision making. Increasingly robust HTA agencies are expected to be created, implying downward pressures on price pressures and increased evidence requirements.

PHP15
INTEGRACIÓN DE UN MARCO CONCEPTUAL PARA LA EVALUACIÓN DE LA CALIDAD DE SERVICIOS FARMACÉUTICOS HOSPITALARIOS ENFOCADOS A LA MEJORA DE LA FARMACOTERAPIA
Diaz de León-Castañeda C, Reyes-Morales H
Instituto Nacional de Salud Pública, Cuernavaca, Mexico
OBJECTIVOS: En el contexto de la incorporación del profesional farmacéutico en el ámbito hospitalario del sistema de salud mexicano, el objetivo fue integrar un marco conceptual para la evaluación de la calidad de servicios farmacéuticos hospitalarios enfocados a la mejora de la farmacoterapia (SMF's). **METODOLOGÍAS:** Se utilizó el marco conceptual de Donabedian para la evaluación de la calidad de la atención médica como un marco de referencia para el desarrollo del marco conceptual de evaluación de la calidad de SMF's. Asimismo, se utilizó el marco conceptual para la identificación, denominación y categorización de acontecimientos adversos a los medicamentos (AAM). Dentro de las dimensiones de estructura, proceso y resultado se adicionaron diferentes tópicos y variables importantes relacionadas con estas dimensiones. Adicionalmente, se realizó un estudio piloto utilizando metodología cualitativa para evaluar la calidad de SMF's de algunos hospitales públicos y privados de México, que consistió de entrevistas en profundidad a jefes de unidades de farmacia hospitalaria o clínica de algunos hospitales públicos o privados de México. Las entrevistas se transcribieron y analizaron utilizando una aproximación a la metodología de teoría fundamentada. **RESULTADOS:** Se integró un marco conceptual para la evaluación de calidad de SMF's que puede abordarse desde diferentes perspectivas metodológicas (cuantitativas o cualitativas). El estudio cualitativo piloto permitió utilizar el marco conceptual desarrollado e identificar aspectos importantes de estructura, proceso y resultado relacionados con la calidad de SMF's, como la calidad de las instalaciones e infraestructura, la presencia y calidad de programas de capacitación, el apoyo de las autoridades del hospital, la aceptabilidad de los servicios por otros profesionales de la salud, el clima laboral y la satisfacción de los recursos humanos. **CONCLUSIONES:** El marco conceptual desarrollado permite fundamentar la evaluación de la calidad de SMF's. El abordaje cualitativo realizado permitió identificar aspectos clave en las dimensiones de calidad.

AUDIT OF THE COVERAGE DECISION-MAKING PROCESS IN A GOVERNMENT AGENCY IN URUGUAY: FROM THE GUIDELINES TILL THE PATIENTS
Garcia Marti S[1], Pichon-Riviere A[2], Aruj P[3], Glujovsky D[4], Bardach A[5], Rodríguez A[6]
[1]*Institute for Clinical Effectiveness and Health Policy, Buenos Aires, Argentina,* [2]*Institute for Clinical Effectiveness and Health Policy (IECS), BUENOS AIRES, Argentina,* [3]*OSDE, buenos aires, Argentina,* [4]*Institute for Clinical Effectiveness and Health Policy (IECS), CABA, Buenos Aires, Argentina,* [5]*Institute for Clinical Effectiveness and Health Policy (IECS), Buenos Aires, Argentina,* [6]*Fondo Nacional de Recursos, Montevideo, Uruguay*
OBJECTIVES: The National Resources Fund (FNR) is a government agency devoted to provide coverage of high cost technologies in Uruguay. A particular characteristic of the FNR is being involved in the whole process of providing access to these technologies, from its buying to its patient administration. To guide this process the FNR, has some clinical coverage guidelines that are used in the clinical coverage decision with each individual patient. During 2009 and 2012 the FNR did an audit process of these guidelines and asked IECS (a non profit academic organization) from Argentina to implement it. To present the process were 12 of these guidelines were audited (colorectal, kidney, CNS and breast cancer, leukemias, cystic fibrosis, hepatitis C, diabetes, palivizumab and rituximab, rheumatoid arthritis and multiple mieloma) and the coverage decision taken on patients with the corresponding diseases. **METHODS:** Systematic bibliographic searches were performed to audit the guidelines and the clinical record of patients with the corresponding diseases was audited summarizing 200 patients in total. **RESULTS:** Regarding the guidelines it was observed that in general there were adequate in its clinical content and updated with the actual evidence promoting a better clinical decision coverage process. Only some reporting aspects as date of bibliographic searches not reported or not clear specification of authors or methodology followed were mentioned. Regarding the patients audit, in 198 cases the decision was in concordance with the guideline being adequate in almost all the cases. **CONCLUSIONS:** An audit process of the coverage decisions implemented in a government agency by an external organism as the one described in this study allows to identify potential improvements to the process, promotes transparency and at the end a better coverage decision-making process and utilization of health resources.

PHP17
DETERMINANTES DE LOS COSTOS DE ACCIDENTES DE TRÁNSITO OCURRIDOS EN MEDELLÍN (COLOMBIA) 2009-2010
García García HI, Lugo Agudelo LH, Castro García PA, Cano Restrepo BC, Vélez Jaramillo DA
Universidad de Antioquia, Medellín, Colombia
OBJECTIVOS: Estimar los determinantes de los costos hospitalarios, de rehabilitación y del paciente en personas lesionadas en accidentes de tránsito en Medellín entre 2009-2010. **METODOLOGÍAS:** Estudio de corte transversal con 375 pacientes con lesiones moderadas y graves, según el New Injury Severity Score (NISS), a quienes se les aplicó una encuesta en el momento del accidente, 3 y 6 meses después. Para estimar los costos de las lesiones se asumió una perspectiva que consideró los costos médicos, del paciente y pérdidas asociadas a la productividad. Los costos médicos se valoraron por medio de los precios de los medicamentos suministrados y las intervenciones realizadas en hospitales de alta complejidad de la ciudad; y los costos del paciente según el salario reportado por él mismo. Se estimó un modelo lineal generalizado relacionando el costo total con las variables edad, sexo, tipo de vehículo, presencia de alcohol, utilización de elementos de seguridad, localización de la lesión, rapidez en la atención y condición del accidentado, identificadas en la revisión de la literatura y clasificadas en determinantes estructurales y próximos. **RESULTADOS:** El 80% de los pacientes eran hombres y de éstos el 71% tenían entre 21 y 40 años. El costo promedio de atención por paciente fue de USD 8.509. El costo de los materiales e insumos representa el 33% del total, seguido por los costos de los medicamentos con 20% y el de hospitalización con 18%. El costo asociado al uso de motocicleta representó el 80% de los costos totales. **CONCLUSIONES:** La edad, el sexo, el tipo de vehículo y la condición del accidentado se encontraron como determinantes fundamentales del costo de atención. La presencia de alcohol y la utilización de elementos de seguridad no representaron la carga esperada debido, tal vez, al sesgo en la información suministrada por los entrevistados.

PHP18
FATORES ASSOCIADOS À COMPRA DE MEDICAMENTOS EM BRASÍLIA: UMA ANÁLISE ECONOMÉTRICA COM DADOS TRANSVERSAIS DE BASE POPULACIONAL
Andrade CHCD[1], Wichmann RM[2], Galvao TF[3], Pereira MG[4], Silva MT[2]
[1]*Universidade Federal do Rio Grande do Sul, Porto Alegre, Brazil,* [2]*Brazilian Ministry of Health, Brasilia, Brazil,* [3]*Federal University of Amazonas; University of Brasilia, Brasilia, Brazil,* [4]*University of Brasília, Brasilia, Brazil*
OBJETIVOS: Investigar os fatores associados à compra de medicamentos pela população adulta de Brasília. **MÉTODOS:** Estudo transversal com aplicação de questionário em pessoas entre 18 a 65 anos, selecionadas por meio de amostragem probabilística em dois estágios, com cotas por sexo e idade, para obter representatividade para o Distrito Federal. Calculou-se tamanho amostral considerando nível de confiança de 95%, margem de erro de 2,5% e frequência de utilização de medicamentos em 50%. Foram entrevistadas 1852 pessoas no primeiro semestre de 2012, sendo obtidos dados sociais,

demográficos e econômicos, presença de doenças crônicas, qualidade de vida e a forma de aquisição de medicamentos nos últimos sete dias. Um total de 20% das entrevistas foram auditadas por telefone quanto a sua autenticidade. O projeto foi aprovado pelo Comitê de Ética em Pesquisa da Universidade de Brasília. Para identificar e avaliar os determinantes da compra de medicamentos utilizou-se três métodos distintos, Logit, Probit e Probabilidade Linear, para elevar a robustez dos resultados. Realizaram-se as análises econométricas através dos programas Gretl e R. **RESULTADOS:** Um total de 1.820 entrevistas válidas, dos quais 59,8% eram mulheres. Foram identificados os potenciais determinantes do consumo de medicamento no DF: classe social, qualidade de vida, doenças crônicas, sexo, idade, plano de saúde e consultas médicas. **CONCLUSÕES:** Ter doenças crônicas, ser do sexo feminino, ser mais velho, possuir plano de saúde e ter se consultado elevam as chances de comprar medicamentos. Por outro lado, pertencer às classes sociais mais baixas e ter melhor qualidade de vida reduz essa chance. Os resultados foram qualitativamente equivalentes nos três métodos, além de apresentarem significância estatística próximos de 5%. É possível que os achados estejam influenciados pelo viés de suscetibilidade dos sujeitos de pesquisa e de prevalência/incidência da compra de medicamentos. Entretanto, como diversas características não são influenciadas pelo tempo, a validade da informação não é afetada.

PHP19

ANÁLISIS DEL GASTO SANITARIO ESPAÑOL 1980-2010

Crespo C, Brosa M

Oblikue Consulting, Barcelona, Spain

OBJECTIVOS: Ilustrar una metodología de distribución del presupuesto sanitario público entre las 17 categorías CIE-9-MC (Clasificación Internacional de Enfermedades, novena revisión, modificación clínica) y su evolución en el tiempo. **METODOLOGÍAS:** La metodología consta de dos fases: una primera fase en la que se realiza una distribución del presupuesto global por tipo de atención sanitaria (atención hospitalaria, ambulatoria o farmacológica), y una segunda fase en que se distribuye el gasto por tipo de atención entre las categorías CIE-9-MC. Para esta distribución se utilizan, en la primera fase, informaciones que permitan asignar las diferentes partidas del presupuesto a los distintos tipos de atención. Por lo que respecta a la distribución por categorías, se utilizan diferentes elementos según el tipo de atención: la estancia hospitalaria, la visita ambulatoria o el consumo farmacéutico por subgrupo terapéutico. Se utilizan los datos del gasto sanitario en España con propósitos ilustrativos. **RESULTADOS:** El análisis del gasto sanitario español entre 1980 y 2010 muestra que la posición relativa en cada ámbito no varía demasiado, dominando la atención hospitalaria (58%) en el ámbito público y la atención ambulatoria (33%) en el privado. La asistencia farmacéutica incrementa su posición relativa tanto en el ámbito privado como en el público, 2,5 puntos porcentuales en los dos casos. De análisis de las 17 categorías CIE-9-MC, cabe destacar el crecimiento continuo e importante de la categoría VII (enf. del aparato circulatorio, de 10% en 1980 al 17,7% del gasto en 2010) y el decremento de la categoría VIII (enf. Respiratorias, del 17,4% al 10,5%). En un segundo término también cabe destacar el crecimiento de la categoría II (tumores, del 4,2% al 9,1%) y de la categoría I (infecciosas, del 5,2% al 2,31%). **CONCLUSIONES:** La distribución del presupuesto aporta un punto de referencia para la planificación y la gestión sanitarias.

PHP20

IS HOSPITALIZED MULTI-MORBIDITY IN ADULTS DETERMINING COSTS OF RE-ADMISSION? EVIDENCE FROM A MULTICENTRIC CROSS SECTIONAL STUDY IN ARGENTINA

Insua JT[1], Villalon R[1], Giunta D[2], Ioli P[3]

[1]*Hospital Universitario Austral, Universidad Austral, Derqui, Argentina,* [2]*Hospital Italiando de Buenos Aires, Caba, Argentina,* [3]*Hospital Privado de la Comunidad, Fundacion Medica de Mar del Plata, Mar del Plata, Buenos Aires, Argentina*

OBJECTIVES: Multi-morbidity (MM) and readmissions in less than 30 days (ReH) require standarized data, diffficult for Argentina. To measure the economic implications, we evaluated if MM determined direct medical costs of ReH. **METHODS:** In cross sectional study of 1 year hospital discharges (*Value in Health;14 (2011):A18*), of patients ≥19 yrs old, primary diagnosis (Dx1) and secondary diagnosis (Dx2), total costs (CT$) mean and median per discharge cost ($, 25P-75P-percentiles), in international dollars PPP, (UN Data: 1Arg$ = 1.608 I$ PPP, 2008) were obtained. To measure of multi-morbidity (MM) we used chronic conditions table in (CC+) counts as positive (CC+) per 2Dx. The 30day readmissions (ReH<30) defined as: 1) any readmission within 30 days and 2) the number of stays with at least one subsequent hospital stay within 30 days(strict definition) (ReH_s). **RESULTS:** In a universe of 45466 discharges, we found 7286 ReH <30 d among adults (≥19 yrs old). Total cost of ReH TC$ 68 145 431I$; mean cost per discharge ($) was 9629 I$ (SD I$ 23 344); Median cost per discharge 4211 I$; (Q1: 1755 -Q3:9291 I$), taken as baseline values for ReH (ReH_s is N= 6018; with I$ of 10 600 -SD I$ 25271) . Stratified against MM as 2Dx1, N=3357, mean discharge cost was I$ 10823 (SD I$ 24005); 1,12 times the value of all ReH. MM at 2Dx5, N=718, I$ 16538 (SD I$ 36839); 1,72; and when MM was in 2Dx8, N=137, I$ 18785 (SD I$ 34764); 1,95 times baseline (*p trend <0.01*). ReH_s reduce total number of readmissions and produce slightly higher costs (full data not shown), e.g. in MM of 2Dx8, ReH_s is N=130, mean discharge cost I$ 19 052 (SD I$ 35591); 1,80 times baseline. **CONCLUSIONS:** This first estimate of ReH<30 costs, sensible duration, and demonstrates impact of multi-morbidity (MM) with the method used.

PHP22

ANÁLISIS DE MINIMIZACIÓN DE COSTOS DE IOBITRIDOL VERSUS OTROS MEDIOS DE CONTRASTE IODADOS ISO E HIPO-OSMOLALES EN POBLACIÓN GENERAL

Simbaqueba E[1], Huerfano L[1], Uriza LF[2], Romero M[1]

[1]*Fundacion Salutia, Bogotá, Colombia,* [2]*Hospital Universitario San Ignacio, Pontificia Universidad Javeriana, Bogotá, Colombia*

OBJECTIVOS: Desarrollar una evaluación económica del uso de iobitridol en la toma de imágenes diagnósticas versus otros medios de contraste iodados similares (seguridad y tolerancia). **METODOLOGÍAS:** Dada la no superioridad ni inferioridad, encontrada en la literatura, de los medios de contraste iodados iso e hipo-osmolales, se realizó una evaluación económica de iobitridol mediante un análisis de minimización de costos, que incluye costos de insumos y recursos utilizados en la realización de urografía, angiografía y escanografía. Para el desarrollo de la evaluación se utilizaron los siguientes medios de contraste: iodixanol, iobitridol, iopamidol, iohexol, ioversol e iopromide, en todas las concentraciones de yodo disponibles en el mercado en Colombia. Los resultados se analizaron para pacientes con peso entre 5-110 kg tomando como referencia de uso la dosis promedio de Yodo para cada uno de los tres exámenes analizados. Se realizó un análisis de sensibilidad univariado de +/- 20%, en los costos de las tecnologías. **RESULTADOS:** Para urografía, en el 64% de los casos analizados resultó ahorrativo el uso de iobitridol 300 mg/ml, presentando un ahorro de COP$ 4.121 por examen per cápita. Para angiografía, el uso de iopamidol de 370 mg/ml es ahorrativo en el 55% de los pesos (kg), frente al 45% con iobitridol de 300 mg/ml, con un ahorro de 3,44% por examen. Finalmente para escanografía, iobitridol de 300 mg/ml se presenta como la tecnología con más frecuencia de ahorro en los pesos (kg) de los pacientes, mostrando un ahorro de 2,87% por examen. El análisis de sensibilidad muestra consistencia del ahorro del uso de iobitridol 300 mg/ml e iopamidol 370 mg/ml. **CONCLUSIONES:** El análisis de minimización de costos muestra a iobitridol e iopamidol como tecnologías que generan ahorro en urografía, angiografía y escanografía, en concentraciones de 300 mg/ml y 370 mg/ml respectivamente, dependiendo del peso del paciente.

PHP23

DRUG DISTRIBUTION STRATEGIES COST IN BRAZIL

Carraro WH, Mengue SS, Haddad EW

Universidade Federal do Rio Grande do Sul, Porto Alegre, Brazil

OBJECTIVES: This research aims to verify the total costs of the medicines that are dispensed by pharmacies of the Brazilian Public Health System (SUS) and that are also part of the *Aqui tem Farmácia Popular* program (PAFP). This program is characterized by the powerful link between the government and the private pharmacies which provide medicines for free or by co-payment for the population. This work also seeks to draft a comparative analysis between the two distribution forms of the drugs. **METHODS:** The direct cost was obtained from the amounts showed on the county purchase invoices. The indirect cost was identified as a result of a field survey. The sampling selection of visited counties was based on a - non- probabilistic - scenario analysis approach from quality criteria and distributed in each of the five country's regions. Collection was performed by completing a semi-structured spreadsheet, by documentary analysis and by participant observation. Data collected correspond to the expenses incurred during 2011. **RESULTS:** The value of the medicines bought by a private pharmacy it is significantly higher than the one paid by the SUS pharmacy. It is considered as possible explanations of differential of the direct cost between two purchases origins some additional elements that elevate the cost of the private pharmacy regarding the one from SUS: purchases volume, purchase frequency, presentation, additional costs as logistics, type of packing, costs related to the certification of good production practices. **CONCLUSIONS:** From the comparative analysis of the SUS pharmacy total cost with the value funded by the Ministry of Health for PAFP medicines, it was possible drawing a comparative with the analyses provided in the National Accounts Tribunal (TCU) audit report. It was observed that the variance shown in the TCU audit report indicates a significant difference between the assessed results in this demonstrative.

PHP24

ECONOMIC BURDEN OF INPATIENT POST-ADMISSION DEHYDRATION – RETROSPECTIVE DATABASE ANALYSIS IN US

Pash E, Hashemi L, Parikh N

Covidien, Mansfield, MA, USA

OBJECTIVES: To compare costs and resource utilization of patients experiencing post-admission dehydration (PAD) to those who do not experience PAD. **METHODS:** All adult inpatient discharges excluding those with suspected dehydration present on admission (ICD-9-CM codes for dehydration: 276.0, 276.1, 276.5X present on admission) were identified from the Premier database(CY2011). Patients with missing information on important variables were excluded. PAD patients were identified using ICD-9-CM codes. PAD and no PAD(NPAD) groups were matched on propensity score adjusting for demographics (age, gender, race, medical, elective patients), patient severity (APR-DRG severity scores) and hospital characteristics (geographic location, bed-size, teaching and urban hospital). Costs (total and departmental), days of stay in hospital(LOS), incidence of mortality and Catheter-Associated Urinary Tract Infection(CAUTI) were compared between groups using t-test for continuous variables and chi-squared test for categorical variable. Sub-groups of medical and surgical population were also matched and analyzed separately. **RESULTS:** Total of 86,398(2.1%) of all the selected patients experienced PAD. Post-matching mean total cost were significantly higher for the PAD group compared to NPAD group($33,945 vs. $22,380, p<0.0001). Mean costs associated with room & board, central supply, surgery, pharmacy and other miscellaneous departments were also significantly higher for PAD group(all p<0.0001). Compared to NPAD group, PAD group had higher mean LOS days(12.9 vs. 8.2) and also had a higher incidence of CAUTI(0.6 vs. 0.5%) and in-hospital mortality(8.6% vs. 7.8%) (all p<0.05). The results for sub-group analysis were also significant for total costs(Medical patients: $22,065 vs. 15,700; Surgical patients: $45,728 vs. $32,091) and LOS days(Medical patients: 11.4 vs. 8.3; Surgical patients: 17.8 vs. 11.4) (all p<0.05). **CONCLUSIONS:** PAD has a potential to add significant burden to hospital costs and resources. Adopting strategies aimed at avoiding PAD may help in reducing hospital cost and resource burden and may improve patient outcomes.

PHP26

CRESCIMENTO DE ÓBITOS PÓS PARTOS CESARIANOS NO BRASIL VERSUS PARTOS NORMAIS

Drago S[1], Ferreira CN[2], Salles GRD[3], Paloni EDMP[2], Santana CFSD[3], Souza C[1], Bonachela P[4], Abreu AA[1]

[1]*ORIZON, Sao Paulo, Brazil,* [2]*ORIZON - Companhia Brasileira de Gestão de Serviços, Sao Paulo, Brazil,* [3]*Orizon, Sao Paulo, Brazil,* [4]*Orizon, SAO PAULO, SAO PAULO, Brazil*

OBJETIVOS: Identificar o crescimento de mortes em partos cesarianas no Brasil e compara-las com a quantidade de mortes em partos normais. **MÉTODOS:** Foram analisados um banco de dados com 16 milhões de vidas pertencentes à hospitais particulares existentes no Brasil (amostra de 35% do mercado) e analisado a quantidade de óbitos pós partos e o tipo de parto realizado todos identificados pelo CID-10. **RESULTADOS:** Dado a tendência brasileira o número de partos no Brasil é inversamente proporcional a orientação da Organização Mundial de Saúde (15% para partos cesarianos e 85% partos normais) a média nacional, de acordo com o Sistema de Informações de Nascidos Vivos (Sinasc), do Ministério da Saúde, é de 52,2% e além desta tendência nacional verificamos que o número de mortes ocorridas pós partos é proporcionalmente maior nas cesariana, além de ter crescido cerca de 135% nos últimos 3 anos, sendo que em 2012 o número de mortes foi 186% maior do que as mortes em partos normais. **CONCLUSÕES:** Este estudo é um alerta as organizações de Saúde Brasileiras quer seja do ambiente particular quanto público, tanto aos elevados números de cesarianas que vem aumentando a cada ano quanto ao riscos deste procedimentos tanto para a mãe quanto para o feto. Devendo ser levado em consideração outros fatores de custos indiretos como tempo de recuperação.

PHP28

HOUSEHOLD FEEDING PRACTICES FOR THE SICK UNDER FIVE CHILDREN; GUCHA SOUTH DISTRICT-KISII COUNTY, KENYA

Mogere DM

Great Lakes University of Kisumu, Kisumu, Kenya

OBJECTIVES: To examine feeding practices among households with under five sick children. **METHODS:** Household baseline survey was carried out in June 2012 where 10 sub locations randomly selected were surveyed. A structured questionnaire was administered to 983 households with under fives . Mid-Upper-Arm-Circumference tapes were administered to under fives, growth monitoring and immunization cards were also examined. **RESULTS:** Fifty-six percent (550/973) fed the sick child less than usual, 14% said a child with diarrhea should not be given anything , 64% said child should not be given ORS, only 8% said sick child should be given soup and water and 13% said child should be given breast milk. After taking MUAC tape measurements 6% could be classified under severely malnourished category. 50% did not have growth monitoring cards and only 45% of the eligible children were currently being breastfed. Level of education of the mother did not seem to influence breast feeding practices, more than three quarters of the widows were not currently breastfeeding, while only 27% of salaried, 38% business and 46% farmers women were currently breast feeding. Catholic women were leading in currently breast feeding mothers with 80% followed by Seventh day Adventist -43%, Indigenous Churches - 42% and Anglican -40% respectively. **CONCLUSIONES:** Majority of the households seem to be burdened with child hood sickness. It is worrying that a significant proportion of 64% of the respondents said that a child with diarrhea should not be given ORS. Probably majority of the households do not know how to manage diarrhea among children at home. Significant proportion of the breast feeding children whose mothers were engaged in salaried and business employments are disadvantaged because they are not being breast fed. Catholic women recorded highest level of breast feeding practices compared to their counterparts in other religious affiliations.

PHP29

SOCIETAL UNMET NEEDS IN BRAZIL: EXAMINING PREVALENCE, TREATMENT RATES, AND HEALTH OUTCOMES

de Renteria J[1], DiBonaventura M[2], Suponcic S[2], Pomerantz D[2]

[1]*Kantar Health, Munich, Germany,* [2]*Kantar Health, New York, NY, USA*

OBJECTIVES: To examine how unmet needs, defined as prevalence rates, treatment rates, and quality of life, compare across the ten most common conditions in Brazil. **METHODS:** Data were obtained from the Brazil 2011 and 2012 National Health and Wellness Surveys (NHWS; N=24,000). The Brazil NHWS is a self-reported nationally representative patient survey of the adult Brazilian population (aged 18+), weighted to correct for any socioeconomic sampling bias. Among the 10 most prevalent conditions in Brazil, prevalence, treatment rates, and health utilities (using the SF-6D algorithm from the Short Form-12v2) were examined. **RESULTS:** Of the conditions respondents reported being diagnosed with, eight had prevalence rates greater than 15% (only restless leg syndrome (RLS) at 4.74% and arthritis at 4.25% were not among the top ten conditions). Despite these prevalence rates, only patients with hypertension (treatment rate=68.48%) reported a treatment rate greater than 50%. The remaining treatment rates generally varied between 19.30% (insomnia) and 40.47% (high cholesterol); patients with RLS reported the lowest treatments rates of all the top ten conditions (1.93%). Indeed, many of the debilitating conditions with respect to health utilities had particularly suboptimal treatment rates: depression (health utilities=0.606; treatment rate=39.00%), anxiety (health utilities=0.639; treatment rate=23.88%), and insomnia (health utilities=0.640; treatment rate=19.30%). **CONCLUSIONS:** Despite high prevalence rates for a variety of chronic conditions, treatment rates in Brazil are particularly poor. One of the exceptions was hypertension, which may be related to the Farmacia Popular do Brasil, which allows for the free distribution of medicines for hypertensive and diabetic patients. However, many conditions, particularly psychiatric ones, were associated with both poor treatment rates as well as significant decrements in health utilities. From a public health perspective, more emphasis should be placed on the importance of proper chronic disease management in Brazil.

PHP30

HEALTH SEEKING BEHAVIOR AMONG MEMBERS OF THE HOUSEHOLDS; CASE OF GUCHA SOUTH DISTRICT, KISII COUNTY, KENYA

Mogere DM

Great Lakes University of Kisumu, Kisumu, Kenya

OBJECTIVES: To investigate health seeking behavior among households with sick persons. **METHODS:** Household baseline survey was carried out in June 2012 where 10 sub locations randomly selected were surveyed. A structured questionnaire was administered to heads of households. **RESULTS:** A total of 1427 households were surveyed. Questionnaire response rate was 83%. Thirty six percent (423/1181) of the respondents said they had at least one member of the household experienced sickness two weeks prior to the survey. Of those who were sick 15% did not seek treatment anywhere, 45% were still sick and 16% had been sick for more than two weeks. Sixteen percent of those who sought care took more than one hour to travel to the facility. Malaria, ARI, pregnancy related, diarrhea, Aids related and flu were mentioned to be the most common diseases the sick were suffering from. Sixty percent (681/1137) of the household heads said they were not aware of any community based referral system for the sick, 66% (467/710) of those who knew about it said a community health worker should identify a sick person in the household and initiate the referral process to a health facility. A total of 26% said the health facility should initiate and facilitate the referral process from the household while 3% mentioned of self referral to the facility for care when one is sick. **CONCLUSIONS:** Despite household members' knowledge on the diseases they were suffering from, a significant proportion did not seek treatment in health facilities even when they had been sick for more than two weeks. This finding is significant as it will inform health care providers specifically those at lower levels of care to mount behavioral change activities aimed to promote early health seeking among household members.

PHP31

MODELO PREDICTIVO PARA LA IDENTIFICACIÓN TEMPRANA DE POBLACIÓN EN RIESGO DE CRONIFICAR EN UNA ADMINISTRADORA DE RIESGOS LABORALES EN COLOMBIA

Romero M[1], Marrugo R[1], Lopez S[2], Acero G[1], Vivas Consuelo D[3], Palacio D[4], Zapata C[4]

[1]*Fundacion Salutia, Bogotá, Colombia,* [2]*Universidad Javeriana, Bogotá, Colombia,* [3]*Universidad Politecnica de Valencia UPV, Valencia, Spain,* [4]*ARP SURA, Medellin, Colombia*

OBJECTIVOS: Diseñar un modelo que permita identificar de manera temprana los pacientes con riesgo de cronificación basados en un análisis predictivo a partir del gasto farmacéutico, en una administradora de riesgos laborales (ARL) en Colombia. **METODOLOGÍAS:** Se revisó el gasto farmacéutico y de atenciones en salud, 2009-2011 en una ARL, identificando los pacientes con tres o más despachos en un periodo de hasta seis meses (criterio adoptado para definir paciente crónico). Los pacientes fueron analizados en 22 grupos de enfermedad basados en la clasificación de enfermedades crónicas por prescripciones (Chronic Disease Score CDS). Éstos fueron caracterizados según variables socio-demográficas y con esta información se construyeron dos modelos de costos que predicen en el gasto total y farmacéutico. Se estimó un modelo logístico binario para predecir el riesgo de llegar a condiciones crónicas. **RESULTADOS:** Se identificaron 143.626 pacientes crónicos. Se estableció que el 5,53% de los pacientes atendidos, tiende a cronificarse. Con un ajuste global, R^2: 19,1%, se evidenció que las variables: edad, salario y número de enfermedades crónicas, generan un impacto significativo, positivo y monótono sobre el gasto médico y el farmacológico. El número de prescripciones, edad del paciente, tipo de atención y origen del siniestro, tienen un impacto positivo sobre la probabilidad de que un paciente llegue a la condición crónica. El modelo fue probado sobre los últimos seis meses de datos, mostrando una sensibilidad superior al 80%. **CONCLUSIONES:** El impacto de las enfermedades crónicas sobre el gasto total es un factor importante en el resultado económico de las ARL en Colombia. El modelo construido permitiría contar mensualmente con un índice de riesgo de cronificación de todos los afiliados, útil en la toma de decisiones, y que permitiría predecir de manera más específica el gasto total y farmacéutico.

PHP32

COMPARING QUALITY OF LIFE AND CLINICAL VARIABLES FOR THE PREDICTION OF FUTURE MEDICAL EVENTS

Rendas-Baum R, Miller K

Optum, Lincoln, RI, USA

OBJECTIVES: Despite increased recognition that quality-of-life scores correlate with health care resource use, their relative predictive value remains understudied. This study compares a well-known quality-of-life measure against comorbidity status and current medical events in their ability to predict medical events in the subsequent 6-month period. **METHODS:** Data are drawn from panels 10 (n=12,358; rounds 2/3) and 11 (n=13,944; rounds 4/5) of the Medical Expenditures Panel Survey (MEPS), collected in 2006 and 2007. The MEPS provides information obtained from medical providers on total number of medical events and conditions associated with each panel round, as well as the physical component summary (PCS) of the SF-12 (rounds 2/4), a self-reported health status survey. Three logistic regression models were used to estimate the probability of higher resource use (6+ medical events vs. < 6) in the subsequent 6 months. Model 1 included the number of comorbidities (none; 1; 2-3; 4+) and current count of medical events as independent variables. Model 2 included just current PCS, and model 3 included all predictors from models 1 and 2. **RESULTS:** Despite being simpler, model 2 (AUC=0.80, pseudo-R2=0.11) had explanatory power close than that of model 1 (AUC=0.88, pseudo-R2=0.20). Model 3 (AUC=0.90, pseudo-R2=0.24) improved slightly on model 1. Under Model 3, a 5-point lower PCS was associated with a 33% increase in the odds of having 6+ medical events in the next 6 months, an association similar to that of having two more medical events (36% increase). **CONCLUSIONS:** Our results suggest that as compared to comorbidity counts and number of medical events, PCS has a similar ability to predict having 6+ medical events in the subsequent 6-month period.

PHP34

ANÁLISIS DE COSTO-EFECTIVIDAD DE LOS PROFESIONALES DE ENFERMERIA CON EXPERIENCIA LABORAL EN UCI VERSUS SIN EXPERIENCIA LABORAL EN EL ERROR DE LA MEDICACIÓN PARENTERAL EN PACIENTES ADULTOS HOSPITALIZADOS EN UCI

Beiza C[1], Orrego N[1], Padilla MF[1], Arriagada MJ[1], Catalan J[1], Fau C[2], Nasabun V[1]

[1]*University of Chile, Santiago, Chile,* [2]*Fundacion 2020, Santiago, Chile*

OBJECTIVOS: Determinar la relación de costo-efectividad de los profesionales de enfermería con experiencia versus sin experiencia laboral en relación al error de tratamiento en la medicación parenteral y los eventos adversos asociados en el tratamiento de los pacientes hospitalizados en las unidades de cuidados intensivos (UCI). **METODOLOGÍAS:** Se utilizó un modelo de árbol de decisión de costo-

efectividad para establecer la comparación entre las alternativas: profesionales de enfermería con experiencia laboral en UCI (PECE) y profesionales de enfermería sin experiencia (PESE), las probabilidades del modelo se determinaron mediante una revisión sistemática de la literatura biomédica, la efectividad es cada evento adverso evitado (EAE), los costos de los procedimientos fueron calculados en pesos chilenos a valor actual desde el punto de vista de una institución de salud, mediante un método de microcosteo. Los datos fueron integrados en el modelo y analizados mediante el programa DATA 4.0 TreeAge, con los cuales se calculó la razón de costo-efectividad de cada una de las alternativas de tratamiento. Se realizó un análisis de sensibilidad y se calculó la razón de Costo-Efectividad Incremental (ICER) generada por una alternativa respecto de la otra. El horizonte de tiempo del análisis fue de un año, debido a esto no se utilizaron tasas de descuento. **RESULTADOS:** Los PECE son la alternativa dominante del análisis. La efectividad de los PECE fue de 85 EAE, en cambio en los PESE fue de 70 EAE. El ICER fue de $17.647 por cada EAE. El análisis de sensibilidad mostró que los resultados obtenidos son robustos. **CONCLUSIONES:** Es más costo-efectivo contratar para la atención y el cuidado de los pacientes en las UCI a PECE, aun cuando el sueldo de estos profesionales sea un 20% superior al de los PESE, ya que por cada EAE se produce un ahorro de $17.647 al sistema de salud.

PHP35

TREATMENT AND OUTCOME ANALYSIS OF RODENTICIDE POISONING IN TERTIARY CARE HOSPITAL IN SOUTH INDIA

Harika C, Pramoda K, Rohini D, Thunga G
Manipal College of Pharmacy, Udupi, India

OBJECTIVES: To analyze the treatment pattern and outcome of rodenticide poisoning in tertiary care hospital. **METHODS:** A retrospective observational study was carried out in a tertiary care teaching hospital on patients admitted due to rodenticide poisoning during the period of 2004 to 2012. All the patients who diagnosed with rodenticide poisoning were enrolled in the study. Patient data like demography, social habits, co-morbid diseases, pre-hospitalization period, type of exposure, type of compound consumed, type of treatment given and outcome were collected in case record form and analyzed. **RESULTS:** Total of 137 patients were enrolled in the study. Among them 69 (50.4%) patients were male and 68(49.6%) were female. The median age of the study population was found to be 24 (11) years. Majority of the poisoning were intentional (96%). The median pre-hospitalization period was found to be 3 (5.75) hours. Among them majority of them consumed zinc phosphide poisoning (29.2%). Treatment pattern analysis showed that majority of them received gastric lavage(48.2%), charcoal(27.7%), vitamin-k (74.5%), Fresh frozen plasma (37.2%) and N-acetyl cysteine (40.1%) as a major course of treatment. Outcome analysis showed that gastric lavage and charcoal administration was found to be beneficial as an initial course of therapy. Among the other treatment modalities N-acetyl cysteine was found to be comparatively beneficial. **CONCLUSIONS:** Gastric lavage and charcoal administration were found to increase the survival rate in the initial stages of management. N-acetyl cysteine was found to be more effective as a main course of therapy.

PHP36

MONITORING HEALTH PROCESSES IN THE REAL WORLD: AN ITALIAN POPULATION DATABASE EXPERIENCE

De Rosa M, Rossi E, Brizuela HJ
CINECA Interuniversity Consortium, Casalecchio di Reno, Italy

OBJECTIVES: To describe a functional approach of a population database for monitoring health economics, patient's outcomes and impact of new drugs. The need to use real-world data to support clinical research was the main driver for the Italian Inter-university Consortium (CINECA) to set-up a population-based patient centric database (ARNO Observatory). **METHODS:** The Italian National Health Service (NHS) is a Public Health System, providing health care assistance to all the population. Since 1987, ARNO Observatory collects and integrates administrative and clinical data for each single patient with high quality and complete information of patient demographics, NHS reimbursed drugs dispensed, hospital discharges, lab tests prescriptions. **RESULTS:** ARNO, with its patient centric approach, provides comprehensive data from a population of over 11 million of patients of a network of 32 Italian Local Health Units. Integration of administrative and clinical data is important to study patient care pathways, to evaluate appropriateness of medical prescriptions, to evaluate real world outcome and to reduce health expenditure. This patient centric approach led to the creation of disease-specific observatories such as diabetes, cardiovascular disease, osteoporosis, etc…, with access to data tailored on specific user profiles at national or local level. The aim is to examine the safety and/or effectiveness of health care products and services in the real-world by measuring performance indicators and impact of new drugs. **CONCLUSIONS:** ARNO Observatory is an important source of information able to show both economical indicators and the good practice of treatment. In particular ARNO enables Health Units and Professionals to conduct research projects on disease management, and benchmarking and it is a valid instrument for epidemiological and economic planning for decision making in Italy.

RELATIONSHIP BETWEEN FALLS AND CNS DRUGS AT A ACUTE CARE TEACHING HOSPITAL IN JAPAN

Egami K[1], Hirose M[2], Tsuda Y[1], Honda J[1], Shima H[1]
[1]*St. Mary's Hospital, Kurume, Japan*, [2]*Shimane University Hospital, Izumo, Japan*

OBJECTIVES: Central nervous system drugs (CNSDs) are commonly used at acute care settings. However, the relationship between falls and CNSDs has not been explored. This study aims to try to address the relationship. **METHODS:** We used data of CNDs prescribed for over fifteen years old in-patients in 2012. There were CNSDs including 20 benzodiazepine agents, two non-benzodiazepine agents, one barbiturate agents, and five others. With regard to CNDs, we examined duration of prescription, duration of administration, and number of patients for falls within 24 hours after immediately being administered. Falls due to CNDs administration is defined as follows: Fall rate for CNDs = number of falls / prescription days x 100. **RESULTS:** There were 344 falls including 142 cases (41.3%) with CNDs administration, and the duration of prescription were 62,622 prescription-days. From the viewpoint of length of drug effectiveness, Fall rate for CNDs were 0.16% in short-acting CNDs, 0.25% in intermediate-acting CNDs, and 0.26% in long-acting CNDs. **CONCLUSIONS:** This result suggested that long-acting CNDs were strongly related with falls. To prevent falls within a hospital, hospital personnel including nursing staff have to be educated about CNDs.

PHP38

SINGLE USE DEVICES IN ARGENTINA: ECONOMIC EVALUATION OF A "REUSE" VERSUS A "SINGLE USE" POLICY

Garay OU[1], Garcia Elorrio E[1], Rodriguez V[1], Spira C[1], Augustovski F[2], Pichon Riviere A[3], García Martí S[4]
[1]*IECS Institute for Clinical Effectiveness and Health Policy, Buenos Aires, Argentina*, [2]*Institute for Clinical Effectiveness and Health Policy (IECS), Buenos Aires, Argentina*, [3]*IECS - Institute for Clinical Effectiveness and Health Policy, Buenos Aires, Argentina*, [4]*Institute for Clinical Effectiveness and Health Policy (IECS), CABA, Argentina*

OBJECTIVES: Several medical devices are labeled for single-use only. The popularity of several "off-label" processes - re sterilization, reprocessing and reuse of single use devices (SUDs)-is mainly due to the cost saving and environmental benefits, but also from scarcity of evidence of adverse safety data. This study objective was to compare differential costs of a reuse vs. a single use policy of SUDs and estimate its implications considering 4 device types (Trocars, endo-cutters, lineal-cutters and harmonic scalpels) from a perspective of an Argentinean private health care organization. **METHODS:** A literature review was performed to identify the clinical outcomes after the use of re sterilized SUDs, which was supplemented with a Delphi-like panel to inform missing parameters. An economic model was built to estimate the cost difference between a surgical procedure performed with SUDs or with a reused sterilized SUD. Costs were expressed in USD of 2012 and were grouped in three categories: device related costs, adverse events, and the incremental surgical time associated to reuse of SUD. Deterministic and probabilistic sensitivity analyses were performed. **RESULTS:** A private health care payer in Argentina would expect to spend USD 425 per surgery if new trocars are used and USD 244 if sterilized material are utilized instead. For endo-cutters the equivalent results were USD 1667 and USD 1102, for linear-cutters USD 1228 and USD 1046 and for harmonic scalpels USD 1041 and USD 292. Results were robust in the sensitivity and scenario analysis. **CONCLUSIONS:** In all the devices and scenarios analyzed, reutilization of SUD resulted less costly than using only new material even after considering the additional cost associated with potential adverse events related to reuse. If we consider total surgical costs, these differences represent savings that range from 2.5% to 14.8%. More research is needed to assess effectiveness and safety of these off-label policies.

PHP39

SERIOUS ADVERSE EVENTS FOR BIOLOGIC RESPONSE MODIFIERS INDICATED FOR THE PROPHYLAXIS AGAINST TRANSPLANT REJECTION. AN INSIGHT FROM SPONTANEOUS ADVERSE EVENT REPORTING SYSTEM

Ali AK
Eli Lilly and Company, Indianapolis, IN, USA

OBJECTIVES: Immunosuppression by biologic response modifiers is essential for successful organ transplantation. These medications have safety concerns that complicate organ transplantation. This study aims to identify and characterize safety signals of serious adverse events associated with exposure to BRM among organ transplant patients. **METHODS:** Empirica Signal (version 7.3) was used to apply pharmacovigilance disproportionality analysis to the FDA Adverse Event Reporting System to identify serious adverse events. Associations between drugs and events were measured by Empirical Bayes Geometric mean (EBGM) and corresponding 95% confidence intervals (EB05-EB95). Associations with EB05 >1 are considered identified safety signals, and associations with EBGM ≥2 are considered significant safety signals that warrants regulatory follow up and possible actions. **RESULTS:** From Q4 1997 to Q2 2012, a total of 12,151 serious adverse event reports for biologic response modifiers were reported and 15.6% of them met safety signal threshold. About 12% of these signals were significant. Sirolimus and Mycophenolate accounted for the majority of all signals, and Antithymocyte Immunoglobulin and Cyclosporine contributed to the majority of significant signals. The following significant signals were identified for Antithymocyte Immunoglobulin (reduced therapeutic response, pulmonary edema, hypotention, serum sickness, infusion related reaction, and anaphylactic reaction); for Azathioprine (alternaria infection, fungal skin infection, and lymphoproliferative disorder); for Cyclosporine (neurotoxicity, graft versus host disease, and thyroid cancer); for Cyclophosphamide (disease progression); for Daclizumab (cytomegalovirus infection); and for Tacrolimus (coma and tremor). Approximately 34% of these events contributed to patient death; 7% were life-theratening; 32% lead to initial or prolonged hospitalization; and 28% contributed to other serious outcomes. **CONCLUSIONS:** Exposure to biologic response modifiers for the prophylaxis against transplant rejection is associated with serious adverse events that could be fatal or life-threatening. Pharmacoepidemiological studies are required to evaluate the identified signals to help understand the benefit-risk profile of these medications.

PHP40

ASSESSMENT OF ADVERSE EVENTS BY USING TRIGGER TOOLS IN SURGERY DEPARTMENT OF AN INDIAN TERTIARY CARE TEACHING HOSPITAL

Vilakkathala R, Mallayasamy S, Konduru S, Rodriques G, Manchanapalli P, Rao AB
Manipal University, Manipal, India

OBJECTIVES: An adverse event (AE) is defined as 'unintended physical injury resulting from or contributed to by medical care. A Trigger is a clue that helps a health care organization to identify adverse events. The objective of this work was to assess adverse events by using trigger tools in surgery units of the study hospital to identify AEs. **METHODS:** The study was carried in a tertiary care teaching hospital. Trigger list was developed and used to review cases (n=333). The severity of harm was categorized as per National Coordinating Council for Medication Error Reporting

and Prevention (NCC MERP) severity scale. **RESULTS:** When the list of triggers was used for the review of AE case reports, 61 triggers were identified in 167 (50.2%) cases. Transfusion / use of blood products (15%), infection of any kind (6.9%) were the commonly noted triggers in the critical care module. In the surgical module, return to surgery (6%) and occurrence of any post surgical complication (6%) were predominantly noted. In the medication module, repeated request for lab investigations (13.2%), use of laxatives (13.2%), pyrexia (10.8%), use of nebuliser/steam inhalation (7.5%), use of analgesics (6.6%) and anti-emetics (5.7%) were commonly noted. When the harm was studied category E was 24.9% followed by Category F-13.8%. **CONCLUSIONS:** The developed trigger list was able to flag 167 case profiles with potential adverse events. This tool has potential application in reviewing the cases for adverse events.

PHP41

EFFECTIVENESS OF DIFFERENT DOSAGE REGIMEN OF PRALIDOXIME IN ORGANOPHOSPHORUS POISONING IN TERTIARY CARE HOSPITAL

Thunga G[1], Pandey S[2]
[1]*Manipal College of Pharmaceutical Sciences, Manipal University, Manipal, India,* [2]*Manipal College of Pharmacy, Udupi, India*

OBJECTIVES: To identify the most appropriate dosage regimen of pralidoxime that can be recommended for the management of OP poisoning. **METHODS:** An open labeled cross-sectional, nonrandomized observational study was carried out in emergency wards of tertiary care hospital. A total of 256 OP poisoned patients were admitted between 2009 to 2013. The basic demographical, clinical characteristics and severity were assessed at admission. Based on the pralidoxime dosage regimen patients were categorized into 4 different groups viz. control, intermittent, 500mg/ hour, 1g/ hour groups. The clinical outcome analyzed in terms of hospitalization days, ventilatory days, total atropine required, and incidence of intermediate syndrome and outcome were assessed for comparison with pralidoxime regimen **RESULTS:** The results showed that majority of OP poisoned patients were in the age group of 21-30 years, and males predominated the females (2.3:1). Clinical Severity assessment of these patients showed that most of them had moderate to high severity. Outcome analysis showed that patients of continuous infusion of pralidoxime had significantly improved recovery rate with least sequel and fatality rate. The incidence of intermediate syndrome, number of ventilation days, total atropine requirement, number of hospitalization days and mortality rate significantly reduced in continuous infusion group. **CONCLUSIONS:** Continuous infusion of pralidoxime at 500 mg/hour resulted in significantly better clinical outcome than other dosing regimens and not associated with adverse derug reactions.

PHP42

ANALYSIS OF BRAZILIAN PUBLIC FUNDING PROCESS FOR NEW BIOLOGIC DRUGS

Rodrigues T, Izmirlieva M, Ando G
IHS, London, UK

OBJECTIVES: To ascertain if the Brazilian HTA body CONITEC, which replaced CITEC in December 2011, is delivering on Ministry of Health (MoH) promises of transparency and set assessment timelines whilst adopting mandatory evidence requirements for new biologic drug funding decisions via the Unified Healthcare System (SUS). **METHODS:** Secondary research based on CONITEC's final reimbursement recommendation reports, evaluating existing and sponsor submitted data. These reports include deliberations from a plenary assembly of representatives from the MoH, drug regulator ANVISA and supplementary health regulator ANS, as well as public consultation contributions. **RESULTS:** CONITEC has delivered on transparency with publications of the rationale behind each of its recommendations, thus enabling pharmaceutical firms to understand how to respond. The 180 day initial analysis phase deadline is being met but evaluation of the implementation phase timeline is premature. Out of the final recommendations published to date for biologics, about 40% correspond to a funding rejection. Biologic medicines have been denied funding from psoriasis to wet AMD due to lack of cost-effectiveness as well as efficacy and safety studies of short duration and small patient populations. The rejection of everolimus for a rare brain tumour shows that orphan drugs are not being treated differently. Positive endorsements of biologics from breast cancer to rheumatoid arthritis come with recommendations of significant price cuts and creation of clinical guidelines. **CONCLUSIONS:** Manufacturers are struggling to adjust to evidence requirements needed in supporting funding applications for new biologics, including orphan drugs. Transparency is evident in CONITEC's analysis phase but is absent after a positive recommendation, when the MoH ascertains how the medicine will be offered by SUS. Nonetheless, this is an advance compared to the CITEC process, whereby decisions were not made public and there were no clear timelines.

COSTS OF DENGUE CONTROL AND PREVENTION PROGRAM IN BRAZIL

Santos SM[1], Amorim F[2], Sousa SS[3], Ferreira IA[2], Itria A[4], Siqueira Junior JB[1], Toscano CM[1]
[1]*Federal University of Goias, Goiânia - Goiás, Brazil,* [2]*Municipal Health Department, Goiânia - Goiás, Brazil,* [3]*State Health Department, Goiânia - Goiás, Brazil,* [4]*Departamento de Saúde Coletiva do Instituto de Patologia Tropical e Saúde Pública, Universidade Federal de Goiás. Pesquisador do Instituto de Avaliação de Tecnologia em Saúde (IATS), Goiânia - Goiás, Brazil*

The burden of dengue is significant in Brazil. Between 2002 and 2010 approximately four million probable dengue cases were reported, with significant epidemics in 2002, 2008 and 2010. It is expected that a dengue vaccine, currently under phase 3 clinical trials, will reduce the number of cases, costs of the disease and costs of dengue prevention and control programs, in particular during epidemic peaks. **OBJECTIVES:** Estimate the costs of dengue control program (PMCD) in the municipality of Goiânia-GO, Brazil. **METHODS:** We conducted a retrospective analysis, considering epidemic (October/2009-April/2010), and endemic (May-September/2010) periods of dengue transmission. The public health care system perspective was considered. We considered the following cost components: human resources, training, infrastructure, equipment and office supplies, transportation, personal protective equipment (PPE), field and laboratory equipment, insecticides and social mobilization, considering capital and recurrent costs. Capital costs were estimated for both transmission periods combined. **RESULTS:** The total and monthly recurring costs of the PMCD during the epidemic period was R$8.307.590 (US$4.988.345) and R$1.400.819 (US$841.131) respectively; and in the endemic period was R$ 5.848.678 (US$ 3.511.876) and R$950.619 (US$570.805), with human resources being responsible for the majority of costs in both periods (83 and 86%, respectively). Capital costs for both periods were R$683,315 (U.S.$410,301), with a high cost share for transportation (80%) and infrastructure (13%) components. The Municipal health department was responsible for 83% of total costs, followed by state (13%), and federal (3%) levels. **CONCLUSIONS:** Although the estimated costs of the PMCD is under-estimated, we demonstrate a significant incremental costs (R$3.050,211 or U.S.$1.831.518) during the epidemic period. Our results can provide inputs for cost-effectiveness studies of dengue vaccines, which are important to support decision making regarding its introduction into public health programs.

PHP44

THE ECOLOGY OF MEDICAL CARE IN POOR SETTINGS: SELF REPORTED HEALTH CARE UTILIZATION IN SANTIAGO DEL ESTERO, ARGENTINA

Insua JT
Hospital Universitario Austral, Universidad Austral, Derqui, Argentina

OBJECTIVES: Health services utilization in poor provinces in Argentina is poorly known, due to data poor environments. We utilized a population based health care survey to analyzed the ecology of medical care, and to estimate self reported health care services utilization (SRHCU) patterns among adults (≥18 years old). **METHODS:** A health Survey was performed, with probabilistic, stratified, polyetapic sampling, adding health utilization questions to the National Risk Factor Survey of Argentina (ENFR 2009) questionnaire. We obtained SRHCU stratified as ambulatory visits, emergency, hospitalizations, stratified into age, sex, rural, urban, health status and prior health problem. Analysis was performed with SPSS 17, 95%CI for single proportions was obtained. **RESULTS:** Among 2064 persons that responded de survey, 78,9% were urban-21,1% rural, 41,2% males, mean age was 39,9% (SD 15,8) years old, age range 18-93. The General Health Status was regular or bad (16,08%) (95%CI 14,5-17,7%). Likert scale of health status provided Mean = 86,65 (SD 104,35); Median 80 (25P =70; 75P =90). Acute illness events in prior 4 weeks occurred in 24,8% (95%CI 22,9-26,7%). 70,4% had an ambulatory visit in the prior 6 months (95%CI 68,4-72,4%), while, in prior month 17,0% (95%CI 15,4-18,7%) consulted a physician office [generalist 10,36% (95%CI 9,1-11,7%) and 6,7% specialist (95%CI 5,6-7,8%)]. Office visits rate was 261 per 100 persons per year [increased with age 65+ (305), regular or bad health (458), and rurality (289), decreased for males (197)]. Emergency visits occurred in 106 persons (5,1%) (95%CI 4,18-6,09%); Hospitalization was 10,6% during prior year (95%CI 9,3-11,9%), 78% admitted once and 20% readmitted to the hospital in the same period. **CONCLUSIONS:** Results provide an estimate of SRHCU data, and show lower ambulatory and emergency visit rates, while hospitalization admissions and readmissions is similar to other ecology of medical care studies in other areas of the world.

PHP45

REVISIÓN DE ESTUDIOS DEL COSTE DE LA ENFERMEDAD

Crespo C, Brosa M, Gisbert R
Oblikue Consulting, Barcelona, Spain

OBJECTIVOS: Revisar la respuesta que aportan diferentes analistas a la pregunta: ¿qué es lo que obtenemos del sistema sanitario (SS)? **METODOLOGÍAS:** Se han revisado las propuestas de la OMS, la OCDE y el enfoque del NHS británico. También las aproximaciones de investigadores como D. Cutler y J. Puig-Junoy. **RESULTADOS:** La OMS combina diferentes dimensiones: resultados en salud, equidad, equilibrio financiero y respuesta del sistema sanitario, obteniendo un indicador de medida absoluta y proponiendo dos índices relativos de eficiencia: uno relacionado con el nivel de esperanza de vida ajustada por incapacidad y otro que valora la eficiencia del SS en general. En la OCDE consideran que debe adjudicarse la prioridad a la medición de la relación costo-efectividad. Actualmente sus esfuerzos se orientan a la búsqueda de indicadores de calidad. El tercer enfoque estudia la variación de la productividad en el seno del NHS, definida como el output obtenido en relación con los inputs utilizados. Se considera que la efectividad no puede determinarse dado el grado de incertidumbre con respecto a los efectos específicos del SS y aboga por ponderar los resultados con medidas de calidad. Cutler et al obtuvieron un valor de $19.900 como coste por año de vida ganado (C/AVG) en el período 1960-2000 en EEUU, asumiendo que el SS es el responsable de la mitad del resultado. Puig-Junoy y Merino-Castelló estudiaron para el período 1960-2001 la productividad marginal del gasto sanitario en España y obtuvieron un C/AVG entre 10.045 y 12.937. **CONCLUSIONES:** No hay consenso en cuanto al estudio de la efectividad del sistema sanitario. La indeterminación que supone la influencia de elementos ajenos al mismo en el resultado final supone un inconveniente importante. La incorporación de la calidad puede ayudar a superar, en parte, este problema.

PHP46

COMPARACIÓN DEL TRABAJO EN EQUIPO EN SALAS DE CIRUGÍA ENTRE UN HOSPITAL PRIVADO Y UNO PÚBLICO DE BOGOTÁ, D.C

Amaya Arias AC, Eslava-Schmalbach J, Barajas Sierra R
Universidad Nacional de Colombia, Bogotá, Colombia

OBJETIVOS: Determinar las diferencias del trabajo en equipo en salas de cirugía entre un hospital privado y uno público de Bogotá, D.C. **METODOLOGÍAS:** Estudio observacional analítico. *Muestra:* n= 90 equipos de cirugía, 49 de hospital privado (54%) y 41 de hospital público (46%). Criterios de inclusión: Equipos de cirugía general de hospitales de tercer nivel de complejidad de la ciudad de Bogotá, D.C.

Procedimiento: Los datos usados en este estudio hacen parte de la validación del instrumento OTAS (Observational Teamwork Assessment for Surgery) en Colombia. Una observadora experta en el OTAS ingresó a las salas de cirugía y registró los puntajes otorgados a cada subequipo (anestesiólogos, cirujanos, enfermeros e instrumentadores quirúrgicos) en cinco comportamientos (comunicación, coordinación, cooperación, liderazgo y conciencia situacional) para las tres fases quirúrgicas (pre, intra y post operatorio). Se aplicó la prueba U de Mann-Whitney, se hizo la corrección de Bonferroni para el alfa rechazando la hipótesis nula cuando el alfa era igual o menor a 0,004, manteniendo así un margen de error para el estudio de 5%. **RESULTADOS:** Se encontró que los puntajes obtenidos en el OTAS fueron diferentes en la institución privada comparada con la pública (Z=4,77; p=0,0000), al realizar comparaciones discriminadas se encontraron diferencias significativas en los subequipos de anestesiología (Z=12,17; p=0,0000), en los comportamientos de liderazgo (Z=3,56; p=0,0004) y conciencia situacional (Z=3,20; p=0,001) y en las fases pre quirúrgica (Z=4,41; p=0,0000) y post quirúrgica (Z=4,20; p=0,0000), en todos estos casos los puntajes fueron mayores en los equipos de la institución privada. **CONCLUSIONES:** Teniendo en cuenta el diseño los resultados no pueden ser generalizados. Los hallazgos sugieren una diferencia en algunas habilidades no técnicas e interacción en los equipos de salud según el tipo de institución, esto puede estar relacionado con cumplimiento de protocolos y mayor control de calidad implementados en la institución privada.

HEALTH CARE USE & POLICY STUDIES – Health Technology Assessment Programs

PHP47
APPLICATION OF HEALTH TECHNOLOGY ASSESSMENT AND PHARMACOECONOMICS IN THE DECISION-MAKING PROCESS IN SELECTED EU MEMBER STATES

Marusakova F[1], Bielik J[2]
[1]*GlaxoSmithKline Slovakia, Bratislava, Slovak Republic,* [2]*Trencin University of Alexander Dubcek, Trenèín, Slovak Republic*

BACKGROUND: The application of Health Technology Assessment (HTA) and Pharmacoeconomics (PE) into real health policies in selected European countries (Austria, Bulgaria, Croatia, Czech Republic, Germany, Hungary, Latvia, Poland, Romania, Serbia, Slovakia, Slovenia, UK) was analyzed based on the outputs from the conference "Optimalization of Methods of PE and HTA: Importance for National Health Policy and Cross-Border Cooperation" (Slovakia, 10/2012). **OBJECTIVES:** The objective of the paper was to compare the systems and to find the most transparent one based on the pre-defined criteria. **METHODS:** The primary method used for the analysis was structured evaluation of the outputs from the conference. The other relevant information resulted from the systematic review of PUBMED, EMBASE and CENTRAL in years 2011-2012 extended to official websites of public health institutions and officially published data with the objective to select all papers on HTA/Pharmacoeconomics related to selected European countries. We evaluated 9 characteristics relevant for the decision-making process: legislative background, implementation, binding force, institutionalization, qualified personal resources availability, existed methodology/guidelines, clarity of the process, patient involvement in the process, and respecting the deadline of 180 days for issuing a decision. **RESULTS:** Resulting from the analysis, of selected countries, the UK was shown to have the most transparent system. Germany and Austria ranked second. Hungary and Poland ranked third, followed by Slovakia. The least transparent system was found in Bulgaria and Romania. **CONCLUSIONS:** One of the criteria was qualified personal resources availability that immediately discriminate systems in smaller central and eastern European countries. This should result in developing tailored approaches rather than copying technocratic "western" systems. The system prepared in Romania based on multiple criteria decision analysis principle could be regarded as a positive example.

EXPERIENCIA INICIAL CON UN NUEVO TIPO DE DOCUMENTO DE EVALUACIÓN DE TECNOLOGÍA SANITARIA: "INFORMES DE MESA DE AYUDA"

Alcaraz A[1], Augustovski F[2], Garcia Marti S[3], Rey Ares L[3], Pichon Riviere A[4], Meza V[3], Lombardo J[1]
[1]*Institute for Clinical Effectiveness and Health Policy (IECS), Buenos Aires, Argentina,* [2]*IECS - Instituto de Efectividad Clinica y Sanitaria, Buenos Aires, Argentina,* [3]*Institute for Clinical Effectiveness and Health Policy, Buenos Aires, Argentina,* [4]*IECS - Institute for Clinical Effectiveness and Health Policy, Buenos Aires, Argentina*

OBJECTIVOS: Si bien la utilización de Evaluación de Tecnologías (ETS) para la toma de decisiones es cada vez más utilizada en Argentina, es habitual la disociación entre el tiempo para la toma de decisiones cotidianas y el que demanda la realización de informes tradicionales. El Instituto de Efectividad Clínica y Sanitaria (IECS), una de las principales agencias de ETS de Latinoamérica, provee informes a instituciones públicas, de seguridad social y seguros privados. Se diseñó un nuevo tipo de documento orientado a responder una consulta puntual (motivada por un caso real), de respuesta en 48-72 hs, denominado Informe de Mesa de Ayuda (IMA). El objetivo es describir la experiencia del primer año y evaluar cuáles son las tecnologías más solicitadas como IMA por un grupo de decisores de Argentina y Uruguay. **METODOLOGÍAS:** Descripción y análisis de las bases de datos de IMA realizados por IECS. **RESULTADOS:** Entre enero de 2011 y febrero de 2013 se realizaron 110 IMA. El 78% de los pedidos correspondieron tecnologías terapéuticas (54% dispositivos, 26% procedimientos y 20% radioterapia), 15% a drogas y 7% a tecnologías diagnósticas. Esta distribución fue significativamente diferente a la observada en los informes de ETS donde se observa que el 52% de los pedidos correspondieron a tecnologías terapéuticas, 34% a drogas y 14% a tecnologías diagnósticas. En cuanto a las áreas de interés el 17% de los IMA fueron relacionados con cáncer, el 14% con alteraciones neurológicas, el 12% con patologías traumatológicas, 11% gastrointestinal, 11% con trastornos urinarios, siguiendo en frecuencia motivos quirúrgicos, cardiovasculares, endocrinológicos, trastornos genéticos y oftalmológicos. **CONCLUSIONES:** Es factible implementar los IMA en 48-72 hs, para responder a consultas puntuales acotadas. El perfil fue diferente al de los informes de ETS tradicionales. Los IMA más solicitados fueron aquellos relacionados con tecnologías terapéuticas, siendo el área oncológica la más frecuente.

PHP49
FOLLOWING THE WESTERN HTA MODEL IN LATIN AMERICA: A SELF-FULFILLING PROPHECY?

Kirpekar S
Double Helix Consulting, London, UK

OBJECTIVES: Health technology assessment in Latin America has been relatively more mature than other similarly developed health systems. This research explores the trends of development of HTA in the region to understand similarities to the European HTA model. It further looks at relevance of having such a model in Latin America, the relevance of the complexity of the methodologies and utilities used and finally, the implications of these trends. **METHODS:** The study was conducted in Brazil, Mexico, Argentina and Columbia. Opinions of 18 stakeholders were collected via telephone interviews. Respondents included senior clinical oncologists(3), academics(4), policy advisors(2), senior bureaucrats in the health ministries(3), senior members of HTA bodies(4) and senior executives from manufacturers(2). A scoring system was devised to plot the level of complexity and maturity of the HTA systems / agencies both in Latin America and then comparing it with scores of a similar study across Europe and Australia. The responses around the relevance of the model and implications were analysed qualitatively adding perspective from the author's experience in these countries. **RESULTS:** The level of maturity of HTA processes in all the countries studied was seen to be generally high. The level of association with reimbursement processes was seen to vary. There was a split on the relevance of the European model to the Latin American context. Majority of the academics (n=3/4) and members of HTA bodies (n=2/4) felt that following highly complex European models was a necessary natural progression to the HTA development curve. This was not the observation with the rest of the stakeholders. **CONCLUSIONS:** There is thought to be a trend where there is a push by academics and HTA-related professionals towards making it similar to the European model, and thus increasingly complex. Greater international attention can be a reason, although it must be further explored.

HEALTH CARE USE & POLICY STUDIES – Patient Registries & Post-Marketing Studies

PHP51
IT APPLICATION FOR POST MARKETING DRUG REGISTRIES

De Rosa M, Covezzoli A, Bosio MA, Ortali M
CINECA Interuniversity Consortium, Casalecchio di Reno, Italy

OBJECTIVES: Establishing an active postmarketing safety surveillance and analysis system, used by health professionals, regulatory bodies and sponsors. **METHODS:** The solution consists in making available to the entire community a set of online tools aimed to the data collection and analysis on innovative drugs. The introduction of online integrated environments ensures the appropriate use of drugs, help to monitor drug consumption and related costs and improves the real-time reporting of suspected adverse drug events. The surveillance system collects patients data in a common IT infrastructure within the same network. For 24 antineoplastic drugs the system provides also automatic procedures to manage the 'risk sharing' & 'payment by result' approach, that foresees partial or total refund of the cost sustained by the hospital pharmacy for the drug in case of progressive disease or unacceptable toxicity. **RESULTS:** This presentation will illustrate the Cineca methodological IT approach used also by the Italian National Medicines Agency. The system has been used for 70 innovative drugs from eleven different drugs categories: antineoplastic, antidiabetics, neurological, dermatological, antiasmatics, ophtalmologic, antireumatics and others. More than 500.000 patients were registered by more than 900 health structures in a timeframe of 7 years. **CONCLUSIONS:** The introduction of an online integrated environments ensures a more appropriate drug usage, help to monitor drug consumption and related costs and improves the real-time reporting of suspected adverse drug events.

HEALTH CARE USE & POLICY STUDIES – Population Health

PHP52
EXPLORING INCOME INEQUALITY IN SELF-REPORTED HEALTH STATUS IN CHILE AFTER THE HEALTH CARE REFORM OF 2005

Cabieses B[1], Espinoza MA[2]
[1]*Universidad del Desarrollo, Santiago, Chile,* [2]*Pontificia Universidad Católica de Chile, Santiago, Chile*

OBJECTIVES: Chile carried out a health care system reform in 2005 aimed at reducing health and health care inequities. This study assessed whether household income-related inequality in adult self-reported health status (SRHS) was reduced after this reform. **METHODS:** Before and after study design using the 2000 and 2009 CASEN surveys (252 748 and 246 924 participants, respectively) we compared the Erreygers concentration index (CI) for SRHS (binary variable: poor=0, fair/good=1) between these two years. Factors associated with good health were explored using weighted logistic regression models. Decomposition analysis of the CIs by "legitimate" (age, sex, marital status, number of household members) and "illegitimate" (income, ethnicity, rural/urban, education, occupation, type of health care provision) factors was conducted. **RESULTS:** Results indicated that there was a significant concentration of fair/good SRHS favoring the rich people in Chile in both years (Erreygers corrected CI for bounded binary variables was 0.165 [Standard Error 0.007] in 2000 and 0.053 [0.002] in 2009). We standardized the 2000 and 2009 CIs to assess horizontal inequity and decomposed them into "legitimate" factors such as age and sex and "illegitimate" factors, mostly socioeconomic conditions. Despite the fact that the CIs are not directly comparable between 2000 and 2009, our findings suggest that the CI might have decreased after the reform, but good SRHS continued

to be concentrated among the rich in both years. Decomposition indicated that "illegitimate" factors remained large contributors to income-related inequality in SRHS even after the equity-centered reform of 2005. **CONCLUSIONS:** Findings suggest that income-related inequality in SRHS might have decreased in Chile after the health care reform. Beyond this observed difference over time, the remaining inequality is still largely due to illegitimate factors that should be tackled through broader policies in the country.

HEALTH CARE USE & POLICY STUDIES – Quality of Care

PHP53
PERCEPTION OF USERS OF DRUG DISTRIBUTION PROGRAM IN BRAZIL

Carraro WH, Mengue SS, Haddad EW
Universidade Federal do Rio Grande do Sul, Porto Alegre, Brazil

OBJECTIVES: To characterize the users of access to medicines program developed in Brazil, known as *Aqui Tem Farmácia Popular* Program (PAFP), by identifying those users who migrated from other supply of basic medicines programs by means of a survey explicitly developed for this purpose. This work also seeks to evaluate the meeting customers' needs by the Program and its satisfaction level. **METHODS:** The survey instrument used gathering the users of *Aqui Tem Farmácia Popular* program has been applied in 15 counties from 14 Brazilian states. 1073 interviews composed the sample, in 27 establishments of private pharmacies, during august 2012. The collection instrument was composed by three blocks: questions concerning the use of the PAFP and other programs of medicines supply; user's profile information; and identification of the medicine supplied. **RESULTS:** The evaluation of the users migration from other programs identified that, before the PAFP, 52% of interviewed users was buying the medicines in the private pharmacy and more than 30% was using the Public Service in a Health Center of SUS, a piece of 11% began the treatment after the PAFP. More than 58% of users would use the service of the SUS if there was no PAFP. However, 36% of users reported that they would not use the SUS system for withdrawal of medicines. It was observed that 61% of users gave out to be economizing while withdrawing the medicines with gratuity or at a discount. **CONCLUSIONS:** The conducted survey made possible to characterize the users of PAFP showing aspects concerning the participation and the range of the program. Generally, it was found that the persons are satisfied and they reported to have saved with the program. They also pointed out the convenience they have with the possibility of the access to the medicine in any pharmacy with the PAFP.

PHP54
A NATIONWIDE SURVEY ON PATIENT SAFETY CULTURE IN JAPAN

Hirose M[1], Egami K[2], Tsuda Y[2], Honda J[2], Shima H[2]
[1]*Shimane University Hospital, Izumo, Japan,* [2]*St. Mary's Hospital, Kurume, Japan*

OBJECTIVES: To explore safety culture dimensions among health care professionals using Hospital Survey on Patient Safety Culture (HSOPSC) by developed by AHRQ (Agency for Healthcare Research and Quality). **METHODS:** We surveyed nationwide the situation of patient safety culture in 13 hospitals (5,760 persons) allowed for additional costs on patient safety countermeasures under the social insurance medical fee schedule. The questionnaire consists of seven unit-level aspects of safety culture including 24 items, three hospital-level including 11 items, and four outcome variables including nine items. **RESULTS:** An average number of beds was 360 beds (63 - 1,354 beds). With regard to ownership, 13 hospitals included three municipality and local incorporated agency hospitals, one public hospital, two juridical person with social insurance hospitals, six medical corporation hospitals, and one other hospital. Number of all respondents was 5,118 persons (response rate: 88.9%), and included 295 physicians (90.8%), 2,909 nurses (95.5%), and 146 pharmacists (96.7%). In terms of 12 dimensions, the overall average positive response rate (RR) for the 12 patient safety dimensions of the HSOPS was 49.2%, extremely lower than the average positive RR for the AHRQ data (61%). In terms of health care professionals, the overall average positive RR for pharmacists (46.2%) was lower than that for physicians and nurses (49.6% and 49.4%).With regard to pharmacists, the average positive RRs for 8 dimensions of the 12 dimensions were the lowest among three professionals, and three average positive RRs were the highest; Frequency of event reporting (pharmacists: physicians: nurses=73.6%:53.3%:67.9%), Non-punitive response to error (48.8%:42.6%:40.4%), and Staffing (29.1%:27.0%:25.4%). **CONCLUSIONS:** The HSOPSC measurement provides the evidence for assessment of patient safety culture in Japan's hospitals. This result that patient safety culture has been in a state of development, compared with the US hospitals.

PHP55
COST AND QUALITY OF DYING IN HOSPITAL: RESULTS FROM THE ARGENTINE-HEALTH CARE COST AND UTILIZATION PROJECT (A-HCUP)

Insua JT[1], Villalon R[1], Giunta D[2], Ioli P[3]
[1]*Hospital Universitario Austral, Universidad Austral, Derqui, Argentina,* [2]*Hospital Italiando de Buenos Aires, Caba, Argentina,* [3]*Hospital Privado de la Comunidad, Fundacion Medica de Mar del Plata, Mar del Plata, Buenos Aires, Argentina*

OBJECTIVES: Little is known about dying in Argentina, we studied costs and readmissions (ReH) <30 days of hospital dying adults. **METHODS:** A cross sectional study of 1 year hospital discharges, with HCUPs methods, of patients ≥19 yrs old. We obtained deaths, first admission (1 adm) and ReH ≤365 days and ReH <30 days; total direct medical cost (TC I$), mean (I$) (SD), median I$ (Q1-Q3) discharge cost, (in I$ PPP, 2008), stratified by age/sex, admissions and ReH <30 days and <365 days. **RESULTS:** Total mortality for ≥19 yrs old patients was 4,70%. Among 2137 deaths, Total cost of those dead in hospital, TC I$: 40 540 842 ; mean cost per discharge (I$) was 19853 (SD 45 599); Median cost per discharge I$ 4182; (Q1: 1452-Q3: 17730 I$), comprising 8,31 % of TC I$. Among 43321 discharges, TC$ of those alive, TC: 447 300 754 I$; mean cost per discharge ($) was 10569 I$ (SD 21 217); Median cost per discharge 14 091 I$; (Q1: 2 496- Q3:10 054 I$). Relative dead /alive I$ was 1,88 times higher. Mean discharge cost of deceased stratified by age group (mortality 19-64 yrs. old: 1,52%, I$ 48332, age 19-64/≥19 yrs old ratio: 2,43; 65-74 yrs old: 4,72%,I$ 25968, age ratio: 1,31; 75-84 yrs old: 8,45%; I$ 15471, age ratio: 0,78; 85+ yrs old: 14,09%, I$ 7832, age ratio: 0,39), and sex, males (47,4%) had a I$: 22679 (M/F I$ ratio: 1,45). In 1 adm.(53% of deaths), mean cost was I$ 23 792; while ReH ≤365 days (47% of deaths), I$ 13 530, cost ratio ReH/1 adm= 0,57 ; and if ReH <30 days (29,5%), I$ 12354, cost ratio ReH<30/1 adm=0,52. **CONCLUSIONS:** Understanding the economic burden of dying helps promote better and cost-effective ways of promoting palliative care, old and readmitted deaths are less costly.

HEALTH CARE USE & POLICY STUDIES – Regulation of Health Care Sector

PHP56
FROM "GENERIC SCHEME" TO "BRAND-GENERIC SCHEME": THE EFFECT OF NEW POLICY (2003-2004) ON EFFICIENCY OF IRANIAN PHARMACEUTICAL INDUSTRY

Hashemi Meshkini A[1], Varmaghani M[1], Yousefi M[2], Yaghoubifard S[1], Zekri H[3], Kebriaeezadeh A[1]
[1]*Tehran University of Medical Sciences, Tehran, Iran,* [2]*Tarbiat-Modarres University of Medical Sciences, Mashhad, Iran,* [3]*Allameh-Tabatabaee University of Human Sciences, Tehran, Iran*

OBJECTIVES: Brand-Generic scheme was implemented in Iran to improve the competition in the market. In this study we aim to assess if this new policy has had any positive effect on efficiency of Iranian pharmaceutical companies. **METHODS:** We used Data Envelopment Analysis (DEA) to evaluate the relative efficiency of pharmaceutical companies for the years 1999-2008. The Wilcoxon matched-pairs signed-rank test and also sign test were used to assess the difference between mean relative efficiency of companies before and after policy. **RESULTS:** Although the Wilcoxon matched-pairs signed-rank test did not show any significant difference between before and after new policy in term of both technical and pure (managerial) efficiency of included companies (Pvalue: 0.079 and 0.07, respectively) but the one–sided sign test indicated that only relative pure (managerial) efficiency has improved after this policy (Pvalue: 0.031). **CONCLUSIONS:** The "Brand-Generic scheme" does not seem to be enough policy to improve efficiency of pharmaceutical companies in Iran. To achieve this aim, paying special attention to infrastructural requirements including non-discriminating and transparent laws and regulations for supporting competition, the competitive pricing policies, the presence of international companies in the market and full privatization of companies had to be also considered by policy makers.

PHP57
REGULATING THE ACCESS TO AN ADEQUATE AND AN INTEGRAL ASSISTANCE IN BRAZILIAN PRIVATE HEALTH PLANS

Silva FHCV
Agência Nacional de Saúde Suplementar, Rio de Janeiro, Brazil

OBJECTIVES: To describe the main actions promoted by the The Federal Regulatory Agency for Private Health Insurance and Plans (ANS) to regulate the access of private health plans beneficiaries to an adequate and an integral assistance. **METHODS:** A retrospective analysis of data about coverage in health plans since ANS creation (1999) was done to identify the main actions promoted by the agency in this area. It included the set of rules published and ANS periodic publications. **RESULTS:** A very important identified mechanism that ANS employs for regulating the users access to a full assistance is the elaboration of a list of medical procedures. This list constitutes the minimum obligatory coverage for all plans. It is periodically reviewed and incorporations and/or exclusions are made according to some precepts like: clinical evidence, epidemiological relevance, among others. The guidelines implementation is another important instrument identified in this study to the improvement of private health assistance. ANS established a collaboration term with the Brazilian Medical Association (AMB) to develop guidelines, to spread and to monitor their implementation. **CONCLUSIONS:** The actions presented are the main one promoted by ANS to regulate the access to an adequate and an integral assistance. They can also improve the sector efficiency along with the rational use of techniques and medical technologies. The instruments discussed will be a guide to upgrade the health plans management and their efficiency. The patients will have safer end more effective treatments and ANS keeps the balance and promotion of health in private health with a new model.

PHP58
A MEDIAÇÃO DE CONFLITOS NA AÇÃO FISCALIZATORIA DO SETOR DE SAÚDE SUPLEMENTAR BRASILEIRO

Tanaka FHR, Franco S
ANS - Brazilian Private Health Regulatory Agency, Rio de Janeiro, Brazil

OBJETIVOS: Demonstrar a eficácia da utilização de meios consensuais de mediação de conflitos pela Administração Pública no controle e fiscalização do cumprimento das normas que regulam a assistência suplementar à saúde no Brasil. **MÉTODOS:** Desde 2010, a ANS – Agência Nacional de Saúde Suplementar implementou o procedimento NIP (Notificação de Investiação Preliminar), cujo objetivo é realizar a mediação de conflitos entre operadoras de planos de saúde e consumidores, no que tange a situações que envolvem negativa de cobertura assistencial. A NIP é um processo totalmente eletrônico, que confere maior celeridade e eficácia na resolução das reclamações dos consumidores, induzindo uma melhora na relação operadora/consumidor. Com a NIP, as operadoras têm prazo de 5 dias para solucionar o conflito junto ao beneficiário e responder à ANS sobre as medidas tomadas. Após processamento na NIP, a reclamação pode ser finalizada por inexistência de infração, reparação de conduta ou encaminhada para abertura de processo administrativo, nos casos em que o conflito não foi resolvido. **RESULTADOS:** Desde sua implementação, a resolutividade dos conflitos na NIP manteve-se acima de 70% do total de reclamações recebidas, o que em 2012 significou a conclusão de 42.672 das 54.412 denúncias de negativa de cobertura assistencial (78,4% de resolutividade). Antes de seu advento, as reclamações eram analisadas por meio de instituição de processo administrativo sancionador, que duravam, em média, 18-24 meses para sua conclusão, podendo levar ao arquivamento da denúncia ou lavratura de auto de infração contra a operadora. **CONCLUSÕES:** A NIP conferiu maior eficácia ao processo fiscalizatório da ANS, proporcionando maior

satisfação aos beneficiários de planos de saúde. Os dados obtidos na NIP são utilizados para monitoramento da garantia de atendimento e acesso às coberturas obrigatórias, que podem gerar a suspensão de comercialização dos planos identificados com falhas assistencias, bem como instauração de regimes especiais de recuperação pela ANS.

PHP59
CONSTRUCCIÓN DE UN MODELO DE PRIORIZACIÓN APLICABLE A LATINOAMÉRICA – EL CASO DE COLOMBIA
Avila A[1], Verbel A[1], Castro H[1], Mejia A[1], Sarria A[2]
[1]*Instituto de Evaluación Tecnológica en Salud - IETS, BOGOTÁ, Colombia,* [2]*Agencia Española de Evaluación de Tecnologías Sanitarias (AETS) del Instituto de Salud Carlos III, MADRID, Spain*
OBJECTIVOS: Los sistemas de salud deben enfrentar el desafío de hacer uso eficiente de recursos limitados ante necesidades crecientes de salud. Colombia no ha sido ajena a éste desafío. El Ministerio de Salud ha entendido la importancia de articular un sistema de salud que incorpore un sistema de priorización del gasto sistemático, transparente y legítimo. En el marco de lo anterior, fue creado el "Instituto de Evaluación Tecnológica en Salud (IETS)", que tiene como objetivo proporcionar recomendaciones sobre tecnologías en salud y mejores prácticas, basadas en evidencia, para el gobierno nacional y demás actores, como insumo para la toma de decisiones. En este proceso, uno de los primeros pasos es diseñar un proceso para la priorización y selección de tecnologías a evaluar. **METODOLOGÍAS:** A partir de una revisión de diferentes metodologías de priorización, se propuso un mecanismo de análisis de decisión de múltiples criterios, que fue discutido en panel de expertos del gobierno y otros actores. Se realizó un piloto de priorización que permitió detectar los principales riesgos y desafíos en cada etapa del proceso. A partir de la discusión, construcción colectiva y experiencia del piloto, se seleccionaron, definieron y ponderaron los criterios de priorización, y se diseñaron las diferentes etapas e instrumentos para llevar a cabo el proceso. **RESULTADOS:** Los criterios seleccionados fueron la gravedad de la enfermedad, la población afectada, el costo de adquisición de la tecnología, la atención a grupos vulnerables, el interés de salud pública y la solicitud de la ciudadanía. **CONCLUSIONES:** Emplear criterios explícitos facilita que la priorización sea un proceso legítimo y transparente. La propuesta permitirá al Ministerio de Salud, como líder del proceso con el concurso de otros actores, contar con herramientas para priorizar y seleccionar tecnologías para evaluación. La experiencia colombiana dará herramientas metodológicas a otros países interesados en la construcción de este tipo de procesos.

PHP60
THE NOTIFICATION OF PRELIMINARY INVESTIGATION (NIP) OF THE FEDERAL REGULATORY AGENCY OF PRIVATE HEALTH AND INSURANCE AND PLANS (ANS): A TOOL TO FACILITATE THE ACCESS TO THE MANDATORY COVERAGE
Silva FHCV
Agência Nacional de Saúde Suplementar, Rio de Janeiro, Brazil
OBJECTIVES: To describe the instrument NIP (Notification of Preliminary Investigation) and it's role on solving conflicts related to the obligatory coverage access, between health plans and patients. **METHODS:** A critical analysis of the rule that created NIP (Regulatory Resolution nº 226/2010), established by The Federal Regulatory Agency for Private Health Insurance and Plans (ANS), was done to characterize the tool. **RESULTS:** The Notification of Preliminary Investigation (NIP) consists of a communication time to mediate the relationship between consumers and providers of health plans in cases of unauthorized procedures by the provider. NIP is an electronic process to solve the conflicts before a process that can lead to the punishment of the health plan provider. A contact is previously made to notify the health plan provider about the problem and it has five business days to answer it. This way, the health plan provider has the opportunity to solve the question without punishment and the beneficiaries can have a faster access to the procedure prescribed by the doctors. If the procedure doesn't have coverage according to the supplementary health rules (it is not listed on ANS Medical List of Procedures), the demand is filed. If the provider's answer is not enough to conclude the question, it's sent to the Inspection Department to a more detailed analysis before being finished. **CONCLUSIONS:** The NIP is a mediation instrument that can help ANS to solve the problems between beneficiaries and health plan providers, giving a fast answer to both interested actors of the process. It can be positive because sometimes the questions are solved without the provider punishment and the beneficiaries' injury. The conflict mediation by NIP can contribute to the change in the entities attitude and culture and can also promotes the interaction and the active participation of the actors involved.

PHP61
THE QUALITATIVE PROFILE OF THE COVERAGE COMPLAINTS MADE BY HEALTH PLAN USERS TO THE FEDERAL REGULATORY AGENCY FOR PRIVATE HEALTH INSURANCE AND PLANS (ANS)
Silva FHCV
Agência Nacional de Saúde Suplementar, Rio de Janeiro, Brazil
OBJECTIVES: To define the qualitative profile of the coverage complaints made by health plan users, to The Federal Regulatory Agency for Private Health Insurance and Plans (ANS). **METHODS:** A retrospective analysis of the Notification of Preliminary Investigation (NIP) registers in 2011 and in the first half of 2012 was performed. The data were extracted from Inspection System (SIF). The variables considered were: the subject of the coverage complaints (Medical List of Procedures, Time for Coverage Access, Managed Care, etc.), the date of the contract (before or after ANS regulation) and the type of the plan (individual/ family or collective). **RESULTS:** The study shows a change on predominant coverage subject: In 2011 43,5 % of the complaints were about " Medical List of Procedures". In 2012, the main subject was "Time for coverage access" (36,2% of he coverage complains)." It was possible to verify that, in both years considered, there was a prevalence of ANS regulated contracts of individual/familiar type (44.8% in 2011 and 47.7% in 2012). **CONCLUSIONS:** This study helped to know the qualitative profile of the coverage complaints in brazilian supplementary health. The increased number of complaints about "Time for coverage access" in 2012 may indicate that the services offered are not being enough to attend the users. The higher percentage of NIPs of individual/family plans, compared to collective ones, may be a reflection of a greater weakness in consumer-provider relationship in this type of contract.

PHP62
PODER POPULAR Y REGULACIÓN DEL PRECIO DE LOS MEDICAMENTOS EN VENEZUELA
Adesso G
Universidad Central de Venezuela, Caracas, Venezuela
OBJECTIVOS: Explorar el rol del Poder Popular en el proceso de regulación del precio de los medicamentos en Venezuela, articulado por la Superintendencia Nacional de Costos y Precios (SUNDECOP) en conformidad con lo establecido en la Ley de Costos y Precios Justos y las Providencias Administrativas relacionadas. **METODOLOGÍAS:** Estudio exploratorio documental basado en la búsqueda y revisión de los artículos de prensa disponibles y publicados en la página Web oficial de la SUNDECOP. La búsqueda y recuperación de la información fue realizada el 10 de marzo de 2012. Se tomaron en cuenta para la revisión los artículos que incluían en su contenido las palabras: participación o poder popular y regulación del precio de medicamentos. **RESULTADOS:** Se identificaron 172 artículos noticiosos publicados desde 13 julio 2011 hasta 27 de febrero de 2013. Se revisaron 12 artículos de prensa que cumplían con el criterio de inclusión. El 50% de los artículos revisados resaltan la participación del Poder Popular en la definición de las políticas de precios y los criterios a tomar en cuenta por el Sistema Nacional Integrado de Costos y Precios para la fijación del precio de medicamentos, mientras que en 10 de los artículos se desprende el papel del Poder Popular como controlador social para vigilar el cumplimiento de la regulación una vez sea decretada por la SUNDECOP. **CONCLUSIONES:** Además de las eventuales acciones de inspección y fiscalización, el Poder Popular en Venezuela está aportando insumos a la SUNDECOP que serán incorporadas en el proceso de tomas de decisiones para fijar el precio a los medicamentos durante el año 2013. Se sugiere profundizar en un posterior estudio para conocer y analizar cómo y en qué medida esos aportes del Poder Popular están siendo incluidos en el análisis metodológico para establecer la definitiva regulación del precio de los medicamentos.

NOVEL PRICING STRATEGIES TO SUPPORT SUSTAINABLE ACCESS TO MEDICINE IN LATIN AMERICA
Shankar R, Lindon L, Hooper J, Rowbottom RC
IMS Consulting Group, Cambridge, UK
With lower returns from price pressures in developed markets, it is imperative for pharma companies to seek growth in emerging markets such as Latin America. Simultaneously, with rising incomes, a growing middle class in emerging markets is increasing demand for access to innovative medicine, especially in diseases such as oncology, CV and diabetes. Achieving commercial expansion as well as increasing access to innovative medicine in Latin America needs new pricing strategies and funding models. We discuss and evaluate alternative pricing strategies and funding models to support commercial expansion and increase access to innovative medicines in Latin American markets such as Brazil, Argentina, Mexico and Colombia. These include current industry strategies, equitable pricing strategies and strategies focused on local market conditions. We model the impact of these strategies on both specialty and primary care medicines. The modelling is based on insights and assumptions drawn from analogue analysis in pharmaceuticals and other industries. It is supplemented by interviews with industry experts in Latin American market strategies. For the modelling we assume current market and public and private insurance coverage structures. We find that in primary care medicines there is considerable opportunity for commercial and access gain through more differentiated pricing strategies. These strategies are more commercially (revenue and profit) optimal than current industry strategy. At the same time, they are also access optimal in terms of the eligible patients they provide access to. In the case of specialty medicines, differential pricing strategies can increase commercial potential, but there is a gap between commercially optimal and access optimal strategies. This gap can be bridged through increased financing for these medicines. Based on this analysis, we suggest a path forward in which pharmaceutical companies can collaborate with governments and other stakeholders to achieve increased access to innovative medicines in a commercially sustainable manner.

PHP64
ACCESS TO MEDICINES INDEX: MEASURING HOW WELL COUNTRIES PROVIDE ACCESS TO MEDICINES
Shankar R[1], Hickson S[1], Gorokhovich L[2]
[1]*IMS Consulting Group, Cambridge, UK,* [2]*IMS Consulting Group, London, UK*
Developing countries are now following the steps of developed countries in implementing universal health coverage. Health care systems and policies differ across countries resulting in various levels of medicine access. To evaluate which systems and policies lead to better access, we need a measure to compare how well countries provide access to medicine for their populations. Using IMS proprietary data as well as public sources, our analysis proposes a Country Access to Medicines Index that compares and ranks countries on access to medicine outcomes across four pillars: medicine reimbursement coverage, time to reimbursement, medicine affordability and support for innovation. Medicine reimbursement coverage measures private or public insurance cover for a representative basket of medicines across major communicable and non-communicable diseases. It has three components: share of population covered, share of medicines covered and share of costs covered. The time to reimbursement pillar measures average time to reimbursement for the selected basket. The affordability pillar measures relative cost of medicine basket compared to the international average both in absolute terms and as a share of per capita GNI in each country. The innovation pillar measures local patents and investment in R&D. We used this index to compare and rank more than 30 developed and developing countries. We then look at the policies in these countries to identify features that lead to better index scores. We find that five broad factors can help explain

access to medicines performance. First is the level of health financing. Second is a structured and transparent pricing and patient access system that prioritises resource allocation to high need diseases and sets economically justifiable or value based prices. Third is the development of health care infrastructure. Fourth is the provider and pharmacy incentives that promote appropriate use of medicine. And finally, a system that protects intellectual property rights.

PHP65

GUIDING PRINCIPLES FOR EFFECTIVE PRIVATE HEALTH INSURANCE IN EMERGING MARKETS

Shankar R[1], Birkmose JC[2], Lee STM[1], Colasante W[1]
[1]*IMS Consulting Group, Cambridge, UK,* [2]*Novartis, Basel, Switzerland*

While emerging market governments are investing more in health care, there is still a large gap between demand and supply. The gap can be primary cover in some countries; while in others, it can be health care services or costs that are not covered publicly. Private health insurance is stepping in to bridge some of this gap. We studied private health insurance across major emerging markets in Asia, Latin America and Africa to understand current situation and future trends. We found that private health insurance is growing across these markets. Its main role has been to extend primary cover to certain segments of the population. In most cases, these are the relatively affluent or employed segments. However, we also see the emergence of community based private health insurance as well as public subsidization of private insurance to cover the less well off. However, several barriers prevent private insurance from significantly increasing health coverage. These are the lack of information to properly assess actuarial risks and make proper claims settlements, moral hazard, adverse selection and the non-coverage of pre-existing conditions. We then studied specific innovative examples which have tried to address some of these barriers. For example, Roche is partnering with Swiss Re to provide actuarial expertise to local insurance companies to enable affordable premium for cancer medicine coverage in China. India's Yeshasvini community-based health insurance programme provides coverage to rural poor through well-specified procedures for enrollment, treatment and claim settlement and monitoring. GSK Brazil increased reimbursement of oncology drugs with some health insurance companies through risk-sharing agreements. Learning from such cases, we developed specific guiding principles on how private insurance can be used to provide increased and effective access to health care in emerging markets. These principles can help inform appropriate policy setting on private health insurance in emerging markets.

THE ECONOMICS OF REPRODUCTION: HOW 'PRIMACY OF SUCCESSION' HAS INFLUENCED ACCEPTANCE AND PROVISION OF ASSISTED FERTILITY TREATMENTS THROUGHOUT HISTORY

Jones C[1], Erten MZ[1], Sills ES[2]
[1]*University of Vermont - College of Medicine, Burlington, VT, USA,* [2]*Pacific Reproductive Center, Irvine, CA, USA*

Viewing human history through a medical lens can offer a renewed appreciation for today's vexing reproductive challenges, as some dilemmas encountered in modern times are actually continuations of similar economic challenges experienced long ago. Succession crises have been an inherent feature of many national systems, which can lead to complex rules of inheritance to preserve dynastic patrimony. Assuming fertility is unimpaired, this system can work well to maintain market stability and intergenerational order. However, on more than one occasion infertility has disrupted this seamless transition of control; posthumous birth, while less common, has also made its own contribution to human culture. The details of an individual's reproductive life are typically impervious to formal study. Yet, archival sources including ancient literature and formal court records do occasionally provide evidence of otherwise deeply personal concerns of a different era. This survey depicts posthumous birth and infertility as crucial gears in the mechanism of economics, demonstrating how each has drawn considerable social interest, occasionally even impacting national security and dynastic succession. This assessment describes issues, worries, and desires of patients of antiquity and finds that these align closely with contemporary reproductive challenges. Because children and family are so central to the human experience, the consequences of reproduction (or the lack thereof) make substantial imprints upon the cultural, economic, and political landscape—irrespective of civilization or century. This research places selected reproductive motifs in a broad historical context to suggest that some fundamental tenets in the human condition remain essentially unchanged, despite a vast accumulation of knowledge made possible by impressive gains in science and technology.

A LEI DE ACESSO À INFORMAÇÃO FORTALECE O PAPEL DA AVALIAÇÃO DE TECNOLOGIAS EM SAÚDE (ATS) DE FORNECER INFORMAÇÕES SÓLIDAS E TRANSPARENTES AOS USUÁRIOS DO SISTEMA ÚNICO DE SAÚDE

Brito GV, Vidal JS
Brazilian Ministry of Health, Brasília, Brazil

OBJETIVOS: A Lei de acesso à informação (LAI), lei nº 12.527, de 2011, recentemente sancionada no Brasil, tem mudado o cenário jurídico nacional, permitindo uma maior participação popular e o controle social das ações governamentais. Essa lei regulamenta o direito constitucional de acesso dos cidadãos às informações públicas, amplia a participação da sociedade, nas diferentes esferas do governo, e permite melhoria na gestão pública. Desde a institucionalização do Sistema Único de Saúde (SUS), a participação popular vem sendo um dos pilares da sua organização. No início, essa participação limitava-se ao envolvimento da sociedade nos Conselhos e Conferências de Saúde, conforme a lei nº 8.142, de 1990. Entretanto, para garantir o caráter universal e integral imputado ao SUS, é mister que se incorpore a participação popular na formulação, fiscalização, execução e manutenção de políticas de saúde. Além dos Conselhos e Conferências, o empoderamento do usuário, um processo que reconhece o direito de participação nas decisões que afetam o cotidiano e promove espaços democráticos para o controle social das instituições, representa forma de participação popular mais contemporânea, inclusive consoante com a ideologia da LAI. Esse movimento ativo da sociedade, demandar o sistema, provoca a percepção por unidades gestoras da importância do envolvimento do usuário. Para essa interlocução é necessário adaptar a linguagem para que se disseminem informações compreensíveis e, de fato, úteis à sociedade. Com isso, a área de avaliação de tecnologias em saúde do Ministério da Saúde teve que se mobilizar para fornecer informações direcionadas aos usuários, fortalecendo seu papel de informá-los a respeito do valor relativo das tecnologias com informações confiáveis, sólidas e transparentes, inclusive seus impactos ético e social. Nesse contexto, a LAI, como instrumento oportuno de participação social, é uma ferramenta capaz de direcionar as demandas e ações de saúde, conferindo maior transparência ao processo.

PATHOLOGICAL GAMBLING: A GROWING ADDICTION

Dannon P
Tel Aviv University, Neer Yaakov, Israel

Gambling is a popular activity of humankind across most cultures and throughout history. Gambling disorders affect 0.2–5.3% of adults worldwide. During the last decades researchers had found that pathological gamblers (PG) are not a homogenous group and some of the patients diagnosed as PG better resemble some other categories characteristics: 1-*The impulsive subtype* is characterized by young adult male predominance, high levels of risk taking behavior and lack the ability to plan ahead. They tend to lose large sums of money in one sitting and associated with attention deficit disorder (ADD), alcohol and other substance abuse and dependence and other impulse control disorders. 2-*The obsessive- compulsive* (OC) subtype, which usually prefers slot machines, lottery and scratch tickets, is characterized by female predominance which has midlife onset (probably as a response to a perceived psychological trauma) and tend to be associated with higher rate of depression and maladaptive coping mechanisms. 3-*The addictive subtype*is characterized by betting a small amount of gambling at a time in a repetitive and compulsive fashion. In this group there is a male predominance and higher rates of alcohol abuse and dependence. Various treatment models have been suggested for gambling disorders. In general, post-treatment effects were positive for different types of therapy (eg, behavioral, and cognitive) and method of therapy However, treatment outcome studies that compared GA to CBT have indicated poor outcomes and attendance of GA. Treating PG according to its subtype: For the impulsive subtype they suggested starting with mood stabilizer. For OC subtype start with SSRI's, if not effective switch to mood stabilizers. For addictive subtype start treatment with bupropion, if not effective switch to naltrexone or nalmefen.

TRASTUZUMABE PARA CÂNCER DE MAMA COM SUPEREXPRESSÃO DE HER-2: EVIDÊNCIA DE EFICÁCIA, SEGURANÇA E ESTIMATIVA DE CUSTO

Alvares J, Mata AD, Guerra Junior AA, Acurcio FA
Universidade Federal de Minas Gerais, Belo Horizonte, Brazil

OBJETIVOS: Trastuzumabe é um anticorpo monoclonal humanizado derivado de DNA recombinante, que se liga ao domínio extracelular do receptor do fator de crescimento epidérmico humano, HER-2. Esse anticorpo bloqueia o ligante natural e infra-regula o receptor. Sua utilização isolada ou em associação com quimioterápicos proporciona desaceleração na progressão do câncer de mama metastático HER-2 positivo. Este estudo avalia a eficácia, segurança e custo estimado do trastuzumabe comparado com outras opções terapêuticas para o tratamento de câncer metastásico com superexpressão HER-2. **MÉTODOS:** Revisões sistemáticas (RS) de ensaios clínicos comparando trastuzumabe com outras opções terapêuticas foram pesquisadas em The Cochrane Library, Medline, Lilacs, Centre for Reviews and Dissemination and Tripdatabase. O custo médio mensal do tratamento foi estimado com base nos preços do Banco de Preços em Saúde, do Ministério da Saúde. **RESULTADOS:** Foram incluídas nove RS. Todas elas mostraram moderada a alta qualidade de evidência. Nas nove RS os principais desfechos avaliados foram sobrevida global, sobrevida livre de doença e tempo até a recorrência tardia. Trastuzumabe apresentou melhores resultados quando comparado com placebo. Trastuzumabe, em associação com taxanos, capecitabina e anastrozol apresentou melhores resultados que os medicamentos sem a associação. O risco de desenvolvimento de disfunções cardíacas faz com que o uso combinado de antraciclinas com trastuzumabe seja desaconselhado. O custo médio mensal do tratamento é de R$34.181,24. **CONCLUSÕES:** Com base na evidência disponível, é recomendado o uso de trastuzumabe no tratamento de câncer metastásico com superexpressão HER-2, em associação com paclitaxel ou docetaxel. O uso em monoterapia não é indicado.

PCN2

O USO DE TEMOZOLOMIDA NO TRATAMENTO DE ASTROCITOMA DE BAIXO GRAU – CÂNCER NO CÉREBRO

Gomes RM[1], Ribeiro Júnior NG[2], Costa JO[1], Júnior AAG[1], Acurcio FA[1]
[1]*Universidade Federal de Minas Gerais, Belo Horizonte, Brazil,* [2]*Centro Colaborador do SUS, Belo Horizonte, Brazil*

OBJECTIVOS: Avaliar a eficácia e segurança da temozolomida, no tratamento isolado ou adjuvante do Astrocitoma de Baixo Grau comparado com outras opções terapêuticas e com a radioterapia – tratamento padrão atual, em resposta às demandas judiciais recebidas para o fornecimento deste medicamento para o tratamento do Astrocitoma de Baixo Grau no Estado de Minas Gerais, Brasil. **MÉTODOS:** Foram pesquisadas as bases The Cochrane Library, Centre for Reviews and Dissemination, Medline via Pubmed, LILACS e Clinical Trials. Avaliações de Tecnologias de Saúde

foram pesquisadas em sites de agências nacionais e internacionais. Não houve restrição de idiomas na busca das evidências. **RESULTADOS:** Foram incluídas duas Revisões Sistemáticas (RS), as quais não compararam o uso da temozolamida com outra opção terapêutica e nem com a radioterapia. A primeira RS avaliou a eficácia de três diferentes esquemas de administração da temozolomida para tratar Gliomas de Baixo Grau entre os quais estão incluídos os Astrocitomas de baixo grau (Grau I e II). A segunda RS fez uma análise qualitativa de estudos fase II para criar um guia de conduta e prescrição do uso da temozolomida para tratamento dos tumores cerebrais. Os estudos incluídos constituíram um conjunto de evidências classificadas como de baixa qualidade. As RS foram consideradas no estudo devido a escassez de evidências sobre o tema. Existem quatro ensaios clínicos em desenvolvimento que objetivam avaliar o uso de temozolamida isolada ou como adjuvante comparada à radioterapia. **CONCLUSÕES:** Até a presente data não existem evidências disponíveis que suportem o uso da temozolomida em Gliomas de Baixo Grau entre os quais estão incluídos os Astrocitomas de baixo grau (Grau I e II). Os resultados dos ensaios clínicos em andamento serão essenciais para definição da melhor estratégia de tratamento para esta condição de saúde.

PCN3

PARECER TÉCNICO-CIENTÍFICO: EFICÁCIA E SEGURANÇA DO USO DO RITUXIMABE NO TRATAMENTO DE LEUCEMIA LINFOCÍTICA CRÔNICA

Souza KM[1], Koury CDN[1], Nunes AA[2]
[1]*FIPE -Fundação de Ensino e Pesquisas Econômicas, Brasília, Brazil,* [2]*University of São Paulo - USP, Ribeirão Preto, Brazil*

OBJETIVOS: Analisar as evidências científicas sobre eficácia e segurança do Rituximabe associado à QT convencional com fludarabina + ciclofosfamida (RFC) comparado à QT convencional (FC) isolada para o tratamento da Leucemia Linfocítica Crônica (LLC). Realizar estimativas de custo de tratamento da LLC com FC e FCR em suas indicações terapêuticas por ciclo. **MÉTODOS:** Para a elaboração do Parecer Técnico-científico, foram utilizadas as Diretrizes Metodológicas para elaboração de PTC do Ministério da Saúde do Brasil. Foi realizada ampla busca nas bases de dados Medline (via Pubmed), Embase, Lilacs e CRD que comparassem esquemas terapêuticos contendo RFC. A estratégia de busca foi geral e sensível e incluiu termos para leucemia linfocítica crônica e rituximabe. Para a estimativa de custos, foi considerado o esquema terapêutico com medicamentos oncológicos e não oncológicos e o modo de usar para o tratamento do LLC, bem como a apresentação farmacêutica e seu preço obtido de um serviço de onco-hematologia de hospital de ensino público de alta complexidade. **RESULTADOS:** Foram selecionados 3 estudos e de maneira geral o esquema de tratamento composto pela utilização de rituximabe, fludarabina e ciclofosfamida pode melhorar efetivamente a taxa de sobrevida global e a remissão completa, além de prolongar a sobrevida livre de progressão. Para os desfechos de segurança, o tratamento com RFC apresentou maiores eventos adversos comparados à FC. Nas estimativas de custo, verificou-se o alto custo para o tratamento com o esquema RFC, chegando aproximadamente a R$ 76.155,00 por ano de tratamento em contraste com a QT convencional (FC) de R$ 30.336,00. **CONCLUSÕES:** Os estudos selecionados apresentaram baixa qualidade metodológica, e os resultados devem ser avaliados com cautela. Além disso, por ser uma doença que acomete principalmente pessoas com idade superior a 65 anos, é necessário avaliar os possíveis impactos causados pela diferença de idade e estadiamento da doença.

PCN4

ESTIMACIÓN EPIDEMIOLOGICA DEL CÁCER DE PULMÓN DE CELULAS NO PEQUEÑAS EN MÉXICO

Peniche-Otero G[1], Herrera-Rojas J[1], Gryzbowski E[1], Muciño-Ortega E[2], Galindo-Suárez RM[2]
[1]*Customized Premium Products S.A. de C.V., México D.F., Mexico,* [2]*Pfizer S.A. de C.V., Ciudad de México, Mexico*

OBJECTIVOS: Estimar la incidencia, prevalencia y mortalidad del cáncer de pulmón de células no pequeñas (CPCNP) en México, así como la prevalencia de adenocarcinomas y mutaciones EGFR o ALK en este tipo de cáncer. **METODOLOGÍAS:** En base a GLOBOCAN 2008 se estimaron la incidencia, prevalencia y mortalidad anual por CPCNP en México en 2012. La proporción de casos de CPCNP y de adenocarcinomas en CPCNP se extrajo de estudios publicados realizados en México. El porcentaje de presentación de metástasis, valoración en la escala del estado funcional de la Eastern Cooperative Oncology Group (ECOG) y la presentación de mutaciones EGFR o ALK se extrajo de fuentes del Instituto Nacional de Cancerología. **RESULTADOS:** Se estimó que la incidencia de CPCNP en 2010 ajustada por sexo fue de 9.28 y de 3.89 casos por 100,000 habitantes para hombres y mujeres, respectivamente. La incidencia para ambos sexos fue de 6.49 y la incidencia proyectada para 2030 de 11.15. Los casos fatales fluctúan entre 7,092 en 2010 a 14,573 en 2030. Los casos prevalentes estimados para el 2012 fueron 8,225 y llegan a 15,548 en el 2030. Considerando la prevalencia de CPCNP en 2012, los casos esperados del tipo histológico adenocarcinoma fueron 4,688, de los cuales 3,985 (85%) presentan ECOG 0 ó 1 (Con síntomas que le impiden realizar trabajos arduos, aunque se desempeña normalmente en sus actividades cotidianas). El 77% (3,068) presentarían enfermedad metastásica y 31% de ellos (951) presentarían una mutación EGFR o ALK. **CONCLUSIONES:** La estimación de la prevalencia de marcadores biológicos EGFR o ALK en pacientes con CPCNP del tipo adenocarcinoimoide en México es la base para la estimación del impacto presupuestal del uso de terapias blanco en este grupo de pacientes, que es un factor a considerar en el diseño de políticas y gestión de programas para la atención de estos pacientes.

PCN5

RELATIVE CLINICAL VALUE IN ADVANCED CANCER TREATMENTS

Preto MC[1], Monteiro RC[1], Santinho CS[1], Bernardino GDR[1], Donato BMK[2], Fanti L[3], Stefani SD[4]
[1]*Bristol-Myers Squibb, São Paulo, Brazil,* [2]*Bristol-Myers Squibb Company, Wallingford, CT, USA,* [3]*Bristol-Myers Squibb, Sao Paulo, Brazil,* [4]*Hospital Mãe de Deus, Porto Alegre, Brazil*

OBJECTIVES: To evaluate clinical and economic value of ipilimumab in the treatment of advanced melanoma compared with drugs available for the treatment of advanced cancer. **METHODS:** An analysis was performed comparing ipilimumab and other drugs for advanced cancer regarding overall survival (OS) and costs associated with improvement in survival. Parameters analyzed were: improvement in median/mean OS, improvement on survival rate at 1 year and the number needed to treat (NNT) to avoid one death. Monthly costs for improvement in mean OS were evaluated. Efficacy data were obtained from clinical trials. Medications costs were obtained from official price lists, such as Banco de Dados de Preços do Sistema de Saúde do Ministério da Saúde Brasileiro and Lista da Câmara de Regulação do Mercado de Medicamentos da Agência Nacional de Vigilância Sanitária (CMED). **RESULTS:** Improvement in median OS ranged from +2.8 (sorafenib) to +4.8 (transtuzumab), and improvements in mean OS ranged from +1.6 (sorafenib) to +6.1 (ipilimumab). Only ipilimumab showed better mean OS compared with the median OS (6.1 vs. 3.7). This demonstrates the effect of ipilimumab in prolonging OS in long term, which is observed in a considerable proportion of patients treated with this drug. Major improvement in the survival rate in 1 year occurred with ipilimumab (20%). The NNT to prevent 1 death ranged from 7 (ipilimumab) to 61 (bevacizumab for lung cancer). Costs per month of mean OS improvement ranged from BRL 34,906 (sorafenib) to BRL 64,410 (bevacizumab for lung cancer). **CONCLUSIONS:** This comparative analysis of drugs used for treatment of advanced cancer used key parameters for decision making in health sciences. The results suggest that ipilimumab delivers superior clinical and economic benefits when compared with other drugs available in Brazil for the treatment of advanced cancer.

CANCER – Cost Studies

PCN6

COMPARING THE POTENTIAL BUDGET IMPACT OF NOVEL THERAPIES FOR ADVANCED MELANOMA IN SECOND-LINE UNDER BRAZILIAN PRIVATE HEALTH CARE SYSTEM PERSPECTIVE

Tsuchiya CT, Buschinelli CT, Tobaruella FS, Maximo MFM, Guzzo MR, Gonçalves TM
Roche Brazil, São Paulo, Brazil

OBJECTIVES: Prior to availability of novel agents such as vemurafenib and ipilimumab, poor outcomes were associated with advanced melanoma treatment. In Brazil, vemurafenib (VEM) is an oral therapy for BRAF-V600E-mutated unresectable or metastatic melanoma in all treatment lines meanwhile ipilimumab (IPI) is an intravenously administered drug for metastatic melanoma in second-line. Whereas IPI is compulsorily reimbursed in private system as labeled, this study aims to estimate the potential budget impact of second-line VEM coverage in Brazilian Private Healthcare System. **METHODS:** The study focused in second-line setting since IPI has no indication for first-line in Brazil. Based on an epidemiologic approach, the potential pool of patients for each drug was estimated. It was adopted that private market accounts for 40% oncology patients. BRAF-V600E mutation positivity rates of 50% were assumed. Treatment costs were assessed evaluating drugs acquisition expenses (considering the ex-factory prices) based on labeled posology and when applicable mutation testing costs or infusion fees. Mean treatment durations were 6 months (VEM) and 3 months or 4 cycles (IPI). Reports were made in Brazilian Reais (BRL1.00~USD0.51 Feb/2013). **RESULTS:** In 2013, a potential of 408 advanced melanoma patients in second-line would be expected in the private system. Screening all patients and treating those eligible with VEM (204 patients), would result mean treatment costs per patient of BRL110,633 (VEM) and BRL182,852 (IPI). Therefore, system would be charged by expenses of BRL59,906,137 instead of BRL74,647,411 in a scenario with no testing and all second-line patients treated with IPI. **CONCLUSIONS:** Considering VEM availability in private health care system for advanced melanoma in second-line, BRL14.7Mio savings could be achieved in 2013. Testing all patients and reimbursing VEM seems to be economically advantageous mainly due to lower cost associated to VEM and the opportunity of testing patients with BRAF-mutation, identifying those who has more chance to respond to the treatment.

PCN7

BUDGET IMPACT ANALYSIS FOR THE USE OF VANDETANIB IN MEXICAN ADULT PATIENT DIAGNOSED WITH ADVANCED UNRESECTABLE MEDULLARY THYROID CANCER

Ascencio ISI[1], Polanco AC[1], Ruiz C[2], Pizarro M[3], Soto H[4], Salazar A[2]
[1]*AstraZeneca, México, D. F., Mexico,* [2]*Iteliness Consulting, D. F., Mexico,* [3]*Hospital Infantil de Mexico Federico Gomez, México D.F., Mexico,* [4]*Health Solutions Consulting, D. F., Mexico*

OBJECTIVES: Determine the financial impact of including vantedanib in public health institutions in Mexico, in the treatment of adult patients with advanced or metastatic unresectable medullary thyroid cancer (MTC). **METHODS:** In order to have a greater accuracy of the total population with advanced unresectable MTC with social security, we obtained the total population based on the reports in Histopathological Registry of Malignant Neoplasms (RHNM), GLOBOCAN and Wells 2012. All the related care costs were obtained by institutional references and the resource use were determined by clinical practice guidances and clinical studies. Horizon: 5 years. Comparator: vandetanib and external radiotherapy as palliative care, as there are currently no available alternative that has an impact in terms of PFS. Discount rate: 5%. The outcome measure was incremental expenditure for the use of vandetanib versus external radiotherapy in absolute terms and relative to total national health expenditure, in Mexico. **RESULTS:** The incremental expenditure for the first year was USD$663,558.50 and for the fifth year USD$716,403.10, represent 0.0082% and 0.0088% to total national health expenditure respectively. **CONCLUSIONS:** Vandetanib is the only option to patients with advanced unresectable MTC, there are no other therapies which can slow the progression of advanced disease including radiotherapy and chemotherapy. Because of the low prevalence of the disease, the use of vandetanib only represents an average annual increase of 0.0086% for total national health expenditure and should be considered the optimal choice in this population.

PCN8

COSTO E IMPACTO PRESUPUESTAL DEL TRATAMIENTO DEL CÁNCER DE PÚLMON DE CELULAS NO PEQUEÑAS DEL TIPO ADENOCARCINOMA CON GRADO ECOG 0,1,2 EN ESTADIO IV CON MUTACIÓN + (EGFR O ALK) CON TERAPIAS BLANCO EN MÉXICO

Peniche-Otero G[1], Herrera-Rojas J[1], Gryzbowski E[1], Muciño-Ortega E[2], Galindo-Suárez RM[2]

[1]*Customized Premium Products S.A. de C.V., México D.F., Mexico,* [2]*Pfizer S.A. de C.V., Ciudad de México, Mexico*

OBJECTIVOS: El impacto económico que tendría en México la incorporación gradual de pacientes con cáncer de pulmón de células no pequeñas en estadio IV (tipo adenocarcinoma), con mutación EGFR y ALK (CPCNP+), a esquemas basados en terapias blanco no se ha estimado. Este estudio estuvo enfocado a estimar este impacto desde la perspectiva del Sector Salud. **METODOLOGÍAS:** Con datos de GLOBOCAN 2008 se estimó la prevalencia 2012 de pacientes CPCNP+ en México. Un panel de expertos (n=20, 2 centros de alta especialidad) determinó el perfil de uso de recursos para atender a estos pacientes: hospitalización, medicamentos, consulta con especialista, administración del medicamento, pruebas de laboratorio y gabinete, tamizaje EGFR y/o ALK. Los costos se estimaron mediante metodología *bottom-up* en el Instituto Nacional de Cancerología y se expresan en US$ de 2012. Se realizó análisis de impacto presupuestal en base al Presupuesto de Egresos de la Federación (PEF) 2012. **RESULTADOS:** Se estimó que en 2012 había 3,068 pacientes candidatos a ser sometidos a tamizaje para EGFR y/o ALK, de los cuales 951 (31%) serían positivos (candidatos a tratamiento con terapias blanco). El costo esperado anual por paciente tratado con terapias blanco fue US$283,180 mientras que el costo correspondiente a pacientes que reciben quimioterapia convencional fue US$247,338. Suponiendo que el 6% (61) de los pacientes CPCNP+ fueran atendidos con terapias blanco y el resto (890) con quimioterapia convencional, el impacto presupuestal hubiera sido de 0.1% y 0.65% del PEF 2012, respectivamente. **CONCLUSIONES:** La prevalencia de pacientes CPCNP+ en México es de aproximadamente 8.5/100,000 habitantes. La diferencia en el costo esperado de tratamiento entre quimioterapia y terapias blanco es de alrededor de 15%. La introducción gradual de terapias blanco por las instituciones del Sector Salud es una estrategia que permitiría planificar el impacto presupuestal de esta adopción en base a la disponibilidad de recursos.

PCN10

ANÁLISE DAS POTENCIALIDADES DE CUSTO-MINIMIZAÇÃO ATRAVÉS DA DETERMINAÇÃO DO MARKET SHARE ENTRE OS QUIMIOTERÁPICOS DE REFERÊNCIA QUE POSSUEM GENÉRICOS CADASTRADOS EM UMA OPERADORA DE PLANO DE SAÚDE

Reis HPLC, Vieira JB, Magalhães DDP, Sartori DP, Fonseca DB, Barsi UD, Filho AEAM, Alencar JLL, Maciel JAP, Viana ADJR, Souza MIP

Unimed Fortaleza, Fortaleza, Brazil

OBJETIVOS: Identificar as potencialidades de custo-minimização através da determinação do *market share*entre os quimioterápicos de Referência que possuem Genéricos cadastrados em uma operadora de Plano de Saúde em Fortaleza, Ceará - Brazil. **MÉTODOS:** Estudo de minimização de custos em uma amostragem de medicamentos pertencentes à classe dos quimioterápicos (n=175 códigos). A fonte de dados foi a Tabela de Medicamentos padronizados na operadora e utilizados em 2012. Incluiu-se na amostra os custos com antineoplásicos pertecentes a classe A (Alto Custo - Curva ABC). Foram excluídos os medicamentos utilizados como suporte e hormonioterapia. Em seguida, fez-se a classificação das categorias, segundo Agência Nacional de Vigilância Sanitária (ANVISA) quanto a Referência, Genérico e Similar. Considerou-se a perspectiva da Operadora de Saúde. **RESULTADOS:** O câncer mais prevalente foi o de Mama (n=203; 31,28%) seguido de Brônquios e Pulmões (n=55; 8,47%). Quanto ao sexo observou maior prevalência em mulheres (n=442; 68,10%). O custo total com quimioterápicos em 2012 foi R$ 28.918.397,51, no qual 71,14% (R$ 20.571.337,18) foram com medicamento de Referência, seguido de 0,91% (R$ 261.787,42) com Genérico e 0,77% (R$ 222.507,38) Similar. Detectou-se que 27,19% (R$ 7.862.765,53) dos com quimioterápicos de Referência tem potencialidades de uso de genérico (Docetaxel, Doxorrubicina, Gencitabina, Irinotecano, Oxaliplatina, Paclitaxel,). Quanto ao impacto financeiro haveria uma redução nos custos por volta de 24,94% (R$ 1.960.973,72), se utilizássemos somente o genérico nessas potencialidades de uso, representando o melhor cenário. **CONCLUSÕES:** O mercado de genéricos é hoje uma realidade no país, tendo criado um segmento importante no mercado de medicamentos e seu incremento na quimioterapia traria economias substanciais nas diferentes instituições de saúde, como as operadoras.

PCN11

ECONOMIC IMPACT OF INCLUDING SEQUENTIAL BEVACIZUMAB FOR THE TREATMENT OF PATIENTS WITH KIRSTEN RAS WILD TYPE UNRESECTABLE METASTATIC COLORECTAL CANCER IN FOUR LATIN AMERICAN COUNTRIES

Rautenberg T[1], Tournier C[2], Ngoh CA[2], Arnaiz F[3], Carrizo M[3], Lewi D[4], Garcia A[5], Mitre N[5], Painemal C[6], Parada L[7], Bárbosa D[7], Rosselli D[8], Alva M[9], Torrecillas L[10]

[1]*Assessment In Medicine AiM GmbH, Lörrach, Germany,* [2]*F. Hoffmann-La Roche, Basel, Switzerland,* [3]*F. Hoffmann-La Roche, Tigre, Argentina,* [4]*Hospital Fernandez, Tigre, Argentina,* [5]*F. Hoffmann-La Roche, Santiago, Chile,* [6]*Centro Oncológico Integral de Santiago (ONCOISA), Santiago, Chile,* [7]*F. Hoffmann-La Roche, Bogotá D.C, Colombia,* [8]*Pontificia Universidad Javeriana, Bogotá D.C, Colombia,* [9]*F. Hoffmann-La Roche, Mexico City, Mexico,* [10]*Instituto de Seguridad y Servicios Sociales de los Trabajadores del Estado, México D.F., Mexico*

OBJECTIVES: To evaluate and compare the economic impact in terms of drug and administration cost of first to second line (1L>2L) sequential bevacizumab (BEV) to other sequences of biologics in the treatment of patients with Kirsten Ras wild type (KRAS WT) unresectable metastatic colorectal cancer (mCRC) in four Latin American countries. **METHODS:** A previously developed Treatment Sequencing Costing tool was adapted for Argentina, Chile, Colombia and Mexico. A private payer perspective was adopted for Argentina and Chile and a public payer perspective for Colombia and Mexico. Locally sourced drug acquisition and administration costs were included in the analysis. Cost of sequences was calculated based on proxy treatment durations of 6.1 months (1L), 4.0 months (2L) and 2.7 months (3L). Sequences analyzed for the respective countries were elicited from local experts and clinical guidelines in addition to 1L>2L BEV sequences obtained from the ML18147 trial. **RESULTS:** When 1L>2L BEV replaces sequences which include 1L anti-EGFR regimens, it results in an average potential cost reduction of ARS -42,796; $CLP -13,774,258; $COL -8,922,387 and $MXN-174,606 for Argentina, Chile, Colombia and Mexico respectively. When 1L>2L BEV replaces sequences which include 2L anti-EGFR regimens it results in an average potential incremental cost of ARS +25,331; $CLP +1,769,387 and $MXN +25,515 for Argentina, Chile and Mexico. **CONCLUSIONS:** In Argentina, Chile, Colombia and Mexico, when 1L>2L BEV replaces sequences which include 1L anti-EGFR regimens, it results in an average potential cost reduction. When 1L>2L BEV replaces sequences which include 2L anti-EGFR regimens, it results in a potential incremental cost which allows for the possibility of including a 3L anti-EGFR regimen.

PCN12

COST/BENEFIT ANALYSIS OF FIRST LINE CHRONIC LYMPHOCYTIC LEUKEMIA (CLL) TREATMENTS IN MEXICO

Wehler E[1], Leyva V[2], Bertwistle D[3], Munakata J[4], Valencia A[5], Hernandez A[5], de la Torre L[5], Gonzalez L[6]

[1]*IMS Health, Alexandria, VA, USA,* [2]*IMS Health, Mexico City, Mexico,* [3]*IMS Health, London, UK,* [4]*IMS Health, San Francisco, CA, USA,* [5]*Janssen, Mexico City, Mexico,* [6]*Janssen, Raritan, NJ, USA*

OBJECTIVES: To calculate and compare the costs and costs per PFS and OS for first line CLL treatment regimens in Mexico. **METHODS:** Relevant treatment regimens were selected based on KOL input and data availability. Treatment regimen costs were calculated using the dose, number of doses per cycle, and number of cycles per regimen from published clinical trials. Drug acquisition and administration costs were obtained from IMSS. Administration costs were applied once per treatment day, regardless of the number of drugs administered. Progression-free survival (PFS) and overall survival (OS) benefits for each regimen were calculated by applying hazard ratios for PFS and OS from a recent network meta-analysis to the median PFS and OS reported for chlorambucil. Cost/ benefit ratios were expressed as the regimen cost per month of PFS or OS. **RESULTS:** Regimens assessed were chlorambucil, fludarabine, fludarabine+ cyclophosphamide+ rituximab (FCR) and cyclophosphamide+doxorubicin+vincristine+prednisone (CHOP). Costs were estimated in 2012 Mexican pesos. The regimen cost for chlorambucil ($3,101) was less than fludarabine, FCR and CHOP ($50,430, $525,481 and $105,246, respectively). Only FCR and CHOP incurred administration costs. The hazard ratios for OS and PFS showed FCR was the most effective treatment versus chlorambucil (0.24 and 0.73, respectively). The cost/PFS benefit ratio was most favorable for chlorambucil ($352/month) versus fludarabine, FCR and CHOP ($4,757, $14,318 and $18,145, respectively). Chlorambucil also had the lowest cost/OS benefit ratio ($39/month) versus fludarabine, FCR and CHOP ($639, $4,865 and $1,441, respectively). **CONCLUSIONS:** Chlorambucil was the least costly of the Mexican CLL treatment regimens assessed in absolute terms and per benefit. However, there is a need for a CLL treatment that provides greater efficacy in terms of PFS and OS than chlorambucil, but costs less than FCR. Future studies should focus on the incremental cost-effectiveness of new regimens for this indication.

PCN13

THE AFFORDABILITY OF ONCOLOGY AND HIV/AIDS TECHNOLOGIES IN BRAZIL COMPARED TO THE UNITED STATES AND OTHER OECD COUNTRIES

Zueger P[1], Becker R[2]

[1]*University of Illinois at Chicago, Chicago, IL, USA,* [2]*Russell Becker Consulting, Chicago, IL, USA*

OBJECTIVES: Brazil's universal access to health care program has been deemed successful by several different measures. However, given limited health care budgets, the affordability of newer, increasingly expensive technologies can become a major access barrier. This study compares the affordability of current HIV/AIDS and oncology technologies in Brazil to those in the U.S. and other Organization for Economic Cooperation and Development (OECD) countries. **METHODS:** Per patient treatment costs for HIV/AIDS and oncology technologies in Brazil, the U.S. and other OECD countries were obtained from published studies and datasets. Non-Brazilian studies were chosen for their comparability to the Brazilian counterpart studies in terms of patient populations, disease characteristics, treatments, and economic perspective. Costs compared included drugs, procedures, administrative costs, and total cost of treatment. All costs were converted to 2011 U.S. dollars. The two affordability measures utilized included: 1) Cost per gross domestic product (GDP) per capita, and 2) cost per health care spending (HCS) per capita. These measures were compared between Brazil and other OECD countries to estimate the relative affordability of HIV/AIDS and oncology technologies. **RESULTS:** A majority of technologies assessed were less affordable in Brazil compared to comparator OECD countries by both affordability measures. Under the GDP measure, oncology technologies in Brazil consumed approximately 2 to 20 times the amount of available resources compared to OECD countries. Using the HCS measure, health care resource consumption in oncology was 4 to over 40 times that of OECD countries. Differences in relative affordability of HIV/AIDS technologies were generally smaller, with resource consumption in each country generally varying by less than 3 times that of the comparator country using each affordability measure. **CONCLUSIONS:** Although oncology and HIV/AIDS technology access in Brazil has increased in recent years, these treatments may be relatively less affordable compared to other developed countries given Brazil's current resource and budget constraints.

PCN14

DIRECT MEDICAL COSTS (DMC) OF TREATING CHRONIC LYMPHOID LEUKEMIA (CLL) PATIENTS IN THE PRIVATE HEALTH CARE SYSTEM IN BRAZIL: RESULTS FROM A 12-MONTH RETROSPECTIVE ANALYSIS OF AN ADMINISTRATIVE DATABASE

Paloni EDMP[1], Ferreira CN[1], Asano E[2], Santana CFSD[3], Pereira ML[4]

[1]*ORIZON - Companhia Brasileira de Gestão de Serviços, Sao Paulo, Brazil,* [2]*Janssen-Cilag Farmaceutica, Sao Paulo, Brazil,* [3]*Orizon, Sao Paulo, Brazil,* [4]*Janssen Cilag Farmaceutica, São Paulo, Brazil*

OBJECTIVES: To determine 1-year direct medical costs of treating patients with Chronic Lymphoid Leukemia (CLL) from the Brazilian Private Healthcare System perspective. **METHODS:** The Orizon database, an administrative database containing inpatient and outpatient claims to a pool of 102 HMOs representing 34% of the total Private Health System, was reviewed from Jan/2009 to Dec/2012. Eligibility criteria were patients starting CLL (ICD-10 code C911) treatment from Apr/2009 to Dec/2011. Outcome was direct medical costs (DMC) per patient-year, calculated as the sum of the medical claims for each patient included in the analysis, for a maximum period of 12-months or death or loss of follow-up, whichever comes first. DMC was categorized in chemotherapy, hospitalizations, and other outpatient costs. Further analysis was conducted for chemotherapy and hospitalizations. **RESULTS:** From 735 patients with CLL identified in the database, 164 met eligibility criteria and were included in the analysis, representing a total of 100 patients-years. Total DMC in this population was R$ 16,555,421 (mean cost of R$ 165,827 per patient-year), from which R$ 9,451,124 (57%) are related to chemotherapy, R$ 5,341,862 (32%) to hospitalizations and R$ 1,762,434 (11%) to other outpatient costs. Outpatient laboratory exams accounted for only a small fraction (R$ 176,545, 1%) of DMC, and only one patient had a record of radiotherapy (<1% of DMC). A total of 326 hospitalizations were identified in 79 (48%) patients, with an average cost of R$ 16,386 ± 29,185 per hospitalization. Chemotherapy drugs accounted for 71% of the total costs with chemotherapy, the rest divided between other drugs (12%), disposable devices (6%), hospital facility fees (5%) and other costs (6%). **CONCLUSIONS:** Patients with CLL represent a significant economic burden to private payers. Chemotherapy and hospitalization costs accounts for almost 90% of the total costs.

PCN15

COSTS OF HORMONAL RECEPTOR POSITIVE, HER 2 NEGATIVE METASTATIC BREAST CANCER (MBC-HR+) IN BRAZILIAN PRIVATE SYSTEM (BPS): A REAL WORLD AND PUBLISHED LITERATURE ANALYSIS

Clark OAC[1], Paladini L[1], Engel T[1], Nishikawa AM[1], Borges L[1], Caldas A[2], Valentim J[2]
[1]*Evidencias, Campinas, Brazil*, [2]*Novartis Biociências SA, São Paulo, Brazil*

OBJECTIVES: Recently, MBC-HR+ was found to have a diverse pattern of response to the treatment compared to other MBC. Our aim is to determine the costs of treatment associated with this disease, from the perspective of BPS. **METHODS:** A large private database of medical claims for chemotherapy (Ch) (Evidencias Database) was searched in order to identify MBC-HR+, that were treated in the last two years (2011-12). We extracted data regarding treatment received, length of the treatment and antropometric data for each MBC-HR+ patient. After, medical literature was performed for studies of MBC-HR+ treatments and the same data was extracted. Based on the combination of real-world (RW) and published data we constructed a decision tree, considering three groups of MBC-HR+, according to the sites of metastasis: bone exclusive (B), Visceral exclusive (V) and bone plus visceral (BV). For each group, we calculated the costs of the treatment plus adverse events, by a micro-costing approach. We simulated a cohort of 100 patients with MBC-HR+ in a decision tree, to obtain the costs for each group and a mean cost/ patient. **RESULTS:** RW data showed the following distribution of patients: B 38%, V 42% BV 20%. Lengths of treatment (in months) were B: 25.1 to 30.5; V 16.1; BV 14 to 19.6. Most commonly used treatments were, B – two hormonal lines, fulvestrant and three lines of Ch. V – Four lines of Ch; BV- one hormonal line, fulvestrant, three lines of Ch. Most used Ch drugs were docetaxel, paclitaxel and gemcitabine. Mean costs/patient/ group, considering hormones, Ch, bisphosphonates, hospitalization, infusion, evaluations of the disease, radiation therapy and adverse events were: B- R$ 135,744 (US$ 67,872); V R$ 129,079 (US$64,539) and BV R$ 117,172 (US$58,568). **CONCLUSIONS:** MBC-HR+ is associated to a high cost of treatment under the BPS perspective.

PCN16

COST-EFFECTIVENESS OF PAZOPANIB AS FIRST LINE TREATMENT FOR METASTATIC RENAL CELL CARCINOMA IN BRAZIL: UPDATED ANALYSIS

Pepe C[1], Sedlmayer C[2], Machado M[2]
[1]*MedInsight, São Paulo, São Paulo, Brazil*, [2]*GlaxoSmithKline Brazil, Rio de Janeiro, Brazil*

OBJECTIVES: Targeted therapies shows marked clinical improvements over standard treatments such as interferon alfa (IFNa) in the treatment of advanced/metastatic renal cell carcinoma (mRCC). We report an updated cost-effectiveness analysis of pazopanib, sunitinib, and bevacizumab (the later associated INFa) as first line treatments for mRCC under the Brazilian public health care perspective. In previous analysis, taxation was accounted exclusively for pazopanib's price.[Value Health 2012;15(4):A218] The present analysis applied ex-factory 0% tax prices, where now all comparisons were made under tax waiver programs. **METHODS:** A Markov model was designed to simulate mRCC progression, mortality and costs. The assessed time-horizon was 2 years. An indirect comparison estimated the relative efficacy and safety of the targeted therapies in mRCC patients. Costs and consequences of disease treatment were computed for each comparator. Only direct medical costs were considered and reported in 2013 Brazilian currency (1BRL=0.50USD). Drug prices derived from official price list (i.e., CMED). Disease management costs were those from a public reimbursement database (i.e., SIGTAP). Costs and outcomes were discounted at 5% yearly. Outcomes assessed were progression-free survival (PFS) and quality-adjusted life years (QALYs). Stochastic simulations tested model robustness. **RESULTS:** The indirect PFS hazard ratio (<1 favours pazopanib [95%CI]) indicated that pazopanib is not statistically different from sunitinib (0.93 [0.56, 1.56]) or bevacizumab+IFNa (0.79 [0.48, 1.32]). A recent head-to-head clinical study (COMPARZ) of pazopanib versus sunitinib confirmed indirect results. Estimated costs and QALYs were BRL 93,389.88 and 0.90 for pazopanib, BRL 124,923.36 and 0.93 for sunitinib, and BRL 185,942.43 and 0.88 for bevacizumab+INFa. Propabilistic analysis showed favourable economic results to pazopanib in >90% of simulations when compared to sunitinib. Bevacizumab+INFa was dominated in all scenarios. **CONCLUSIONS:** Pazopanib reported significantly lower costs and similar benefits against studied comparators as first line treatment of patients diagnosed with mRCC under the Brazilian public health care perspective.

PCN17

COST-EFFECTIVENESS ANALYSIS OF INCORPORATION OF THE HPV VACCINE TO THE NATIONAL IMMUNIZATION PROGRAM / NIP OF BRAZIL

Novaes HMD[1], azevedo e Silva G[2], Ayres A[2], Itria A[3], Rama C[4], Sartori AMC[5], De Soarez PC[1], Clark A[6], Resch S[7]
[1]*University of Sao Paulo, Sao Paulo, Brazil*, [2]*Universidade Estadual do Rio de Janeiro, Rio de Janeiro, Brazil*, [3]*Departamento de Saúde Coletiva do Instituto de Patologia Tropical e Saúde Pública, Universidade Federal de Goiás. Pesquisador do Instituto de Avaliação de Tecnologia em Saúde (IATS), Goiânia - Goiás, Brazil*, [4]*Secretaria do Estado de Saúde de São Paulo, São Paulo, AL, Brazil*, [5]*University of Sao Paulo, Sao Paulo, SP, Brazil*, [6]*London School of Hygiene and Tropical Medicine, London, UK*, [7]*Harvard University, Boston, MA, USA*

OBJECTIVES: To estimate cost-effectiveness of adding human papillomavirus (HPV) vaccine to Brazil National Immunization Program, compared with the current strategy for control of cervical cancer, the screening program based on conventional Papanicolaou citology. **METHODS:** We used a static decision tree analysis model, CERVIVAC, software developed by PAHO ProVac Initiative. The model compared two strategies: 1) a cohort of girls aged 10 years to represent the epidemiological situation, current screening, and care of precursor lesions and cancer (without vaccination) with 2) a cohort of girls aged 10 years who were applied 3 doses of HPV vaccine, maintaining the conditions of screening and care of precursor lesions and cancer, as they are currently. National parameters for the epidemiology of cervical cancer, screening expenditures and National Cervical Cancer Control Program were estimated in depth. The estimates were based on the health information systems of the Public Health System, SUS (SIH, SIA, APAC, SIAB, SIGTAP and SISCOLO), national survey (PNAD 2008) and relevant national literature. **RESULTS:** The vaccine introduction would reduce the burden of disease. The model estimated 261 deaths avoided and 7595 DALYs averted, in each successive cohort to be vaccinated. The ICER per DALY averted R$ 18,121 would be considered cost-effective, according to the parameters adopted by WHO. In univariate sensitivity analysis, only a lower discount rate and a high incidence and mortality would make the introduction of the vaccine very cost-effective. **CONCLUSIONS:** The vaccine introduction should bring benefits for the control of cervical cancer, but it will require large investments by the NIP. It should be guaranteed the right conditions for the immunization program sustainability and equity in a population perspective as well as to improve the screening program.

PCN18

ANÁLISIS COSTO-EFECTIVIDAD DE EVEROLIMUS MÁS EXEMESTANO PARA PACIENTES CON CÁNCER DE MAMA AVANZADO CON RECEPTORES HORMONALES POSITIVOS (RE+), HER2–, QUE FALLARON A LOS INHIBIDORES DE AROMATASA NO ESTEROIDEOS (IANES) EN MÉXICO

Zhang J[1], Pramanik A[2], Fuentes-Alburo A[3], Anaya P[4], Tinajero-Ayala B[5], Zhou ZY[6], Xie J[7], Signorovitch J[6], Fan L[6]
[1]*Novartis Pharmaceuticals Corporation, East Hanover, NJ, USA*, [2]*Novartis Asia Pacific Pharmaceuticals Pte Ltd, Singapore, Singapore*, [3]*Novartis Corporation, Mexico, Distrito Federal, Mexico*, [4]*Novartis Oncology, Mexico, México D.F., Mexico*, [5]*Novartis Oncology, México D.F., Mexico*, [6]*Analysis Group, Inc., Boston, MA, USA*, [7]*Analysis Group, Inc., New York, NY, USA*

OBJECTIVOS: Evaluar el perfil costo efectividad de everolimus en combinación con exemestano en pacientes con cáncer de mama avanzado, RE+, HER2–, que fallaron a los IANES. **METODOLOGÍAS:** Se desarrolló un modelo de Markov con ciclos mensuales y un horizonte temporal de diez años. El modelo compara a) exemestano+everolimus seguido por tres líneas de quimioterapia y mejor terapia de soporte (MTS) con b) tres líneas de quimioterapia más MTS. Se incluyó la probabilidad de muerte desde cualquier tratamiento. La secuencia de quimioterapia se definió a través de un panel de expertos. Las probabilidades de transición para everolimus+exemestano se obtuvieron del estudio BOLERO-2. Se realizó una revisión de la literatura para las probabilidades de transición de las quimioterapias. Se incluyeron los costos de los medicamentos y de su administración, los costos asociados con eventos adversos, monitoreo y de la MTS. Los resultados se presentan en $MXN de 2012 desde una perspectiva del Sistema Público de Salud mexicano. Se aplicó una tasa de descuento del 5% para costos y efectividades. Se realizaron análisis de sensibilidad probabilístico (ASP) con mil repeticiones y diferentes análisis de sensibilidad univariados, incluyendo un análisis con horizonte temporal de por vida. **RESULTADOS:** El modelo mostró que everolimus+exemestano resulta en 1.32 años de vida ganados con un costo incremental de $314,327 dando como resultado una razón de costo efectividad incremental (RCEI) de $237,902. El ASP mostró que la RCEI está dentro del rango recomendado por la OMS (1 a 3 PIBs per capita) en la mayoría de los casos. La RCEI con un horizonte temporal de por vida fue de $209,292. **CONCLUSIONES:** El presente análisis mostró que utilizar everolimus más exemestano en pacientes con cáncer de mama avanzado, RE+, HER2–, que fallaron a los IANES es una opción costo efectiva de acuerdo a las recomendaciones de la OMS.

PCN19

ANÁLISIS DE COSTO-EFECTIVIDAD DE ERLOTINIB EN EL TRATAMIENTO DE PACIENTES CON CÁNCER PULMONAR DE CÉLULAS NO PEQUEÑAS, CPCNP, CON MUTACIÓN DEL GEN EGFR+, EN COLOMBIA

parada Vargas LA, Barbosa DA
Roche Colombia, Bogotá D.C, Colombia

OBJECTIVOS: Evaluar la costo-efectividad de Erlotinib como tratamiento en primera línea (1L) de pacientes con cáncer pulmonar de células no pequeñas, CPCNP estadio IIIB/IV, con mutación del gen EGFR+, en comparación con la quimioterapia estándar (carboplatino/ Paclitaxel) y con Getinib, desde la perspectiva del Sistema de Salud Colombiano. **METODOLOGÍAS:** Se empleó un Modelo de Markov que simula el curso del CPCNP, con ciclos mensuales. Los estados de salud considerandos en el modelo son: Libre de progresión de enfermedad (LPE), Libre de progresión de enfermedad con respuesta (LPER), Progresión de enfermedad (PE); y Muerte. Se consideran costos directos y eventos adversos en pesos colombianos, años de vida ganados libres de enfermedad (AVGLE), para Erlotinib y Gefitinib comparados con quimioterapia estándar. Las probabilidades de transición se tomaron de la literatura, los costos se obtuvieron a partir de consenso de expertos según la práctica habitual, los costos de

los medicamentos se tomaron de las bases oficiales (SISMED y Circular 04 de 2012). Se empleó una tasa de descuento de 3% para costos y beneficios. **RESULTADOS:** El costo total para los 60 ciclos de la terapia con Erlotinib fue de $153 millones por 1.55 AVGLE; frente a la quimioterapia estándar con $122 millones por 1.28 AVGLE; y para la terapia con Gefitinib de $158 millones para 1.43 AVGLE. La razón de costo efectividad incremental de Erlotinib empleado en 1L es de $112 millones por 0,27 AVGLE, con respecto al esquema estándar de quimioterapia. La razón de costo efectividad incremental de Gefitinib es de $245 millones para alcanzar 0.14 AVGLE. **CONCLUSIONES:** Erlotinib mantiene el costo por beneficio ganado de la terapia estándar que ya esta siendo reembolsada por el Sistema de Salud Colombiano; en ese sentido, se puede considerar una terapia eficiente.

PCN20

ANÁLISIS DE COSTO-EFECTIVIDAD DE BEVACIZUMAB PARA EL TRATAMIENTO DE PRIMERA LÍNEA EN PACIENTES CON CÁNCER COLORRECTAL METASTÁSICO, CCRM EN COLOMBIA

parada Vargas LA, Barbosa DA
Roche Colombia, Bogotá D.C, Colombia

OBJECTIVOS: Realizar un análisis de costo-efectividad (ACE) sobre el uso de Bevacizumab vs anticuerpos anti-receptor de factor de crecimiento epidérmico (EGFRI), utilizados con esquemas de FOLFIRI o FOLFOX/XELOX en el tratamiento de primera línea de los pacientes con CCRm con presencia de KRAS silvestre (WT) en Colombia, según la perspectiva del Sistema de Salud Colombiano. **METODOLOGÍAS:** Se empleó un Modelo de Markov, con ciclos mensuales, para estimar costos Supervivencia Libre de Progresión (SLP) en función del estado KRAS, a partir del costo por éxito clínico (Número Necesario a Tratar, NNT, para mantener un paciente libre de progresión a 12 meses). Se incluyeron costos directos y eventos adversos en pesos colombianos, para: FOLFIRI+Bevacizumab; FOLFIRI+Anti EGFR; FOLFOX/XELOX+Bevacizumab; FOLFOX/XELOX+EGFR. Las probabilidades de transición se tomaron de la literatura, los costos se obtuvieron a partir de consenso de expertos según la práctica habitual, los costos de los medicamentos se tomaron de las bases oficiales (SISMED y Circular 04 de 2012). No se empleó tasa de descuento por ser un análisis hasta un año. **RESULTADOS:** 1.*Costos FOLFOX WT ($COP):* Folfox (10.446.152), Folfox+Anti EGFR (90.221.332), Folfox+Bevacizumab (28.238.377). 2. *Costos FOLFIRI WT ($COP):* Folfiri (16.968.778), Folfiri+Anti EGFR (104.049.002), Folfiri+Bevacizumab (45.235.174), Xelox+Anti EGFR (94.513.398), Xelox+Bevacizumab (45.488.519). 3. *SLP meses WT:* Folfox (7.2), Folfox+Anti EGFR (7.7), Folfox+Bevacizumab (11.5), Xelox+Bevacizumab (10.6); Folfiri (8.7), Folfiri+Anti EGFR (9.9), Folfiri+Bevacizumab (11.5). 5. La Razón de Costo Efectividad Incremental mostró que el uso de Bevacizumab + (FOLFOX/XELOX) y FOLFIRI es una terapia dominante. **CONCLUSIONES:** El uso de FOLFIRI/FOLFOX+Bevacizumab resulta ser la opción más costo-efectiva para una disposición a pagar de apróximadamente COP$36 millones. Los cálculos de costo efectividad estuvieron en linea con los resultados para otras terapias contra el cancer.

PCN21

COST-EFFECTIVENESS AND COST-UTILITY ANALYSIS OF MIFAMURTIDE PLUS COMBINATION CHEMOTHERAPY IN PEDIATRIC PATIENTS WITH OSTEOSARCOMA AFTER RESECTION SURGERY

Vargas-Romero JA[1], Figueroa-Rodriguez A[2], Chiu-Ugalde J[1], Sánchez-Kobashi R[3], Gay-Molina JG[3], López-Alvarenga JC[4]
[1]*Medical Research Department,Takeda-Mexico, Naucalpan, Mexico,* [2]*Market Access and Government Sales Department, Takeda-Mexico, Naucalpan, Mexico,* [3]*Tecnología e Informática para la Salud, S.A. de C.V., México D.F., Mexico,* [4]*Hospital General de México O.D., México D.F., Mexico*

Current treatment for high-grade osteosarcoma (HGO) consists in primary tumor complete surgical excision and adjuvant multi-agent combined chemotherapy for subclinical metastatic disease. In Mexico, osteosarcoma prevalence is ≤5 cases per 10,000 people; drugs targeting the disease are therefore designated orphan medicinal products. This is the case of mifamurtide, a potent monocytes and macrophages inducer. **OBJECTIVES:** This study aimed to determine the most cost-effective treatment for resectable, non-metastatic HGO in pediatric patients. Therapies compared were combined chemotherapy (high doses methotrexate, doxorubicin, cisplatin, with or without ifosfamide) vs combined chemotherapy plus mifamurtide. **METHODS:** Efficacy data regarding combination chemotherapy alone or with mifamurtide were obtained from the INT-0133 study. A Markov model was designed using Excel™ software. According to treatment guidelines, the model considered six stages: disease-free; disease progression; recurrence; progression-free after recurrence; progression after recurrence; death. The model adopted the Mexican public health institutions' perspective over a 60-year timeframe. Univariate sensitivity analyses were conducted to determine the robustness of the model. Average utility was calculated from published studies. Costs were from the Mexican Institute of Social Security (IMSS). Outcome measures included cost, ICER and ICUR. **RESULTS:** Cost-effectiveness analysis showed that while the chemotherapy combination regimen plus mifamurtide was more effective (19.74 vs. 18.17, LYG) it was also more costly (USD $102,635.8 vs. $13,148.89), with a discount rate of 3.5%. The ICER is USD $56,746.14. The cost-utility analysis found the same results, with the chemotherapy plus mifamurtide proving to be most effective treatment (19.55 vs. 17.95 QALY), or 1.60 additional QALY. The ICER was USD $55,837.7. Sensitivity analyses showed the model to be robust. **CONCLUSIONS:** Mifamurtide is a cost-effective treatment for pediatric patients with osteosarcoma. The additional 1.60 QALYs are relevant for the population, offering longer survival with a better quality of life.

PCN22

HOW UNIVERSITY HOSPITAL OF CRETE SUCCEEDED IN DECREASING CYTOSTATICS' BUDGET IN 2012?

Gkogkozotou VK[1], Asithianakis P[2]
[1]*UNIVERSITY HOSPITAL OF CRETE, CRETE, Greece,* [2]*UNIVERSITY HOSPITAL OF CRETE (PAGNI), CRETE, Greece*

OBJECTIVES: UHC is the largest hospital in Crete and among the 5 largest hospitals in Greece. With the implementation of the memorandum, all operators were asked to reduce their costs, while special emphasis was placed on decreasing health care costs. In 2012, in this context, UHC made various attempts to diminish its budget. **METHODS:** Two events happened in 2012: 1) Pharmaceutical companies were asked to offer discounts for their products' price; 2) A central unit for the cytostatics drugs' dilution for all oncologic therapies was founded. Good management and economy of scale succeeded in quantity saving of drugs that were re-entered in pharmacy's stock. **RESULTS:** The effect of these combined actions was examined in achieving the goal of reducing the pharmaceutical expenditure. In order for the data to be comparable, only the drugs used in the CU were studied. Specifically, there are 113 medications (62 prototypes, 31 generics and 20 orphan drugs), which derived from 23 companies. In 2012, 100.000 units were consumed in hospital that worth 10 M€. The combined results were impressive as a budget reduction of 21.4% was achieved (15.4% due to discounts and 6% due to the CU). As per the discounts, 82% of cytostatics' value represents prototypes and expensive drugs, which were limited to the legal rebate of 5% discount, while 17% is mostly generics whose discounts varied from 29.5 to 92.9%. Thus, 73.4% of the value benefit was due to generic and 26.6% due to the prototype drugs. As for the CU's savings, 6000 pieces were returned to the pharmacy. A total of 91.7% of the value benefit derived from the prototypes and the remaining 8.3% from the generic and orphan drugs. **CONCLUSIONS:** Taking into consideration that cytostatic drugs' cost equals 1/3 of the total pharmaceutical expenditure, even if only these two events were taking place, a 7.1% budget decrease was achieved.

PCN23

EVALUACIÓN ECONÓMICA DEL USO DE LA PERFUSIÓN AISLADA DE EXTREMIDAD CON TASONERMIA EN PACIENTES CON SARCOMA DE TEJIDO BLANDO IRRESECABLE

Gay JG[1], Jones K[1], Valencia C[2], Garcia D[2]
[1]*TI SALUD, MEXICO, Mexico,* [2]*BOEHRINGER INGELHEIM, MEXICO, Mexico*

OBJECTIVOS: Identificar la relación costo-utilidad de la perfusión aislada de extremidad (PAE) con tasonermina (factor de necrosis tumoral 1a (FNTα-1a) y quimioterapia, en comparación con amputación, para el control del sarcoma de tejidos blandos irresecable en extremidad con la perspectiva de salvamento de la extremidad. **METODOLOGÍAS:** El análisis se enfocó en la calidad de vida ganada gracias al salvamento de la extremidad en comparación con amputación, en el tratamiento del sarcoma de tejidos blandos irresecables. Se desarrolló un modelo Markov de cinco años, comparando cinco posibles resultados para PAE con dos estados de amputación. Los estados de salud para PAE (pierna y brazo) incluyeron: éxito del procedimiento; éxito con pérdida de movilidad y muerte. Las utilidades para la población mexicana fueron obtenidas utilizando el método TTO y estados de salud EQ-5D. Además, utilizando información de distintas dependencias públicas, el modelo consideró costos médicos directos y el costo de las complicaciones asociadas con el tratamiento. Posteriormente, se realizó un análisis de sensibilidad univariado sobre los costos directos, el costo de las complicaciones y las tasas de descuento. **RESULTADOS:** Durante el período de análisis, el tratamiento más efectivo fue la PAE con tasonermia y quimioterapia, obteniendo una ganancia de 2.88 AVACs, en comparación con los 1.39 obtenidos para amputación. Además, la RCEI de PAE utilizando tasonermia ascendió a $123,357.78 pesos mexicanos. **CONCLUSIONES:** La PAE utilizando tasonermia en pacientes con sarcoma de tejidos blandos irresecable es considerada una alternativa costo-efectiva en el contexto mexicano, ya que la RCEI fue inferior a un PIB per cápita. Adicionalmente, el impacto positivo que tiene el procedimiento sobre la calidad de vida de los pacientes, sin comprometer su esperanza de vida, convierte a tasonermia en una opción atractiva para un grupo de pacientes que carecen de opciones de tratamiento.

PCN24

COSTO-UTILIDAD DE INTERVENCIONES PREVENTIVAS CONTRA EL CÁNCER DE CUELLO UTERINO EN MUJERES PERUANAS

Gutiérrez-Aguado A
Ministerio de Economía y Finanzas, LIMA, Peru

OBJECTIVOS: Estimar el costo-utilidad de la vacuna bivalente y tetravalente contra el Virus de Papiloma Humano en las mujeres peruanas de 10 años de edad comparando el tamizaje de Papanicolau y el no vacunar. **METODOLOGÍAS:** Se realizó una evaluación económica de tipo costo-utilidad estructurado sobre un modelo matemático de Markov. La población de estudio fue una cohorte hipotética de niñas de 10 años de edad para la vacunación y para el caso del tamizaje de Papanicolau, se consideró a la población de 30-49 años. Los costos de la vacunación se estimaron desde la perspectiva del financiador, con base en estos costos y los años de vida ajustados por calidad (QALY) como medidas de resultado de cada una de las intervenciones evaluadas, se calcularon las razones costo-utilidad incremental y análisis de sensibilidad utilizando una tasa de descuento del 3%. **RESULTADOS:** El costo anual de la vacunación bivalente fue de USD 9'014,006.05, para el tamizaje con Papanicolau fue de USD 3'048,448.82 y el costo del CCU fue de USD 16'270,359.3. La Razón incremental de costo efectividad (ICER) para la vacunación bivalente fue de 3377 USD/QALY, para el tamizaje de Papanicolau fue de 6,554 USD/QALY, para la vacunación tetravalente fue de 19,274 USD/QALY y para el no vacunar fue de 30,904 USD/QALY. **CONCLUSIONES:** La vacunación bivalente contra el VPH resultar ser costo-efectiva, en comparación con la vacuna tetravalente y el tamizaje de Papanicolau, sin embargo los resultados no fueron robustos al incorporar la incertidumbre existente.

CANCER – Health Care Use & Policy Studies

TRATAMENTO DO CÂNCER COLORRETAL METASTÁTICO COM BEVACIZUMABE E CETUXIMABE: ACESSO E IMPACTO ECONÔMICO EM UM HOSPITAL UNIVERSITÁRIO

Ungari AQ, Pereira LRL, Nunes AA, Peria FM
University of São Paulo - USP, Ribeirão Preto, Brazil

OBJETIVOS: Avaliar o acesso e o impacto econômico da introdução das terapias-alvo bevacizumabe e cetuximabe no tratamento do câncer colorretal metástico em um hospital universitário após o início do Processo Administrativo (Resolução SS 54/2012). **MÉTODOS:** Estudo retrospectivo e descritivo realizado de janeiro de 2010 a junho de 2012, junto aos pacientes portadores de câncer colorretal metastático em seguimento no Serviço de Oncologia Clínica do Hospital das Clínicas da Faculdade de Medicina de Ribeirão Preto-USP em uso de tratamento quimioterápico. Foi avaliado o número de pacientes atendidos; o tempo médio entre solicitação, avaliação pela Secretaria de Estado da Saúde de São Paulo e recebimento dos medicamentos; o intervalo médio de tempo entre início de uso do medicamento após seu recebimento; gasto financeiro total e o gasto financeiro médio por paciente. **RESULTADOS:** No período do estudo foram tratados com bevacizumabe e cetuximabe, respectivamente, 28 e 30 pacientes. Foi identificado um tempo médio entre o pedido, avaliação pela SES-SP e recebimento dos medicamentos de 43 dias; um tempo médio de 14 dias para o início do uso após o recebimento dos medicamentos e um gasto financeiro total com cetuximabe de R$1.112.145,09 e R$1.157.444,69 com bevacizumabe, sendo o gasto médio total de R$37.071,03 por paciente tratado com cetuximabe e R$41.337.31 com bevacizumabe. **CONCLUSÕES:** O Processo Administrativo proporcionou acesso dos pacientes com maior rapidez a estes medicamentos, sendo de extrema importância se conhecer os recursos financeiros empregados aos medicamentos disponíveis. A adoção dessa medida contribuiu para a garantia do acesso da população à assistência oncológica, constituindo-se em um elemento importante para o adequado enfrentamento dos desafios que a progressão da incidência de câncer representa para a saúde pública brasileira.

PCN26

IMPACT OF PUBLIC PAYER CONCENTRATION ON PUBLIC SECTOR DISCOUNTS FOR SELECTED CANCER SUPPORTIVE CARE PRODUCTS IN BRAZIL AND MEXICO

Sandorff E[1], Ziai Buetas A[2], Severi Bruni D[3]
[1]*ICON, Blue Bell, PA, USA,* [2]*ICON, London, UK,* [3]*ICON, El Segundo, CA, USA*

OBJECTIVES: When contracting with large accounts, manufacturers have long understood the importance of discounting to gain the favor of high-volume customers over the competition. The objective of this research is to compare what levels of discounting is necessary to sell pharmaceutical products in the highly-competitive cancer-supportive care market to the leading public payers in two of Latin America's largest markets, the *Sistema Único de Saúde* (SUS) of Brazil and the *Instituto Mexicano del Seguro Social* (IMSS) of Mexico. As the level of concentration in terms covered lives as a percentage of their respective countries' total populations varies this will provide insight into the importance that concentration plays in securing greater discounts. **METHODS:** Quantitative analysis of SUS and IMSS tender purchase data compared with ex-manufacturer prices for selected cancer supportive care agents in Brazil and Mexico. Products will be divided into innovative and commoditized baskets to provide insight into any differences that level of differentiation may play when contracting with these payers. **RESULTS:** Due to its higher concentration of covered lives to total population, discounts on sales for the selected products to SUS were greater than on those to IMSS. This was true for innovative as well as commoditized products, although differences in coverage policies for higher-cost, innovative drugs result in greater variability of data than for the commoditized basket of products. **CONCLUSIONS:** Discounting plays a critical role in securing contracts with large accounts, and is even more important with payers that cover a larger proportion of their populations. This is especially true for commoditized products, while innovative products show greater ability to avoid more pronounced discounting with even the largest public payers in the countries due to their greater level of differentiation.

PCN27

VARIABILIDADE NO TRATAMENTO DO CANCER DE MAMA NO BRASIL

Cherchiglia ML[1], Pereira J[2], Mateus C[2], Acurcio FDA[3], Andrade EI[3], Machado C[3]
[1]*Universidade Federal de Minas Gerais/Escola Nacional de Saúde Pública, Universidade Nova de Lisboa, Belo Horizonte/Lisboa, Brazil,* [2]*Escola Nacional de Saúde Pública, Universidade Nova de Lisboa, Lisboa, Portugal,* [3]*Universidade Federal de Minas Gerais, Belo Horizonte, Brazil*

OBJETIVOS: Descrever as taxas de utilização do tratamento para câncer de mama feminino e determinar a variabilidade geográfica no uso desse tratamento. **MÉTODOS:** Estudo descritivo ecológico de utilização de tecnologia mediante análise de áreas geográficas, cuja fonte de dados foi a Base Onco, desenvolvida por meio de relacionamento probabilístico-determinístico dos registros de autorização para procedimentos de radioterapia e/ou quimioterapia e dos registros de internação hospitalar pelo SUS, no período de 2000 a 2006. Foram incluídas as pacientes com diagnóstico de câncer de mama entre os anos de 2000 a 2005 e com idade entre 19 a 100 anos. Para conhecer a magnitude da variação do tratamento para o câncer de mama entre os estados brasileiros foram utilizadas taxas brutas e padronizadas de tratamento oncológico por idade por 100.000 mulheres (censo 2000); razão de variação (entre os valores máximos e mínimos observados do percentil 5-95), coeficiente de variação e razão de utilização padronizada (RUE). **RESULTADOS:** Foram analisadas 104.343 mulheres com idade média de 55 anos (DP 13,51), a maioria residia na região sudeste (51%), no momento do diagnóstico estava no estadio II e III (73%) e fez quimioterapia e radioterapia exclusivamente (81%). A taxa padronizada para o tratamento oncológico de câncer de mama foi de 28,61 por 100.000 mulheres com razão de variação, entre o percentil 5-95, em torno de 3,5 vezes. A razão de utilização padronizada apresenta grande discrepância entre os estados. Os estados das regiões centro-oeste norte e nordeste - exceto Ceará e Rio Grande do Norte, apresentam RUE significativamente inferiores ao esperado (2,5 vezes a 15% menos). Os estados do sul e sudeste apresentam taxas superiores de RUE (10% a 38%). **CONCLUSÕES:** As discrepâncias observadas na probabilidade de receber um tratamento oncológico para o câncer de mama poderão indicar iniquidade no acesso aos serviços públicos de saúde no Brasil.

PCN28

VALIDACIÓN DE UN CUESTIONARIO PARA MEDIR RIESGO DE CÁNCER DE PIEL

Morales-Sánchez MA[1], Peralta-Pedrero ML[2]
[1]*Universidad Nacional Autónoma de México, México D.F., Mexico,* [2]*Instituto Mexicano del Seguro Social, México D.F., Mexico*

INTRODUCTION: Actualmente se requieren estrategias para identificar a la población en riesgo de padecer cáncer de piel para implementar medidas de prevención y diagnóstico oportuno. No existen instrumentos validados en idioma español que identifiquen el riesgo de cáncer de piel. **OBJECTIVOS:** Diseñar y validar un cuestionario auto-aplicado para cuantificar el riesgo de cáncer de piel melanoma y no melanoma en población mexicana. **METODOLOGÍAS:** Se diseñó un cuestionario auto-aplicado para medir factores de riesgo para cáncer de piel, cuya validez de apariencia y contenido fue evaluada por cinco expertos. El valor de cada ítem se ponderó de acuerdo al riesgo relativo de los factores de riesgo. Se aplicó el instrumento a grupos extremos para medir la validez de constructo y la consistencia se evaluó mediante "test-retest" a las dos semanas. **RESULTADOS:** Se aplicó el cuestionario a pacientes del Centro Dermatológico "Dr. Ladislao de la Pascua" con y sin cáncer de piel, 147 y 249 respectivamente. El puntaje total del cuestionario fue diferente en ambos grupos (U=2104.5, p=0.0001) y mediante curva ROC (área 0.964, IC95% 0.946-0.981, p=0.0001) se determinó que 5 o más puntos equivalen a riesgo alto para cáncer de piel. La consistencia del instrumento fue de 0.971 (IC95% 0.943-0.986, p=0.0001). **CONCLUSIONES:** Este es el primer instrumento en idioma español válido para medir riesgo de cáncer de piel y que aplicado a nivel poblacional sería una herramienta útil para identificar a los individuos en riesgo que requieren intervenciones preventivas.

PCN29

REQUIREMENT OF CANCER HELP LINES IN INDIA AND THE PERCEPTION OF ALL THE STAKE HOLDERS

Kurian S[1], Pariti B[1], Vilakkathala R[1], Mallayasamy S[1], Kumar HL[2]
[1]*Manipal University, Manipal, India,* [2]*MPower institute of Clinical Research, Bangalore, India*

OBJECTIVES: To analyze the telephonic cancer help lines in India and to determine their need and potential application and also evaluate their potential to enhance flawless and uniform communication in cancer health delivery. **METHODS:** A Multi-Centre survey was conducted across 9 cities pan India with a structured questionnaire. The survey participants were oncologists, paramedical staff, hospital administrators, patients, their care takers, social workers, government officials and medical representatives. Collected data was statistically analyzed. **RESULTS:** A total of 670 people were surveyed across the country. Approximately, only 25% of the surveyed subjects were aware of cancer help lines which mainly encompassed the educated class. However, almost 97% of the total surveyed people revealed complete willingness for this service and its highest need was perceived in the villages. The convenience and comfort of telephone for health education was assessed to be 90.70% and 86.20% respectively and 88% perceived it as better than internet for personalized information. 92.3% of the oncologists acknowledged it to be useful in patient follow-up and for referring physicians for palliative care and majority of the other stakeholders recognized it to be useful in rendering better medical, emotional and supportive care thereby ultimately benefitting the patients in technologically and economically underprivileged countries like India. **CONCLUSIONS:** Owing to the health education potential of cancer helplines, and its ability to link all the health care sectors, its implementation in developing countries like India that face the burden of cancer care, poor patient follow-up and poor psychosocial support will contribute towards better and cost-effective treatment approach as well as overcome the persistent problem of poor communication in the health care delivery and create means for uniform data collection.

PCN30

TRASTUZUMABE NO CÂNCER DE MAMA METASTÁTICO: UMA REVISÃO SISTEMÁTICA DE ANÁLISES CUSTO-EFETIVIDADE

Andrade TSD[1], Mosegui GBG[1], Miranda ES[1], Souza TFGD[1], Vianna CMDM[2], Silva FVC[3]
[1]*Universidade Federal Fluminense, Niterói, Brazil,* [2]*Universidade do Estado do Rio de Janeiro, Rio de Janeiro, Brazil,* [3]*Universidade Estadual do Rio de Janeiro, Rio de Janeiro, Brazil*

OBJETIVOS: Realizar uma revisão sistemática de avaliações de custo-efetividade do trastuzumabe em pacientes com câncer de mama metastático. **MÉTODOS:** Foi realizada uma revisão sistemática de estudos de custo-efetividade do trastuzumabe no câncer de mama metastático, em português, espanhol e inglês, compreendendo o período de 2002 a 2013. As buscas foram realizadas em seis bases de dados eletrônicas, dois ferramentas de busca na internet e pesquisa de referências citadas. Comentários, editoriais, cartas, estudos de caso, artigos de revisão, revisões sistemáticas e metanálises foram excluídos. Os estudos foram selecionados por dois revisores independentes. **RESULTADOS:** Resultados preliminares indicaram a inclusão de 15 estudos. Embora a maioria tenha cumprido com as diretrizes de custo-efetividade, a qualidade dos resultados foi limitada. Esquemas de tratamentos adotados pelas análises de custo-efetividade foram variados. Finalmente, as análises utilizaram diferentes limiares para determinar se o tratamento com o trastuzumabe foi custo-efetivo. **CONCLUSÕES:** O uso de trastuzumabe combinado ou não a taxanos ou capecitabina, foi custo-efetivo em relação a desfechos secundários, porém no que se refere ao desfecho primário sobrevida global, houve diferentes conclusões. Esses resultados variados são, provavelmente, devido a julgamentos feitos pelos autores dos estudos incluídos nesta revisão durante a tradução dos ensaios clínicos e por problemas metodológicos para avaliar custos e desfechos. Mais estudos de custo-efetividade devem ser realizados com o objetivo de avaliar o uso do trastuzumabe no câncer de mama metastático.

DIABETES/ENDOCRINE DISORDERS – Clinical Outcomes Studies

PDB1

COMPARACIÓN INDIRECTA DE LA EFECTIVIDAD DE LA COMBINACIÓN DE HIPOGLUCEMIANTES ASOCIADOS A METFORMINA EN PACIENTES DIABÉTICOS TIPO 2

Sanchez O, Romero M
Fundacion Salutia, Bogotá, Colombia

OBJECTIVOS: Comparar el porcentaje en la reducción de hemoglobina glicosilada (HbA1c) posterior al tratamiento en pacientes con Diabetes Mellitus e inadecuado

control glucémico tratados con diferentes combinaciones de hipoglucemiantes orales con metformina. **METODOLOGÍAS:** Mediante una revisión de la literatura se identificó y evaluó la efectividad de [vildagliptina, sitagliptina, saxagliptina, linagliptina, glimepiride y glibenclamida] asociados a metformina versus monoterapia de metformina (Septiembre 2012). Los estudios encontrados se evaluaron en similitud de diseño y características de los pacientes; y a partir de los resultados de éstos se reconstruyeron las distribuciones de Hb1Ac al inicio y a 24 semanas. El análisis se hizo por diferencia de medias (reducción de HbaA1c) de acuerdo al método de Bacher mediante el software Indirect Treatment Comparison. **RESULTADOS:** Los grupos tratado con vildagliptina de 50, 100 mg y glimepiride no eran similares a los tratados con las otras combinaciones respecto al nivel de Hb1Ac de inicio (8,4% *ee* 0,08; 8,3% *ee* 0,07 y 7,7% *ee* 0,03 respectivamente) limitando su comparabilidad. Las comparaciones entre las demás combinaciones de hipoglucemiantes demostraron una mayor reducción de la HbA1c frente a la monoterapia con metformina. Ninguna de las combinaciones presentó superioridad en el desenlace analizado, aunque presentan diferencias en otros aspectos que pudieran modificar el resultado final como adherencia y presentación de hipoglucemia. **CONCLUSIONES:** Se demuestra la mayor efectividad de las combinaciones de hipoglucemiante-metformina versus monoterapia de metformina, en pacientes con Diabetes Mellitus e inadecuado control glucémico. No existen diferencias de efectividad cuando se mide el nivel de cambio de HbA1C a las 24 semanas. Se requieren análisis que tengan en cuenta variables a largo plazo como los eventos micro y macro vasculares y otras variables como la tasa de presentación de hipoglucemia que entre las tecnologías analizadas.

DIABETES/ENDOCRINE DISORDERS – Cost Studies

PDB2
ANÁLISIS DE IMPACTO PRESUPUESTARIO DE LINAGLIPTINA ADICIONADA A METFORMINA EN EL TRATAMIENTO DE PACIENTES CON DIABETES MELLITUS EN COLOMBIA

Romero M[1], Marrugo R[1], Herran S[2], Di Domenico M[2]
[1]*Fundacion Salutia, Bogotá, Colombia,* [2]*Boehringer Ingelheim, Bogotá, Colombia*

OBJETIVOS: Determinar el impacto sobre la unidad de pago por capitación (UPC) de la utilización de linagliptina adicionada a metformina en pacientes con Diabetes Mellitus tipo 2 (DM2), con inadecuado control glucémico, en el sistema de salud de Colombia. **METODOLOGÍAS:** A partir de un modelo de costo-efectividad que muestra el beneficio de uso de linagliptina adicionada a metformina en el tratamiento de pacientes con DM2, se realizó un análisis de impacto presupuestario para un quinquenio, considerando costos directos en salud asociados a la historia natural de la enfermedad, incluyendo eventos macrovasculares y microvasculares, en una cohorte móvil de pacientes. Los costos directos de atención de salud se tomaron de Registros Individuales de las Prestaciones de Salud y de aseguradores, con un reemplazo del 50% frente a glibenclamida/metformina (incluida en el plan de beneficios del sistema de salud). Se hizo un análisis de sensibilidad univariado haciendo variar la tasa de reemplazo. **RESULTADOS:** Dada una tasa de prevalencia de 0,04 e incidencia de 0,00879 de DM2 en Colombia, y el supuesto de que el 10% de los pacientes requiere la intervención, el costo acumulado a 5 años, sería de US$ 2.143.046.352 tratados solo con glibenclamida/metformina, frente a US$ 2.067.111.599 si se usa linagliptina adicionada a metformina, con una participación del 50%. En el primer año, el impacto de la inclusión de linagliptina sería del 0,21% sobre la UPC. Del segundo al quinto año, se generarían ahorros sobre la UPC de 0,004%, 0,13%, 0,27% y 0,41%, respectivamente. Es decir, al cabo de cuatro años ya sería ahorrativo. Remplazos mayores a 60% generarían más ahorros al sistema. **CONCLUSIONES:** La introducción de linagliptina adicionadaa metformina, en el plan de beneficios del sistema de salud colombianoserá notablemente menos costosa que la actual utilización de glibenclamida/metformina, en un periodo de cinco años.

PDB3
LONG-TERM COST COMPARISON BETWEEN PARICALCITOL AND CALCITRIOL FOR THE TREATMENT OF SECONDARY HYPERPARATHYROIDISM IN CHRONIC KIDNEY DISEASE IN MEXICO

Sanchez-Casillas JL, Ramirez-Lopez-De-N MG
Abbvie Inc., Mexico City, Mexico

OBJECTIVES: Assess cost burden related to drug usage in a long term treatment (5 years) in patients with Secondary hyperparathyroidism (SHPT), considering hospitalization cost, erythropoietin (EPO) consumption and other direct health care costs from an institutional perspective. **METHODS:** A statistical model was developed to simulate an average Mexican patient resources usage in 5 years' time-frame treated with two alternatives paricalcitol and calcitriol based on clinical data in published literature. Resources usage considered: SHPT treatment drugs, EPO, hospitalization costs and medical supplies. Unit costs were collected from Mexican Government Databases: Instituto Mexicano del Seguro Social (IMSS) official database, Official Journal of the Federation (DOF) and Banco de Mexico. Univariable sensibility analysis was executed. **RESULTS:** SHPT medication treatment cost were US$21.92 with calcitriol and US$10,658.00 with paricalcitol during five years, while total costs for paricalcitol patients was US$5,304.20(-8.5%) lower compared to calcitriol in this time-frame. Most savings occur in hospitalization costs where calcitriol patients require in average US$35,633.36 while paricalcitol patients required just US$24,532.88. Erythropoietin consumption costs during 5 years was also lower by US$4,910.88 in paricalcitol patients compared to calcitriol ($p<0.05$). During the first two years total costs for the patients treated with paricalcitol was slightly higher than those treated with calcitriol, US$441.79(+1.7%), due to the initial paricalcitol dosage which is reasonably higher than maintenance dosage. **CONCLUSIONS:** Based on this cost comparison model, from institutional perspective, paricalcitol treatment is less costly when the patient is treated with a middle-term (more than 2 years) or long-term (5 years) perspective at IMSS in Mexico.

PDB4
ANÁLISIS COMPARATIVO DE INSULINA GLARGINA FRENTE A INSULINA DETEMIR: MODELO DE MINIMIZACIÓN DE COSTOS PARA COLOMBIA

Fragozo A[1], Misas JD[2], Jaramillo A[2]
[1]*Universidad del Bosque, Bogotá, Colombia,* [2]*Sanofi-aventis de Colombia S.A., Bogotá, Colombia*

Las insulinas análogas basales son opciones eficaces en el tratamiento de pacientes con DM2. No obstante, el costo del tratamiento, dado su impacto presupuestal desde la perspectiva del pagador, puede afectar la elección del medicamento. **OBJECTIVOS:** Determinar los costos asociados para alcanzar metas glucémicas con el uso de insulinas análogas basales, insulina glargina (IG) vs insulina detemir (ID), a través de un modelo de minimización de costos. **METODOLOGÍAS:** Búsqueda sistemática de literatura en PUBMED de estudios clínicos comparativos entre IG y ID para pacientes DM2 insulino-requirentes para extraer datos de uso, efectividad y frecuencia de eventos adversos. La meta de control glucémico definida fue HbA1c7%. Los costos de insulinas fueron tomados del Sistema Integrado de Precios de Medicamentos 2011 del Ministerio de Salud y precios de IMS Consulting Group promedio móvil anual para noviembre de 2011. Los análisis de sensibilidad se realizaron con simulaciones de Monte Carlo en dosis y precios de las insulinas. **RESULTADOS:** Cinco publicaciones cumplieron con criterios de inclusión. La diferencia promedio entre dosis de IG e ID fue 15,99U (SD10,04U), a favor de IG. El porcentaje promedio de pacientes que requirieron dos dosis con ID fue de 56,2% (SD35,7%). No hubo diferencias significativas en eventos hipoglicémicos. Para el canal retail, en 4 estudios se apreció un mayor costo entre IG vs ID (Rosenstock USD$435, Hollander USD$532, Swinnen USD$967 y Currie USD$357 anuales) a favor de IG y solo un estudio mostró mayor costo para IG (Raskin USD$69 anuales). Para el canal institucional, en todos los estudios, el tratamiento con IG es la modalidad más económica según costos anuales. **CONCLUSIONES:** La diferencia en dosis promedio entre IG e ID genera una diferencia significativa en costos anuales a favor de IG. El uso de IG en el manejo del paciente DM2-IR es una alternativa costo/efectiva frente a detemir.

PDB5
DIRECT MEDICAL COSTS OF TREATING DIABETES-RELATED COMPLICATIONS IN ARGENTINA

Elgart J[1], De la Llave G[2], Camillucci C[3], Vega-Hernandez G[4], Watkins M[4], Hammerby E[5], Nikolajsen A[5], Gagliardino JJ[1]
[1]*CENEXA. Centro de Endocrinología Experimental y Aplicada (UNLP-CONICET La Plata), La Plata, Argentina, Buenos Aires, Argentina,* [2]*Omint Argentina, Buenos Aires, Argentina,* [3]*Hospital Privado de Córdoba CMC S.A., Córdoba, Argentina,* [4]*IMS, London, England,* [5]*Novo Nordisk A/S, Søborg, Denmark*

OBJECTIVES: Diabetes is a chronic disease, which when not treated appropriately, leads to increased risk of developing preventable complications, increasing the cost of care. This represents a heavy burden for the public health budget in Argentina. The objective was to collect direct medical costs of treating diabetes-related complications in Argentina. **METHODS:** Following a literature review no data on the cost of diabetes-related complications were found in Argentina. To obtain robust data, we approached 3 local key opinion leaders from both social security (SS) and private (P) health care sectors with access to local databases; they covered 3 geographic areas of Argentina: Buenos Aires city (P) and Buenos Aires and Cordoba provinces (SS). Standardized forms were used for data collection and final values represent average cost of the SS and P sectors. Direct costs were classified into 6 groups: disease management, treatment of acute-events, renal-disease, eye-disease, neuropathy/foot ulcers and cardiovascular-complications. Values are presented in 2012 US-dollars per "event occurring in the first year" and annual follow up costs (exchange rate 1USD = 4.89ARS). **RESULTS:** The diabetes-related complications with highest first year average costs were renal-complications (renal transplant 37,833USD; peritoneal-dialysis 24,655USD and haemodialysis 23,748USD), followed by cardiovascular related events (myocardial infarction 5,939USD; congestive heart failure 4,884USD; peripheral vascular disease 4,200USD and angina 3,799USD). The cost of an amputation procedure was 2,727USD while those of prosthesis and post-amputation follow up were 3,255USD and 1,470USD, respectively. The cost of eye-laser therapy was 449USD while a cataract procedure was 1,186USD. High costs were also associated with treatment of neuropathy (1,141USD), infected foot ulcer (747USD) and gangrene (1,684USD). **CONCLUSIONS:** These findings suggest that implementation of prevention strategies to reduce the development of diabetes-related complications may decrease the diabetes burden on the health care budget. Furthermore the data presented will provide useful inputs for economic evaluations in Argentina.

PDB6
DIRECT COSTS OF TYPE 2 DIABETES IN MEXICO FROM THE PUBLIC HEALTH CARE SECTOR PERSPECTIVE

Chatzitheofilou I[1], Babineaux SM[2], Ramírez-Gámez J[3], McDonell A[1], Vega-Hernandez G[1]
[1]*IMS, London, England,* [2]*Eli Lilly & Company, Indianapolis, IN, USA,* [3]*Eli Lilly and Company, México, Mexico*

OBJECTIVES: To quantify the annual cost of type 2 diabetes mellitus (T2DM) in Mexico and explore the relative contributions of different components of cost. **METHODS:** A cost of illness model was developed in Microsoft Excel 2007 to estimate the economic burden of T2DM in Mexico from the public health care payer perspective. Cost of routine management and complications were included in the analysis. Data inputs for prevalence of T2DM (weighted to include only patients who are diagnosed and treated) and related complications, costs and routine management were sourced from the published literature and publicly available databases, where available. Primary research approaching local key opinion leaders was performed to fill data gaps. Sensitivity analyses were conducted to identify data inputs which were most likely to impact overall results when varied. Costs are presented in Mexican pesos 2012. **RESULTS:** The annual cost of T2DM in Mexico is estimated to be $107,343,890,388MXN($8,643,348,612USD). This figure represents ~13% of the national health care expenditure. The cost of complications were estimated to account for 91% of the total cost of T2DM, with cardiovascular and eye complications accounting for 49% and 18% of total costs, respectively. Routine management, including drug costs, was estimated to comprise

9% of total cost of T2DM. The cost estimate was most sensitive to incidence and event cost of peripheral vascular disease, stroke and severe vision loss. **CONCLUSIONS:** Based on the present analysis, T2DM places a significant financial burden on the health care system in Mexico, with cost of treating related complications being the main cost driver. Given the model focuses on diagnosed and treated T2DM patients, it is likely this cost is even higher when undiagnosed and untreated patients are considered. Delaying the onset of complications could result in a reduction in costs, as well as benefits for the patient and health care system.

PDB7

DIRECT COSTS OF TYPE 2 DIABETES FROM THE BRAZILIAN PUBLIC HEALTH CARE SECTOR PERSPECTIVE

Hnoosh A[1], Babineaux SM[2], Piras de Oliveira C[3], McDonell A[1], Vega-Hernandez G[1]
[1]*IMS, London, England,* [2]*Eli Lilly & Company, Indianapolis, IN, USA,* [3]*Eli Lilly do Brasil, Sao Paulo, Brazil*

OBJECTIVES: This study aimed to quantify the annual financial cost of type 2 diabetes (T2DM) in Brazil and explore the relative contribution of different components of cost. **METHODS:** A cost of illness model was developed in Microsoft Excel 2007 to estimate the financial cost of T2DM in Brazil from the public health care payer perspective. Cost of routine management and complications were included in the analysis. Data inputs for prevalence of T2DM (weighted to include only patients who are diagnosed and treated) and related complications, costs and routine management were sourced from the published literature and publicly available databases, where available. Key opinion leader input was sought to fill data gaps. Sensitivity analyses were conducted to identify parameters which were most likely to impact overall results when varied. Costs are presented in Brazilian Reals 2012. **RESULTS:** The annual cost of T2DM in Brazil is estimated to be 11,275,921,167 BRL ($5,471,123,022USD) which represents 5.3% of national health care expenditure. Costs of complications were estimated to account for 56% of the total cost of T2DM. Cardiovascular complications accounted for 32% of total T2DM cost. Diabetes drug costs were estimated to account for 31% of total T2DM health care spending. The overall cost estimate was most sensitive to the laser eye surgery, hemodialysis and cardiovascular complications and the frequency and cost of routine physician consultations. **CONCLUSIONS:** The findings indicate that there is a high economic burden of T2DM for the Brazilian health care system. Cost of treating related complications was the main driver. An even higher burden of the disease is expected if undiagnosed and patients currently not being treated start receiving public medical attention. The burden of the disease could considerably be reduced if T2DM related complications were avoided, which not only benefits the health care system but the patients as well.

PDB8

TRENDS IN HEALTH CARE RESOURCES UTILIZATION, COST AND MEDICATION SELECTION IN THE TREATMENT OF DIABETES

Lachaine J, Beauchemin C
University of Montreal, Montreal, QC, Canada

OBJECTIVES: Diabetes is one of the most common chronic diseases in Canada. It affects about 6.8% of the Canadian population. Treating and managing the disease and its complications is associated with a significant economic burden. The objective of this study was to analyse trends in terms resource utilization, cost and treatment patterns in the management of diabetes. **METHODS:** Patients covered by the Quebec provincial drug reimbursement program (RAMQ) who had a diagnosis of diabetes, in 2005 and were covered continuously by the public drug program for the period from January 2006 to December 2010 were selected. Health care resources in terms of diabetes medications and physician visits, hospitalization, intensive care unit stay, hospital outpatient clinic visits, and emergency room visits associated with a diagnosis of diabetes were estimated over a 5-year period, from January 2006 to December 2010. Trends in the proportion of diabetes medications used each year over the 5-year study period were also estimated. **RESULTS:** A total of 46,194 diabetic patients were included in the study. The mean age of the study population was 65.4 years (SD=12.3) and proportion of male/female was 47% and 53% respectively. Over the study period, annual cost of diabetes medications varied from $320 (SD=464) in 2006 to $372 (SD=546) in 2010 (+16%) while total cost of treatment associated with diabetes varied from $627 (SD=1456) to $715 (SD=1632) (+14%) during that period. Metformine remains the most widely used medication throughout the study period with 64.3% of users in 2006 and 65.6% in 2010. Proportion of insulin users increased from 15.2% to 22.7% while gliclazide users increased from 4.4% to 11.2% during the study period. **CONCLUSIONS:** Over the five-year study period cost of diabetes treatment has increased at a rate similar to inflation, while trends of increased adoption of insulin and newer medications is observed.

PDB9

COST-EFFECTIVENESS OF PARICALCITOL VERSUS PARATHYROIDECTOMY FOR SECONDARY HYPERPARATHYROIDISM TO CHRONIC KIDNEY DISEASE IN MEXICO

Sanchez-Casillas JL, Ramirez-Lopez-De-N MG
Abbvie Inc., Mexico City, Mexico

OBJECTIVES: Secondary hyperparathyroidism (SHPT) affects one of every two Mexicans with chronic kidney disease (CKD) at stage five. The objective of this research was to assess cost effectiveness (CE) of Paricalcitol intravenous administration (IV) versus parathyroidectomy (PTX) from Mexican payer perspective. **METHODS:** A decision tree model was designed to simulate patient resources usage and survival rate in 5 years time-frame treated with paricalcitol IV and parathyroidectomy based on clinical data in recent published literature. Time-frame begins when a patient is refractory to Calcitriol therapy and physician decides to treat with Paricalcitol or program PTX. Resources usage considered were just directly related to SHPT treatment: drug cost, surgery and hospitalization costs and medical supplies linked. Unit costs were collected from Mexican Government Databases: IMSS official database, Diagnosis Related Groups from IMSS, Official Journal of the Federation. (Cost considered 5% annual discount rate).Incremental Cost-Effectiveness Ratio (ICER) was calculated with treatment costs and Life-years gained (LYG) offset based on incremental survival rate of compared therapies. Probabilistic Multivariable sensibility analysis was completed with 5,000 simulated patients. **RESULTS:** Survival rate and confidence interval obtained from model was 0.63 (0.60, 0.66) for paricalcitol and 0.46 (0.44, 0.48) for PTX. Average survival of both therapies resulted in an incremental 0.61 LYG for paricalcitol patients (+18%). Average five years treatment cost for Paricalcitol patients was $10,024.25, while PTX was US$5,369.74(-46%) resulting in an ICER of US$7,619.94 per LYG, which is 28.2% below Mexican Gross Domestic Product (GDP) per capita. Probabilistic analysis shown: 90.1% of patient treated had a cost-effective outcome and 7.2% of cases had a dominant outcome. **CONCLUSIONS:** According to results obtained and using a threshold of US$29,306.29 (3 x GDP per capita), Paricalcitol is a highly cost-effective treatment option compared to PTX when treating patients with SHPT at IMSS.

PDB10

COST-EFFECTIVENESS OF FIXED-DOSE COMBINATION (FDC) OF VILDAGLIPTIN/METFORMIN FOR THE TREATMENT OF DIABETES MELLITUS TYPE 2 IN MEXICO

Lemus A[1], Jimenez Aranda P[2]
[1]*Novartis, Mexico City, Mexico,* [2]*Novartis, Coyoacan, Mexico*

OBJECTIVES: Type 2 Diabetes is a major public health care problem in Mexico. Some patients may require more than one oral antidiabetic treatment to achieve glycemic control. Vildagliptin, a DPPIV inhibitor is an option in combination with the standard treatment of metformin. The objective was to assess the cost-effectiveness of Vildagliptin/Metformin FDC versus other oral treatments available in the public market. **METHODS:** Cost-effectiveness analysis of the oral antidiabetic treatments available in the public market in Mexico was conducted. The comparisons included the following options: Vildagliptin/Metformin FDC, glibenclamide, and thiazolidinediones (Rosiglitazone and pioglitazone). Cost effectiveness analysis versus other oral antidiabetics incorporated the incidence and costs of adverse events according to Ferrannini 2009 and Gonzalez-Ortíz 2009 for glibenclamide and Motola 2012 for thiazolidinediones. Drug costs were elicited from public tenders and health care services from unitary costs of the IMSS. The perspective is the public health provider and the time horizon is one year. **RESULTS:** The use of Vildagliptin/Metformin FDC (50/500 or 850 mg) BID compared to glibenclamide, is a dominant strategy if the cost per hypoglycemia exceeds US$714.03. Vildagliptin/Metformin FDC is dominant versus pioglitazone,if the cost of fractures incurred by pioglitazone exceeds US$56.56. Drug acquisition costs of Vildagliptin/Metformin FDC are 150% cheaper per patient treated vs rosiglitazone; additionally rosiglitazone is associated with myocardial infarction events. **CONCLUSIONS:** Vildagliptin/Metformin FDC is an opportunity for resource optimization in the public sector. This cost effectiveness analysis is not considering other potential adherence benefits which are related with having two treatments in one pill.

PDB11

PROBABILISTIC SENSITIVITY ANALYSIS TO ANALYZE THE COST-EFFECTIVENESS OF ORAL HYPOGLYCEMIC AGENTS IN THE INITIAL ORAL DRUG TREATMENT OF OUTPATIENTS DIAGNOSED WITH TYPE 2 DIABETES IN PRIMARY CARE

Diaz de León-Castañeda C, Pinzon-Florez CE, Arredondo A
Instituto Nacional de Salud Pública, Cuernavaca, Mexico

OBJECTIVES: To perform a probabilistic sensitivity analysis to analyze previously reported results about the cost-effectiveness of oral hypoglycemic agents (OHA's) in the initial oral drug treatment of patients diagnosed with type 2 diabetes mellitus in public primary attention in Mexico. **METHODS:** A probabilistic sensitivity analysis was made in order to analyze results previously reported in which a deterministic sensitivity analysis was performed to study the cost-effectiveness of three OHA's: metformin, glibenclamide and acarbose. We used TreeAge-Pro® software for programming and simulating a Markov model of two health states ($HbA_{1C} \leq 7\%$ or $HbA_{1C} > 7\%$) and twelve cycles of 1 month for a time horizon of 1 year. The parameters of monthly success probability as beta distributions and monthly costs as lognormal distributions of therapeutic alternatives were computed through a parametrization of data. Monte Carlo's simulations were computed for cohorts of 10,000 patients for each treatment option. **RESULTS:** The results of the Monte Carlo's simulations showed very close iterations clouds for metformin and glibenclamide showing evident dominance of both over acarbose. In the acceptability curve generated, for a willingness to pay (WTP) = 0 the probabilities to be cost-effective were 49.46 %, 43.04 % and 7.50 % for glibenclamide, metformine and acarbose, respectively, whereas for a WTP = 1 mexican GDP per capita (US $ 7876.00 in 2009) were 66.26 %, 26.98 % and 6.76%. The glibenclamide versus metformin incremental cost-effectiveness analysis showed similar results as mentioned before, showing 59.72% of iterations below the WTP = 1 mexican GDP per capita line. **CONCLUSIONS:** The probabilistic sensitivity analysis showed which the initial drug therapy with glibenclamide or metformin have advantage over acarbose. There is not sufficient evidence to say glibenclamide has advantage over metformin for WTP near to cero, as in low to middle income countries where containment of expenditures is important.

PDB12

A HEALTH ECONOMIC ANALYSIS OF THE LONG-TERM OUTCOMES AND COSTS ASSOCIATED WITH USING CANAGLIFLOZIN VERSUS SITAGLIPTIN AS AN ADD-ON TO METFORMIN (MET) IN MEXICO

Teschemaker AR[1], Neslusan C[1], Puig A[2], Valencia A[3], Johansen P[4], Willis M[4]
[1]*Janssen Global Services LLC, Raritan, NJ, USA,* [2]*Johnson and Johnson World Headquarters, New Brunswick, NJ, USA,* [3]*Janssen, Mexico City, Mexico,* [4]*The Swedish Institute for Health Economics, Lund, Sweden*

OBJECTIVES: Canagliflozin (CANA) is a novel inhibitor of the sodium glucose cotransporter 2 in development for treating patients with type 2 diabetes mellitus (T2DM). In a previously reported randomized, double-blind, 4 arm parallel group (placebo, CANA 100mg, CANA 300mg and sitagliptin 100mg [SITA]) study of 1284 subjects inadequately controlled on MET monotherapy, CANA 100mg and 300mg significantly decreased HbA_{1c} versus placebo after 26 weeks of therapy by 0.62% and 0.77%, respectively; SITA decreased HbA_{1c} versus placebo by 0.65%. In this trial, both

CANA doses and SITA significantly reduced systolic blood pressure (CANA 100mg: 5.36 mmHg; CANA 300mg: 6.58 mmHg; SITA 3.34 mmHg), however, only CANA significantly reduced body weight (CANA 100mg: 2.5%; CANA 300mg: 2.9%) versus placebo. The objective of this study was to simulate the health outcomes and associated costs attributable to using CANA versus SITA in Mexico. **METHODS:** Forty-year outcomes associated with adding CANA 100mg or CANA 300mg versus SITA to MET were simulated using ECHO (Economic and Health Outcomes)-T2DM, a validated micro-simulation model. Treatment effects and patient characteristics were sourced from the trial. Simulated treatment was intensified when HbA_{1c} exceeded 7.5% by adding basal insulin, and subsequently prandial insulin. Disutilities associated with micro- and macro-vascular events were obtained from the literature and costs were adapted to the Mexican setting. **RESULTS:** Using CANA 300mg versus SITA was projected to reduce relative risks for key events (e.g. myocardial infarction 10.2%; congestive heart failure 6.6%; macroalbuminuria 6.6%; microalbuminuria 6.2%), improve QALYs (0.046), and result in lower costs per patient ($1927MXN). Simulation results of CANA 100mg versus SITA were generally similar, albeit estimates of reductions in relative risks, QALY gains and associated costs differences were smaller. **CONCLUSIONS:** These simulations suggest that using CANA versus SITA as an add-on to MET could result in improved outcomes and reduced costs in Mexico.

PDB13

ECONOMIC EVALUATION OF INSULIN LISPRO MIX 25 WITH GLARGINE IN THE TREATMENT OF TYPE 2 DIABETES MELLITUS PATIENTS IN THE MEXICAN PUBLIC HEALTH CARE SYSTEM IN MEXICO

Carlos F[1], Ramírez-Gámez J[2]
[1]*R A C Salud Consultores S.A. de C.V., México D.F., Mexico,* [2]*Eli Lilly and Company, México, Mexico*

OBJECTIVES: Compare expected costs and health-outcomes in patients with Diabetes Mellitus Type 2 (DMT2) in the Public Sector in Mexico treated with glargine or 25%-insulin lispro, 75%-insulin lispro protamine suspension (LM25). **METHODS:** This analysis included a hypothetical cohort of insulin-naïve patients with T2DM, aged 30–80, years, with A1C>7.0% taking antihyperglycemic drugs for 90 days. Effectiveness measures included; (1) Percentage of patients with A1C<7.0% levels at 24 weeks, (2) frequency and type of micro and macrovascular complications (MMVC) and (3) hypoglycemic events per 1000 patients considering one-year timeframe. Costs evaluated were: 1) acquisition costs; 2) cost of hypoglycemic events; and 3) MMVC. Efficacy measures and mean-daily-dose was obtained from DURABLE, parallel, open-label and randomized study comparing directly LM25 and Glargine. Incidences of MMVC were estimated using data from UKPDS study group and data from Meta-analysis by Quayum following a similar process outlined by Grima. Acquisition costs were derived from the transparency portal of the Mexican Social Security Institute. Healthcare services utilization from hypoglycemic episodes were calculated according to international published literature and IMSS Unit Costs updated to 2013 following IMSS methodology, while other associated expenses with MMVC complications come from Mexican reports and Diagnostic Related Groups (DRG) published by IMSS this data was updated to January 2013 using the Bank of Mexico inflation calculator. Costs are expressed in 2013 USD (1USD=$12.70MXN) **RESULTS:** All results consider 1000 patients treated in a 1-yeat timeframe. Acquisition costs for LM25 were lower compared to glargine ($291,395 vs $383,521, 24% lower), although costs per hypoglycemia events were higher for LM25 ($12,242 vs. $3,673). Direct medical costs for MMVC were higher for Glargine ($668,027 vs. $754,435) Total medical costs were higher for glargine compared to LM25 ($971,663 vs. 1,141,628). **CONCLUSIONS:** Results of the present study suggest that compared with LM25, health care costs are significantly higher for glargine.

PDB14

HEALTH ECONOMIC BENEFITS OF SENSOR AUGMENTED INSULIN PUMP THERAPY IN COLOMBIA

Gomez A[1], Alfonso-Cristancho R[2], Prieto-Salamanca D[3], Valencia JE[4], Lynch P[5], Roze S[6]
[1]*Hospital Universitario de San Ignacio, Bogotá, Colombia,* [2]*University of Washington, Seattle, WA, USA,* [3]*RANDOM Foundation, Bogotá D.C., Colombia,* [4]*Medtronic Latinamerica Inc., Bogota, Colombia,* [5]*Medtronic, Tolochenaz, Switzerland,* [6]*HEVA HEOR, Lyon, France*

OBJECTIVES: To estimate the health economic impact of Sensor-Augmented Insulin Pump (SAP) Therapy among Insulin-Dependent Diabetes Mellitus (IDDM) patients in Colombia. **METHODS:** The Core Diabetes Model (CDM) is highly validated, computer simulation model to determine the long-term health outcomes and economic consequences of diabetes interventions. A recent real life clinical study in Colombia evaluating 217 IDDM patients (average baseline HbA1c of 8.97%, mean age 34 years, and average diabetes duration of 14 years) who initiated SAP therapy showed that SAP therapy led to a reduction of -1.47% HbA1c as well as a significant reduction in severe hypoglycaemic events. The impact of the reduction in the fear of hypoglycaemic events on quality of life was also included. **RESULTS:** Life expectancy of patients with SAP was increased by 3.51 years and diabetes related complications were delayed on average by 1.74 years. The Incremental-Cost-Effectiveness-Ratio (ICER) for SAP was $44,889,916COP ($24,939USD) per Quality-Adjusted-Life-Year gained based on direct costs only. SAP related therapy costs were partially offset by the savings due to the reduction in long-term complications, including proliferative diabetic retinopathy (PDR), Severe Vision Loss (SVL), End Stage Renal Disease (ESRD), and Amputations (AMP). The relative reduction in incidence of these complications (PDR 42%, SVL 20%, ESRD 46%, AMP 12%) as well as the average delay in their onset (4.9 years, 4.0 years, 3.8 years, 3.7 years, respectively) due to SAP therapy is profound. When including indirect costs, SAP demonstrated an even lower ICER. Extensive sensitivity analyses showed the robustness of the results. **CONCLUSIONS:** Using a payer's perspective, our analysis showed that SAP is cost-effective over a lifetime horizon in IDDM patients in the Colombian setting (using a WTP threshold of $60,771,600COP [3x GDP]) and can lead to an increase in life expectancy. When using a societal perspective, SAP was even more cost-effective.

PDB15

SHORT AND LONG-TERM COST-EFFECTIVENESS OF SWITCHING THERAPY FROM NPH INSULIN TO INSULIN DETEMIR IN PEOPLE WITH TYPE 2 DIABETES

Home PD[1], Malek R[2], Gálvez GG[3], Hammerby E[4], Nikolajsen A[4], Henriksen O[5], Andersen MFB[5]
[1]*University of Newcastle upon Tyne, Newcastle upon Tyne, UK,* [2]*Internal Medicine, CHU Setif, Sétif, Algeria,* [3]*Instituto Jalisciense de Investigacion en Diabetes y Obesidad, Guadalajara, Mexico,* [4]*Novo Nordisk A/S, Søborg, Denmark,* [5]*Last Mile P/S, Copenhagen K, Denmark*

OBJECTIVES: To assess the cost-effectiveness (CE) of switching from NPH insulin ± oral glucose-lowering drugs (OGLDs) to insulin detemir ± OGLDs in people with type 2 diabetes (T2DM) in countries in different economic circumstances based on observational data gathered in routine clinical practice. **METHODS:** The A_1chieve® study assessed safety and outcomes over 24 weeks in 66,726 people with T2DM starting insulin analog therapy. Most people (96%) stated better glycemic control as reason to switching therapy, with 31% also stating hypoglycemia problems as a further reason. The CE analyses included data for people switching to detemir in South Korea (n=90) and in seven Arabian Gulf countries (n=124). Data were collected on clinical effectiveness and adverse events, and health-related quality of life using the EQ-5D questionnaire. CE analyses used the IMS CORE diabetes model with 1 and 30 year time horizons, with South Korea and Saudi Arabia country-specific costs for complications and therapies and background mortality rates. CE was measured by comparing outcomes at study-end with outcomes at pre-study. Incremental cost-effectiveness ratios (ICERs) are expressed as cost per QALY in local currencies, USD and in fractions of local GDP per capita. CE was pre-defined using the WHO definition of <3 times GDP per capita. **RESULTS:** 1-year ICERs were: South Korea (KWR 3,236,798; USD 2,980; GDP 0.13), and Saudi Arabia (SAR 27,221; USD 7,258; GDP 0.36). 30-year ICERs were: South Korea (KWR 872,589; USD 803; GDP 0.04), and Saudi Arabia (SAR 6,349; USD 1,693; GDP 0.08). Sensitivity analyses covering cost of self-monitoring, deterioration of glucose control with time, and other time horizons showed the results to be robust. **CONCLUSIONS:** Switching from NPH±OGLDs to detemir±OGLDs in people with T2DM as performed in the A_1chieve® study was found to be cost-effective in both country settings at 1 and 30 year time horizons.

PDB16

SHORT AND LONG-TERM COST-EFFECTIVENESS OF SWITCHING THERAPY FROM INSULIN GLARGINE TO INSULIN DETEMIR IN PEOPLE WITH TYPE 2 DIABETES

OBJECTIVES: To assess the cost-effectiveness (CE) of switching from insulin glargine ± oral glucose-lowering drugs (OGLDs) to insulin detemir ± OGLDs in people with type 2 diabetes (T2DM) in Saudi Arabia, South Korea and Algeria based on observational data gathered in routine clinical practice. **METHODS:** The A_1chieve® study assessed safety and outcomes over 24 weeks in 66,726 people with T2DM starting insulin analog therapy. The CE analyses included people switching to detemir in Saudi Arabia (n=102), South Korea (n=82) and in 3 North-West African countries (n=94). Data were collected on clinical effectiveness and adverse events, and health-related quality of life using the EQ-5D questionnaire. CE analyses used the IMS CORE diabetes model with 1 and 30 year time horizons, with Saudi Arabia, South Korea and Algeria country-specific costs for complications and therapies and background mortality rates. Incremental cost-effectiveness ratios (ICERs) are expressed as cost per QALY in local currencies, USD and in fractions of local GDP per capita. CE was pre-defined using the WHO definition of <3 times GDP per capita. **RESULTS:** The switch was found to be less costly and have better outcomes in South Korea after 30 years and in Saudi Arabia at both time horizons. 1-year ICERs were: Saudi Arabia (SAR -5,849; USD -1,559; GDP -0.08), South Korea (KWR 296,842; USD 273; GDP 0.01), and Algeria (DZD 267,771; USD 3,363; GDP 0.80). 30-year ICERs were: Saudi Arabia (SAR -14,839; USD -3,957; GDP -0.19), South Korea (KWR -1,133,202; USD -1,043; GDP -0.05), and Algeria (DZD 226,818; USD 2,849; GDP 0.68). Sensitivity analyses on the 30 year time horizon showed the findings to be robust. **CONCLUSIONS:** Switching from glargine±OGLDs to detemir±OGLDs in T2DM as performed in the A_1chieve® study was found to be cost-effective across all country settings at 1 and 30 year time horizons.

IMPACTO DE LA DIABETES SOBRE LA PRODUCTIVIDAD EN ARGENTINA

Asteazaran S, Elgart J, Gagliardino JJ
CENEXA. Centro de Endocrinología Experimental y Aplicada (UNLP-CONICET La Plata), La Plata, Argentina, Buenos Aires, Argentina

OBJECTIVOS: Estimar y caracterizar el impacto de la enfermedad sobre la productividad laboral de personas con diabetes (DM) en Argentina. **METODOLOGÍAS:** Estudio descriptivo observacional relevando información mediante el cuestionario WPAI-GH (Work productivity and activity impairment - General Health version) en personas adultas (18 a 75 años) con DM, que concurrieron a su consulta habitual a dos centros asistenciales de La Plata. Los encuestados también respondieron sobre aspectos socioeconómicos y complicaciones de su enfermedad. La pérdida de productividad se estimó por el método del capital humano. Los resultados se presentan como media ± desvío estándar (DS) o proporciones. Para las comparaciones se utilizaron los test t de student, Kruskal-Wallis y Chi cuadrado, según correspondiera. Se consideró significativo p<0,05. **RESULTADOS:** Aceptaron participar en el estudio 73 personas con DM; 54,8% hombres con edad de 57 ± 15 años. El 42,5% poseía estudios superiores (nivel terciario o universitario completo). El 60,3% trabajaba, 6.4% estaba desempleado y el 33,3% inactivo (jubilado, pensionado). El tiempo promedio de trabajo fue de 43 ± 17 horas/semana y el 38% faltó/retiró de su trabajo por su enfermedad. El tiempo de trabajo perdido por ausentismo fue 9.1%, y por disminución de la productividad el 22%. La diabetes también disminuyó un 25% la capacidad para realizar actividades regulares diarias, afectando más a mujeres que a hombres (30 y 20,3%, respectivamente). La pérdida de productividad monetaria por ausentismo

debido a la DM se estimó en $21,516 ± 8062 año/persona. **CONCLUSIONES:** La DM afecta significativamente la productividad laboral en nuestro medio.

PDB19

COSTO DEL AUTOMONITOREO GLUCÉMICO EN PACIENTES EN TRATAMIENTO COMBINADO ORAL Y CON INSULINA EN ARGENTINA

Elgart J, Gonzalez L, Gagliardino JJ, Rucci E
CENEXA. Centro de Endocrinología Experimental y Aplicada (UNLP-CONICET La Plata), La Plata, Argentina, Buenos Aires, Argentina

OBJECTIVOS: Aunque el automonitoreo glucémico (AMG) es una herramienta útil para optimizar el control de la diabetes, no existe en Argentina evidencia de su uso e impacto económico. Este estudio trata de estimar en Argentina, el número de tiras reactivas (TR) para AMG utilizadas en el Sistema de la Seguridad Social (SSS) y su impacto en el costo total de la prescripción terapéutica, en la transición de terapia combinada de antidiabéticos orales (ADO) al agregado de insulina. **METODOLOGÍAS:** Estudio observacional retrospectivo, utilizando registros de una organización del SSS (OSPERYH, consumo de TR de 681 afiliados durante 2012) y de otras dos entidades de la SSS, a través de 8.115 recetas anónimas de medicamentos y TR prescriptas en el período Febrero-Abril 2012 y registradas por el Colegio Farmacéutico de la Provincia de Buenos Aires (COLFARMA). Los resultados representan la media ± desvío estándar (DS) o proporciones. Evaluación estadística: utilizamos los test t de student, Kruskal-Wallis y Chi cuadrado, según correspondiera. Se consideraron significativas diferencias con p<0,05. **RESULTADOS:** *OSPERYH:* las TR fueron provistas bajo sistema de auditoría que incluye educación diabetológica, tipo de tratamiento y grado de control metabólico. Los tipos de tratamiento afectaron significativamente el consumo mensual de TR: combinación ADOs 25±12 *vs.* , ADO+insulina 36±15. El costo total combinación ADOs fué $456 *vs.*ADO+insulina $669 y las TR representaron el 42% y 32% del costo total, respectivamente. COLFARMA: también el tipo de terapia afectó significativamente el consumo mensual de TR pero con valores tres veces superiores: combinación ADOs 75±47 *vs.* ADO+insulina 89±63. El costo total combinación ADOs fue $711 *vs.*ADO+insulina $983, y las TR representaron el 63% y 54% del costo total, respectivamente. **CONCLUSIONES:** El consumo de TR para AMG aumenta en función de la incorporación de insulina al tratamiento y auditorías como la descripta optimizan su consumo e impacto económico.

PDB20

RELACIÓN DEL ÍNDICE DE MASA CORPORAL Y GASTO EN MEDICAMENTOS EN PERSONAS CON DIABETES EN ARGENTINA

Prestes M, Elgart J, Gonzalez L, Gagliardino JJ
CENEXA. Centro de Endocrinología Experimental y Aplicada (UNLP-CONICET La Plata), La Plata, Argentina, Buenos Aires, Argentina

OBJECTIVOS: Evaluar la relación entre el Indice de Masa Corporal (IMC) y el gasto en medicamentos de personas con Diabetes (DM) en Argentina. **METODOLOGÍAS:** Estudio descriptivo observacional relevando el IMC y el consumo de medicamentos de la Base QUALIDIAB. El gasto mensual en medicamentos se determinó mediante técnicas de microcosteo, considerándose el precio promedio de las presentaciones disponibles en el mercado, sin ajustes. Los valores se expresaron en pesos argentinos (Diciembre 2012). Las personas se estratificaron según IMC de acuerdo a la clasificación de la OMS (Normal: ≥18,5 y < 25; Sobrepeso: ≥25 y < 30; Obesidad: IMC≥ 30). Los resultados se expresaron como media ± desvío estándar (DS). Para las comparaciones se utilizaron los test t de student, ANOVA y Kruskal-Wallis, según correspondiera. Coeficientes de correlación de Pearson (r) se utilizaron para evaluar el grado de asociación. Se consideraron significativos p<0,05. **RESULTADOS:** Se analizaron 1134 registros, edad 63 ± 12 años, 55,4% mujeres. El gasto promedio mensual en medicamentos fue de $ 975, el gasto en medicamentos para la DM fue $779, para la Hipertensión $ 241 y para la Dislipemia $ 128. El gasto en medicamentos aumentó en función del IMC: Normal: $782; Sobrepeso: $936 y Obesidad: $1149. El gasto fue significativamente mayor en Hombres ($1045 vs. $919). El gasto total de medicamentos se correlacionó significativamente con IMC (r: 0,164), al igual que el correspondiente a medicamentos antihipertensivos (r: 0,113) y los utilizados para controlar la hiperglucemia (r: 0,079). **CONCLUSIONES:** En pacientes con DM en Argentina, el IMC se asocia positivamente con el gasto en medicamentos. Estrategias terapéuticas que disminuyan efectivamente el IMC generarían beneficios tanto médicos como económicos.

DIABETES/ENDOCRINE DISORDERS – Patient-Reported Outcomes & Patient Preference Studies

PSYCHOMETRIC PROPERTIES OF THE HYPOGLYCEMIA PERSPECTIVES QUESTIONNAIRE (HPQ) IN TYPE 2 DIABETES MELLITUS

Kawata AK[1], Ong SH[2], Therapontos C[3], Mavrogenis P[3], Kulich K[2], Chen WH[4], Coyne K[4]
[1]*Evidera, Bethesda, MD, USA,* [2]*Novartis Pharma AG, Basel, Switzerland,* [3]*Novartis Pharma Services Inc. Cyprus, Nicosia, Cyprus,* [4]*Evidera, Bethesda, MD, USA*

OBJECTIVES: The Hypoglycemia Perspectives Questionnaire (HPQ) was developed with clinician and patient input to assess symptoms, behaviors, and impact of hypoglycemia on diabetic patients. **METHODS:** The HPQ was administered to adult patients with type 2 diabetes mellitus (T2DM) on antidiabetic treatment as part of a cross-sectional, epidemiological study evaluating hypoglycemia and health-related quality of life (HRQoL) in Cyprus. Demographic and clinical data were collected. Patients also completed the Audit of Diabetes Dependent Quality of Life (ADDQoL-19), treatment satisfaction questionnaire, and EuroQol-5 Dimensions (EQ-5D). The original HPQ consisted of 45 items rating current status or behavior related to hypoglycemia on an 11-point numeric rating scale (NRS) and 7 additional descriptive hypoglycemia event frequency items. Analyses included examination of HPQ item performance, item reduction, and factor structure. Measurement properties (reliability, construct validity, known-groups validity) of the final HPQ were evaluated. **RESULTS:** A total of 500 T2DM patients completed the HPQ with a mean age of 61±10 years; 32.6% women. Based on item evaluation, the original HPQ item pool was reduced to 22 items. Exploratory and confirmatory factor analysis identified 21 items contributing to 3 hypoglycemia domains (Symptoms [8 items], Compensatory Behaviors [7 items], Worry [6 items]) and a single-item of global symptom awareness. HPQ domains had high internal consistency reliability (Cronbach's alpha=0.78-0.92). Construct validity was demonstrated by significant correlations between HPQ scores with HRQoL, treatment satisfaction, and health status. HPQ also demonstrated ability to discriminate between known groups. Compensatory behaviors and symptom awareness were higher for patients with a recent low blood sugar event (p<0.001) and high symptom awareness corresponded to less concern about experiencing symptoms of low blood sugar and worry (p<0.05). **CONCLUSIONS:** These results provide preliminary evidence that HPQ is reliable and valid for assessing the experience and impact of hypoglycemia on T2DM patients.

TRANSLATION AND VALIDATION OF HINDI VERSION OF DIABETES QUALITY OF LIFE – MEASURE (DQOL-M) IN INDIAN TYPE 2 DIABETES PATIENTS

Pawar S[1], Thakurdesai P[2]
[1]*Smt. Kashibai Navale College of Pharmacy, Pune and Research Scholar Karpagam University, Coimbatore, Pune, India,* [2]*Indus Biotech Private Limited, Pune, India*

OBJECTIVES: To test the reliability and validity and of newly translated Hindi version of DQOL-M instrument in Indian type 2 diabetic populations. **METHODS:** Backward and forward translation was carried out and intermediate version was compared with original instrument to check the linguistic equivalence. After pilot testing the final Hindi version of DQOL-M was administered to 250 patients with type 2 diabetes twice at the interval of four weeks. Psychometric parameters like treatment satisfaction, Impact of treatment, worries of social vocational issues of diabetes were assessed. Cronbach alpha for total score was calculated to study the reliability of instrument. **RESULTS:** Internal consistency was assessed using Cronbach alpha and value of 0.86 was gained for the summary score. Cronbach alpha for treatment satisfaction was found to be 0.77, for Impact of treatment it was 0.73 and for worries of social vocational issues score of 0.83 was gained. No significant difference was observed in test-retest analysis. Pearson correlations were assessed for all the four subscales and were found to be significant. **CONCLUSIONS:** This modified and final translated version of instrument confirms the linguistic validity of the questionnaire for the Hindi language and evaluates the psychometric properties of the questionnaire for psychometric validation. Indian Hindi version of DQOL-M is valid and reliable instrument for measuring HRQOL of diabetic type 2 patients.

PHARMACEUTICAL COST ANALYSIS OF DIABETES MELLITUS USING CLINICAL RISK GROUPS IN VALENCIAN COMMUNITY

Romero M[1], Uso Talamantes R[2], Vivas Consuelo D[3], De la Poza Plaza E[3], Sancho Mestre C[3], Trillo Mata JL[2], Barrachina I[3]
[1]*Fundacion Salutia, Bogotá, Colombia,* [2]*Conselleria de Sanidad, Valencia, Spain, Spain,* [3]*Universidad Politecnica de Valencia UPV, Valencia, Spain*

OBJECTIVES: Metabolic agents have the highest expense (130 million Euros per year in the Valencian Community) among the top five therapeutic categories of drugs for adults aged 18 and over. Treatment of Diabetes Mellitus (DM) is the main cause of this. Moreover, diabetes is a chronic illness that requires continuous medical care and patient self-management education to prevent acute complications and to reduce the risk of long-term complications. Clinical Risk Groups (CRGs) are a tool claimed as valid for diabetes patient management. In this context we use this methodology to conduct a pharmaceutical cost analysis of diabetes in an Eastern Spanish region where the prevalence reaches approximately 8 %. **METHODS:** A database of 5,200,000 subjects was used to analyse the prevalence of patients with DM, comorbidity and complications. The patients with DM diagnoses were classified into CRGs to know their severity levels and pharmaceutical cost was also assigned. A multivariable statistical analysis was performed to evaluate the correlation and level of explanation between CRGs' severity level and pharmaceutical expenditure. **RESULTS:** Identified 300,698 patients with DM type 2 for a prevalence of 7.85% in men and 6.77% in women being the 13.2% and 7,98% in unders 50 years old, respectively. The 69,1% treated with orals hypoglycemics being combied therapy in over 75% of these. The use cosumption ratio glucometer strip, increaes with disease progression. It Was posible to identify the presence of complicactions in patiens analysed. A high correlation between pharmaceutical costs and CRG severity level was found. Comorbidity is a predictor for adjusting the risk of pharmaceutical expenditure. **CONCLUSIONS:** The model obtained could be a useful tool for managing pharmaceutical budget policies and patient management. The use of this measurement technique is useful for monitoring the health medical expense.

PDB25

INFLUENCE OF ONE WEEK EDUCATION PROGRAM ON THE KNOWLEDGE AND APPROACH OF PHARMACY STUDENTS TOWARDS DIABETES MELLITUS

Khan MS, Akhtar N, Ali A
The Islamia University of Bahawalpur, Punjab-Pakistan, Bahawalpur, Pakistan

OBJECTIVES: To assess the improvement in knowledge and attitude of Pharmacy student towards diabetes by implementing one week education program. **METHODS:** Study was conducted between January 7, 2013 to January 11, 2013 which engaged pharmacy students comprising two groups: experimental and control groups. Lectures and visual presentations on diabetic education and practice were conducted. Three surveys were performed on two group's i.e. non intervened control, non- intervened experimental and intervened experimental surveys. Questionnaire was used as survey tool. **RESULTS:** Mean score on knowledge about diabetes was increased from 68.81% to 88.90% after educational intervention while that of control group was 74.75%. General knowledge of diabetes was increased from 66.37% to 89.90% while that of control was 69.28%. Risk factors knowledge was increased from 61.05% to 90.20% while that of control was 70.20%. Symptoms knowledge increased

from 80.70% to 95.58% while that of control was 88.56%. Therapeutic complications knowledge was increased from 71.58% to 88.57% while that of control was 78.82%. Medication knowledge of diabetes was increased from 80.26% to 83.67% while that of control was 74.51%. Lifestyle knowledge of diabetes was increased from 72.81% to 89.80% while that of control was 84.64%. Knowledge about preventions in diabetes was increased from 69.47% to 86.53% while that of control was 80.78%. Knowledge about diet was increased from 48.68% to 77.55% while that of control was 42.16%. Knowledge about monitoring diabetic conditions was increased from 84.21% to 92.35% while that of control was 86.27. Scores in all diabetic knowledge aspect was increased after education intervention and was significantly ($P<0.05$) different from that of control group. **CONCLUSIONS:** Institutions may ethically help in the reinforcement of student's knowledge by implementing such educational programs which may increase the educational skills, efficiency and confidence of pharmacy students as well as professionals.

PDB26

ACUTE EXPOSURE OF BISPHENOL-A FROM ELECTRONIC GADGETS DOES NOT INDUCE OXIDATIVE STRESS IN THE RAT BRAIN

Kumar N[1], Sharma VP[2]

[1]*Shri Ramswaroop Memorial University, Barabanki, India,* [2]*CSIR-Indian Institute of Toxicology Research, Lucknow, India*

OBJECTIVES: To investigate the effects of BPA on oxidative damage in terms of activity level of antioxidant enzymes in different regions of the rat brain. **METHODS:** In this study, BPA migration was estimated through physio-chemical parameters and leachate (equivalent to 4mg/kg body weight) was used for animal dosing. Three groups of Albino Wister rats (190+20grm) were used for control, sham, and treated. The antioxidant enzymes including superoxide dismutase (Mn-SOD), catalase (CAT), glutathione peroxidase (GPx) and reduced glutathione level (GSH) were measured in different brain regions i.e. corpus striatum, frontal cortex, thalamus and midbrain. **RESULTS:** No significant changes were observed in most of the brain regions yet the level of GPx activity in corpus striatum (29.65±0.98 nmoles/min/mg protein) and level of GSH activity in frontal cortex (2.33±0.12 µmoles/g protein) was found to decrease significantly ($p<0.05$) when compared to controls. In addition, no significant effects were observed for the oxidative damage in brain regions of sham group when compared to control group. **CONCLUSIONS:** Thus study suggests that acute exposure (4mg/kg body weight per day up to 28 days) of BPA does not induce significant oxidative damage in the rat brain. Furthermore, study might re-examine before affirm the final remark for subscribers and regulatory bodies at similar doses.

COSTS OF PRIMARY BILIARY CIRRHOSIS TREATMENT WITH URSODEOXYCHOLIC ACID IN BRAZIL

Lemos LLP, Mata AD, Gomes RM, Guerra Junior AA, Acurcio FA

Universidade Federal de Minas Gerais, Belo Horizonte, Brazil

OBJECTIVES: To estimate the cost of treatment of primary biliary cirrhosis with ursodeoxycholic acid (UDCA) in Brazil and to evaluate the efficacy and safety of this treatment. **METHODS:** We considered the doses of 8, 12 and 15mg/Kg and a patient weighing 70Kg to estimate the cost of treatment. We used the maximum price to the producer in the CMED (Drug Market Regulation Chamber) list of 03/15/2013 with 18% of ICMS (Circulating Goods and Services Tax), and applied CAP (Adequacy Coefficient of Prices)of 25% . We used Purchasing Power Parity of 1,0USD=1,8BRL. To access efficacy and safety we searched the databases The Cochrane Library, CDR, Tripdatabase, MEDLINE and LILACS to identify systematic reviews (SR) of clinical trials that reported data on mortality, biochemical improvement measurements and adverse events. **RESULTS:** The estimated annual cost of treatment was USD2,239.24 with the dose of 8mg/Kg; USD3,168.97with the dose of 12mg/Kg; and UDS4,098.71 with the dose of 15mg/Kg. We included seven SRs; four evaluating UDCA versus placebo/observation; one UDCA versus colchicine; one UDCA versus methotrexate; and one UDCA versus bezafibrate. Generally, until four years of treatment there were no difference between UDCA and placebo/other interventions with respect with mortality, hepatic transplant incidence, worsening or arising of itching and fatigue, and incidence of hepatic complications. In the other hand there were improvements in surrogate outcomes like hepatic function markers, especially bilirubin. In all studies UDCA was well tolerated by patients. **CONCLUSIONS:** Improvements in the blood levels of hepatic markers did not match mortality rates or the incidence of transplant. The main symptoms of the disease, itching or fatigue, were not altered by the use of UDCA. There is a lack of evidence of studies evaluating quality of life of the patients, which perhaps could be improved by the use of UDCA. Besides, long observational studies could connect biochemical improvement and mortality rate.

COST-EFFECTIVENESS OF TELAPREVIR IN GENOTYPE 1 CHRONIC HEPATITIS C VIRUS (HCV) INFECTION IN ARGENTINA

Garcia Marti S[1], Alcaraz A[1], Valanzasca P[1], Garay Ulises U[1], McMullen M[1], Rey Ares L[1], Peirano I[2], Bessone F[3], Fainboim H[4], Gadano A[5], Galdame O[5], Vujacich C[6], Caporale J[1]

[1]*Institute for Clinical Effectiveness and Health Policy (IECS), Buenos Aires, Argentina,* [2]*Janssen, Buenos Aires, Argentina,* [3]*Sanatorio Parque, Santa Fe, Argentina,* [4]*Hospital Muñiz, Buenos Aires, Argentina,* [5]*Hospital Italiano de Buenos Aires, Buenos Aires, Argentina,* [6]*FUNCEI, Buenos Aires, Argentina, Buenos Aires, Argentina*

OBJECTIVES: Direct acting antiviral therapies (DAA) in addition to PEG 2a + RBV (PR) are a new therapeutic option with higher rates of sustained virological response (SVR) than dual therapy (PR) alone in chronic hepatitis C. Currently, two alternatives of DAA, telaprevir (TVR) and boceprevir (BOC), are available in Argentina. The aim of this study was to evaluate the cost-effectiveness of adding TVR to PR in treatment naive and previously treated patients with HCV in Argentina compared to PR alone and with the addition of BOC. **METHODS:** A lifetime Markov model was developed including HCV, cirrhosis, liver transplant and death as health states. QALYs as an outcome measure, a private health subsector perspective and a 5% discount rate for health benefits and costs have been used. Costs are expressed in local currency. A review of the literature to obtain epidemiologic and resources utilization data was performed and when data were not available or validation was needed a Delphi panel with local experts was carried out. Deterministic and probabilistic sensitivity analysis was performed. **RESULTS:** In comparison with PR, TVR avoided 166 cirrhosis cases and 13 deaths per 1,000 patients and shown an ICER of $141,922/QALY and $74,332/QALY for the naïve and for the previously treated patients respectively. TVR presented extended dominance (lower ICER) against BOC in naïve patients and complete dominance (less costly and more efficacious) in most of the previously treated ones, except in the partial responders subgroup. Against the WHO criteria TVP versus PR presented a 42% of probability of being cost effective for naïve and 75% of probability of being cost effective for previously treated patients. **CONCLUSIONS:** TVR dominated BOC and its ICER against double therapy was slightly above WHO 3x GDP criteria in Argentina from a private subsector perspective.

PGI3

ANÁLISIS DE COSTO EFECTIVIDAD DE ACIDO GADOTERICO FRENTE A OTROS MEDIOS DE CONTRASTES BASADOS EN GADOLINIO

Simbaqueba E[1], Uriza LF[2], Romero M[1], Huerfano L[1]

[1]*Fundacion Salutia, Bogotá, Colombia,* [2]*Hospital Universitario San Ignacio, Pontificia Universidad Javeriana, Bogotá, Colombia*

OBJECTIVOS: Evaluar la costo efectividad del uso de ácido gadotérico en resonancia magnética para pacientes con insuficiencia renal crónica tipo 4 y 5, versus otros medios de contraste gadolínicos (gadopentetato de dimeglumina, gadoversetamida, gadodiamida, gadobutrol) analizando como desenlace la sobrevida del paciente que presenta como evento adverso Fibrosis Sistémica Nefrogénica (FSN). **METODOLOGÍAS:** La efectividad de medios de contraste ha sido evaluada en términos de seguridad. Al revisar la literatura se encontraron diferencias en la probabilidad de desarrollo (FSN) como principal complicación del uso de estos medios de contraste en pacientes con enfermedad renal avanzada, siendo letal en más del 56% de los casos. Mediante un modelo de árbol de decisión desde la perspectiva del tercero pagador se compararon los diferentes medios de contraste tomando como desenlace de análisis la sobrevida medida en años de vida ganados, para una esperanza de vida de 64,5 años y una edad promedio de 60 años, sobre las características del caso base. Los costos fueron obtenidos de precios de mercado de bases de datos de aseguradoras en pesos colombianos, 2012. El costo usado para las tecnologías fue el de la presentación 15 ml. **RESULTADOS:** No se encontraron reportes de casos de FSN con gadotérico o gadobutrol. El ácido gadotérico mostró un promedio de año de vida de 1,706 mejor que gadodiamida, gadopentetato de dimeglumina y gadoversetamida; y fue el menos costoso frente a todos los analizados (COP$ 132.000) seguido de Gadobutrol (COP$ 161.202) siendo dominante en todos los escenarios analizados. En el análisis tipo Montecarlo con variaciones de +/-50% mantiene su dominancia en el 95% de las iteraciones. **CONCLUSIONES:** El acido gadotérico es la opción más favorable por su dominancia dada por su menor costo, y mejor o igual efectividad frente a los demás comparadores, justificando con esta información su mayor preferencia en el uso.

PGI4

RULING OUT IBD IN THE UNITED KINGDOM AND BRAZIL: IS THE USAGE OF F-CALPROTECTIN IN PRIMARY CARE COST-EFFECTIVE?

Mascialino B[1], Hermansson LL[2], Larsson A[3]

[1]*Thermo Fisher Scientific, Phadia, Uppsala, Sweden,* [2]*Thermo Fisher Scientific, Uppsala, Sweden,* [3]*Uppsala University, Uppsala, Sweden*

OBJECTIVES: The inflammatory bowel diseases (IBD) are characterized by chronic inflammation of the gastrointestinal tract; the irritable bowel syndrome (IBS) is a functional disorder (prevalence 10%-20%). They present overlapping symptoms, making diagnosis difficult in primary care. Endoscopy is the gold standard for IBD, but it often turns negative due to IBD's low prevalence, it is expensive, uncomfortable and risky for the patient. F-Calprotectin is a marker of intestine inflammation: as IBD patients exhibit levels higher than the general population and IBS patients, F-Calprotectin can be used to rule out IBD. The only CE evaluation on F-Calprotectin has been published by NHS (CEP09041, 2010); based on new evidence, we propose a refined model to evaluate the CE of F-Calprotectin compared to the standard pre-endoscopic serologic test (CRP+ESR) to distinguish IBD from IBS in the UK and Brazil. **METHODS:** F-Calprotectin sensitivity (0.96) and specificity (0.96) were evaluated from a meta-analysis performed in March 2013; CRP+ESR sensitivity (0.35) and specificity (0.73), and the costs come from CEP09041. Published HRQoL values for IBD and IBS were transformed in QALYs with transfer-to-utility techniques. The outcomes included cost savings, cost per QALY. Uncertainty was addressed with a probabilistic sensitivity analysis. **RESULTS:** Results for UK show that F-Calprotectin is CE with respect to CRP+ESR: a) it results in more corrected IBD diagnoses at a lower price (it costs 113£ less per patient); b) it reduces the number of unnecessary endoscopies, increasing the number of correctly diagnosed IBD (N=59) and IBS (N=195) patients; c) it brings about a QALY gain per patient equal to 0.0034QALYs; the ICER of the CRP+ESR diagnostic strategy is 47,783£, and it falls well outside the cost-effectiveness bounds (20,000–30,000£ per additional QALY). Similar results were found for Brazil. **CONCLUSIONS:** F-Calprotectin is CE to rule out IBD in primary care in UK and Brazil.

PGI5

COST-EFFECTIVENESS OF TELAPREVIR IN GENOTYPE 1 CHRONIC HEPATITIS C VIRUS (HCV) INFECTION IN CHILE

Garcia Marti S[1], Alcaraz A[1], Valanzasca P[1], Garay Ulises U[1], McMullen M[1], Rey Ares L[1], Peirano I[2], Oksenberg Reisberg D[3], Soza Ried A[4], Poniachik J[5], Brahm Barril JR[6], Caporale J[1]

[1]*Institute for Clinical Effectiveness and Health Policy (IECS), Buenos Aires, Argentina,* [2]*Janssen, Buenos Aires, Argentina,* [3]*INDISA Clinica de Familia, Providencia, Chile,* [4]*Pontificia Universidad*

Católica de Chile, Santiago de Chile, Chile, [5]Hospital Clinico de la Universidad de Chile, Santiago de Chile, Chile, [6]Hospital Clinico Universidad de Chile, Santiago de Chile, Chile

OBJECTIVES: Direct acting antiviral therapies (DAA) in addition to PEG 2a + RBV (PR) are a new therapeutic option with higher rates of sustained virological response (SVR) than dual therapy (PR) alone in chronic hepatitis C. Currently, two alternatives of DAA, telaprevir (TVR) and boceprevir (BOC), are available in Chile. The aim of this study was to evaluate the cost-effectiveness of adding TVR to PR in treatment naive and previously treated patients with HCV in Chile compared to PR alone and with the addition of BOC. **METHODS:** A lifetime Markov model was developed including HCV, cirrhosis, liver transplant and death as health states. QALYs as an outcome measure, a health care system perspective and a 6% discount rate for health benefits and costs have been used. Costs are expressed in local currency. A review of the literature to obtain epidemiologic and resources utilization data was performed and when data were not available or validation was needed a Delphi panel with local experts was carried out. Deterministic and probabilistic sensitivity analysis was performed. **RESULTS:** In comparison with PR, TVR avoided 174 cirrhosis cases and 16 deaths per 1,000 patients and shown an ICER of $14,730,736/QALY and $8,300,511/QALY for the naïve and for the previously treated patients respectively. TVR dominated BOC in naïve patients and in most of the previously treated ones (was less costly and more efficacious), except in the partial responders subgroup. Against the WHO criteria TVP versus PR presented 80% of probability of being cost effective for naïve and 96% of probability of being cost effective for previously treated patients. **CONCLUSIONS:** TVR dominated BOC and was cost-effective against WHO 3x GDP criteria in comparison to double therapy from the national health care system perspective in Chile.

PGI6

ECONOMIC EVALUATION OF DIRECT ACTING ANTIVIRAL (DAA) TREATMENTS FOR HEPATITIS C VIRUS (HCV) INFECTION IN PREVIOUSLY TREATED PATIENTS FROM THE PERUVIAN HEALTH CARE SYSTEM PERSPECTIVE

Ariza JG[1], Hinojosa R[2]

[1]*Janssen Cilag, Bogotá, Colombia, [2]Janssen Cilag Peru, Lima, Peru*

OBJECTIVES: DAA treatments in addition to Ribavirin (RBV) and peginterferon (Peg-INF) (PR), provides the greatest opportunity to fully achieve sustained virological response (SVR) in HCV infected patients. Currently, two alternatives of DAA, telaprevir (TVR) and boceprevir (BOC), are available in Peru. The objective of this study is to assess: which is the most efficient DAA treatment to compliment the PR in previously treated patients. **METHODS:** A Markov model was used from the payer perspective to estimate costs and benefits throughout the whole life. Transition probabilities, utilities and resources usage were obtained from literature and through a mixed treatment comparison. Only direct costs were considered as medications, laboratory tests, complications costs and adverse events by using tariffs and tender prices from EsSalud. Outcomes were measured as SVR, quality adjusted life years (QALY) and events of cirrhosis per 1,000 treated patients. Two alternatives were assessed: 1) 12 weeks of TVR plus PR and 2) 24-44 weeks of BOC plus PR. Discount rate 3% and exchange rate (1 USD = 2,6 S/). **RESULTS:** 1) *Total costs (USD)*: TVR plus PR ($56,058), BOC plus PR ($64,536). 2) *Medication costs (USD)*: TVR plus PR ($47,297), BOC plus PR ($54,649). 3) *SVR*: TVR plus PR (76%), BOC plus PR (60%). 4) *QALY*: TVR plus PR (6,02), BOC plus PR (5,87). 5) *Cirrhosis per 1,000 treated patients*: TVR plus PR (311), BOC plus PR (363). Incremental Cost Effectiveness Ratio (ICER) was negative, showing that 12 weeks of TVR plus PR is a dominant therapy. **CONCLUSIONS:** When a DAA is considered, in addition to PR, for previously treated patients, TVR is the preferred choice because of its potential cost-savings versus BOC and incremental health benefits versus BOC.

PGI7

COST-EFFECTIVENESS OF TELAPREVIR IN GENOTYPE 1 CHRONIC HEPATITIS C VIRUS (HCV) INFECTION IN COLOMBIA

Garcia Marti S[1], Alcaraz A[2], Valanzasca P[2], Garay OU[2], McMullen M[2], Rey Ares L[2], Idrovo V[3], Prieto Ortiz J[4], Tapias M[3], Obregon J[5], Ariza JG[6], Caporale J[2]

OBJECTIVES: Direct acting antiviral therapies (DAA) in addition to PEG 2a + RBV (PR) are a new therapeutic option with higher rates of sustained virological response (SVR) than dual therapy (PR) alone in chronic hepatitis C (HCV). Currently, two alternatives of DAA, telaprevir (TVR) and boceprevir (BOC), are available in Colombia. The aim of this study was to evaluate the cost-effectiveness of adding TVR to PR in treatment naive and previously treated patients with HCV in Colombia compared to PR alone and with the addition of BOC. **METHODS:** A lifetime Markov model was developed including HCV, cirrhosis, liver transplant and death as health states. QALYs as an outcome measure, a health care system perspective and a 3% discount rate for health benefits and costs have been used. Costs are expressed in local currency. A review of the literature to obtain epidemiologic and resources utilization data was performed and when data were not available or validation was needed a Delphi panel with local experts was carried out. Deterministic and probabilistic sensitivity analysis was performed. **RESULTS:** In comparison with PR, TVR avoided 172 cirrhosis cases and 24 deaths per 1,000 patients and shown an ICER of $21,260,647/QALY and $8,461,107/QALY for the naïve and for the previously treated patients respectively. TVR dominated BOC in naïve patients and in most of the previously treated ones (was less costly and more efficacious), except in the partial responders subgroup. These results were robust in the sensitivity analysis. **CONCLUSIONS:** TVR dominated BOC and and was cost-effective against WHO 3x GDP criteria in comparison to PR from the national health care system perspective in Colombia.

QUALITY OF LIFE IN PATIENTS WITH GASTROESOPHAGEAL REFLUX DISEASE IN SLOVAKIA

Bielik J[1], Marusakova E[2], Matisakova I[1], Gerlichova K[3]

[1]*Trencin University of Alexander Dubcek, Trencin, Slovak Republic, [2]GlaxoSmithKline Slovakia, Bratislava, Slovak Republic, [3]Trencin University, Trencin, Slovak Republic*

OBJECTIVES: The estimated prevalence of complicated gastroesophageal reflux disease (GERD) is approximately 2% in the European population and showing 10-fold increase over the past 20 years. The objective of this paper was to find out the level of QoL in patients with GERD in Slovakia. **METHODS:** The primary method used for the analysis of QoL was the presence of transient disability period and combined questionnaire consisting of 4 parts: A. Demography and socioeconomics (13 items), B. Generic questionnaire (SF-36), C. Visual scale (4 items), D. Complementary (information and habits, 13 items). The Likert scale was used in closed questions. The sample included 100 patients treated in the gastroenterological outpatient clinic (34 men and 66 women). Of these, 72 patients were in productive age. The patients were chosen according to the order in which they visited the clinic. **RESULTS:** One month and two months of sick days were recorded in 8.3% and 7% of patients, respectively; 84,7% of patients did not report any sick days. The loss of money of up to 400 € and between 401 and 800 € was recorded in 11.1% and 4.2 % of patients, respectively; 84.3 % of did not report any loss of money. Present level of QoL was identified as 5.12 on the scale of 10, while in the time of the GERD diagnosis it was 3.86. QoL was 8.25 in the time without GERD and 8.17 in optimal state of health, respectively. Future expectations were perceived as positive in 56% of patients and negative in 44% of patients. **CONCLUSIONS:** A total of 95% of patients were well and very well informed about its characteristics. Paradoxically, only 48% of them used their medications regularly, although regular and occasional administration of medications was shown to have positive impact on health status in 56% and 44% of patients, respectively.

A LOW ANTIVIRAL TREATMENT RATE IN CHRONIC HEPTITIS C PATIENTS IN TAIWAN- A NATIONWIDE PHYSICIAN-BASED SURVEY

Yu ML[1], Huang JF[2]

[1]*Kaohsiung Medical University Hospital, Kaohsiung City, Taiwan, [2]Kaohsiung Municipal Hsiao-Kang Hospital, Kaohsiung Medical University, Kaohsiung City, Taiwan*

OBJECTIVES: Hepatitis C virus (HCV) infection is the most common cause of liver cirrhosis and liver cancer worldwide. In addition to low disease awareness both in public and affected patients, a low disease treatment rate remains to be an important issue regarding disease control in primary care. The nationwide prevalence of anti-HCV seropositivity in Taiwan is 4.4%. However, there are scattered hyperendemic areas in Southern Taiwan with an extremely high prevalence rate reaches 57.9% high. Therefore, several public health strategies with periodic assessment aiming to promote liver health have been performed for two decades. **METHODS:** We aimed to elucidate the reasons of lower treatment rate in our country. In this hospital-based, physician-oriented study, a proportional sampling based on previous documented HCV prevalence of geographic locations in Taiwan was conducted. An anonymous questionnaire regarding treatment status in anti-HCV-positive patients was collected from these selected physicians. Patient's information including sex, age, anti-HCV therapy, and the reason for not receiving antiviral therapy was inquired by their primary care physicians. **RESULTS:** Seventy-six physicians were recruited into this survey (Medical center n=46; regional hospital n=23; primary clinic n=7). A total of 2,722 anti-HCV-positive subjects in Taiwan were enrolled into this analysis. Among them, 54.5% (1,479/2,722) had ever received anti-HCV treatment before. The treatment rate of medical centers was 63.1%, which was higher than 52.7% of regional hospitals, and 33.8% of primary clinics, respectively ($p<0.0001$ for pair-wise chi square test; $p<0.0001$ for trend test). Males had a significantly higher motivation for receiving antiviral therapy than females (58.6% vs. 50.5%, $p<0.0001$). The main reason for not receiving anti-HCV therapy was fear of side effects (38%), followed by ineligibility for insurance reimbursement (18%), and lack of awareness (11%). **CONCLUSIONS:** In Taiwan, half of the HCV-infected patients have not received antiviral therapy. The low treatment rate may contribute to HCV hyperendemic status.

EVALUATION OF FACTORS AFFECTING TREATMENT RESPONSE AND RISK FACTORS FOR PATIENTS DIAGNOSED WITH NON-PSYCHOTIC MAJOR DEPRESSIVE DISORDER: A LITERATURE REVIEW

Greene N[1], Greene M[2]

[1]*Massachusetts College of Pharmacy and Health Sciences, Boston, MA, USA, [2]Georgia State University, Bethel, MA, USA*

OBJECTIVES: To conduct a systematic review of literature on factors that are affecting patient treatment response and risk factors for patients diagnosed with Non-Psychotic Major Depressive Disorder (MDD). **METHODS:** A literature search was performed using relevant search terms to identify articles published from 2000 to 2010 on the factors affecting treatment response and risk factors for MDD. Studies were identified through electronic Embase, Cochrane, Medline, and PubMed databases. Additional parameters were placed on the final search strategy to limit the retrieval to articles written in English, involving human subjects. **RESULTS:** The initial search revealed 874 articles for factors affecting treatment response and 590 articles for risk factors affecting MDD from PubMed/Medline/Embase/Cochrane databases. After removing duplicates and non-rele-

vant articles, the final articles that were considered for review were 82 for treatment response and 13 for risk factors. Fifty-one studies examined non-genetic factors, serotonin-related genetic factors and variety of genes and polymorphism biomarkers to determine their association with MDD treatment response. Thirty-one studies focused on variables that were found to be associated with some aspect of MDD and their impact on treatment response and include: comorbidity (n=12), demographic and socioeconomic (n=6), and depression-related (n=13) variables. Thirteen studies examined the risk factors for MDD. Of these, 2 studies focused on the role of biomarkers in MDD risk. And, 11 studies focused on variables that were found to be associated with some aspect of MDD and their impact on MDD risk, and focused on comorbidity (n=5), demographic and socioeconomic (n=2), depression-related (n=3), and environmental variables (n=1). **CONCLUSIONS:** The majority of the biomarker studies examined associations between the serotonin transporter, genes and polymorphisms in response to various MDD treatments. With respect to correlate studies, younger age of MDD onset, as well as family history of mood disorders, were both associated with a longer duration of MDD illness.

PMH2

LENGTH OF STAY AND OUTCOMES FOR ADOLESCENTS TREATED FOR SUBSTANCE USE DISORDER: AN ANALYSIS OF DOSE RESPOSE USING PROPENSITY SCORES

Ciesla J[1], Mazurek K[2]
[1]*Northern Illinois University, DeKalb, IL, USA,* [2]*University of Illinois, Champaign-Urbana, Champaign, IL, USA*

OBJECTIVES: This research uses propensity score methods to identify the relationship between amount of treatment and treatment outcome for adolescents with psychoactive substance use disorder (PSUD). The objective is to describe the dose response relationship in terms relevant in economic evaluation. Outcomes studies in this population show that longer treatment leads to more positive outcomes. The standard for residential programs is a minimum of 21 days of treatment and ideally up to 90 days. **METHODS:** The subjects are 377 adolescents who successfully completed primary treatment from 2004-2010. All were placed at ASAM level III.5 (Clinically-Managed, Medium/High Intensity Residential). The data are from treatment records and a 234-item questionnaire. The questionnaire responses were matched to variables in treatment records creating a rich source of pre-treatment characteristics. This research operationalizes dose with four one-month categories (1 dose=1 month) to capture nonlinearities between service use and outcomes. The outcome is three-month post-treatment drug/alcohol abstinence. The categories were fairly even and captured 92% of variation in dose. The first stage of statistical analysis used multinomial logistic regression to predict dosage with pre-treatment variables while adjusting for characteristics influencing both dose and treatment outcome. Propensity scores were then created for each dosage category. The dose response relationship was assessed using a binomial logistic regression including the four dose categories as dummy variables (lowest dose category as reference). **RESULTS:** The overall relationship between dose and outcome was significant (p=0.01) as were outcome improvements over the four doses. Improvements were significant ($p \leq 0.01$) decreasing as dose increased—Exp.(B) was1.204 (1.2 times more likely to abstain) for one month, 1.532 two months, 1.643 three months, and 1.794 for four months (% correctly classified=94.2; – 2LL=44.712; Cox and Snell R^2=0.475.) **CONCLUSIONS:** This research shows a significant dose response relationship between treatment length and treatment outcome with response diminishing on the margin.

PMH3

CLINICAL OUTCOMES OF PATIENTS WITH MAJOR DEPRESSIVE DISORDER TREATED WITH EITHER DULOXETINE OR SELECTIVE SEROTONIN REUPTAKE INHIBITORS IN MEXICO

Hong J[1], Novick D[1], Montgomery W[2], Dueñas H[3], Peng X[4], Kadziola Z[5], Haro JM[6]
[1]*Eli Lilly and Company, Windlesham, UK,* [2]*Eli Lilly Australia Pty Ltd, West Ryde, Australia,* [3]*Eli Lilly de Mexico, México D.F., Mexico,* [4]*Eli Lilly and Company, Indianapolis, IN, USA,* [5]*Eli Lilly GmbH, Vienna, Austria,* [6]*Parc Sanitari Sant Joan de Déu, CIBERSAM, Universitat de Barcelona, Barcelona, Spain*

OBJECTIVES: To compare treatment outcomes in patients with major depressive disorder (MDD) treated with either duloxetine or a selective serotonin reuptake inhibitor (SSRI) for up to 6 months in a naturalistic setting in Mexico. **METHODS:** Data in this *post hoc* analysis were taken from a 6-month prospective, non-interventional, observational study that included a total of 1,549 MDD patients without sexual dysfunction in twelve countries (N=591 in Mexico). Depression severity was measured using the Clinical Global Impression (CGI) and the 16-item Quick Inventory of Depressive Symptomatology Self-Report (QIDS-SR_{16}). Pain was measured using the pain related items of the Somatic Symptom Inventory (SSI), and quality of life (QoL) was measured using the EQ-5D instrument with the UK population tariff and the EQ-VAS. Probabilities of initiating duloxetine (vs. SSRIs), expressed as propensity scores, were first constructed using logistic regression. Mixed effects modelling with repeated measures (MMRM) analysis was then used to compare treatment effectiveness and QoL between the duloxetine (N=168) and SSRI (N=413) groups, controlling for the propensity scores and other patient characteristics. **RESULTS:** The severity of depression was comparable between the two groups at baseline. Duloxetine-treated patients, however, had a higher level of pain severity and a lower level of QoL (EQ-5D) than SSRI-treated patients at baseline ($p \leq 0.001$). Both descriptive and MMRM regression analyses showed that patients treated with duloxetine had better outcomes during follow-up, compared with patients treated with SSRIs. At 6 months, duloxetine-treated patients had lower levels of CGI (2.25 vs. 2.52, p=0.005), QIDS-SR_{16} (3.95 vs. 5.35, p<0.001), and SSI-pain related (8.52 vs. 9.64, p<0.001), and higher levels of EQ-5D (0.92 vs. 0.87, p<0.001) and EQ-VAS (64.62 vs. 57.63, p=0.006) (MMRM results). **CONCLUSIONS:** Duloxetine-treated patients had better 6-months outcomes in terms of depression severity, pain and QoL, compared with SSRI-treated patients.

PMH4

A COMPREHENSIVE REVIEW OF EPIDEMIOLOGY AND ECONOMIC STUDIES FOR PATIENTS DIAGNOSED WITH NON-PSYCHOTIC MAJOR DEPRESSIVE DISORDER

Greene N[1], Greene M[2]
[1]*Massachusetts College of Pharmacy and Health Sciences, Boston, MA, USA,* [2]*Georgia State University, Bethel, MA, USA*

OBJECTIVES: To conduct a systematic review of literature in on epidemiology and economic studies for patients diagnosed with Non-Psychotic Major Depressive Disorder (MDD). **METHODS:** The initial search strategy was developed in the PubMed/Medline database, and was then translated for the Cochrane and Embase database searches. Search strings for epidemiology and economics studies for MDD were constructed using varied approaches that included the use of MeSH terms, as well as keywords that would afford the best retrieval. Search statements were then combined to produce a final search set. Additional parameters were placed on the final search strategy to limit the retrieval to articles written in English, involving human subjects and published between 2000 and 2010. **RESULTS:** Our search revealed 289 articles for epidemiology and 200 articles for economic studies on MDD from PubMed/Medline/Embase/Cochrane databases. After removing duplicates and non-relevant articles, 17 for epidemiology and 26 for economic studies were included in the final analysis. Fifteen studies on epidemiology were focused on MDD prevalence, one study was on cumulative incidence. Prevalence estimates were higher for lifetime than past year and ranged between 3.1% and 26.6% for lifetime prevalence and between 1.5% and 11.7% for past-year prevalence. Two studies examined burden of illness, one study budgetary impact of MDD, 14 studies examined cost effectiveness of MDD treatments, 3 studies examined cost utility analysis and 6 other studies examined retrospective claims analysis. **CONCLUSIONS:** MDD prevalence was higher in the lifetime estimates, when compared to the estimates reflecting shorter time frames, although there appeared to be greater variability in the lifetime estimates. Overall, the cost of treating MDD varied with type of study, study time frame, study perspective, the year in which the costs were calculated, and the pharmacotherapy prescribed.

PMH5

EVALUATION OF ASSOCIATIONS AMONG BIOMARKERS, CORRELATES AND TREATMENT EFFICACY IN CLINICAL STUDIES IN PATIENTS DIAGNOSED WITH NON-PSYCHOTIC MAJOR DEPRESSIVE DISORDER: A LITERATURE REVIEW

Greene N[1], Greene M[2]
[1]*Massachusetts College of Pharmacy and Health Sciences, Boston, MA, USA,* [2]*Georgia State University, Bethel, MA, USA*

OBJECTIVES: To perform a systematic review of literature in peer-reviewed journals on clinical biomarkers, correlates and treatment efficacy in clinical studies on patients diagnosed with Non-Psychotic Major Depressive Disorder (MDD). **METHODS:** The initial search strategy was developed in the PubMed/Medline database and was then translated for the Cochrane and Embase database searches. Search strings for biomarkers, correlates and treatment efficacy in patients with MDD were constructed using varied approaches that included the use of MeSH terms, as well as keywords that would afford the best retrieval. Also included were search terms that used an asterisk as a wildcard applied to a word stem. Search statements were then combined to produce a final search set. Additional parameters were placed on the final search strategy to limit the retrieval to articles written in English, involving human subjects and published between 2000 and 2010. **RESULTS:** The initial search revealed 871 articles from PubMed/Medline/Embase/Cochrane databases. After removing duplicates and non-relevant articles, the final articles that were included in the review were 131. Forty-eight studies examined biomarkers and primarily focused on the relationship between biomarkers and MDD treatment response. Only 29 of the 48 studies found a significant association between a biomarker and treatment response. Twenty-nine studies examined MDD correlates such as comorbidity or demographic variables. A poorer response to treatment was found for those patients who experienced comorbid anxiety, irrespective of the type of treatment. Fifty-four studies focused on treatment efficacy and are divided into 3 groups: SSRIs only, SNRIs only, and a comparison across SSRIs, SNRIs, and bupropion. Overall, the SSRIs showed comparable efficacy when compared to each other or placebo. **CONCLUSIONS:** Most of the biomarker studies examined associations between the serotonin transporter and response to various MDD treatments. The majority of efficacy studies found that the treatments that are within the class had comparable efficacy.

MENTAL HEALTH – Cost Studies

PMH6

THE IMPACT OF ANTIPSYCHOTICS POLYPHARMACY ON HEALTH CARE COSTS OF PEOPLE WITH MENTAL DISORDERS IN SÃO PAULO CITY, BRAZIL

Razzouk D, Sousa A, Oliveira GG, Cardoso A, Mari JJ
Universidade Federal de Sao Paulo, SAO PAULO, Brazil

OBJECTIVES: Antipsychotics polypharmacy (AP) has been associated with more adverse drug effects, higher treatment costs, worse clinical outcomes and sudden death. Though, the frequency of such practice may reach 50 % in some clinical settings. The aims of this study were to estimate AP costs and its influence on the direct costs of health care package in a sample of people with mental disorders in São Paulo city, Brazil. **METHODS:** We used a bottom-up approach for the estimation of direct costs according to public health service provider perspective. Direct costs included costs with accomodation (residential service), inpatient, outpatient and emergency services and treatment received in the previous month, in 147 subjects with mental disorders living in twenty residential services during the year 2011. We evaluated quality of life, social behavior problems, psychiatric diagnosis, severity of symptoms, sociodemographics characteristics and pattern of health service use. **RESULTS:** AP was found in 38% of the sample and it was not related with gender, age, severity of psychiatric symptoms, quality of life and social behavior problems. Antipsychotics monotherapy costs were related with the type of antipsychotic: Atypical antipsychot-

ics costs were 167.4 times higher than typical antipsychotic costs. AP mean monthly costs per person varied with the type of association between antipsychotics: typical-atypical associations costs were U$257.5± U$228.5, while mean costs between two typical antipsychotics were U$4.36 ± U$4.02. Polypharmacy added U$300.00 dolars per person per month to direct costs of health care (excluding accomodation). For each additional antipsychotic associated, it was observed an additional montlhy costs per person of U$87.5 in the total costs of health care package (health services, treatment and accomodation). **CONCLUSIONS:** AP added substantial costs and risks to treatment and to health care costs and quality. This should be taken in account in resource allocation in public policies, especially in low-resources settings.

PMH7

MODELIZACIÓN ECONÓMICA DEL GENOTIPADO DEL CITOCROMO P450 CON EL TEST BRAINCHIP EN EL TRATAMIENTO DE LA DEPRESIÓN MAYOR

Crespo C, Villacampa A, Brosa M
Oblikue Consulting, Barcelona, Spain

OBJECTIVOS: BrainChip es un test genético que predice la respuesta al tratamiento farmacológico de la depresión mayor (DM) determinando los polimorfismos de las isoenzimas CYP450. El objetivo ha sido valorar la eficienciade la incorporación del test BrainChip previa a la prescripción farmacológica en DM tras fallo en primera línea. **METODOLOGÍAS:** Se desarrolló un modelo de Markov de ciclos bimensuales para cada fármacode una cohorte hipotética depacientes adultos con DM tras fallo en primera línea. La cohorte se adecuó a la distribución del mercado actual y a su modificación tras incorporar BrainChip. Los datos de eficacia (no respuesta, respuesta y remisión) provienen de revisiones de la literatura y el uso de recursos y costes fue adaptado para el análisis inicial a España. Se analizaron los resultados en un horizonte temporal de 1, 3, 5, 7 y 10 años desde la perspectiva del sistema sanitario aplicando un descuento del 3% sobre los efectos y los costes (euros 2011). **RESULTADOS:** BrainChip mejora la remisión entre un 9,5%-11,7% y la respuesta entre 5,5%-10,2%, alcanzando a los 10 años una respuesta del 72%. Los pacientes con DM mejoran la calidad de vida con BrainChip entre 0,04 y 0,25 años de vida ajustados por calidad. El coste de Brainchip se compensa a los 2 años resultando siempre coste-efectivo a corto plazo y dominante a partir del tercer año, mostrando ahorros de 1399€/paciente tras 10 años. **CONCLUSIONES:** BrainChip en DM es dominante, permite prescribir los tratamientos con menos riesgos y costes y más eficacia. El modelo desarrollado permitiría la adaptación del análisis a cualquier país de Latinoamérica utilizando datos de costos locales.

PMH8

COST EFFECTIVENESS OF PALIPERIDONE PALMITATE VERSUS RISPERIDONE LONG-ACTING INJECTABLE, QUETIAPINE AND OLANZAPINE FOR THE TREATMENT OF PATIENTS WITH SCHIZOPHRENIA IN COLOMBIA

Casallas C[1], Ariza JG[2]
[1]*Universidad de la Sabana, Bogotá, Colombia,* [2]*Janssen Cilag, Bogotá, Colombia*

OBJECTIVES: Schizophrenia is a chronic disorder that requires long-term treatment with antipsychotic medication to minimize relapse and provide clinical benefit to patients. For patients with schizophrenia, non-adherence to medication is a risk factor for relapse and re-hospitalization. Long-acting Injectable (LAI) formulations of atypical antipsychotics provide constant medication delivery and the potential for improved adherence. The objective of this study is to assess the cost-effectiveness of paliperidone palmitate (PP) versus risperidone long acting injectable (RLAI), olanzapine (OP) and quetiapine (QP). **METHODS:** A Markov decision analytic model was developed to simulate multi-episode patients transitioning through different states on monthly basis over a 5 year time horizon from the perspective of the Colombian Health System. Probability of relapse, level of adherence, side effects, utilities and treatment discontinuation were derived from scientific literature. Only direct costs were considered as medications, laboratory tests, relapses and adverse events by using national tariffs and prices from Ministry of Health medication database. Outcomes were measured as relapses rate and Quality Adjusted Life Years (QALY). Discount rate 3%, exchange rate (1 USD = 1,794 COP) and threshold considered 3xPIB per capita (USD 20,066 / QALY). **RESULTS:** *Total costs (USD):* PP (13,338), RLAI (12,635), OP (11,481) and QP (13,247). *Hospitalization relapses costs (USD):* PP (3,276), RLAI (3,341), OP (4,881) and QP (6,840). *QALY:* PP (3.09), RLAI (3.00), OP (2.93) and QP (2.87). *Relapses rate:* PP (1.35), RLAI (1.38), OP (2.01) and QP (2.81). *Incremental Cost Utility Ratios (ICUR: USD / QALY):* PP vs. RLAI (4,517), PP vs. OP (6,713) and PP vs. QP (230). **CONCLUSIONS:** Considering a willingness to pay of USD 20,066 per QALY, the incremental cost of PP versus other alternatives could be compensated by its incremental benefits in terms of relapses avoided and QALY gained. From Health Care Provider perspective, PP demonstrates savings in terms of less hospital setting relapsing costs.

PMH9

THE COST-EFFECTIVENESS AND COST-UTILITY OF PALIPERIDONE PALMITATE IN THE TREATMENT OF SCHIZOPHRENIA IN GUATEMALA

Obando CA[1], Gonzalez L[2], Muschett D[1]
[1]*Janssen, Panama City, Panama,* [2]*Janssen, Raritan, NJ, USA*

OBJECTIVES: To compare from the Guatemaltecan third payer perspective the cost-effectiveness of paliperidone palmitate with oral quetiapine. **METHODS:** A Markov model was developed to assess the cost-effectiveness and the cost-utility of treatments available for schizophrenia in Guatemala. The model was adjusted to reflect the compliance of the patient and the real world effectiveness of both treatments. A 10 year time horizon was used. All direct medical costs relevant for the third payer were included. Four types of side effects were considered in the model: extrapyramidal symptoms, weight gain, diabetes and tardive dyskinesia. Deterministic and probabilistic sensitivity analyses were performed. **RESULTS:** Effectiveness outcomes were reported both in QALYs and relapses avoided. The costs were reported in the local currency Quetzales and all cost and outcomes were discounted at 5% per year. Paliperidone palmitate dominated oral quetiapine by being less expensive (14% less) and more effective (44% less relapses and 20% more QALYs). The sensitive analyses confirmed the robustness of the results. **CONCLUSIONS:** Paliperidone palmitate appeared to be a cost-saving treatment option in comparison with oral quetiapine for patients with schizophrenia in Guatemala. The model reflected a better compliance with paliperidone palmitate that is related to less relapses, a better quality of life and reduced hospitalization costs.

MENTAL HEALTH – Patient-Reported Outcomes & Patient Preference Studies

NEEDS ASSESSMENT OF PATIENTS TREATED IN COMMUNITY PSYCHOSOCIAL CENTERS IN SÃO PAULO, BRAZIL

Nascimento A[1], Velasco TM[2], Oliveira MSC[1]
[1]*Faculdade de Ciências Medicas da Santa Casa de São Paulo, São Paulo, Brazil,* [2]*Hospital Alemão Oswaldo Cruz, São Paulo, Brazil*

OBJECTIVES: To describe the needs of patients treated at community psychosocial centers in Sao Paulo, Brazil. **METHODS:** Cross-sectional study with 373 patients who were attending psychosocial care activities at least three times per week in community psychosocial centers, during 2007-2008. Needs were assessed using the "Camberwell Assessment of Need" (CAN). Psychotic symptoms were assessed using the "Positive and Negative Symptom Schedule" (PANSS). **RESULTS:** Mean age of patients was 40.0 years (standard deviation, SD = 12.6 years); 57.6% were male, 57.9% had fundamental education, 40.5% have schizophrenia, 15.9% have worked during last 12 months and 14.7% were living alone. Median time attending in community psychosocial centers was two years (range of 15 days to 30 years) and mean number of weekly therapeutic activities was 3.6 (SD = 2.3). The mean score for the total number of needs was 7.1 (SD = 2.8), with a range of 0 to 15 (maximum = 22). Basic needs were reported by 38 (10.2%) patients; at least one social need was reported by 90.9%. At least one functioning need was reported by 94.4% patients; 85.5% have at least one health need; 86.3% have at least one service need. Women showed higher number of needs than men ($p = 0.02$) and educational until fundamental level was also associated with more needs ($p = 0.02$). We did not observe associations between weekly activities, unemployment, age, diagnosis and number of needs. Patients with higher PANSS scores showed more needs ($p < 0.001$). **CONCLUSIONS:** We observed higher number of needs than in studies conducted in Europe, in all conceptual domains assessed by CAN. Many patients showed needs related to health and services, despite the time that they were attending in community psychosocial centers. Patients' needs should take in account in order to improve the quality of care offered in mental health services.

MENTAL HEALTH – Health Care Use & Policy Studies

CLINICAL PRACTICE GUIDELINE MAJOR DEPRESSIVE DISORDER FOR GENERAL PRACTITIONERS

Kongsuk T
Prasrimahabhodi Psychiatric Hospital, Ubon Ratchathani, Thailand

OBJECTIVES: To develop the clinical practice guideline major depressive disorder for general practitioners in primary and secondary health care setting included the diagnosis, differential diagnosis, severity classification and medical treatments. **METHODS:** A list of 13 key elements of a CPG development process were developed that consisted of 1) setting the review teams; 2) determining the problems; 3) determining health outcomes;4) evidence based literature review; 5) meeting to draft the CPG; 6) formulating draft of CPG; 7) apprising the content of CPG by experts; 8) trail phase; 9) evaluating for trail phase; 10) developing the curricular for CPG training; 11) preparing for CPG training; 12) evaluating; and 13) improving the CPG related with evaluated results. **RESULTS:** There were 3 main processes in clinical practice guideline major depressive disorder for general practitioners in primary and secondary health care setting (CPG-MDD-GP) which were 1) Assessment of major depressive disorder (clinical assessment using 9Q screening tool and DSM-TR diagnostic criteria, differential diagnosis, diagnosis for major depressive disorder and coding of diagnosis); 2) Management of major depressive disorder; and 3) Management of hospitalized patients. General practitioners were satisfied with the CPG-MDD-GP in trial phase. A total of 416 general practitioners in all provinces were trained to use the CPG-MDD-GP then they would be followed and evaluated. Psychiatrists in psychiatric hospitals/ institutes would be available for consultation from the general practitioners. **CONCLUSIONS:** The CPG-MDD-GP should be distributed to all general practitioners in primary and secondary health care setting. Next step, it would be useful for developing the CPG for MDD in the tertiary health care setting.

PMH12

CONTRIBUTION OF LATIN AMERICA TO MENTAL HEALTH IN PREGNANCY

Lorenzo LS[1], Einarson A[2], Einarson TR[3]
[1]*Psinapsys Psychiatric Private Center, La Plata, Argentina,* [2]*The Hospital for Sick Children, University of Toronto, Toronto, Ontario, Canada,* [3]*University of Toronto, Toronto, ON, Canada*

OBJECTIVES: To identify and describe published articles dealing with issues of mental health in pregnancy from Latin American counties **METHODS:** Medline, Embase and LILACS databases were searched for published studies originating from Latin America regarding mental health issues in pregnancy. Search terms included the names of all countries in the United States Census Bureau International Database + mental health + pregnancy. We included all research and review articles dealing with pregnancy and/or lactation, epidemiology of mental disorders, prevention or treatment of mental disorders, outcomes assessment, and counseling/drug information dissemination. Excluded were papers dealing exlusively with postpartum depression, HIV transmission, induction of abortion, in vitro fertilization, contraception or the use of alcohol or drugs of abuse. Data were analyzed descriptively. **RESULTS:** The search identified 701 studies; 110 (16%) met the criteria. The earliest was published in 1984 and the contribution has increased exponentially [Y=-1E-125*exp(0.1452X), where X is the year; R-squared=0.97). The majority (n=80; 73%) consisted of original research and the other 27% were reviews (23 overviews, 3 systematic reviews/meta-analyses, 4 other). Most frequent topics were depression (37%) as well as mixed anxiety/depression (6%), mental health during pregnancy (32%;), psychotropic drug use in pregnancy (13%), suicidality (6%), and quality of life (1%). By country, 58 (53%) were produced by Brazil, followed by Mexico (n=18, 17%), Chile (n=10, 9%), Colombia

(n=9, 8%), Peru (n=5, 5%), Argentina and Ecuador (each with 3, 3%), and one each from Costa Rica, Paraguay, and Venezuela. Contributions were positively correlated with the size of the population (Spearman's rho=0.76, P=0.03). **CONCLUSIONS:** Latin America has begun to make a small but significant contribution to the literature, However, more than 50% were from Brazil, so other countries will benefit from further research, addressing their unique social and economic needs regarding mental health in pregnancy.

PMH14

STANDARDIZED TOOL FOR MEASUREMENT OF HEALTH SERVICES COSTS AND UTILIZATION IN A SAMPLE WITH MENTAL DISORDERS: TRANSLATION, CULTURAL ADAPTATION AND INTERRATER RELIABILITY OF THE CLIENT SOCIODEMOGRAFIC AND SERVICE RECEIPT INVENTORY BRAZILIAN VERSION

Sousa A, Cardoso A, Oliveira GG, Mari JJ, Razzouk D
Universidade Federal de Sao Paulo, SAO PAULO, Brazil

OBJECTIVES: Information on health service utilization and costs is scarce in the mental health. The *Client Socio demographic and Service Receipt Inventory (CSSRI)*, developed by Knapp and Chisholm, has been widely used for the measurement of health care costs including mental health services. The aims of this study were the translation, cultural adaptation and feasibility and the interrater reliability of the Brazilian version of the CSSRI. **METHODS:** CSSRI was translated to Portuguese (Inventário Sociodemografico de Utilização e Custos de Serviços ISDUCS) by mental health researchers. Structure and cultural adaptations were made according to the Brazilian public health system. Two independent researchers applied it in a sample of 30 subjects with mental disorders living in residential services in São Paulo city, Brazil. **RESULTS:** The ISDUCS was consisted by six sections and one additional annex covering data on: Sociodemographic information; accommodation, employment and income, medication and services use. Application lasted from twenty to sixty minutes. The sample had 50 years on average, with 60% females, with 18% illiterates, 51.6 % primary education, with length of psychiatric hospitalization of 10 years on average, 45% had severe psychiatric symptoms, 20% had moderate symptoms and 35% mild symptoms. Subjects had difficulties to answer the following questions: 24.4%, did not know about his/her education level, 76.7% did not know about the name of the medication in regular use, 58.8% did not know about visit to health professionals in the previous month, 36.4% did not know about receiving their benefits. Interrater reliability was calculated using kappa coefficient, varying from 0.8 to 1.0 for all items, showing excellent reliability. **CONCLUSIONS:** ISDUCS was feasible and reliable to be applied in Brazilian mental health settings. Additional sources like medical records and carers information were necessary to collect all data probably due to low education and severity of psychiatric symptoms of this sample.

SENSORY SYSTEMS DISORDERS – Clinical Outcomes Studies

EFECTIVIDAD Y COSTO-EFECTIVIDAD DE LA FLUORACIÓN DEL AGUA EN LA PREVENCIÓN DE CARIES DENTAL

Zaror C, Vallejos C, de La Puente C, Velasquez M, Corsini G, Bustos L, Reveco R
Universidad de La Frontera, Temuco, Chile

OBJECTIVOS: Determinar si la fluoración del agua a concentraciones de 0,6 a 1 ppm es más efectiva y costo-efectiva que la no fluoración del agua en la prevención de la caries dental. **METODOLOGÍAS:** Se realizó una revisión sistemática de la literatura en MEDLINE, EMBASE, COCHRANE, SCIELO, LILACS, CRD database, BBO, PAHO y WHOLIS, limitada desde el 2002 al 2012. Se incluyeron meta-análisis, revisiones sistemáticas, cohortes, casos y controles, estudios económicos y corte transversal con al menos dos poblaciones comparadas. Dos investigadores de forma independiente realizaron una evaluación de la calidad de los artículos seleccionados y que cumplieron los criterios de inclusión. **RESULTADOS:** La búsqueda arrojó 468 artículos de los cuales 27 cumplieron los criterios de inclusión y 8 fueron incluidos como evidencia para evaluar la efectividad, y 4 para evaluar costo efectividad. Se concluye una reducción del riesgo de caries del 15.4 % (95% CI 10.8%, 20.1%) p<0.001 en población infantil y adolescente, y de un 34.6% (95%CI: 12.6%-51.0%) p<0.001 en población adulta de acuerdo a las revisiones sistemáticas incluidas. Todos los estudios incluidos concluyen que la fluoración del agua es altamente costo-efectiva, con Indices de Costo-efectividad bajos, aun cuando la medida de resultado es dimensionada en formas distintas (Daly, Qaly, dólares ahorrados). **CONCLUSIONES:** Existe evidencia tipo I que la fluoración del agua potable, a concentraciones de 0,6 a 1 ppm, es más efectiva y costo efectiva que la no fluoración del agua en la prevención de la caries dental.

SENSORY SYSTEMS DISORDERS – Cost Studies

A COST–EFFECTIVENESS AND BUDGET IMPACT ANALYSIS OF DIFFERENT BIOLOGIC TREATMENTS FOR PSORIASIS IN COLOMBIA

Ariza JG, Nuñez C
Janssen Cilag, Bogotá, Colombia

OBJECTIVES: There are three subcutaneous biologic therapies approved for psoriasis in Colombia: ustekinumab, etanercept and adalimumab. A network meta-analysis demonstrates a better incremental efficacy of ustekinumab versus the other two alternatives. However, considering that the medication cost is higher for ustekinumab, this analysis evaluates the cost-effectiveness and budget impact of the three alternatives assuming the Colombian Health System perspective. **METHODS:** A decision tree was designed from the payer perspective to estimate costs and benefits for one year time horizon. Clinical data were obtained from a network meta-analysis in order to model treatment response and second line treatment progression. Benefits were measured as probability of achieving a PASI 50 response at the end of 12 weeks of treatment. Only direct costs were considered using national tariffs and prices from Ministry of Health medication database. For budget impact analysys a target population of 550 patients is estimated and three scenarios of ustekinumab adoption were assessed: current scenario (13% market share), middle penetration scenario (28% market share) and a high penetration scenario (50% of market share). No discount rate was used. Exchange rate (1 USD = 1,794 COP). **RESULTS:** *Total cost per patient (USD)*: ustekinumab (23,229), etanercept (25,079) and adalimumab (23,825). *PASI 50 response (% of patients)*: ustekinumab (90%), etanercept (76%) and adalimumab (81%). *Cost per responder patient*: ustekinumab (25,810), etanercept (32,999) and adalimumab (29414). *Budget Impact* (USD): current scenario (13,387,999), middle penetration scenario (13,262,955) and high penetration scenario (13,114,969). **CONCLUSIONS:** When a subcutaneous biologic is considered as the first line choice of treatment for psoriasis, ustekinumab is the prefered first line therapy. Ustekinumab progressive adoption, in the Colombian Health System, demonstrates potential savings driven by its better efficacy and less probability of requiring a second line more expensive treatment.

PSS3

THE DIRECT COSTS OF DRUG-INDUCED SKIN REACTIONS IN POLAND

Wisniewska N, Szkultecka-Debek M, Owczarek W, Paluchowska B, Jahnz-Rozyk K
Military Institute of Medicine, Warsaw, Poland

OBJECTIVES: Drug-induced skin reactions (DISR) may be a serious medical problem, and economical in every country. **METHODS:** The aim of the study was to analyze the direct costs (costs of medication, laboratory costs, costs of physician visits) of 164 patients (57M, 107 W, mean age 53.7years) hospitalized in the Department of Dermatology, Military Institute of Medicine, Poland between 2002 - 2012 due to DISR from the public payer (NHF) and hospital perspective. **RESULTS:** In the group of the most common forms of DISR there were toxic - allergic dermatitis (n=85) and erythema multiforme (n=41). The most common cause of drug-induced skin reactions were beta lactam antibiotics, cephalosporins and NSAIDs. Symptoms of DISR appeared on an average after 7.4 days of treatment. The average hospital stay was 4.54 day per patient. Direct average cost of treatment from the NHF perspective was 717€ per patient and from the hospital perspective was 680 € per patient. **CONCLUSIONS:** Treatment of DISR is expensive, but well priced by the public payer in Poland.

PSS4

EVALUACIÓN DE COSTO-EFECTIVIDAD DE LA TRABECULOPLASTIA LÁSER SELECTIVA COMO PRIMERA OPCIÓN DE TRATAMIENTO EN GLAUCOMA PRIMARIO DE ÁNGULO ABIERTO EN COLOMBIA

Bernal MM[1], Organista J[1], Rico A[1], Romero M[2], Barrero JR[3]
[1]*Universidad de Bogotá Jorge Tadeo Lozano, Bogotá, Colombia*, [2]*Fundacion Salutia, Bogotá, Colombia*, [3]*Oftalmologo, Bogotá, Colombia*

OBJECTIVOS: Evaluar la costo-efectividad de la Trabeculoplastia Láser Selectiva (TLS), como primera opción de tratamiento del Glaucoma Primario de Ángulo Abierto (GPAA) sin manejo previo versus el tratamiento médico con latanoprost, desde el punto de vista del tercero pagador en Colombia. **METODOLOGÍAS:** Se diseñó un modelo de Markov en ciclos bimestrales que simuló una cohorte hipotética de 100 pacientes adultos, con GPAA recientemente diagnosticados y que inician tratamiento ya sea con TLS o latanoprost (agonista de la prostaglandina), en un horizonte temporal de cinco años, con variaciones de +/-20% en las variables. Con este modelo se evaluó el tiempo libre de enfermedad medido en años. Se utilizaron probabilidades variables en el tiempo, del estudio cabeza-a-cabeza de Katz 2012. Los costos directos de salud fueron estimados con información de dos aseguradoras de Colombia. Se asumió una tasa de abandono del tratamiento médico referidas por Iskedjian 2011. Se aplicó una tasa de descuento del 3% a costos y desenlaces. Finalmente, se realizó un análisis de sensibilidad univariado y multivariado tipo Montecarlo. Se estimó que el fallo de primera línea en cualquiera de los dos brazos sería de COP$ 810.596 (umbral propuesto). **RESULTADOS:** El uso de TLS como primera línea de tratamiento mostró la mayor efectividad (286,9 años) frente a latonoprost (98,3 años) en los 100 pacientes. Al aplicar el descuento la razón de costo-efectividad incremental fue de $391.122,24 por año libre de enferemedad ganado. El analisis tipo montecarlo mostró que TLS se mantiene costo-efectiva en el 100% de los casos. **CONCLUSIONES:** El uso de TLS mostró ser muy costo efectivo frente al uso de latanoprost en las condiciones del caso base y el umbral propuesto. Teniendo en cuenta que el costo de la TLS se aplica al inicio del tratamiento, resulta conveniente estimar el impacto presupuestario para apoyar la toma de decisión.

PSS5

COSTO-EFECTIVIDAD DEL SCREENING Y TRATAMIENTO DE HIPOACUSIA BILATERAL EN RECIÉN NACIDOS (RN) EN CHILE

Castillo-Laborde C[1], Loayza S[2], Aravena M[2], Freile B[2], Castillo-Riquelme M[2]
[1]*Ministerio de Desarrollo Social, Santiago, Chile*, [2]*Ministerio de Salud, Santiago, Chile*

OBJECTIVOS: El objetivo principal es determinar la costo-efectividad incremental de pasar de una estrategia selectiva (RN prematuros) de screening y tratamiento oportuno de hipoacusia bilateral congénita a una estrategia de screening universal. **METODOLOGÍAS:** El análisis se realizó desde la perspectiva del sector público y consideró como horizonte temporal la sobrevida de una cohorte de RN. La información epidemiológica se obtuvo de fuentes oficiales del Minsal, literatura y de una encuesta realizada a expertos. La precisión de los test diagnósticos se obtuvo de la literatura y la caracterización del proceso de *screening* de las Guías Clínicas nacionales. La efectividad de los tratamientos de amplificación se obtuvo por consulta a expertos. Para la medición de beneficios se determinaron *outcomes* intermedios (caso pesquisado) y *outcomes* finales (QALY). Para el análisis de la información se utilizó un modelo de árbol de decisión. Se realizaron análisis de sensibilidad determinístico (ASD) univariado y análisis de sensibilidad probabilístico (ASP) considerando los principales parámetros. **RESULTADOS:** Los costos totales por RN de la estrategia de *screening* selectivo fueron de $26.486,4 (pesos chilenos) y para la estrategia universal de $32.620,5, en tanto que la efectividad en QALY fue de 30,0523 y de 30,0708, respectivamente, obteniéndose un ICER $331.368,22. El costo por caso extra de hipoacusia bilateral congénita detectado precozmente al pasar de una estrategia a otra es de

$4.215.913 (US$8.875,61). **CONCLUSIONES:** El pasar de la estrategia selectiva focalizada en RN prematuro a una estrategia universal resulta costo-efectivo. Este resultado no se modificó con la variación de parámetros con incertidumbre asociada en los ASD y ASP. Con una disposición a pagar de $6,97 millones (PIB per cápita Chileno) la probabilidad de que la ampliación a una estrategia universal de tamizaje resulte costo-efectiva es de un 99,3%.

PSS6

ANÁLISIS DE MINIMIZACIÓN DE COSTOS DEL USO DEL AFLIBERCEPT EN DEGENERACION MACULAR RELACIONADA CON LA EDAD EN COLOMBIA

Romero M, Huerfano L, Acero G
Fundacion Salutia, Bogotá, Colombia

OBJECTIVOS: Hacer una evaluación económica del uso de aflibercept versus ranibizumab para el tratamiento de la Degeneracion Macular Relaciona con la Edad de tipo exudativa, desde el punto de vista del tercero pagador en Colombia. **METODOLOGÍAS:** Se hizo un análisis de minimización de costos partiendo de una revisión de literatura que analizó la efectividad y seguridad entre las tecnologías. Se diseñó un modelo de árbol de decisiones basados en la historia natural de la enfermedad y el modelo de atención, incluyendo las dosis en cada una de las tecnologías y otros costos directos de atención, en un horizonte temporal de dos años. Los costos fueron obtenidos de del Sistema de Información de Precios en Medicamentos (SISMED) y de los Registros Individuales de la Prestación de Servicios de Salud (RIPs) expresados en dólares de 2012. Se efectuó un análisis de sensibilidad univariado en una sola vía, modificando la dosis estándar a dosis a demanda, como sugiere el estudio de Rosenfeld et al., 2006. **RESULTADOS:** Estudios cabeza a cabeza encontrados (VIEW1 y VIEW2) no mostraron diferencias significativas en términos de seguridad y efectividad, medida como ganancia en letras; aunque aflibercept demostró un 33,4% de ganancia frente al 31,6% de ranibizumab. El modelo en un paciente promedio mostró que el uso de aflibercept generaría un ahorro de US$11.468,78 a los 2 años. El análisis de sensibilidad del modelo a demanda muestra que aflibercept se mantiene ahorrativo frente a ranibizumab. **CONCLUSIONES:** No se encuentraron diferencias de efectividad entre las tecnologías evaluadas; sin embargo, aflibercept se mostró como la tecnología ahorrativa en el tratamiento de la Degeneracion Macular Relaciona con la Edad exudativa, desde el punto de vista del tercero pagador en Colombia. El menor número de dosis requeridas en el tratamiento con aflibercept podría generar adherencia que asegure mayor efectividad.

PSS7

EVALUACIÓN ECONÓMICA DEL USO DE DOS TRATAMIENTOS FARMACOLÓGICOS EN DEGENERACIÓN MACULAR RELACIONADA CON LA EDAD DE TIPO EXUDATIVA (DMRE) PARA VENEZUELA

Romero M[1], Bastardo YM[2], Sanabria M[1]
[1]*Fundacion Salutia, Bogotá, Colombia,* [2]*Universidad Central de Venezuela, Caracas, Venezuela*

OBJECTIVOS: Estimar mediante un modelo de minimización de costos, el precio máximo al que sería favorable la inclusión dentro del sistema de salud venezolano el uso de aflibercept como tratamiento de la DMRE de tipo exudativa. **METODOLOGÍAS:** La revisión de la literatura no mostró diferencias en cuanto a efectividad y seguridad entre al aflibercept y el ranibizumab en los estudios cabeza a cabeza (VIEW1, VIEW2). Por lo que mediante un análisis de minimización de costos basado en el modelo de atención de la enfermedad y en un horizonte temporal de dos años se estimó a las dosis utilizadas en el estudio clínico el precio máximo a que podría ingresar el aflibercept al mercado tomando como referencia el precio de ranibizumab de $VEF 4.640,83, los costos de atención y del medicamento fueron tomados de información proveniente de aseguradores en Bolívares fuertes. Se efectuó un análisis de sensibilidad univariado en una sola vía, modificando a dosis por demanda, como lo sugiere el estudio de Rosenfeld PJ y colaboradores. **RESULTADOS:** El estudio clínico muestra mejor resultado para aflibercept pero las diferencias no son significativas. El análisis económico arrojó como costo máximo por dosis de Aflibercept, un valor de $VEF 10.598,46; un valor inferior al anterior generaría un ahorro al sistema de salud venezolano. El análisis de sensibilidad univariado en una sola vía al utilizarlos por demanda determinó que Aflibercept se mantendría como tecnología ahorrativa a un precio de $VEF 7.201,13. **CONCLUSIONES:** Aflibercept sería una opción favorable al sistema de salud, por cuanto genera menos dosis de aplicación facilitando una mayor adherencia y sería ahorrativo en el tratamiento de la DMRE exudativa para Venezuela sí su costo en el mercado se encuentra entre $VEF 7.201,13 y 10.598,46 según el esquema de tratamiento que se utilice y de acuerdo a los escenarios evaluados.

EVOLUCIÓN CLÍNICA DE UNA COHORTE DE PACIENTES CON ENFERMEDAD RENAL CRÓNICA INTERVENIDOS EN UN PROGRAMA DE SALUD RENAL

Paz JJ[1], Sanabria M[2], Perea D[2], Astudillo K[2], Bunch A[2], Laganis S[2]
[1]*Mutual ser EPSS, Cartagena, Colombia,* [2]*Baxter RTS, Bogotá, Colombia*

OBJECTIVOS: El objetivo es describir la velocidad de progresión de la ERC, la permanencia, los meses ahorrados en diálisis, los desenlaces y causas de egreso de una cohorte de pacientes en estadíos 3, 4 y 5 que estaban en el programa Clínica de Salud Renal (CSR) de RTS Colombia y Mutual Ser entre el periodo comprendido entre diciembre 2010 y diciembre 2012. **METODOLOGÍAS:** En esta cohorte histórica de pacientes con ERC se analizan los desenlaces clínicos del programa, en términos de la mediana de progresión de la enfermedad renal crónica, medida como delta de tasa de filtración glomerular en ml/min/año; se reportan las proporciones de pacientes con velocidad de progresión menor que -4 ml/min/año y menor que -2 ml/min/año. Específicamente para los pacientes de ERC estadio 5, se calculan los meses trascurridos en estadio 5 libres de diálisis. Se reporta además la mortalidad de esta cohorte. **RESULTADOS:** En diciembre de 2010 habían 634 pacientes en el programa, de estos 510 permanecieron en el programa hasta diciembre de 2012 (80,44%). La velocidad de progresión fue menor a -4ml/min/año en el 82,2% de los pacientes y en un 60,8% menor de -2ml/min/año. Los meses ahorrados en diálisis en los pacientes en estadio 5 fueron 11 meses. El 19,5% (n=124) de pacientes habían egresado del programa al final de periodo de observación. Las causas de egreso fueron: mejoría a TFG >60 ml/min/año (40,3%), muerte (29,0%), ingreso a diálisis (12,1%), suspensión voluntaria (5,7%), otros (12,9%). Seguimos a los pacientes 31582 pacientes-mes, equivalente a 2631 pacientes-año y la mortalidad fue 0.0137 muertes por paciente-año en el programa. **CONCLUSIONES:** Los meses evitados de diálisis por paciente en ERC 5 son 11. Una proporción sustancial de pacientes alcanzaron las metas de progresión de ERC. La principal causa de egreso del programa fue por mejoría de la TFG.

CLINICAL BENEFITS OF IMMUNOSUPPRESSION THERAPY IN RENAL TRASPLANT PATIENTS. SYSTEMATIC REVIEW AND META-ANALYSIS

Cerezo O[1], Bravo MG[2], Jimenez Aranda P[3], Lemus EA[2]
[1]*Independient Investigator, Mexico, Mexico,* [2]*Novartis Farmaceutica, México D.F., Mexico,* [3]*Novartis, Coyoacan, Mexico*

OBJECTIVES: To study the clinical benefits of immunosuppression therapy for renal transplantation, through systematic review and meta-analysis **METHODS:** Two independently searches were performed in biomedical databases: Medline, Embase, Cochrane, Health Virtual Library and clinical trials from NIH website. Specific selection criteria were followed to collect the majority of evidence, items as temporality, methodology design, patient population, drug, therapy stage(induction/starting, maintenance, acute-rejection treatments), algorithms details and outcomes(acute rejection, graft loss, deaths, and rate of infection and malignancy). According to "Grades of Recommendation Assessment, Development and Evaluation"(GRADE-criteria) we assessed the quality of articles in order to run a meta-analysis. **RESULTS:** The study included 9 RCT of basiliximab vs ATG, and after heterogeneity test, the meta-analysis was performed with FEM (fixed effects model). In acute rejection, we obtained an OR of 1.092 CI95% [0.85–1.4] (in favor of Basiliximab). Infection risk and neoplasm development were in favor of basiliximab with (OR 1.6[CI95% 1.1–2.3] and OR 3.2[CI95% 1.1–9.4], respectively). Basiliximab vs Non-induction included 5 RCT, resulting in OR 1.8 [CI95% 1.4–2.4] and NNT of 8 (in favor of basiliximab) in acute rejection, also basiliximab had a better infection risk profile (OR 4.2 [CI95% 3–5.9]). Cyclosporine vs Tacrolimus included 26 RCT, with an OR estimate for acute rejection of 1.9 ([CI 95% 1.6-2.1] in favor of Tacrolimus). Mycophenolate-Sodium(MPS)/Mycophenolate-Mofetil(MMF) vs azathioprine included 5 RCT (2 with MPS), with an OR for acute rejection of 2.2 (CI 95%1.7–2.8) in favor of MPS/MMF, and NNT of 7 (CI95% 5–10). Additionally, we evaluated the GI AE's profile of MMF vs MPS, and we obtained an OR 0.65 (CI95% 0.5–0.8), in favor of MPS. **CONCLUSIONS:** The present study assessed the clinical outcomes of treatments for renal transplantation. Basiliximab, Tacrolimus and MMF/MPS proved to have better clinical effects for outcomes like acute rejection, infection risk and neoplasm development.

BUDGET IMPACT ANALYSIS OF RENAL POST-TRANSPLANT PROPHYLAXIS WITH BELATACEPT IN COLOMBIA

Alfonso-Cristancho R[1], Diaz-Sotelo OD[2], Rosselli D[3], Rueda JD[3], Garrido Lecca S[4]
[1]*University of Washington, Seattle, WA, USA,* [2]*RANDOM Foundation, Bogota, DC, Colombia,* [3]*Pontificia Universidad Javeriana, Bogotá, Colombia,* [4]*Bristol-Myers Squibb Company, Lima, Peru*

OBJECTIVES: Renal transplantation is currently the most effective treatment for End Stage Renal Disease (ESRD) and its success is linked to effective immunosuppressive regimes. A new immunosuppressive agent, belatacept has recently entered the market. The mechanism of action of belatacept focuses on selective blockade of T cell activation, improving renal graft survival for a prolonged period of time with less toxicity compared to standard immunosuppressive regimes. The objective of this study was to estimate the budgetary impact to the health care system in Colombia after the introduction of Belatacept for renal post-transplant prophylaxis. **METHODS:** An Excel-based budget impact model was used to estimate over a 5 years period the average per-member-per-year (PMPY) costs of adding belatacept to the health insurance coverage in Colombia. We considered a base case scenario with prevalence of ESRD is 0.05%; annual incidence of renal transplant of 3.5% and mortality after transplant of 4%. The model considers doses and costs of belatacept, cyclosporine, everolimus, sirolimus and tacrolimus, management and costs for adverse events and clinical resources used. Data for the model inputs was extracted from published literature and local sources. A market share of belatacept increasing from 1% in year one to 10% by year five was assumed for this analysis. **RESULTS:** It was estimated that including belatacept in the health insurance coverage would increase health system spending for renal post-transplant prophylaxis on COP$7.700 (USD 4.31) PMPY, an aggregated budget impact of COP$13 million (USD 7,283) (4.44%) over the five years (additional annual investment of COP$2.6 million). Belatacept presents lower adverse events costs in comparison with other alternatives. **CONCLUSIONS:** The availability of belatacept in post-transplant prophylaxis treatment for patients in Colombia would provide a new therapeutic option for immunosuppression with lower adverse events at a limited budget impact to the Colombian health care system.

PUK4

IMPACTO PRESUPUESTAL DE LA ENFERMEDAD RENAL TERMINAL EN COLOMBIA CON UN INCREMENTO DEL NÚMERO DE TRASPLANTES

Rosselli D, Rueda JD, Díaz CE
Pontificia Universidad Javeriana, Bogotá, Colombia

OBJECTIVOS: La prevalencia de enfermedad renal terminal (ERT) en Colombia viene creciendo a cuatro veces el crecimiento poblacional (5% vs. 1,2%). El número de trasplantes renales, sinembargo, se viene reduciendo. El objetivo es estimar el impacto presupuestal de un incremento en el número de trasplantes. **METODOLOGÍAS:** En pesos colombianos y dólares americanos de 2012 (1 USD = 1785 COP), y desde la perspectiva del sistema de salud, estimamos los costos asociados a dos escenarios: Escenario 1: una reducción progresiva de 2% anual del número de trasplantes (tendencia histórica); o Escenario 2: un aumento gradual (5% anual) del número de trasplantes

durante el período 2013-2017. La prevalencia de ERT se proyectó a partir de datos oficiales. Los costos se obtuvieron de distintas fuentes: casos reales para determinar uso de recursos, tarifarios oficiales (ISS 2001 ajustado) para procedimientos, y SISMED para medicamentos. Todos los datos fueron validados en reuniones de expertos, se siguieron las guías ISPOR para impacto presupuestal. **RESULTADOS:** Según nuestros estimados, el número de pacientes con ERT pasará de 27.890 en 2013 a 33.900 en 2017. En el Escenario1 el costo pasará de COP$837.882 millones (USD$469,4 millones) a COP$ 1.009.782 millones (USD$565,7 millones), un crecimiento en pesos constantes de 20,5 %. En el Escenario 2 el costo llegaría COP$1.044.883 millones(USD$585,4 millones), un incremento absoluto de 3 % con respecto al Escenario 1. El número de pacientes trasplantados pasaría de 3.601 a 4.145 mientras los muertos en el quinquenio se reducirían en 14; ello equivaldría a COP$64,5 millones (USD$36.134) por paciente trasplantado adicional o COP$2.507 millones (USD$1,4 millones) por muerte evitada. **CONCLUSIONES:** Un incremento del 5% anual del trasplante renal representa un aumento del 3% del costo de la atención de la ERT en Colombia. Parte del "ahorro" actual con la diálisis se debe a mayor mortalidad.

PUK5

COST-EFFECTIVENESS OF PARICALCITOL IN END STAGE CHRONIC KIDNEY DISEASE SECONDARY HYPERPARATHYROIDISM PATIENTS ON DIALYSIS, IN BRAZIL

Menezes FG[1], Nita ME[1], Peixoto RB[2]
[1]*Abbott Laboratórios do Brasil Ltda., São Paulo, Brazil,* [2]*Abbott, São Paulo, Brazil*

OBJECTIVES: To understand from the perspective of the Brazilian National Health System (SUS) the cost-effectiveness of treating secondary hyperparathyroidism with IV paricalcitol versus IV calcitriol in dialysis patients diagnosed with end stage chronic kidney disease. **METHODS:** A decision-analytic Markov model comparing the use of IV paricalcitol versus calcitriol. Main outcomes include parathyroidectomy, hospitalizations or death, life time costs and the results are reported as incremental cost-effectiveness ratios (ICER). The treatment costs are based on the DATASUS administrative claim database which includes individuals with an end stage chronic kidney disease secondary hyperparathyroidism diagnosis, who underwent hemodialysis at SUS, from 2009 to 2012. The main clinical outcomes are based on clinical trials or cohort studies reporting those outcomes. **RESULTS:** The reference case analysis was a 5-year time horizon based on a comparison of treatment with paricalcitol versus calcitriol, of end stage chronic kidney disease secondary hyperparathyroidism dialysis patient. The use of paricalcitol leads to savings amounting R$ 113.999.601,06 to SUS and an increase in life-years gained (0.52 years). Paricalcitol was dominant over the comparator (calcitriol), indicating better health outcomes and lower costs. One-way sensitivity analyses and probabilistic sensitivity analyses confirmed the robustness of the model. **CONCLUSIONS:** In our model the substitution of IV calcitriol by IV paricalcitol can be a more cost-effective choice in the management of secondary hyperparathyroidism.

PUK6

CATHETER-ASSOCIATED URINARY TRACT INFECTIONS: COST COMPARISON STUDY FROM THE PUBLIC PAYER PERSPECTIVE

Tolentino AC, Schutz V
Universidade Federal do Estado do Rio de Janeiro, Rio de Janeiro, Brazil

OBJECTIVES: To compare costs of catheter-associated urinary tract infection (CAUTI) with the reminding intervention (RI) and without reminding intervention (WRI) from the public payer perspective. Urinary catheter (UC) is one of the most invasive devices used in health care, and its insertion contributes to the development of urinary tract infections (UTI), which accounts for 40% of all nosocomial infections. About 12%-16% of patients in the intensive care unit have a UC inserted at some point during hospitalization. Unnecessary use of UC may lead to CAUTI, which represents about 80% of UTI, contributing not only to excess morbidity and mortality, but also increasing costs. A prospective study published (Apisarnthanarak 2007) evaluated the effectiveness of a program to improve hospital quality, which included an intervention to remind physicians to remove unnecessary UC. **METHODS:** Efficacy data was obtained from the literature which compared RI to WRI. Data from the Brazilian Hospital Information System (SIH/DATASUS) from 2012 was used to define the annual number of high complexity admissions of adult patients in public hospitals, assuming WRI as current practice. Resource utilization was estimated through published data and unit costs were obtained from Brazilian official price lists. **RESULTS:** A total of 659.934 hospitalizations were identified in the database, with a mean length of stay of 6.7 days. According to Apisarnthanarak 2007, RI to WRI showed reductions of CAUTI of 9.4%. The estimated consumable costs associated were 1,222.45BRL/pacient/7 days of treatment. For all admissions in 2012, the total cost of CAUTI represented 247,091,949.90BRL for WRI and 223,865,239.68BRL for RI, respectively (medical supplies only). The estimated savings were 23,226,710.22BRL/year for the Brazilian public system. **CONCLUSIONS:** RI showed that staff education generates benefits for the hospital and patients, decreasing costs and unnecessary hospitalization. Further researches including other clinical outcomes, longer follow-up and complications could result in higher savings for the public payer.

PUK8

FRECUENCIA Y COSTOS DE HOSPITALIZACIÓN EN UNA POBLACIÓN DE PACIENTES EN DIALISIS EN COLOMBIA

Sanabria M[1], Astudillo K[1], Sanchez R[2], Camargo D[1], Bunch A[1]
[1]*Baxter RTS, Bogota, Colombia,* [2]*Universidad Nacional de Colombia, Bogotá, Colombia*

OBJECTIVES: Chronic renal disease patients are often hospitalised. The present study was carried out as no studies have measured such population's hospitalisation frequency and duration in Colombia nor has their economic burden been analysed. **METHODS:** This was a dynamic retrospective cohort study of 223 patients receiving dialysis therapy during 2010. Haemodialysis (HD) and peritoneal dialysis (PD hospitalisation frequency was measured, as were the number of days spent in hospital, total hospital bill and average cost per day of hospitalisation. Multivariate analysis was used for evaluating factors related to hospitalisation cost (i.e. a generalised linear model with log link). **RESULTS:** Hospitalisation rate was 0.72 hospitalisations per patient/year, 6.32 days were spent in hospital per patient/year and average hospitalisation rate was 8.68 days. No differences were observed between haemodialysis patients and peritoneal dialysis regarding such rates. Average hospitalisation bill was $2,567,680. **CONCLUSIONS:** The study population had higher hospitalisation rates and spent less days in hospital than that stated in other reports. No differences were observed between HD and PD patients regarding these rates.

PUK9

COSTO-EFECTIVIDAD DE LAS PRUEBAS PARA LA TAMIZACIÓN DE BACTERIURIA ASINTOMÁTICA DURANTE LA GESTACIÓN

Chicaiza L[1], Garcia-Molina M[1], Moreno M[2], Urrego J[1], Rincon CJ[3], Amaya J[4], Diaz L[4], Rubio J[4], Gomez PI[4]
[1]*Facultad de Ciencias Económicas, Universidad Nacional de Colombia, Bogotá, Colombia,* [2]*Universidad Nacional de Colombia, Bogotá, Colombia,* [3]*Universidad Nacional de Colombia, Bogotá, Colombia,* [4]*Universidad Nacional de Colombia, bogotá, Colombia*

OBJECTIVOS: Estimar la razón de costo-efectividad de las pruebas para tamizar la bacteriuria asintomática (BAS) durante la gestación en Colombia. **METODOLOGÍAS:** Se diseñaron dos árboles de decisión que presentan como unidad de desenlace el número de casos de pielonefritis evitados y el número de partos pretérmino evitados, respectivamente. La perspectiva es la del sistema de salud. Las cifras monetarias fueron expresadas en pesos colombianos de 2010. Se hicieron análisis de sensibilidad univariados y probabilísticos. **RESULTADOS:** La razón de costo-efectividad incremental (RCEI) del urocultivo para pielonefritis evitadas es de $877.494; para partos pretérmino evitados es de $13.895.576. La RCEI de la tinción de Gram para pielonefritis evitadas es de $314.914 y para partos pretérmino evitados es de $.1 399.593. El urocultivo confirmatorio ante resultado positivo del parcial de orina es una estrategia dominada en todos los casos. **CONCLUSIONES:** El urocultivo es la alternativa que más casos de pielonefritis y de partos pretérmino evita. Si el umbral de disponibilidad a pagar es superior a $970.000 por caso adicional de pielonefritis evitado, o superior a $14.550.000 por caso adicional de parto pretérmino evitado, el urocultivo será costo-efectivo. Para umbrales entre $350.000 y $970.000 por caso adicional de pielonefritis evitada, o entre $2.500.000 y $14.550.000 por caso adicional de parto pretérmino evitado, la tinción de Gram será costo-efectiva. Para umbrales menores, el parcial de orina sin urocultivo confirmatorio será costo-efectivo.

PUK10

COST-EFFECTIVENESS OF CINACALCET CHRONIC KIDNEY DISEASE PATIENTS ON DIALYSIS WITH SECONDARY HYPERPARATHYROIDISM IN BRAZILIAN PUBLIC HEALTH CARE SYSTEM (SUS)

Nishikawa AM[1], Coutinho MB[2], Custodio MR[3], Pecoits-Filho RF[3], Clark OAC[1]
[1]*Evidencias, Campinas, Brazil,* [2]*Amgen Brazil, Sao Paulo, Brazil,* [3]*Brazilian Nephrology Society, Sao Paulo, Brazil*

OBJECTIVES: Cinacalcet effectively reduces elevated levels of parathyroid hormone (PTH) in patients with CKD and consequently may reduce cardiovascular events, mortality and bone metabolism. This study assesses the cost-effectiveness of cinacalcet plus standard of care for the treatment of SHPT patients on dialysis compared to standard of care (SoC) alone, which includes vitamin D and phosphate binders, under the SUS perspective. **METHODS:** A Markov (state transition) cohort model with monthly cycles and 10-year time horizon was developed using published data from randomized controlled trials. The impact of cinacalcet treatment on mortality, cardiovascular events, fractures and parathyroidectomy were calculated based on a retrospective analysis. The Markov model consisted of the following health states: patient in target according to National Kidney Foundation Kidney Disease Outcomes Quality Initiative (KDOQI) targets (SHPT parameters in target range), patient not controlled (one or more parameters out target range) and death. Extensive one-way sensitivity analysis was conducted. Costs were extracted from official databases of prices of SUS. **RESULTS:** The life years gained (LYG) obtained with cinacalcet plus SoC and SoC alone was 4,42 and 3,55, respectively, resulting in an incremental cost-effectiveness ratio of USD 17,032 in a 10 year time horizon. Additional analysis showed that compared to SoC, cinacalcet was associated with more adequate levels of serum PTH, reduced the number of cardiovascular events (0,66 vs. 0,70), bone fractures (0,14 vs. 0,24) and parathyroidectomies performed (0,01 vs. 0,15). The sensitivity analysis showed that the main drivers of the result were the mortality probability in each of the SoC and cinacalcet groups, and the cost of cinacalcet acquisition. **CONCLUSIONS:** This model with data from the Brazilian Public Healthcare System shows that cinacalcet was cost-effective (cost per LYG gained) when compared to SoC.

PUK11

COST-EFFECTIVENESS ANALYSIS OF RABBIT ANTITHYMOCYTE GLOBULIN COMPARED TO BASILIXIMAB IN THE INDUCTION OF RENAL TRANSPLANT PATIENTS

Escudero P[1], Misas JD[2], Orozco-Cabal LF[2]
[1]*Nephrology and Transplant Medicine, Bogotá, Colombia,* [2]*Sanofi-aventis de Colombia S.A., Bogotá, Colombia*

Rabbit antithymocyte immunoglobulin (r-ATG) and basiliximab are used as induction treatment for renal transplant patients. Since the cost associated with these procedures is a limiting factor in their availability, it is necessary to determine the cost-effectiveness ratio, given the differences in clinical outcomes among them. **OBJECTIVES:** To determine the incremental cost-effectiveness ratio between r-ATG and basiliximab for defined clinical outcomes in patients undergoing induction treatment for renal transplantation. **METHODS:** We completed meta-analyses for r-ATG and basiliximab in induction treatment. The data was used to define global effectiveness outcome measures (i.e. relative risk-RR) necessary to perform a cost-effectiveness analysis for Colombia. The attributable risk was calculated using the RR for each clinical outcome. **RESULTS:** The quadrant analysis for the cost-effectiveness ratio showed that the simulations are in the first quadrant (I), except for the fatal outcome of high-risk patients located in quadrant IV. For every other outcome and analysis group, there was an increase in effectiveness and cost. The costs of reducing 1% the attributable risk

for each outcome (incremental cost-effectiveness) using r-ATG vs. basiliximab were: acute allograft rejection USD$5,4 (standard-risk) - $8,7 (high-risk); delayed graft function for high-risk patients USD$57,4; graft failure USD$20 (standard-risk)-$31 (high-risk); death USD$19,9 (standard-risk) -$39,1 (high-risk). **CONCLUSIONS:** The results of the comparative analysis of r-ATG vs. basiliximab in induction of renal transplant patients showed that r-ATG is a cost-effective alternative for a significant proportion of the population for the examined outcomes in Colombia. The investment necessary to reduce the risk of the considered outcomes can be low considering its benefits, especially in a context where the availability of donors is limited.

PUK12
COST-EFFECTIVENESS OF BASILIXIMAB AS INDUCTION THERAPY FOR KIDNEY TRANSPLANTATION IN MEXICO
Lemus A[1], Jimenez Aranda P[2]
[1]*Novartis, Mexico City, Mexico,* [2]*Novartis, Coyoacan, Mexico*
OBJECTIVES: In Mexico 2,200 kidney transplantations were performed in the last 5 years. The objective of this study was to assess the cost-effectiveness of Basiliximab, which is a chimeric interleukin (IL)-2 receptor monoclonal antibody, versus antithymocyte globulins (ATG) or do not apply an induction therapy. **METHODS:** Cost-effectiveness analysis of three strategies: Basiliximab, ATG, and no induction, for the induction stage of kidney transplantation. Effectiveness was measured by the incidence of acute-rejection within 12 months. Time horizon was 1 year, and no discount rate was applied. Brenan D, et al, 2006 showed non-statistically difference in efficacy between Basiliximab and ATG. However, Nashan B, et al., 1997 found a difference on acute-rejection risk in ~17 percentage points (37.9% vs. 54.8%) between Basiliximab versus no-induction strategy. The costs included were the drugs cost and the kidney transplantation cost that was estimated in US$29,334 according to DRGs at IMSS. Drug costs were from public tenders and from public health institution's perspective. **RESULTS:** The induction cost with Basiliximab was US$31,191 and US$76,621 with ATG. Basiliximab has the less average cost-effectiveness ratio (C/E) per acute rejection avoided with US$512.46 compared to ATG. Basiliximab has the similar efficacy as ATG in patients at high risk for acute rejection, but with a lower cost which equals to 146% less per patient treated during the induction stage. Basiliximab compare to no-induction the Incremental cost-effectiveness ratio (ICER) per rejection avoided was US$14,642. **CONCLUSIONS:** The analysis is not considering the whole opportunity cost of a kidney transplant beyond the cost of the intervention itself. However, Basiliximab represents a cost effective therapy for of acute-rejection in kidney transplantation with the lower average cost-effectiveness compared to no-induction and dominant vs ATG.

PUK13
COSTO-EFECTIVIDAD DEL TRASPLANTE RENAL COMPARADO CON LA DIÁLISIS EN COLOMBIA
Rosselli D, Rueda JD, Díaz CE
Pontificia Universidad Javeriana, Bogotá, Colombia
OBJECTIVOS: Evaluar costos, utilidad y efectividad del trasplante renal comparado con terapia dialítica en adultos con enfermedad renal terminal en Colombia, desde la perspectiva del sistema de salud. **METODOLOGÍAS:** Se diseñó un modelo de Markov con 60 ciclos mensuales (horizonte 5 años) y 8 estados, incluyendo muerte como estado absorbente. Las transiciones entre estado se obtuvieron de los registros internacionales (Collaborative Transplant Study, University of Heidelberg, y US Renal Data System). Los costos se presentan en dólares de 2012 (1 USD = COP$ 1785) y se obtuvieron de diferentes fuentes locales: casos reales y validación de expertos para uso de recursos, tarifarios oficiales (ISS 2001 ajustado) para procedimientos, SISMED para medicamentos. Las utilidades, en años de vida ajustados por calidad (AVAC), se obtuvieron promediando las reportadas en la literatura. Los datos se validaron en reuniones de expertos. Se hicieron análisis de sensibilidad univariados, multivariados y probabilísticos. Otros indicadores de efectividad fueron meses de vida ganados, meses de diálisis evitados y muertes evitadas. La tasa de descuento fue 3% y el umbral de costo-utilidad de 3 veces el PIB = USD$ 20,168. **RESULTADOS:** El costo promedio total del paciente trasplantado a 5 años fue de $87,342, y el de diálisis $77,451, para una utilidad de 2.9832 y 2.1037 AVAC respectivamente (razón de costo-efectividad incremental RCEI = $11,246). Otros resultados fueron $1434 por mes de vida ganado, $282 por mes de diálisis evitado y $48,487 por muerte evitada. Parte de la diferencia en costos entre las terapias es debida a la mayor sobrevida del paciente trasplantado. Si igualamos la mortalidad de ambas terapias los costos se igualarían al comenzar el tercer año. **CONCLUSIONES:** El trasplante renal es más costo efectivo, tiene mayor sobrevida y mejor calidad de vida; a partir del tercer año es costo-ahorrador al ajustar por mortalidad.

URINARY/KIDNEY DISORDERS – Patient-Reported Outcomes & Patient Preference Studies

PUK14
QUALIDADE DE VIDA EM PACIENTESTRANSPLANTADOS RENAIS
Maia RCF[1], Monteiro WMS[1], Silva MGC[2]
[1]*Secretaria de Saúde do Estado do Ceará, FORTALEZA, Brazil,* [2]*UECE, Fortaleza, Brazil*
OBJETIVOS: Descrever o estado de saúde autopercebido e quantificar a qualidade de vida relacionada à saúde dos pacientes submetidos a transplante renal em hospitais públicosde Fortaleza- Ceará. **MÉTODOS:** A amostra foi composta de 50 pacientes submetidos a transplante renal entre 30 a 90 dias de pós-operatório, atendidos nos ambulatórios dos hospitais do estudo, no período de janeiro a julho de 2012 e que concordaram em participar do estudo. A amostra foi aleatória sendo aplicado o Euroqol-5D-5L (EQ-5D-5L) para mensuração indireta de preferências por estados de saúde, acrescentado questões sobre perfil sociodemográfico. **RESULTADOS:** Os 5 domínios de avaliação do instrumento EQ5D mostraram que no item mobilidade, 42(84%) pacientes não apresentam problemas, quanto aos cuidados pessoais, 44(88%) não tem problemas em realizá-los, 22(44%) deles não referiram problemas para realizar suas atividades habituais, enquanto 9(18%) sentem problemas moderados e outros 9(18%) se sentem incapazes de realizar suas atividades habituais. No domínio dor/mal-estar, 33(66%) não refere dores ou mal estar. Sobre ansiedade e depressão, 36(72%) não se sentem ansiosos ou deprimidos. O estado de saúde autopercebido, medido pela escala analógica visual, mostra uma pontuação mínima de 30 e máxima de 100, numa média de 78,5. A grande maioria dos pacientes 24(48%) considera sua saúde excelente, 17(34%) afirmam estar com saúde regular. Apenas 9(18%) da amostra considera sua saúde ruim.Quanto às condições socioeconômicas da amostra, 40(80%) pacientes estão em idade produtiva (20-59 anos), média de 41 anos, sendo a predominância do sexo masculino 34(68%). A maioria dos pacientes entrevistados, 27(54%), recebe apenas o salário mínimo como renda individual, obtida por aposentadoria ou auxílio doença. **CONCLUSÕES:** Pelo resultado obtido nessa pesquisa infere-se que os pacientes transplantados renais apresentam uma boa qualidade de vida nos primeiros meses após transplante. Sugere-se pesquisa prospectiva com o intuito de observar sobrevivência e as mudanças na qualidade de vida desses pacientes.

PUK15
HEALTH-RELATED QUALITY OF LIFE OF HEMODIALYSIS PATIENTS IN INDONESIA
Perwitasari DA
Ahmad Dahlan University, Yogyakarta, Indonesia
OBJECTIVES: Health-Related Quality of Life (HRQoL) is one important outcome that should be monitored especially in chronic diseases. The long periode of treatment and the progress of diseases can give significant influence to patietns' HRQoL. The study about HRQoL in developing countries will be important as one success parameter of treatment outcome. We conducted this study to understand the quality of life of the hemodialysis patients in Indonesia. **METHODS:** . We carried out observational study in the public hospital during 2 months. The subjects involved in this study were chronic renal failure patients which have been at least two times hemodialyzed in a public hospital. All of the patients were covered with national health insurance to avoid to finance impact of quality of life. The quality of life was measured by Indonesian version of WHO-QoL questionnaire which included physical health function, mental health function, environmental function, and social function. The association between quality of life domain and other functions were evaluated as well. **RESULTS:** This study showed that in average the scale of fifty hemodialysis patients' quality of life was 70.38. In the other hand, the scale of physical, emotional, environtmental and social function were 23.58, 18.10, 14.86 and 7.76, respectively. There were positive correlations between the functions and quality of life domain. The function that had highest impact on quality of life domain was physical function and the function smallest impact on quality life of domain was social function. **CONCLUSIONS:** We understand that patients' physical function during hemodialysis could deteriorate their quality of life. Thus the better service of health care given to the hemodialysis patients in Indonesia could increase their quality of life.

EFFICACY AND SAFETY OF PULMONARY VEINS ISOLATION WITH CRYO TECHNIQUE
Curnis A[1], Cerini M[1], Lipari A[1], Vassanelli F[1], Salghetti F[1], Locantore E[1], Belotti M[1], D'Aloia A[1], Vizzardi E[1], Elmaghawry M[2], Raweh A[3], Bontempi L[1]
[1]*University of Brescia, Brescia, Italy,* [2]*Aswan Heart Centre, Aswan, Egypt,* [3]*Faculty of Medicine, Ludes University, Lugano, Switzerland*
OBJECTIVES: Pulmoanry vein isolation using cryoablation represents a recently developed technology for atrial fibrillation management. Its safety and efficacy need to be evaluated. **METHODS:** From February 2011 to December 2012, 58 patients underwent pulmonary veins isolation by cryoablation with Arctic Front Cryoballoon (40 men and 15 women) with a mean age of 64.2 ± 11.3 years (range 44-71), symptomatic paroxysmal atrial fibrillation refractory to medical therapy and at least two antiarrhythmic drugs. In 12 patients (20.6%) there was a normal left atrial diameter, while in the remaining 36 (79.4%)there was a documented mild to moderate dilatation (mean diameter 50 mm). The ejection fraction (EF) measured by echocardiography was normal in 47 patients (81%, mean FE 58.3%), while in 11 patients (19%) there was a moderate left ventricular dysfunction (mean EF 43 %). 76% of patients underwent 2 cryo applications for pulmonary vein, while in the remaining 24% of patients was not possible the cannulation of the lower right pulmonary vein for technical-anatomical reasons. We performed a clinical follow-up at 3 and 6 months with 24h Holter ECG (27 pts) and subcutaneous implant of Loop Recorder (28 pts). **RESULTS:** At the end of follow-up: 51 patients (87.9%) were asymptomatic for palpitations and in sinus rhythm, 4 patients (6.9%) went to the emergency department for palpitations with electrocardiographic evidence of typical atrial flutter and underwent SVC-tricuspid isthmus ablation and 3 patients (5.21%) experienced episodes of AF lasting less than 24 hours. **CONCLUSIONS:** The isolation of pulmonary veins ostium by cryoablation with Arctic Front Cryoballoon in our series is a safe and effective technique with a low incidence of recurrence of the arrhythmia in the short term.

RESEARCH ON METHODS – Cost Methods

PRM3
ESTUDIOS DEL COSTE DE LA ENFERMEDAD
Crespo C, Gisbert R, Brosa M
Oblikue Consulting, Barcelona, Spain
OBJECTIVOS: Analizar la producción de estudios del coste de la enfermedad (CoE) en el mundo durante 2000-2010. **METODOLOGÍAS:** Se realizó una revisión de los estudios de "Coste de la enfermedad" en inglés y español en PubMed y otras fuentes. Tras

la selección de artículos por el abstract o el título (si no existía abstract), se revisaron directamente los artículos. Los criterios de inclusión fueron estudios donde apareciera un coste total para la patología o bien un coste por año y paciente siempre que no fuera de un estudio de evaluación económica. **RESULTADOS:** Se hallaron 233 trabajos que cumplían la palabra clave. Esta cifra se redujó a 153 cuando se pasó al estudio sobre de los artículos completos. La distribución temporal de los estudios es desigual, mostrando 25 en 2009 y 4 en 2000. Las enfermedades del sistema nervioso con 33 (21,6%) trabajos figuran en primer lugar siendo la EPOC con 13 (8,5%) las patologías más frecuentes. Se obtuvieron los costes directos en 127 y los indirectos en 92, en tres casos se utilizó el enfoque del período de fricción. Se obtuvo el coste total en 81 estudios y por paciente-año en 91. Domina el enfoque de la prevalencia 129 frente al de incidencia 7 y el método "bottom up" 94 frente al "top down" 46, y USA, con casi un tercio de los estudios, el país del mundo con mayor peso en este tipo de análisis. **CONCLUSIONES:** Se mantiene –y de hecho crece- el interés por CoE con enfoque de prevalencia y "bottom up", detallando los costes indirectos y no sólo los sanitarios.

PRM4

CONSUMPTION PATTERNS, MARKET CHARACTERISTICS AND REGULATION IN THE PHARMACEUTICAL INDUSTRY: EVIDENCE FROM TWO THERAPEUTIC GROUPS IN INSURED POPULATION IN ARGENTINA

Maceira D

Center for State and Society Studies (CEDES), Buenos Aires, Argentina

OBJECTIVES: Using a theoretical framework based on estimating demand functions under uncertainty, this paper proposes to highlight the importance of including economic variables of market structure and actors' strategic organization in the design of regulations on the pharmaceutical sector, beyond the relevance of pharmacological and clinical tools. The specification of regularity standards in social health insurance schemes requires of dynamic tools to improve the decision-making process within a framework of evidence-based medicine and cost-effectiveness analysis. **METHODS:** With a sample of 9,147 and 27,647 observations on prescriptions by population covered by social insurance in Argentina, the paper two analyzes therapeutic groups: hypertensive and lipid lowering, respectively. Econometric implementation implied classical least squares estimation and logistic models for therapeutic group, product and brand. **RESULTS:** The data provides consistent messages about the presence of differentiation mechanisms that overshadow the traditional inverse relationship between price and sales. In particular, the interaction between brand and drugs, which can be extended to technological changes in a dynamic context, implies a complementary perspective in designing a regulatory framework. **CONCLUSIONS:** The power of negotiation and establishment of rules of producers must be considered in each particular therapeutic class, allowing coordinated incentives to encourage rational prescription behavior, moving in a pattern of more cost-effective and equitable use of resources.

A EVOLUÇÃO DA REDE BRASILEIRA DE AVALIAÇÃO E TECNOLOGIA EM SAÚDE

Gonçalves L[1], Souza KM[2]

[1]*Brazilian Ministry of Health, Brasília-DF, Brazil,* [2]*Brazilian Ministry of Health, Brasília, Brazil*

OBJETIVOS: A Rede Brasileira de Avaliação e Tecnologia em Saúde (REBRATS), composta por 53 membros, atua no incentivo ao acesso livre à informação científica através do banco de dados criada em 2009 o SISREBRATS, visando divulgar os estudos em Avaliação de Tecnologias em Saúde (ATS) no Brasil. Além disso, a iniciativa destina-se a aumentar a visibilidade das pesquisas, dos pesquisadores, das instituições e da rede e auxiliar a sociedade no processo da educação científica e educação em saúde. O objetivo desse estudo é avaliar o crescimento da rede e a evolução da disseminação das informações científicas no Brasil através da REBRATS. **MÉTODOS:** Levantamento dos dados da base da REBRATS através da contabilização das informações computadas, do número de usuários, estudos cadastrados e o aumento dos membros da rede. **RESULTADOS:** Em uma análise realizada entre de abril de 2010 e março de 2013, houve expressivo aumento do número de usuários que podem incluir estudos no banco de dados, que passou de 29 para 226, são representados pelos pesquisadores que fazem parte da REBRATS. Neste mesmo cenário, observa-se a ampliação dos membros que formam a rede, representando 20,5% de crescimento. Neste mesmo período observou-se aumento de 85,6% de novos cadastros dos estudos que são disponíveis para acesso da sociedade e dos gestores de saúde do Brasil. **CONCLUSÕES:** Os resultados demonstraram que houve um crescimento significativo de pesquisadores e de instituições na REBRATS. Como consequência desse aumento, observou-se a ampliação dos estudos cadastrados na base. O SISREBRATS é um sistema de acesso livre e com potencial para prover informações que podem subsidiar a tomada de decisão dos gestores de saúde do pais. Apesar do crescimento, é necessário realizar contínuos esforços para ampliação da base, considerando a magnitude e a quantidade de instituições membros da REBRATS.

PRM6

DIFERENCIAS EN LA CONSECUCIÓN DE INFORMACIÓN SOBRE COSTOS DEL MANEJO DE LA DIABETES MELLITUS EN COLOMBIA

Alfonso-Cristancho R[1], Diaz-Sotelo OD[2], Barbosa T[3], Prieto Salamanca D[3]

[1]*University of Washington, Seattle, WA, USA,* [2]*RANDOM Foundation, Bogotá, DC, Colombia,* [3]*RANDOM Foundation, Bogotá, Colombia*

OBJECTIVOS: La información sobre costos y uso de recursos en salud es indispensable para desarrollar evaluaciones económicas. En Colombia, los diferentes actores del sistema de salud tienen fuertes restricciones para brindar acceso a su información, la cual en su mayoría no es pública. El objetivo de este análisis fue cuantificar el acceso a la información y las diferencias reportadas en la información disponible sobre costos de la Diabetes Mellitus en Colombia. **METODOLOGÍAS:** En el desarrollo de una evaluación económica, se identificaron los recursos en salud para el manejo de la enfermedad a partir de guías nacionales y protocolos institucionales. Los costos médicos directos fueron buscados en múltiples fuentes, incluyendo: el Sistema de Información de Medicamentos del Ministerio de Salud, manuales tarifarios oficiales, bases de datos de instituciones prestadoras y aseguradoras en salud y bases de datos de precios en farmacias. **RESULTADOS:** Un total de 24 instituciones fueron contactadas para obtener información sobre costos médicos directos. Sólo 6 (25%) suministraron los datos requeridos, que correspondían a costos de hospitalización, procedimientos, manejo ambulatorio, pruebas diagnósticas y medicamentos asociados con el manejo de la enfermedad. Ninguna de las instituciones entregó más del 70% de la información solicitada. La mayor parte de instituciones con restricciones de acceso a los datos, adujo políticas internas que no permitían hacer pública su información de costos. Las diferencias reportadas en costos para el manejo de la Diabetes de las instituciones que suministraron datos fueron: 56% en costos de hospitalización, 82% en procedimientos, 88% en manejo ambulatorio, 59% en pruebas diagnósticas y 91% en medicamentos. **CONCLUSIONES:** Existen dificultades para la consecución de costos y uso de recursos para evaluaciones económicas en Colombia y amplia variación en la información obtenida, lo que genera altos niveles de incertidumbre y la transparencia y representatividad de los resultados puede verse seriamente afectada.

PRM7

USO DE BASES DE DATOS O SISTEMAS DE INFORMACIÓN PARA SOPORTAR LA TOMA DE DECISIONES EN SALUD EN COLOMBIA

Alfonso-Cristancho R[1], Diaz-Sotelo OD[2], Maestre K[3], Quijano Arango M[3]

[1]*University of Washington, Seattle, WA, USA,* [2]*RANDOM Foundation, Bogota, DC, Colombia,* [3]*Novartis Pharma AG, Bogotá, DC, Colombia*

OBJECTIVOS: Actualmente existe una tendencia global en el uso de información de la vida real para soportar la toma de decisiones en salud. En Colombia, hay poca información respecto al uso de la información generada por los diferentes actores del sistema de salud. El objetivo de este estudio fue identificar las fuentes de información disponibles y su uso actual para soportar la toma de decisiones en salud. **METODOLOGÍAS:** Usando una encuesta semi-estructurada auto-diligenciable dirigida a diferentes grupos de tomadores de decisiones de instituciones aseguradoras y prestadoras de servicios de salud, autoridades de salud, industria farmacéutica e instituciones académicas y de investigación, se evaluó la información disponible y su uso actual en la toma de decisiones. **RESULTADOS:** Un total de 39 tomadores de decisiones en 30 instituciones respondieron la encuesta (40% aseguradores, 17% prestadores, 14% industria farmacéutica, 3% entidades gubernamentales y 26% de otras entidades). De ellos 95% reportaron tener bases de datos relacionadas con sus actividades en el sistema de salud; de éstos, 83% usan datos de costos para soportar la toma de decisiones; 58% reportaron que indicadores como años de vida ganados por calidad, años de vida perdidos por discapacidad y desenlaces reportados por el paciente no se tienen en cuenta para la toma de decisiones. En contraste, el 50% de las instituciones usan sistemáticamente indicadores de desempeño y perfiles epidemiológicos. **CONCLUSIONES:** Si bien existen mecanismos de almacenamiento y análisis de datos sobre prestación de servicios, eventos de interés en salud pública y costos de atención, su uso en Colombia es incipiente, limitando la realización de estudios más complejos como evaluaciones económicas o estudios de efectividad comparativa, necesarios para favorecer la toma de decisiones mejor informadas. La participación activa de los actores en el uso sistemático de esta información, puede ser de gran utilidad para mejorar la eficiencia del sistema de salud.

PRM8

ÁNALISE DE SIGNIFICÂNCIA DO BANCO DE DADOS DE HOSPITAIS PARTICULARES BRASILEIRO

Ferreira CN[1], Souza C[2], Bonachela F[3], Abreu AA[2], Paloni EDMP[1], Drago S[2], Salles GRD[4], Santana CFSD[4]

[1]*ORIZON - Companhia Brasileira de Gestão de Serviços, Sao Paulo, Brazil,* [2]*ORIZON, Sao Paulo, Brazil,* [3]*Orizon, SAO PAULO, SAO PAULO, Brazil,* [4]*Orizon, Sao Paulo, Brazil*

OBJETIVOS: Avaliar o grau de importância do banco de dados da Orizon (informações de hospitais particulares) para a sociedade Brasileira. **MÉTODOS:** Foram realizadas análises quantitativas e qualitativs da base de dados da Orizon comparada com os dados conhecidos da ANS (Agência Nacional de Saúde) que regulamenta os planos de saúde no Brasil. Os dados quantitativos analisados foram: número de vidas, tipo de operadora existente na base, volume de transações e histórico da base. Quanto aos dados qualitativos foram mensurados os tipos e qualidade das informações e analisados dados estatístico descritivo. **RESULTADOS:** A Base de dados Orizon possui 16.161.999 vidas que corresponde à 35% do mercado de saúde suplementar, comparado com os dados da ANS por pagador obteve-se a seguinte representatividade: autogestão a base possui 24% de todo o mercado, 16% de cooperativa médica, 14% filantropia, 8% medicina de grupo e 94% de todas as seguradoras especializas em saúde, além de 1.141.316 vidas pertencentes à grupos não regulamentado pela ANS, sua distribuição por média nos Estado Brasileiro por beneficiários que possui plano de saúde corresponde à 22%. Somente nos dois anos o volume de transações (consultas, internações, cirurgias e exames) correspondeu à 285.353.901. As informações existentes são: tipo de internação, motivo da alta, tipo do gasto, tempo de internação, descrição do item (material, exame, procedimento, taxa, medicamento e alimento), quantidade, valores, localização geográfica, gênero e idade. **CONCLUSÕES:** No Brasil existe somente a base de dados pública do sistema único de saúde (SUS) com informações do mercado público de saúde não sendo possível mensurar a saúde total brasileira, desta forma o banco de dados Orizon vem para auxiliar à mensurar todo mercado brasileiros de forma totalmente significante e necessária.

RESEARCH ON METHODS – Modeling Methods

PRM9

ANALYSIS OF MANDIBULAR TEST SPECIMENS USED TO EVALUATE BONE FIXATION SYSTEMS

Passeri LA[1], Baccarin LS[1], Casarin RCV[2], Silva JVL[3]

[1]*Unicamp, Campinas, Brazil,* [2]*Paulista University, Sao Paulo, Brazil,* [3]*CTI, Campinas, Brazil*

OBJECTIVES: To evaluate, through biomechanical tests, which synthetic material used for the manufacturing of test especimens (ABS plastic, polyamide, and polyurethane) shows a better biomechanical behavior for *in vitro*simulations of load resistance of a fixation method established to mandibular SSRO [Sagittal Split Ramus Osteotomy]. **METHODS:** 30 synthetic and standardized replicas of human hemimandibles with SSRO were divided into 3 groups of 10 samples each: Group A - ABS plastic, Group B - Polyamide, and Group C - Polyurethane. These were fixed by three positional bicortical screws (16 mm length, 2.0 mm system), in an inverted "L" pattern, using drilling guides and advancement of 5 mm. Each sample was subjected to a vertical linear load and the load resistance values recorded at 1, 3, 5, 7, and 10mm displacement. The standard deviations and means were compared using analysis of variance ($p<0.05$) and Tukey's test. **RESULTS:** It was observed a tendency for lower values in group B than in groups A and C. In displacements of 3 and 5 mm, there was a difference between groups A and C to group B ($p<0.05$). In displacements of 7 and 10 mm, there was a difference among the 3 groups, the highest values being found in group C and the lowest ones in group B ($p<0.05$). **CONCLUSIONES:** Taking into consideration the results achieved and the behavior of each material used as substrate, we can consider that ABS plastic was very flexible and polyurethane very rigid. On the other hand, polyamide samples behaved more likely to the human cortical bone, which can be validated to perform load tests, for SSRO, compared to other tested materials.

PRM10

CALIBRATION OF A COST-EFFECTIVENESS MODEL TO EVALUATE THE INCORPORATION OF A QUADRIVALENT HPV TYPES 6, 11, 16, 18 VACCINE IN ARGENTINA: DISEASE BURDEN COMPONENT

Pichon-Riviere A, Caporale J, Alcaraz A, Bardach A, Klein K, Rey Ares L, Augustovski F
Institute for Clinical Effectiveness and Health Policy (IECS), Buenos Aires, Argentina

OBJECTIVES: To calibrate the disease burden component (mortality and incidence rates from cervical cancer) of a cost-effectiveness model that aims to evaluate the incorporation of a quadrivalent HPV Type 6, 11, 16, 18 vaccine in Argentina. **METHODS:** We adapted a previously developed mathematical model (Elbasha 2010) to evaluate the health and economic impact of routine vaccination of 11 years old females. The model is a dynamic transmission model which estimates the direct and indirect (via herd immunity) health benefits of vaccination. Individuals enter the model as they are born; move between successive age groups at an age, gender and sexual activity specific rates, and exit the model as they die. A systematic search on effectiveness, local epidemiology, resource use and costs was undertaken to populate the model. Selected intermediate parameters (probability of transmitting genital HPV infection per sexual partnership by HPV genotype, and percent of females with cervical cancer that recognize their symptoms and seek treatment) were used for calibration. The perspective used was that of the health care system, with a horizontal span of 100 years and a rate of discount of 5% for costs and health effects. **RESULTS:** The model was properly calibrated with results in a range of +/- 1% as compared to national vital statistics and Globocan. The model showed an incidence of 5,285 new cases of HPV 16&18 related cervical cancers per year in Argentina and 1,511 deaths for 2013. Eighty-seven and 80% of incident cases and deaths were concentrated in the 35 to 85 age group, and a median age of death of 55 years. **CONCLUSIONS:** The model proved to be an evidence-based, internally valid tool for the assessment of the main HPV related disease burden and can serve as the basis for the further evaluation of the cost-effectiveness of HPV routine vaccination in Argentina.

MEDICIÓN DE LA CALIDAD DE VIDA POR MEDIO DEL "DERMATOLOGY LIFE QUALITY INDEX" EN PACIENTES CON PSORIASIS: UNA REVISIÓN SISTEMÁTICA

Ordoñez Molina JE[1], Palacios Barahona AU[1], Londoño Garcia AM[2], Jimenez Tamayo SB[1]
[1]*CES University, Medellin, Colombia,* [2]*Universidad Pontificia Bolivariana, Medellin, Colombia*

OBJECTIVOS: Evaluar la calidad de vida relacionada con la salud en pacientes con psoriasis, medida a través del Dermatology Life Quality Index (DLQI). **METODOLOGÍAS:** Se realizó una revisión sistemática en Pubmed, Cochrane Library, Embase y CINAHL sobre la calidad de vida relacionada con la salud en pacientes con psoriasis leve, moderada y severa. Se incluyeron artículos que evaluarán la calidad de vida en su condición basal mediante la escala DLQI y se reportó el resultado utilizando el Psoriasis Assessment and Severity Index (PASI) como resultado secundario. La búsqueda sólo incluyó estudios en inglés publicados desde 1994 hasta agosto de 2012. Se excluyeron los artículos que comparaban diferentes tipos de tratamiento en términos de mejoría de la calidad de vida antes y después de la administración del medicamento, así como la evaluación de la calidad de vida en diferentes variantes de la enfermedad tales como la artritis psoriática y psoriasis de las uñas. **RESULTADOS:** Se identificaron ocho artículos que cumplieron con los criterios de inclusión y exclusión que evaluaban la calidad de vida relacionada con la salud en pacientes con psoriasis leve y moderada mediante la escala DLQI. Se evidenció una pérdida de la calidad de vida en los pacientes con psoriasis, en sus actividades diarias y de trabajo, así como en la vida sexual. El promedio de DLQI estuvo entre 6,4 a 10,8; se observó una gran variabilidad en la duración de la enfermedad entre 17,6 y 28,9 años. Un total de dos estudios reportaron el PASI, el cual estuvo entre 6,53 y 10,5, lo que indica enfermedad leve y moderada. **CONCLUSIONES:** La psoriasis afecta la calidad de vida de los pacientes que padecen la enfermedad tanto en su forma leve como moderada, y este deterioro es superior a los encontrados en enfermedades tales como acné, vitíligo, alopecia y urticaria, entre otras enfermedades.

THYROID DYSFUNCTION DETECTION IN PREGNANCY: UNIVERSAL SCREENING OR TARGETED HIGH-RISK CASE FINDING? A META-ANALYSIS

Gudala K, Bansal D, Kandikatla LR, Krishna PSR
National Institute of Pharmaceutical Education and Research, Mohali, India

OBJECTIVES: Recent consensus guidelines do not advocate universal thyroid function screening during pregnancy but recommend testing high-risk pregnant women with a personal history of thyroid or other autoimmune disorders or with a family history of thyroid disorders. Maternal subclinical hypothyroidism during pregnancy is associated with various adverse outcomes. The present study aims to assess efficiency of the targeted high-risk case-finding approach in identifying women with thyroid dysfunction during early pregnancy. **METHODS:** A comprehensive literature search was done in PubMed and EMBASE databases till July 2012 for studies related to screening of thyroid dysfunction. Data was extracted from each relevant article. The primary estimate was pooled odds ratio with 95% CI. Data analysis was done by Comprehensive Meta Analysis software. Heterogeneity was assessed by I^2 statistics. Publication bias was assessed using Begg and Egger test. Sensitivity analysis was also performed. **RESULTS:** A total of 5 studies (published between 2007 and 2011) were found to be pertinent after exclusion of irrelevant studies. Because of significant heterogeneity, a random effects model was chosen. For the effectiveness of universal screening, pooled odds ratio was found to be 2.87 (95% CI, 1.60-4.94, p=0.00). **CONCLUSIONS:** Targeted thyroid function testing of only the high-risk group would miss about one third of pregnant women with overt/ subclinical hypothyroidism.

PRM13

DESARROLLO DE UNA ESCALA DE ESTRUCTURAS Y PROCESO PARA LA EVALUACIÓN DE LOS CENTROS DE HEMODIÁLISIS

Scarpitta C, Saona G, Leiva G, Gambogi R, Opertti A
Fondo Nacional de Recursos, Montevideo, Uruguay

OBJECTIVOS: Desarrollar una escala de indicadores de calidad de estructuras y procesos para los centros de hemodiálisis del Uruguay. **METODOLOGÍAS:** Un conjunto de expertos nacionales elaboró una lista de indicadores basados en estándares que fueron evaluados mediante visitas técnicas en los centros desde 2004 hasta la actualidad. Mediante el Análisis de Coordenadas Principales (ACoP) y la distancia de Gower se estudió el conjunto de indicadores buscando obtener un número reducido de factores que expliquen una proporción importante de la varianza del sistema de indicadores en el período 2007 a 2010. Se construyó la escala de estructuras y procesos empleando como ponderación la mediana de la distancia euclidea entre los indicadores para el espacio de factores obtenidos en el ACoP. Mediante estadística descriptiva se analizó el comportamiento de la escala en el tiempo y respecto de los indicadores originales. Aplicando el criterio de Kaiser se seleccionaron los dos primeros factores del ACoP (varianza explicada 37,63%), el análisis presentó un índice de estrés de 0,1646. **RESULTADOS:** La escala desarrollada mostró una tendencia temporal de mejora en la calidad de las estructuras y procesos brindados por los centros de hemodiálisis. También se observó una asociación significativa con varias de las dimensiones de estructuras y procesos evaluados. **CONCLUSIONES:** Se considera que el instrumento desarrollado es adecuado para la valoración global de las prestaciones en hemodiálisis en las áreas de estructura y procesos.

PRM14

APPLIED COMPARISON OF META-ANALYSIS TECHNIQUES

Wang L[1], Lewis-Beck C[2], Baser E[3], Fritschel E[4], Baser O[5]
[1]*STATinMED Research, Dallas, TX, USA,* [2]*Freddie Mac (formerly of STATinMED Research, Ann Arbor, MI), McLean, VA, USA,* [3]*STATinMED Research, Ankara, Turkey,* [4]*Texas Department of State Health Services (formerly of STATinMED Research, Dallas, TX), Austin, TX, USA,* [5]*STATinMED Research/The University of Michigan, Ann Arbor, MI, USA*

Meta-analysis is an approach that combines findings from similar studies. The aggregation of study-level data can provide precise estimates for outcomes of interest, allow for unique treatment comparisons, and explain differences arising from conflicting study results. Proper meta-analysis includes five basic steps: identify relevant studies; extract summary data; compute study effect sizes, perform statistical analysis; and interpret and report the results. **OBJECTIVES:** This study aims to review meta-analysis methods and their assumptions, apply various meta-techniques to empirical data, and compare the results from each method. **METHODS:** Three different meta-analysis techniques were applied to a dataset examining the effects of the bacille Calmette-Guerin (BCG) vaccine on tuberculosis (TB). Fixed-effect, random-effect modeling and meta-regression were applied for analysis, with added study-level covariates. Overall and stratified results, by geographic latitude were reported. **RESULTS:** Estimates of treatment effect differed depending on the technique applied. When a fixed effect model was applied to estimate the effect of a vaccination against tuberculosis, the log odds ratio was -0.436 (confidence interval [CI: -0.528, -0.344]). After testing for heterogeneity and fitting a random effects model, the estimate was reduced to -0.741 (CI [-1.12, -0.352]), and the CI became wider. When covariates were added to the model to explain the heterogeneity, the treatment effect was reduced even further. All three techniques showed statistically significant effects from the vaccination. However, once covariates were added, efficacy diminished. Independent variables, such as the latitude of the location in which the study was performed, appeared to be partially driving the results. **CONCLUSIONS:** Meta-analysis is useful to draw general conclusions from a variety of studies. However, proper study and model selection are important to ensure the correct interpretation of results. Basic meta-analysis models are fixed-effects, random-effects, and meta-regression.

DISPONIBILIDAD Y FUENTES DE LA INFORMACIÓN PARA LA TOMA DE DECISIONES EN REUMATOLOGÍA: USO DE LOS ESTUDIOS ECONÓMICOS

Guzman Vazquez S[1], Rodriguez Mendoza MM[2], Pizarro M[3], Soto H[4]
[1]*UNAM, México D.F., Mexico,* [2]*Universidad Autónoma Metropolitana, Distrito Federal, Mexico,* [3]*Hospital Infantil de Mexico Federico Gomez, México D.F., Mexico,* [4]*Health Solutions Consulting, D. F., Mexico*

OBJECTIVOS: Identificar el impacto de la obligatoriedad de presentar una Evaluación Económica (EE) para la inclusión de medicamentos en el Cuadro Básico Nacional en las publicaciones de EE relacionada con el área de reumatología en México. **METODOLOGÍAS:** Se realizó una búsqueda sistemática de las publicaciones de EE y reumatología publicados entre 1995 y 2011. Los estudios de EE fueron clasificados por tres expertos en economía de la salud con base a los criterios de Drummond, Sí los estudios contemplan comparación de dos o más alternativas y sí valoran los costos y consecuencias de las alternativas examinadas se dice que es un estudio de evaluación económica completa (EEC). Se valoró sí la modificación en el año 2003 tuvo impacto significativo en términos de número de publicaciones. **RESULTADOS:** Se identificaron un total de 263 artículos de EE entre 1995 y 2011, 93(35%) de fueron EEC. En el periodo 1995-2002 se identificaron 56 estudios, 19(34%) EEC. En el periodo de 2003-2011 (después de la modificación del reglamento) se identificaron un total de 207 publicaciones de EE, 74(36%) EEC. El 79% de las publicaciones se concentra en el periodo 2003-2011, con un total de 207 publicaciones. Del total de publicaciones las relacionadas con reumatología fueron 3% (n=9) de las cuales 33% fueron completas, 67% fueron parciales. Se destaca que antes de la modificación del reglamento en 2003 se detectó un estudio de EE/reumatología mientras que después del año 2003 el número de publicaciones ascendió a 8 artículos. **CONCLUSIONES:** La EE en México a través del número de publicaciones se ha ido desarrollando notablemente, asimismo el hacer obligatorio el presentar un estudio de EE para la inclusión de un insumo al Cuadro Básico y Catálogo de Insumos del Sector Salud fue un punto de partida para el desarrollo de la EE en México.

A UNIFIED METHODOLOGICAL FRAMEWORK FOR THE ECONOMIC EVALUATION OF THERAPEUTIC MEDICAL DEVICES

Iglesias CP
University of York, York, UK

To inform policy decisions economic evaluation (EE) studies require the systematic identification and (quantitative) synthesis of the relevant evidence base on the clinical effectiveness, quality of life (QoL) and costs associated with the use of competing health technologies. Existing methods for EE are linked to principles of evidence-based medicine and, as such, are geared primarily towards the evaluation of pharmaceuticals. Some authors have claimed that medical devices (MDs) cannot be evaluated using the same principles. We take the opposite viewpoint and argue that used within the right evaluative framework existing EE methods are indeed appropriate to assess the cost effectiveness of therapeutic MDs. What makes the (economic) evaluation of MDs challenging is the fact that the quantity, quality, and characteristics of the evidence base around them, is often fragmented, heterogeneous and associated with high levels of uncertainty. In these circumstances it is important to acknowledge the value of eliciting and quantitatively summarising physicians and other experts' beliefs regarding the effectiveness and resource use demands associated with MDs already in use. Using real life examples this paper shows how a Bayesian stepwise iterative approach has helped address some of the challenges associated with the EE of MDs, while guiding policy decisions regarding technology adoption, research funding and design. Relevant steps include: a) identification of existing evidence base and elicitation of experts' beliefs on clinical effectiveness , QoL and costs - i.e. "a priori evidence base"; b) quantitative synthesis of this a priori evidence base to inform the parameters of an EE model; (c) initial estimation of the model; d) assessment of the economic value of conducting further research (VoI); e) collection of new patient level data (PLD) in a pilot study; (f) new evaluation of the EE model updating the prior estimates using primary PLD; g) further VoI analysis.

DISEASE-SPECIFIC STUDIES

CARDIOVASCULAR DISORDERS – Clinical Outcomes Studies

PCV1
COSTS AND CONSEQUENCES OF ORAL ANTICOAGULATION IN ATRIAL FIBRILLATION IN COLOMBIA

Rosselli D[1], Rueda JD[1], García ÁA[1], Rodriguez-Morales AJ[2], Garrido Lecca S[3], Vargas Zea N[4], Mould JF[5], Donato BMK[6], Juarez Garcia A[7]
[1]*Pontificia Universidad Javeriana, Bogotá, Colombia,* [2]*Universidad Tecnológica de Pereira, Pereira, Colombia,* [3]*Bristol-Myers Squibb Company, Lima, Peru,* [4]*Pfizer S.A.S., Bogota, Colombia,* [5]*Pfizer, New York, NY, USA,* [6]*Bristol-Myers Squibb Company, Wallingford, CT, USA,* [7]*Bristol-Myers Squibb Mexico City, México D.F., Mexico*

OBJECTIVES: To determine the clinical consequences and it's associated costs of the usage of oral anticoagulation therapy for the treatment of atrial fibrillation (AF) in Colombia by establishing the cost per disease related event. **METHODS:** We used a 6-week cycle length, 17 functional state Markov model of the main clinical outcomes in the lifetime of a hypothetical cohort of 1,000 patient with AF per treatment arm. The pivotal clinical studies for apixaban, dabigatran, rivaroxaban compared to warfarin were the source of safety and efficacy data. Data for the analysis was extracted from this literature using indirect comparison methods. Costs in Colombian pesos 2012 are expressed in American dollars (1 US$ = COP$ 1785). To estimate costs, we analyzed resource use of a sample of 53 stroke, 148 myocardial infarction, 6 systemic embolism patients in San Ignacio University Hospital. Results were validated by an expert panel. **RESULTS:** The number of events associated with each anticoagulant therapy (apixaban, dabigatran 110mg, dabigatran 150mg, rivaroxaban and warfarin, respectively) were: stroke and systemic embolism 349, 363, 351, 360, 369. ISTH major bleedings 235, 212, 233, 280, 277; clinically relevant non major bleedings 342, 337, 357, 395, 383; myocardial infarctions 102, 114, 116, 101, 104; and event related deaths 459, 485, 475, 469, 481. Apixaban could be associated with savings in non pharmacological cost of $ 360, $170, $145 and $311 per treated patient compared to dabigatran 110mg, dabigatran 150mg , rivaroxaban and warfarin, respectively. **CONCLUSIONS:** In this non-pharmacological cost avoidance assessment we determined that apixaban can be a cost saving alternative in the long term. Versus SoC (warfarin), apixaban may be the only NOAC with consistent benefit on all relevant events. Consistent with trial data, lifetime modeling suggested reduction in the mortality.

PCV2
COMORBIDITIES ASSOCIATED TO ATRIAL FIBRILLATION (AF) IN SELECTED LATIN AMERICA COUNTRIES

Leyva-Bravo V[1], Soriano MA[1], González-Rojas GL[1], Galindo-Rodriguez JA[2], Diaz GF[3]
[1]*IMS Health, Mexico City, Mexico,* [2]*Instituto de Salud Dr. Hernan Alessandri, Santiago, Chile,* [3]*Escuela de Medicina "JM Vargas" Universidad Central de Venezuela, Caracas, Venezuela*

OBJECTIVES: AF is the most common chronic cardiac arrhythmia worldwide and is an important risk factor for morbidity related mainly to an increased risk of cerebrovascular events and heart failure. This study examined the prevalence of comorbidities among patients receiving treatment for AF in 4 Latin America countries to convey a more comprehensive picture of the total disease burden. **METHODS:** For study purposes, co-morbidity was defined as the presence of one or more disorders in addition to a primary disease, or the effect of such additional disorders. A 3-step process was conducted in order to understand treatment patterns for patients suffering from AF: 1) health care assessment per country; 2) evaluate patient's information; and 3) data analysis to understand and determine treatment algorithms. Data were collected through 59 face-to-face interviews with cardiologists in Argentina, Brazil, Chile, and Venezuela. **RESULTS:** Analysis per country suggested that, in Chile and Venezuela, 98% and 94% of patients, respectively, reported at least one co-morbidity. In Argentina this pattern was observed in 81% of the patients, whereas in Brazil this was 78%. Findings revealed that the main 5 comorbidities associated with AF were: 1) Hypertension: LatAm 43%, Argentina 28%, Brazil 45%, Chile 43%, Venezuela 33%; 2) Dyslipidemia: LatAm 22%, Argentina 11%, Brazil 25%, Chile 21%, Venezuela 18%; 3) Diabetes: LatAm 13%, Argentina 8%, Brazil 11%, Chile 10%, Venezuela 18%; 4) Cardiopathies: LatAm 8%, Argentina 4%, Brazil 8%, Chile 8%, Venezuela 9%; and 5) Thyroid disease: LatAm 7%, Argentina 4%, Brazil 3%, Chile 12%, Venezuela 9%. **CONCLUSIONS:** Overall, the analysis suggests that hypertension is the main co-morbidity associated with AF, followed by dyslipidemia and diabetes. The health burden carried by patients often extends far beyond AF. Physicians should carefully consider comorbidities and concomitant medications when managing patients.

PCV3
ICEBERG PHENOMENON OF HEART FAILURE IN HOSPITALIZED PATIENTS: A MULTICENTRIC CROSS SECTIONAL STUDY

Insua JT[1], Villalon R[1], Giunta D[2], Ioli P[3]
[1]*Hospital Universitario Austral, Universidad Austral, Derqui, Argentina,* [2]*Hospital Italiando de Buenos Aires, Caba, Argentina,* [3]*Hospital Privado de la Comunidad, Fundacion Medica de Mar del Plata, Mar del Plata, Buenos Aires, Argentina*

OBJECTIVES: Heart failure (HF) ranks high in hospital utilization, cost and quality/safety consequences. We studied occult HF as secondary diagnosis (2Dx) in a multicentric study of the A-HCUPs. **METHODS:** A multi-centric cross sectional study of 1 year hospital discharges adapted HCUPs for Argentina. We estimated HF by HCUPs' CCS#108 SL (heart failure) in 2Dx to measure submerged HF; obtained HF in first diagnosis (1Dx), and 365 day readmissions (ReH), <30 day ReH, mortality and case fatality. 2Dx1=in first secondary Dx; 2Dx5=fifth 2Dx, etc. International dollars PPP, (UN Data: 1Arg$ = 1.608 PPP, 2008) were used. **RESULTS:** Among 45466 discharges ≥19 years old, we found 1178 discharges with CCS#108 among 1Dx (incidence: 2,59%*; 95%CI 2,44-2,74%); mortality 0,24% ** (95%CI 0,20-0,29%); 365 days ReH was 60,9% (95%CI 58,1-63,7%) and <30 day ReH of 18,1% (95%CI 15,9- 20,3%). 864 discharges had CCS #108 (HF) among any 2Dx (from 1 to 10 2Dx), (incidence: 1,90%; 95%CI 1,77-2,03%) (p<0,001 vs*), descending from 2Dx1: 316, 2Dx5: 89; and 2Dx8: 36 discharges. HF was one among several multi-morbid conditions. Outcomes of discharges with 2Dx1 are 365 day ReH: 57,3 % (95%CI 51,8-62,7%) and <30 day ReH: 17,1% (95%CI 12,9- 21,2%), mortality 0,09 (95%CI 0,06-0,12%,(p<0,001 vs**), case fatality: 12,66% (95%CI 8,99- 16,32%). Mean cost per discharge was 7 907 I$ PPP and median cost 1 917 I$PPP for HF in 1Dx; while mean was 23316 I$PPP and median cost 12796 I$PPP for CCS #108 in 2Dx5. **CONCLUSIONS:** HF is the leading CCS among several criteria of ranking of discharges. Is one of the leading causes of admissions as detected by 1Dx. However, HF is frequently submerged as a 2Dx, causes significant mortality, costs and readmissions (ReH). Quality, safety and economic studies should consider HF as secondary diagnosis.

PCV4
PERMANENT TRANSVENOUS LEAD EXTRACTION: FACTORS INFLUENCING THE DIFFICULTY OF THE PROCEDURE

Bontempi L[1], Cerini M[1], Lipari A[1], Vassanelli F[1], Salghetti F[1], Locantore E[1], Belotti M[1], D'Aloia A[1], Vizzardi E[1], Raweh A[2], Elmaghawry M[3], Curnis A[1]
[1]*University of Brescia, Brescia, Italy,* [2]*Faculty of Medicine, Ludes University, Lugano, Switzerland,* [3]*Aswan Heart Centre, Aswan, Egypt*

OBJECTIVES: Transvenous lead extraction is increasingly required. The aim of this study was to determine which factors influence the difficulty of a lead extraction procedure through the analysis of a high-volume centre database. **METHODS:** A total of 889 permanent leads were extracted from 469 patients. Factors influencing the difficulty of a procedure were assessed using a multivariate logistic regression model. The fluoroscopy time of the procedure was taken as index of difficulty. **RESULTS:** From January 2003 to December 2012 , 932 of 946 (98.5%) leads were completely removed. Major complications occurred in 1.3% patients. No deaths occurred. Median fluoro time was 8.4 min (3.2 - 17.1). A procedure was classified as difficult when fluoro time was greater then 31.2 min (90th percentile). At a multivariate analysis the predictors of a difficult procedure were the number of extracted leads (OR 1.71, 95%CI 1.06 – 2.8), the presence of screw leads (OR 5.68; 95%CI 1.9 – 16.9), the presence of dual coil shock leads (OR 5.01, 95%CI 1.27 – 19.8), the years since the oldest lead was implanted (OR 1.23, 95%CI 1.15 – 1.31), the absence of leads with vegetation (OR 6.76, 95%CI 1.35 – 33.3). The female gender, the patient age at extraction, the presence of tachy leads, the presence of lead failure weren't predic-

tors of a difficult procedure. **CONCLUSIONS:** Factors influencing the difficulty of an extraction procedure are the number of leads, the presence of screw leads, the presence of dual-coil tachy leads, the years since the oldest lead was implanted and the absence of leads with vegetation.

PCV5

LA UTILIDAD PREDICTIVA DEL EUROSCORE PUEDE SER MEJORADA AL ADICIONAR VALORES DE PEPTIDO NATRIURÉTICO TIPO B O DE HEMOGLOBINA

Hernàndez-Leiva E[1], Dennis R[1], Rondon M[2], Umaña JP[1], Isaza D[1]
[1]*Instituto de Cardiologia-Fundaciòn Cardioinfantil, Bogotà DC, Colombia,* [2]*Pontificia Universidad Javeriana, Bogo, Colombia*

OBJECTIVOS: El Euroscore(EU) es el modelo predictivo más usado en cirugía cardiaca; sin embargo, sobreestima el riesgo y la información necesaria para calcularlo no siempre está disponible. Este estudio fue diseñado para: 1). Definir si adicionar el valor preoperatorio de hemoglobina (HB), péptido natriurético tipo B(BNP) o ambos, al EU, mejoran su capacidad predictiva sobre morbimortalidad a 6 meses de seguimiento postoperatorio en toda la muestra y en los pacientes diabéticos; y 2). Evaluar la utilidad de EU en nuestro medio. **METODOLOGÍAS:** Se incluyeron 492 pacientes quirúrgicos cardiacos. Se comparò directamente la capacidad predictiva de BNP y/o HB vs EU. Luego se evaluó en que tanto la incorporación de BNP y/o HB al EU, adicionaron en términos de lograr mejor discriminación. Para cada uno de los desenlaces se construyeron y compararon curvas ROC. **RESULTADOS:** Sobre mortalidad, BNP o HB no adicionan capacidad predictiva al EU ni en la muestra global ni en diabéticos. La mortalidad intrahospitalaria fue mejor discriminada por EU aislado: área bajo la curva ROC (ABC-ROC): 0.83(IC95%0.75-0.92) y a 6 meses, ABC-ROC 0.73 (IC95% 0.64-0.83); en pacientes diabéticos, ABC-ROC 0.95 (IC95%0.91-1.00) para mortalidad intrahospitalaria y a 6 meses, ABC-ROC 0.84 (IC95% 0.74-0.98). La discriminación obtenida con BNP fue buena para bajo gasto cardiaco: ABC-ROC, 0.72 (IC95% 0.67-0.77); e insuficiencia renal aguda ABC-ROC 0.75 (IC95% 0.76-0.84). Los mejores predictores de transfusión fueron EU+HB ó BNP+HB. EU mostró buena capacidad predictiva (ABC-ROC≥0.70) sobre morbilidad combinada, estancia prolongada en cuidado intensivo, bajo gasto cardiaco e insuficiencia renal y a 6 meses en la discriminación de evento cerebrovascular, tanto en el grupo total como en diabéticos. **CONCLUSIONES:** La capacidad discriminatoria de EU para mortalidad en nuestro medio es muy buena, especialmente en diabéticos. BNP o HB no adicionan capacidad predictiva. En la mayor parte de los desenlaces de morbilidad la discriminación obtenida con BNP aislado es comparable a EU.

PCV6

INDIRECT TREATMENT COMPARISON BETWEEN FIXED-DOSE-COMBINATIONS OF LOSARTAN/AMLODIPINE AND VALSARTAN/AMLODIPINE IN BLOOD PRESSURE CONTROL

Gould AL[1], Unniachan S[2], Wu D[2]
[1]*Merck Research Laboratories, West Point, PA, USA,* [2]*Merck Sharp & Dohme Corp., Whitehouse Station, NJ, USA*

OBJECTIVES: To compare changes in blood pressure after 8 weeks of therapy between a fixed-dose combination (FDC) of amlodipine/losartan and amlodipine/valsartan using a network meta-analysis because there are no trials directly comparing amlodipine/losartan to amlodipine/valsartan. **METHODS:** A systematic search identified six randomized controlled trials of study FDCs and their component monotherapies; 3 included amlodipine/losartan and 3 included amlodipine/valsartan. Conventional fixed-effects methods were used to conduct the comparisons. The change in sitting diastolic and systolic blood pressure (sitDBP, sitSBP) at 8 weeks post-randomization was the primary and secondary effect measures. **RESULTS:** Amlodipine/losartan 5/50 mg produced greater reductions in sitDBP (-1.27 mmHg, 95% confidence interval (CI) -5.7 - 2.2) and sitSBP (-3.7 mmHg, 95% CI -9.0 - 2.9) than amlodipine/valsartan 5/80 mg. Amlodipine/losartan 5/100 mg produced a greater reduction in sitDBP (-0.45 mmHg, 95% CI -3.7 - 2.7) than amlodipine/valsartan 5/160 mg while amlodipine/valsartan 5/160 mg had a greater reduction in sitSBP (0.2 mmHg, 95% CI -6.2 - 6.0) than amlodipine/losartan 5/100 mg. The confidence of superior antihypertensive efficacy for COZAAR XQ 5/50 mg than amlodipine/valsartan 5/80 mg is 77% for sitDBP and 89% for sitSBP, while the confidence of greater efficacy for amlodipine/losartan 5/100 mg than amlodipine/valsartan 5/160 mg is 61% for sitDBP and 48% for sitSBP. With 95% CI, the reduction difference in sitDBP and sitSBP between amlodipine/valsartan 5/80 mg and amlodipine/losartan 5/100 mg is not expected to exceed 1.6 mmHg and 1.26 mmHg, respectively, and not expected to exceed 2.31 mmHg and 5.38 mmHg, respectively with amlodipine/valsartan 5/160 mg versus amlodipine/losartan 5/100 mg. **CONCLUSIONS:** The blood pressure lowering effect with amlodipine/losartan and amlodipine/valsartan was comparable. The findings from this network metaanalysis do not indicate a potential superiority of the reductions realized with amlodipine/valsarta relative to amlodipine/losartan.

PCV7

COMPARATIVE EFFICACY OF BLOOD PRESSURE LOWERING DRUGS IN PRIMARY PREVENTION FOR ELDERLY PATIENTS

Brouwers F[1], Cohen AA[1], Courteau J[1], Farand P[1], Cloutier L[2], Asghari S[3], Vanasse A[1]
[1]*Université de Sherbrooke, Sherbrooke, QC, Canada,* [2]*Université du Québec à Trois-Rivières (UQTR), Trois-Rivières, QC, Canada,* [3]*Memorial University, St. John's, NF, Canada*

OBJECTIVES: Differences in efficacy of different classes of blood pressure lowering drugs (BPLDs) have been observed in elderly primary prevention populations, with beta-blockers (BBs) reported to be less efficacious for primary prevention. In this study, we assessed if these differences remained significant in patients that use statins concurrently. **METHODS:** We conducted a series of population-based nested case-control studies using administrative data from 104,023 diagnosed hypertensive patients without recent antecedents of diabetes or cardiovascular disease (CVD) in the province of Quebec (Canada) between 2000 and 2004. Follow-up ended either with an outcome event, or at the end of 2009. Individuals with an outcome event (all-cause death, CVD event) were considered cases. Controls were matched according to age, sex, date of cohort entry, and comorbidity index. Conditional logistic regression was used to estimate the odds ratio of the outcome events for patients whose treatment in the week before event date included statins and BBs as compared to patients whose treatment included statins and other BPLD(s). **RESULTS:** Patients on statins and BBs showed substantially higher risks for cardiovascular death (OR=2.12, 95%CI: 1.81–2.49), all-cause death (OR=1.64, 95%CI: 1.49–1.81), CVD events (OR=1.96, 95%CI: 1.80–2.12) and hospitalization for CVD (OR=1.99, 95%CI: 1.82–2.17) as compared to patients on statins and other BPLDs. Sensitivity analyses suggest that this higher risk is not due to differences in prescription patterns based on perceived disease severity (indication bias). **CONCLUSIONS:** In elderly hypertensive patients, the concurrent use of statins and BBs is associated with less effective primary prevention in comparison to the use of statins in combination with other BPLDs. Consequently, the difference observed in the efficacy of different classes of BPLDs in elderly populations in primary prevention remains significant in the subpopulation receiving statins. Further studies should be conducted to confirm this finding.

PCV8

DIFFERENCES IN THE WEIGHTED AVERAGE DAILY DOSES OF STATINS IN LATIN AMERICA AND THEIR POTENTIAL IMPACT ON CARDIOVASCULAR OUTCOMES

Mould-Quevedo JF[1], Morehouse L[1], Van Vugt J[2], Liew D[3]
[1]*Pfizer, Inc., New York, NY, USA,* [2]*Pfizer, Inc., Capelle Ad IJssel, The Netherlands,* [3]*University of Melbourne, Melbourne, Australia*

OBJECTIVES: We examined the potential clinical implications of prescribing patterns of generic statins within 11 Latin American markets (LA11). In LA11, generic versions of pravastatin, simvastatin and atorvastatin are available, however, each statin has a different LDL-cholesterol (LDL-C) lowering efficacy that may ultimately result in differences in the incidence of CV events. 2011 LA11 prescription data indicate that statins are prescribed at doses that do not yield equivalent LDL-C lowering. Thus we calculated the weighted average daily doses (WADDs) of pravastatin, simvastatin and atorvastatin within LA11 and estimated the average LDL lowering with each statin, and the incidence of CV events. **METHODS:** The WADDs of prescribed simvastatin, pravastatin and atorvastatin in LA11 were derived from IMS data. The LDL-C modifying potencies of the WADDs were interpolated from dose response curves from Nicholls et al (Am J Cardiol, 2010), and Law et al (BMJ, 2003). The relationship between LDL-C reduction and the resultant impact on cardiovascular events was derived from the Cholesterol Treatment Trialists' Collaboration (CTTC, Lancet 2010), where a 1mmol/L reduction in LDL-C, translated to a 22% reduction in major cardiovascular events. **RESULTS:** Across LA11, the WADDs for pravastatin, simvastatin and atorvastatin were 24.9mg, 22.4mg and 20.6mg, respectively. The corresponding reductions in LDL-C at these doses were estimated to be 25.0%, 33.4% and 40.6%. Assuming a pre-treatment LDL-C of 4.0mmol/L, these lipid changes would lead to reductions in the risk of a major coronary/stroke event of 22.0%, 29.4% and 35.8%, respectively. **CONCLUSIONS:** At currently prescribed WADDs in LA11, the real world use of atorvastatin provides a superior reduction in LDL-C to either simvastatin or pravastatin, and hence would be expected to result in a greater reduction in cardiovascular events.

PCV9

ANALYSIS OF CONSUMPTION OF DIURETICS IN SERBIA FROM 2006 TO 2010

Tomic Z, Sabo A, Mikov M, Milijasevic B, Milijasevic D, Vukmirovic S
Faculty of Medicine, University of Novi Sad, Serbia, Novi Sad, Serbia and Montenegro

OBJECTIVES: Diuretics are drugs of first choice in the treatment of hypertension. The aim of this study was to analyze the consumption of diuretics in Serbia in the period from 2006 to 2010 year. **METHODS:** The data about the use of drugs were taken from the Agency for Drugs and Medical Devices of the Serbia. **RESULTS:** The use of diuretics during the observed period in Serbia is quite small and it ranged from 5 to 6% of the total consumption of all drugs from the C group. Furosemide was the most frequently used diuretic. In the five year period furosemide consumption ranged from 33-55% of the total consumption of all diuretics. The second largest consupmtion during first four years of the study was that of indapamide. Indapamide consumption in the fifth year was at the fourth position. At the third position in drug consumption in the first four years was hydrochlorothiazide. Use of hydrochlorothiazide in 2010 took second place. Spironolactone has occupied the fourth position in the first four years. During the last years of the period spironolactone occupied the third position. Consumption of all other diuretics was small and it was only a few percent of the total consumption of all diuretics. **CONCLUSIONS:** In Serbia, in the observed period, consumption of diuterics is two to three times lower in comparison with the consumption of diuretics in Norway and Finland. This research was supported by Provincial Secretariat for Science and Technological Development, Autonomous Province of Vojvodina project No 114-451-2458/2011 and by Ministry of Science, Republic of Serbia, project no 41012.

PCV10

ANALYSIS OF CONSUMPTION OF ANTIHYPERTENSIVE DRUGS IN SERBIA FROM 2007 TO 2011

Milijasevic B, Milijasevic D, Tomic Z, Sabo A, Mikov M, Tomic N
Faculty of Medicine, University of Novi Sad, Serbia, Novi Sad, Serbia and Montenegro

OBJECTIVES: Drugs of first choice in the treatment of hypertension are: β-blockers, tiazide diuretics, ACE inhibitors, angiotensin receptor inhibitors and Ca channel blockers. The aim of this study was to analyze the consumption of antihypertensive drugs in Serbia in the period from 2007 to 2011 year. **METHODS:** The data about the use of drugs were taken from the Agency for Drugs and Medical Devices of the Serbia. **RESULTS:** The use of diuretics during the observed period in Serbia is quite small and it ranged from 5 to 6% of the total consumption of all drugs from the C group. Consumption of β-blockers was around 12% during all 5 years. Consumption of calcium channel blockers was less than 12% of the total consumption of all drugs from group C in the first 2 years of the observed period. However, consumption of such drugs in the last 3 years growing over 18% of the

total consumption of all drugs from the C group. Total consumption of drugs acting on the renin-angiotensin system (C09) in Serbia in opserved period was over 41 % of the total consumption of all drugs from the C group. The highest percentage in this group belonged to the ACE inhibitors. Consumption of angiotensin receptor inhibitors is small and it is only a few percent of the total consumption of all drugs from C09 group. However, consumption of drugs in this subgroup recorded steady growth in recent years. **CONCLUSIONS:** In Serbia in the observed period, ACE inhibitors are the most frequently used drugs within the group of drugs which is used for treatment of hypertension. This research was supported by Provincial Secretariat for Science and Technological Development, Autonomous Province of Vojvodina project No 114-451-2458/2011 and by Ministry of Science, Republic of Serbia, project no 41012.

IMPACTO ECONÓMICO Y EN DISCAPACIDAD DEL INCREMENTRO DE UTILIZACIÓN DE TROMBOLISIS EN EL CUIDADO AGUDO DE L ICTUS ISQUÉMICO EN CHILE

Hoffmeister L[1], Mar J[2], Lavados P[3], Comas M[4], Arrospide A[2], Biagini L[1], Castells X[4]
[1]*Universidad Mayor, Santiago, Chile,* [2]*Hospital Alto Deba, Mondragon, Spain,* [3]*Universidad del Desarrollo, Santiago, Chile,* [4]*Department of Epidemiology and Evaluation, Institut Municipal d'Investigació Mèdica-Parc de Salut Mar, Mar Teaching Hospital, Barcelona, Spain; Red de Investigación en Servicios de Salud en Enfermedades Crónicas (REDISSEC), Barcelona, Spain*

OBJECTIVOS: Estimar el impacto en discapacidad y económico del incremento de utilización de trombolisis para el manejo agudo de ictus isquémico (IS) en Chile, aplicando un modelo de simulación de eventos discretos. **METODOLOGÍAS:** Se modeló la historia natural y el manejo agudo de los IS para población adulta chilena, incorporando tiempos desde el inicio de síntomas al tratamiento y cuatro escenarios de utilización de trombolisis: a) utilización actual (1,7%), b) utilización de 11,6% tratando todos los pacientes que son atendidos dentro de la ventana terapéutica, c) 25% de utilización, y d) 100% de utilización. Se usaron distribuciones empíricas y teóricas para incluir la probabilidad y tiempos de los eventos. Se realizó una simulación entre 2002-2017, usando el software ARENA. Los resultados fueron la prevalencia de discapacidad por escenario. Se realizó un análisis de impacto presupuestario desde la perspectiva del asegurador público de salud, considerando los costos directos del tratamiento y de rehabilitación. **RESULTADOS:** En 2017 manteniendo la actual utilización de trombolisis (1,7%), la tasa de prevalencia por IS es 360,8 por 100.000 habitantes, presentando una disminución entre los escenarios, siendo 299,8 cuando todos los pacientes son tratados. Con respecto a la utilización actual, aumentar el tratamiento al 11,6% evita 779 discapacitados, al 25% evita 1.783 y tratar a todos los pacientes evita 8.534. A lo largo de la simulación, los costos ahorrados por casos de rehabilitación evitados son más bajos que los costos de la trombolisis. **CONCLUSIONES:** La tasa de prevalencia de discapacidad disminuye moderadamente al incrementar la utilización de trombolisis. El impacto poblacional en discapacidad manteniendo la utilización actual es marginal, siendo recomendable incrementar su utilización. Los costos directos aumentarían por sobre el costo de rehabilitación evitados, sin embargo, es necesario considerar la limitada cobertura de atención de la discapacidad en Chile y los costos sociales.

PCV12

PREVALENCE OF RISK FACTORS OF ST ELEVATED MYOCARDIAL INFARCTION

Rasool F[1], Khan MS[2], Ali A[2], Masood J[2]
[1]*The University of Punjab, Lahore,, Pakistan,* [2]*The Islamia University of Bahawalpur, Punjab-Pakistan, Bahawalpur, Pakistan*

OBJECTIVES: There is no enough data available in our country about the prevalence of risk factors for ST elevation myocardial infarction (STEMI) and which has the highest mortality rate in hospitals of Pakistan. The purpose of study was to access the age distribution, location of infarct, risk factors, sign & symptoms and in-hospital management of STEMI patients in Bahawalpur region, southern Punjab, on of the regions with high risk of coronary heart disease. **METHODS:** A retrospective study of 400 patients diagnosed as STEMI admitted to Bahawal Victoria Hospital (BVH), Bahawalpur, Southern Punjab, Pakistan was done by following their hospital record. **RESULTS:** The mean age of STEMI patients were 40 ±10. Smoking, Diabetes and Hypertension were the risk factors (51.5%), (28%), (20.5%) respectively. Anterior wall Myocardial infarctions were seen (51.5%). Sweating, vomiting, shortness of breath (SOB) & nausea accounted for more than 60% of the symptoms with chest pain mostly in left arm. Among the patients who reached early to hospital & received Streptokinase (SK) were 150 (75%), those late for SK were 44(22%), thrombolytic therapy was contraindicated only in 6 (3%) patients. Most prescribed medication are aspirin (100%), clopidogrel (98%), statin (96%), ACE-I (77.5%), nitrates (69.5%), beta blocker (60%), anticoagulant (50%), LMW-heparin (33 %). **CONCLUSIONS:** The result of our study, in which the risk factors especially smoking were found to have a prevalence in patients with STEM1 living in southern Punjab, suggested that STEM 1 can be prevented by the modification of these risk factors.

CARDIOVASCULAR DISORDERS – Cost Studies

PCV13

A BUDGET IMPACT ANALYSIS (BIA) OF TRANSCATHETER AORTIC VALVE IMPLANTATION (TAVI) IN HIGH-RISK PATIENTS WITH SYNTOMATIC SEVERE VALVE STENOSIS (SSVS) UNDER THE BRAZILIAN PUBLIC HEALTH CARE SYSTEM (SUS) PERSPECTIVE

Paladini L[1], Nishikawa AM[1], Bueno CC[1], Queiroga M[2], Lemos P[2], Clark OAC[1]
[1]*Evidencias, Campinas, Brazil,* [2]*Sociedade Brasileira de Hemodinâmica e Cardiologia Intervencionista (SBHCI), São Paulo, Brazil*

OBJECTIVES: Aortic valve stenosis is a progressive valvular heart disease with a standard care that involves a major open surgery. However, part of the patients is ineligible for surgery, therefore drug therapy is the only option available. Once TAVI is a less invasive surgical option, clinical trials demonstrated significant benefits, although procedure and device are costly. The aim of this study was to estimate the incremental budget impact with this new procedure incorporation under the SUS perspective. **METHODS:** The BIA was based on a Markov model with quarterly cycles and 5-year time horizon in order to predict clinical and economic outcomes in a scenario with TAVI incorporation compared to the actual scenario – drug therapy (amiodarone, furosemide and digoxin) with or without aortic balloon valvoplasty. Epidemiological data were obtained from DATASUS and survival was extrapolated from PARTNER cohort B trial by using a Weibull distribution. Resource use, also gathered from this trial, included early perioperative complications (30 days) and late events (rehospitalization, dialysis, stroke, pacemaker implantation and major vascular complications). Costs were taken from the official Brazilian public official lists (DATASUS and BPS). Market-share data was obtained from Sociedade Brasileira de Hemodinâmica e Cardiologia Intervencionista. **RESULTS:** The estimated number of Brazilian patients eligible for SSVS treatment was 795, 922, 1,180, 1,335 and 1,402 respectively for years 1-5 of analysis. Compared to the current scenario, the inclusion of TAVI procedure with a 13% market share during the analysis period shows an additional budget through year 1-5 of 3.5M, 5.0M, 6.7M, 8.1M and 9.4M, consecutively. **CONCLUSIONS:** The incremental budget impact to include TAVI as a treatment option in the Brazilian Public Healthcare System for SSVS high-risk patients was estimated to be USD 65 million in 5 years.

PCV14

ANÁLISE DE IMPACTO ORÇAMENTÁRIO DO OCLUSOR SEPTAL PERCUTÂNEO PARA O FECHAMENTO DE COMUNICAÇÃO INTERATRIAL (CIA) DO TIPO OSTIUM SECUNDUM

Senna KMS, Costa MG, Tura BR, Correia MG, Santos MS
INC, Rio de Janeiro, Brazil

OBJETIVOS: Analisar o impacto orçamentário do implante de oclusor septal percutâneo para o fechamento de comunicação interatrial do tipo *ostium secundum*em comparação a cirurgia cardíaca convencional. **MÉTODOS:** Análise sob a perspectiva do Sistema Único de Saúde (SUS) em um horizonte temporal de cinco anos, para uma população de pacientes portadores de CIA do tipo *Ostium Secundum*.O modelo considerou os custos com as intervenções durante o período de internação e a análise da incorporação do oclusor seguiu o pressuposto de uma taxa de utilização de 75% dos pacientes portadores de CIA OS. **RESULTADOS:** Apresentou uma redução de mais de sete milhões de reais a favor da incorporação do oclusor percutâneo em relação a cirurgia como procedimento exclusivo. As análises de sensibilidade confirmaram uma economia favorecendo o oclusor percutâneo para o fechamento de CIA *ostium secundum*. E ao cruzar as variações de custos da cirurgia, do oclusor e das taxas de utilização para uma melhor aproximação da realidade, o resultado permaneceu favorável e demonstrou uma concentração do número de casos na faixa entre zero e R$40.000.000,00 em economia. **CONCLUSÕES:** A análise demonstrou a possibilidade de redução dos custos para o fechamento de CIA do tipo *ostium secundum*com a incorporação de uma tecnologia que já vem sendo bem indicada e utilizada ao longo dos últimos 36 anos, como uma alternativa segura e eficaz ao fechamento cirúrgico tradicional. O implante de oclusor septal percutâneo é uma opção repleta de méritos ao evitar que o paciente sofra os traumas físicos e riscos associados ao procedimento cirúrgico, bem como os riscos psicológicos causados pela estética gerada pela cicatriz cirúrgica e trauma da internação para as crianças.

PCV15

ECONOMIC EVALUATION OF COLLAGENASE VERSUS HYDROGEL DRESSINGS FOR CHRONIC-WOUND TREATMENT FROM THE PUBLIC PAYER PERSPECTIVE

Tolentino AC[1], Murta L[2], Pereira N[2]
[1]*Universidade Federal do Estado do Rio de Janeiro, Rio de Janeiro, Brazil,* [2]*ANOVA - Knowledge Translation, Rio de Janeiro, Brazil*

OBJECTIVES: To develop cost-effectiveness analysis of collagenase (CO) versus hydrogel (HG) dressings for chronic-wound treatment in adults, under the perspective of Brazilian public payers. **METHODS:** Data from the Brazilian Hospital Information System from January 1st to December 31st 2012 was used to define the annual number of hospital admissions due to chronic wounds (only non-surgical records with L89 ICD-10 code included). The model assumed that CO is the current practice in Brazilian public hospitals and patients are discharged at the time their wound heals. The difference in MHT was applied to the average length of stay (LOS) reported in the database. Resource use was estimated through expert panel and unit costs were obtained from Brazilian official price lists. **RESULTS:** A total of 280,440 hospitalizations were identified with mean LOS of 4.47 days. The model estimated costs for the inpatient period assuming one dressing change for CO and HG. The cost per dressing change was estimated as 13.83BRL for CO and 11.95BRL for HG and the overall treatment costs were 61.82BRL and 53.42BRL according to the LOS. HG-related incremental costs were -8,40BRL indicating a cost-saving profile. Addopting HG as wound management protocol would save 527,227.20BRL for the 2012 cohort. Benefits in terms of reduction in LOS were not accounted in the base case scenario. **CONCLUSIONS:** HG dressing has shown higher efficacy when compared to CO dressings, with fewer costs. The clinical and economic incremental results between different dressings reinforce the need of evidence-based decision making and rational resource allocation.

PCV16

COST ANALYSIS OF PULMONARY ARTERIAL HYPERTENSION IN A TERTIARY CARE SETTING IN MEXICO CITY

Rely K[1], Ramírez-Neria P[2], Pulido T[3], Escamilla C[4], Alexandre PK[5], Cañedo A[6], Salinas Escudero C[1]
[1]*CEAHealthTech, Mexico City, Mexico,* [2]*Instituto Nacional de Cardiología - Ignacio Chávez, México D.F., Mexico,* [3]*National Heart Institute, Mexico City, Mexico,* [4]*INSP, Mexico City, Mexico,* [5]*Johns Hopkins University, Baltimore, MD, USA,* [6]*Instituto Nacional de Neurología y Neurocirugía, México D.F., Mexico*

OBJECTIVES: The present study determined the total direct health-care costs for the management of PAH patients with differing degrees of disease severity. The study also aimed to find the key cost drivers in the management of PAH. **METHODS:** PAH patients were recruited from a tertiary care hospital between January 1, 2009 and

2011. One-year costs were identified by applying cost data to medical information obtained by review of medical records. Costs included those for medications, laboratory and diagnostic tests, clinic visits, emergency room visits and hospital stays. Contemporary data were obtained from epidemiological studies, government datasets, and other sources to estimate prevalence. National costs (US dollar 2012) of treatment for PAH were estimated by extrapolation of mean cost estimate per person to national incidence data for PAH. Because of uncertainties surrounding some of our estimates such as prevalence, one way sensitivity analyses were undertaken. **RESULTS:** A total of 113 PAH patients were identified and their demographic and clinical characteristics, patterns of care were examined. The mean age was 38 years, and 83% were female. The average per patient annual cost was $ 10,869 without specific treatment (min $ 137; max $155,928). The annual cost for the treatment of a single PAH patient per year with specific therapy (Bosentan) was calculated in $31.433. Aggregate national health care expenditures for treatment of PAH were USD 46.6 million In multivariate analysis, length of hospital stay, stay in ICU, were all significant independent predictors of treatment. **CONCLUSIONS:** There is a correlation between the cost of HAP and disease severity with hospitalization owing to disease severity being a major contributor to cost. With the expected increase in the incidence of PAH in Mexico over the coming decades, these results emphasize the need for effective preventive and acute medical care.

PCV17

COST-OF-ILLNESS STUDY OF PATIENTS SUBJECTED TO CARDIAC RHYTHM MANAGEMENT DEVICES IMPLANTATION: RESULTS FROM A SINGLE TERTIARY CENTRE

Fanourgiakis J

University of Crete, Heraklion, Greece

OBJECTIVES: To estimate the procedure (implantation) cost, the total hospitalization cost and annual follow-up cost, in patients subjected to pacemaker (PM) and implantable cardioverter-defibrillator (ICD) implantation. **METHODS:** A single-center, prospective, cost-of-illness study was conducted between August 2008 and July 2009. In total, 464 consecutive patients were recruited (370 were subjected to PM implantation and 94 to ICD implantation). Resource data were assessed at patients' enrolment in the study and at 6th and 12th months of patients' follow-up. Then, the procedure cost, the total hospitalization cost as well as the annual patients' follow up costs were calculated using a bottom-up approach. **RESULTS:** The mean (95% confidence interval) procedure cost of PM and ICD implantation (including the costs of devices, electrodes, other supplies, and personnel's time) was calculated to be €1803 (€1758–€1858) and €13 521 (€13 153–€13 892), respectively. The mean total hospitalization cost (including procedure cost, hospitalization cost, cost of laboratory and imaging diagnostic examinations and the indirect cost attributed to productivity lost due to patient's hospitalization) was €3926 (€3711–€4167) for PM and €17 764 (€16 852–€18 692) for ICD. The mean annual cost (direct and indirect) was €1816 (€1433–€2421) for PM and €2819 (€2115–€3703) for ICD. No difference was detected in the annual cost between patients with initial implantation and replacement. **CONCLUSIONS:** These data revealed that although these devices are associated with a relatively high upfront cost, the annual societal cost following the implantation is low. Therefore, implantation of such devices should be encouraged since these devices reduce the morbidity and mortality without a high economic burden to society.

PCV18

ECONOMIC BURDEN OF CORONARY HEART DISEASE IN THE PATIENTS ATTENDING NATIONAL HEART CENTER, KATHMANDU, NEPAL

Dangi A[1], Lohani SP[2]

[1]*Nobel College, Pokhara University, Kathmandu, Nepal,* [2]*Center for Health Research and International Relations, Nobel College, Pokhara University, Kathmandu, Nepal*

OBJECTIVES: To calculate cost of illness due to coronary heart disease in the patients attending National Heart Center, Kathmandu, Nepal. **METHODS:** Descriptive cross sectional survey was conducted. The total number of sample was 120. The sample was selected by non-probability purposive sampling method. Data entry and analysis was done using SPSS 16.0. Categorical variables were compared using Independent Sample t-test and cross tabulation was done and chi- square test was applied to show significant difference between variables. **RESULTS:** Agriculture was the main source of income of the coronary heart disease household and the average annual household income was NRs. 1, 54,000 (US $ 1792). The study estimated the average cost of illness to be NRs. 30,888.14 (US $ 360) for an outpatient episode of coronary heart disease which was 20.05% of the average annual income of CHD household. The average total time loss of the CHD household was 8.75 person days. The average total direct cost was NRs. 29,600 (US $ 344) of which medical cost was the largest component. The average monetary value of time loss by the household was found to be 2,981.18 (US $ 35). **CONCLUSIONS:** The study found high cost of illness due to centralised system of health care. The findings of the study showed that households struggled to cope and adopted unsustainable strategies that damaged asset and caused or sustained impoverishment. Thus, estimated cost appears to be sustained economic burden on the individual household.

PCV19

AFFORDABILITY OF ANTIHYPERTENSIVE TREATMENT IN MEXICO

Lemus F, Rivas R

Minister of Health, Mexico, Mexico

OBJECTIVES: Hypertension (HT) is one of the most prevalent chronic diseases in Mexico. In the last two decades, a substantial increase in the prevalence of HT was observed in Mexico from 25% in 1993 to 43.2% in 2006 in adult population (≥20 years old). Almost 50% of population is not under a social security scheme and many patients pay for medicines out-of-pocket. This study's aim was to calculate the affordability of different kinds of antihypertensive drugs in Mexico. **METHODS:** Price data for 5 classes of antihypertensive drugs (diuretics, beta blockers, calcium channel blockers, ACE inhibitors and angiotensin II receptor antagonists or ARBs) were obtained from public internet sources, and the lowest price identified for each generic was used to estimate one month's cost of hypertension treatment; considering the maximum and minimum dosage for each generic. The affordability of treatments was calculated by comparing the total cost of medicines to the daily official minimum wage ($63.12MXN, 2013 prices) **RESULTS:** The number of days' wages required to pay one month of antihypertensive therapy ranged from: 0.08-4.18 for diuretics, 0.67-1.90 for beta blockers, 1.7-3.99 for calcium channel blockers, 0.71-3.31 for ACE inhibitors and 2.38-8.11 for ARBs. **CONCLUSIONS:** Cost could be a substantial barrier for permanence in antihypertensive treatment, so that should be discussed measures to prevent this from happening.

PCV20

TREATMENT COSTS OF ISCHEMIC STROKE PREVENTION AND MANAGEMENT IN PATIENTS WITH ATRIAL FIBRILLATION (AF) IN LATIN AMERICA: ARGENTINA, BRAZIL, CHILE, AND VENEZUELA

Soriano MA[1], Leyva-Bravo V[1], González-Rojas GL[1], Medina-Farina M[2], Duarte MA[3]

[1]*IMS Health, Mexico City, Mexico,* [2]*Hospital Barros Luco, Santiago, Chile,* [3]*Hospital Militar Carlos Arvelo, Caracas, Venezuela*

OBJECTIVES: AF is the most common chronic cardiac arrhythmia worldwide. Most patients with AF need life-long treatment to be protected from ischemic stroke. The aim was to conduct a high level cost assessment for stroke prevention and management in patients with AF [SPAF & SMAF] in 4 Latin American countries. **METHODS:** Overall the costs of SPAF & SMAF were determined through 59 face-to-face interviews with cardiologists in Argentina, Brazil, Chile and Venezuela. Treatment costs were estimated using benchmarks from major private and public hospitals in each country. **RESULTS:** On average, the largest component of real-life medical expenditures for SPAF, under appropriate treatment given CHADS2 scores, was prescription drugs, which ranged from 68% in private to 75% in public. Annual SPAF treatment ranged in price from US$425 in Argentina to US$1,935 in Chile in private institutions and US$85 in Brazil to US$1,199 in Venezuela in public institutions. Moreover, overall treatment costs in Chile were 5X higher than the least expensive country in each sector. For SMAF, using rivaroxaban vs the common Vitamin K antagonists resulted in a 24%-46% cost reduction for disease treatment at a national level due to better patient adherence. This would decrease the stroke incidence/year, which would translate to US$143 M /yr in savings. **CONCLUSIONS:** AF is an important source of health care resource utilization because of repeated medical examinations, extensive use of laboratory tests and pharmacological treatments. Private and public institution cost differences are common in all 4 countries. Improving access to novel drugs, such as rivaroxaban, could help improve cost allocation, inducing a savings opportunity in each country.

PCV21

HEALTH-ECONOMIC ASSESSMENT OF THE USE OF CATHETER-BASED RENAL DENERVATION IN PATIENTS WITH RESISTANT HYPERTENSION IN MEXICO

Ceballos RM[1], Sanchez-Kiobashi R[2], Gay JG[3], Pietzsch JB[4], Geisler BP[4]

[1]*Medtronic, Mexico DF, Mexico,* [2]*TI Salud, Mexico DF, Mexico,* [3]*T.I. Salud, Mexico, México D.F., Mexico,* [4]*Wing Tech Inc., Menlo Park, CA, USA*

OBJECTIVES: Catheter-based renal denervation (RDN) is a new therapy for resistant hypertension, a condition that affects approx. 10-15% of hypertensive patients, in which blood pressure is uncontrolled despite the simultaneous use of three or more antihypertensive drugs. Our objective was to assess clinical and cost-effectiveness of RDN compared to standard of care (SoC) from the Mexican public payer perspective. **METHODS:** A previously published lifetime Markov model was adapted to the Mexican setting to predict clinical endpoints (death, myocardial infarction, stroke, heart failure, coronary heart disease, end-stage renal disease) and costs - based on Mexican epidemiological and cost data. We evaluated the impact of a 32 mmHg reduction in systolic blood pressure, from a baseline of 178 mmHg, in a 58-year old 43% female, 34% diabetic, and 16% smoking cohort, as observed in the Symplicity HTN-2 randomized controlled trial. Direct public health care costs were estimated from the published literature and from governmental databases. The incremental cost-effectiveness ratio (ICER) was computed as incremental costs per life-year gained, discounted at 3%. Deterministic sensitivity analyses were performed. **RESULTS:** RDN was projected to reduce cardiovascular endpoints by 22-32% over 10 yrs., and 7-17% over lifetime. The lifetime ICER was estimated at MXN$ 194,128 (US$ 14,750) per LY gained, and had an incremental cost of MXN$ 117,916 (US$ 8,959) compared to SoC. Application of higher discount rates led to a measured increase in the ICER. **CONCLUSIONS:** Our model projections suggest that RDN reduces and delays cardiovascular events and is a cost-effective therapy in Mexico when considering most international willingness-to-pay thresholds, but remains above the current national government threshold of one GDP/capita of MXN$ 139,900 (US$ 10,630) per additional life year.

PCV22

COST-EFFECTIVENESS OF TRANSCATHETER AORTIC-VALVE IMPLANTATION FOR SEVERE SYMPTOMATIC AORTIC STENOSIS IN INOPERABLE PATIENTS IN THE BRAZILIAN PUBLIC HEALTH CARE SYSTEM

Nishikawa AM[1], Paladini L[1], Borges L[1], Queiroga M[2], Lemos P[2], Clark OAC[1]

[1]*Evidencias, Campinas, Brazil,* [2]*Sociedade Brasileira de Hemodinâmica e Cardiologia Intervencionista (SBHCI), São Paulo, Brazil*

OBJECTIVES: Aortic stenosis is the most common valvular heart disease in the elderly – its prevalence is estimated to be up to 5% in individuals over 75 years. Surgical replacement of the aortic valve is considered the standard care and in the absence of serious coexisting conditions, the procedure is associated with low operative mortality. However, a significant proportion of patients can not undergo surgery due to a high surgical risk associated with advanced age or with the presence of multiple coexisting conditions. Treatment with transcatheter aortic-valve implantation (TAVI) is a therapy with potentially lower peri-procedure risk and has been used as a therapeutic option in this group of patients considered inoperable. Therefore, this study aims to develop a cost-effectiveness analysis of TAVI in patients with severe aortic stenosis who are not suitable for surgical treatment. **METHODS:** A Markov model was developed to compare the TAVI *versus* standard therapy (drug treatment

with or without aortic balloon valvuloplasty). Outcomes in the model were based on safety and effectiveness (as measured by clinical outcomes of chance of successful implantation procedure and survival from PARTNER cohort B trial). Resource use included early perioperative complications (30 days) and late events. Cost data were obtained from Brazilian public lists (DATASUS and BPS). Results were expressed as the reason of incremental cost-effectiveness ratio (ICER) per years gained. Probabilistic sensitivity analysis was performed to confirm robustness of the results. **RESULTS:** Compared with standard therapy with or without aortic balloon valvuloplasty, the use of TAVI improves survival in 0.97 life years with an incremental cost of US$35,071, resulting an ICER of US$36.260/ life year gained. **CONCLUSIONS:** Use of TAVI results in improved survival with a low risk of serious adverse events, and demonstrates a cost-effectiveness profile when compared to other technologies already incorporated by the Brazilian public health system.

PCV24

ANÁLISE DE CUSTO-EFETIVIDADE PARA UTILIZAÇÃO DE OCLUSORES SEPTAIS NO FECHAMENTO DE COMUNICAÇÃO INTERATRIAL (CIA) DO TIPO OSTIUM SECUNDUM COMPARADO COM A CIRURGIA CONVENCIONAL

Costa MGSD[1], Santos MS[1], Correia MG[1], Santos B[1], Correia MIC[1], Cintra MADCT[2], Almeida JM[1], Souza TFGD[3]

[1]*INC, Rio de Janeiro, Brazil,* [2]*Brazilian Ministry Of Health, Rio de Janeiro, Brazil,* [3]*Universidade Federal Fluminense, Niterói, Brazil*

OBJETIVOS: Análise de custo-efetividade comparando as técnicas de fechamento de comunicação interatrial do tipo ostium secundum: cirurgia convencional e implante percutâneo com oclusor septal; na perspectiva do sistema único de saúde (SUS) brasileiro. **MÉTODOS:** Realizada revisão sistemática da literatura através de busca em bases de dados primárias. Avaliação da qualidade da evidência apresentada feita através do GRADE (*Grading of Recommendations Assessment, Development and Evaluation*). A partir da metanálise de 15 artigos foram selecionados os desfechos de fechamento do CIA, complicações e reprocedimento. Proposto um modelo matemático de árvore de decisão que foi utilizado para estimar a razão custo efetividade entre o procedimento de cirurgia convencional e o implante percutâneo com oclusor septal, através do software TreeAge 2012 Pro. O desfecho utilizado como dado de eficácia foi o número de cirurgias realizadas. Determinação dos custos: calculou-se o consumo de recursos variáveis de acordo com o volume de atendimentos entre 2007 e 2010, em um hospital especializado em cardiologia de alta complexidade do Ministério da Saúde. Custos fixos específicos: procedimentos e serviços hospitalares e profissionais foram determinados a partir de valores tabelados retirados do Sigtap (Sistema de Gerenciamento da Tabela de Procedimentos, Medicamentos e OPM do SUS, versão 1.2.0909141204; competência novembro de 2012). **RESULTADOS:** Reprocedimento: cirurgia = 0,37%; implante = 1,44% ; complicações: cirurgia = 12,87%; implante = 3,89%; fechamento: cirurgia = 99,11%; implante imediato = 93,23% e implante Follow-up = 95,21%; custos cirurgia: procedimento = R$ 22.045,70; complicações = R$ 1.038,28; custos implante percutâneo: procedimento = R$ 17.671,87; complicações= R$ 421,02. Ao rodarmos o modelo de árvore de decisão; o resultado foi favorável ao implante percutâneo, com um custo de R$18.408,86, com a probabilidade de ocorrência de cirurgia em 7% dos casos. **CONCLUSÕES:** O fechamento da comunicação interatrial por implante percutâneo de oclusor septal demonstrou ser o procedimento mais custo efetivo, quando comparado a cirurgia convencional.

PCV25

ANÁLISIS DE COSTO-EFECTIVIDAD DE IOXAGLATO VERSUS IODIXANOL EN ANGIOGRAFÍA CORONARIA

Simbaqueba E[1], Huerfano L[1], Uriza LF[2], Romero M[1]

[1]*Fundacion Salutia, Bogotá, Colombia,* [2]*Hospital Universitario San Ignacio, Pontificia Universidad Javeriana, Bogotá, Colombia*

OBJECTIVOS: Realizar un analisis de costo-efectividad del uso de ioxaglato en angiografía coronaria comparado con iodixanol, en pacientes con evento coronario agudo (ECA), desde la perspectiva del tercero pagador en Colombia. **METODOLOGÍAS:** Se diseñó un árbol de decisiones que simula los eventos clínicos relacionados con la angiografía en pacientes con ECA, en un horizonte temporal de un mes. Para un paciente con síndrome coronario agudo con edad promedio de 40 años, esperanza de vida de 74 años y peso promedio de 65 kg, sometido a angiografía coronaria con el uso de ioxaglato o idioxanol en dosis de 320 mgI/ml, se estimó como desenlace la sobrevida medida en años de vida salvados (AVS). El modelo incluye la posibilidad de presentar re-infarto y/o muerte durante y después de la realización del procedimiento (hasta un mes). Los costos de las tecnologías y los eventos fueron estimados de la base de datos estatal de costos y del sistema de precios de medicamentos (SISMED) en pesos colombianos del 2012. **RESULTADOS:** El ioxaglato mostró mayor efectividad (1,1 AVS) frente a iodixanol (29,3 frente a 28,2 respectivamente) y un ahorro de COP$ 833.079, mostrando así dominancia en las condiciones evaluadas. El análisis de sensibilidad probabilístico tipo Montecarlo, mostró que se mantenía la dominancia en el 65% de los casos en 1.000 iteraciones y con variaciones de +/- 50% de los datos. **CONCLUSIONES:** El uso de ioxaglato frente a iodixanol, en las condiciones del caso base y tomando como referencia el desenlace analizado basado en la probabilidad de re-infarto durante el procedimiento de angiografía secundario a un ECA, se muestra como la opción de elección por su mayor efectividad y menores costos, desde el punto de vista del tercero pagador en Colombia.

PCV27

COSTO-EFECTIVIDAD DE CLOPIDOGREL VERSUS TICAGRELOR, AMBOS EN COMBINACIÓN CON ASA, PARA EL MANEJO DEL SÍNDROME CORONARIO AGUDO, DESDE LA PERSPECTIVA DEL SISTEMA DE SALUD PRIVADO EN MÉXICO

Reyes A[1], Araceli C[2]

[1]*Hospital Infantil de México Federico Gomez, MEXICO, Mexico,* [2]*Sanofi Mexico, MEXICO, Mexico*

OBJECTIVOS: Realizar una evaluación económica de clopidogrel versus ticagrelor, ambos en combinación con ASA, para el manejo del síndrome coronario agudo en México. **METODOLOGÍAS:** Se utilizó un modelo de markov para evaluar distintos desenlaces clínicos a partir del grado de función renal de los pacientes con síndrome coronario agudo, desde la perspectiva del sistema de salud privado en México. Los parámetros clínicos incluyeron riesgos de hemorragia, EVC, infarto y muerte, los cuales fueron extraídos de ensayos clínicos y estudios epidemiológicos. Los datos de costos fueron tomados de los tabuladores de reembolso disponibles en los sitios de internet de las compañías aseguradoras, y las estimaciones de costos estuvieron apoyadas por opiniones de expertos. Se realizaron análisis de sensibilidad univariados. Los resultados están expresados en dólares americanos a un tipo de cambio de 12 pesos mexicanos por dólar. **RESULTADOS:** En la cohorte de pacientes con función renal alterada el costo por año de vida ganado con ticagrelor fue de 4168 dls; sin embargo, en los pacientes con función renal normal clopidogrel resultó dominante sobre ticagrelor. En cuanto a hemorragias evitadas y EVC evitados, clopidogrel también resultó dominante sobre ticagrelor en ambas cohortes de pacientes. El costo por infarto evitado con ticagrelor fue de 20,493 dls en los pacientes con función renal alterada y de 2486 dls en los pacientes con función renal normal. **CONCLUSIONES:** Clopidogrel resultó una estrategia dominante sobre ticagrelor en la mayoría de los desenlaces evaluados, tanto en pacientes con función renal como alterada, por lo que puede generar ahorros para los pacientes, mientras ofrece un mejor perfil de seguridad.

PCV28

COST-UTILITY OF DAGIBATRAN FOR CHRONIC ATRIAL FIBRILLATION IN ARGENTINA

Ferrante D[1], Rudich V[2], Stuart P[2]

[1]*Ministry of Health, Argentina, Buenos AIres, Argentina,* [2]*Boehringer Ingelheim, Munro, Argentina*

OBJECTIVES: Dabigatran has shown to be effective in preventing embolic events in chronic atrial fibrillation patients, but it's cost-utility has not been assessed in Argentina. Therefore, our objetive was to estimate the cost-utility of dabigatran used in recomended doses (220mg and 300mg) for the prevention of thromboembolic events in chronic atrial fibrillation. **METHODS:** A Markov model was constructed to simulate a national cohort of patients aged 65 or more, with chronic atrial fibrillation. The strategies compared were dabigatran (220 or 300 mg according to age and kidney function) or coumarins. Markov states were no events, ischemic stroke (with different severities), hemorragic strokes (with different severities) and death. Baseline characteristics were introduced in the model from a recent National Registry. Stroke risk was estimated from baseline characteristics using CHADSVASC2 score. Mortality was estimated from events and age specific mortality. Relative risks both preventing embolic events and bleeding were obtained from RELY study. Resource use was obtained from the National Admissions Database for stroke admissions and major bleedings. Costs were obtained from national health providers, both for anticoagulation costs and admission costs. Discount rate was 3%, costs and effects. The results were expressed in incremental cost-utility ratios (Argentinean pesos-ARS-per QUALY, 1 USD=5 ARS). Sensitivity analysis variables: stroke risk, 95% CI of relative risks of RELY study, stroke costs. **RESULTS:** In the base case analysis, dabigatran in 220 or 300mg doses shown to be more effective than coumarins (incremental QUALYs 0.49), with and incremental cost of ARS 5,923, resulting in an ICER of 12,040 ARS per QUALY gained. Dabigatran was associated with higher drug costs, but lower events costs. In all one way sensitivity analysis, dabigatran remained as a cost-effective strategy. **CONCLUSIONS:** Dabigatran is a cost-effective strategy for anticoagulation in chronic atrial fibrillation patients in Argentina, even considering different population characteristics, resource use and costs of ower local setting.

PCV29

COST-UTILITY OF APIXABAN COMPARED TO WARFARIN FOR STROKE PREVENTION IN PATIENTS WITH ATRIAL FIBRILLATION IN COLOMBIA

Rosselli D[1], Rueda JD[1], García ÁA[1], Rodriguez-Morales AJ[2], Garrido Lecca S[3], Vargas Zea N[4], Juarez Garcia A[5], Mould JF[6], Donato BMK[7]

[1]*Pontificia Universidad Javeriana, Bogotá, Colombia,* [2]*Universidad Tecnológica de Pereira, Pereira, Colombia,* [3]*Bristol-Myers Squibb Company, Lima, Peru,* [4]*Pfizer S.A.S., Bogota, Colombia,* [5]*Bristol-Myers Squibb Mexico City, Mexico DF, Mexico, Mexico,* [6]*Pfizer, New York, NY, USA,* [7]*Bristol-Myers Squibb Company, Wallingford, CT, USA*

OBJECTIVES: To evaluate the cost-utility of apixaban vs warfarin for stroke prevention in patients with atrial fibrillation (AF) from the Colombian health care system perspective. **METHODS:** A validated Markov decision model was adapted from the Colombian Healthcare system perspective. For efficacy and safety inputs, the model is based on data from the ARISTOTLE trial and clinical trials of warfarin therapy for AF. Resource utilization and costing of events were estimated using a reference hospital's billing records and validated with local experts. Costs of procedures were obtained from official tariffs (adjusted ISS 2001). The cost of medications were obtained from SISMED. The study set the price of apixaban at parity price per day to dabigatran 150mg. A discount rate of 3.5% was used for both costs and outcomes. A cohort of 1,000 patients was modeled using a lifetime horizon. Probabilistic sensitivity analysis (PSA) to account for variability in outcomes due to statistic uncertainty in inputs as well as univariate sensitivity analyses to examine the effects of changes in key model parameters were performed. **RESULTS:** Warfarin therapy resulted in a quality-adjusted life expectancy of 8.20 years at a cost of $14,906,026 COP. Treatment with apixaban led to a quality-adjusted life expectancy of 8.64 years at a cost of $23,064,028 COP. The cost-utility ratio was calculated at $ 18,392,415 per QALY. Our findings were robust in univariate sensitivity analyses varying model inputs across plausible ranges. In Monte Carlo analysis, apixaban was cost-effective in 80% of simulations using the recommended threshold for Colombia by the Ministry of Health of $36,000,000 COP per QALY. **CONCLUSIONS:** Apixaban is a cost-effective alternative relative to warfarin for stroke prevention in patients with AF in Colombia, assuming that it is introduced at a price similar to that of dabigatran.

PCV30

CORRELACIÓN ENTRE LOS NIVELES DE LDL-C FRENTE AL RIESGO DE PRESENTACIÓN DE EVENTO CARDIOVASCULAR

Simbaqueba E, Romero M

Fundacion Salutia, Bogotá, Colombia

OBJECTIVOS: Encontrar la correlación entre la presentación de eventos cardiovasculares, infarto agudo de miocardio (IM) y evento cerebro vascular (ECV), con los niveles de colesterol de baja densidad (LDL-c) en prevención primaria, que sirva como una herramienta para la toma de decisiones sobre acciones específicas para el manejo del tema en Colombia. **METODOLOGÍAS:** Se realizó una revisión de literatura científica en diferentes bases de datos, seleccionando estudios clínicos que mostraran el uso de las estatinas en prevención primaria, en pacientes con alto riesgo cardiovascular, y que reportaran desenlaces discriminados por eventos cardiovasculares. Los desenlaces de los estudios de presentación de eventos cardiovasculares se ajustaron a tasas por cada mil pacientes. Se realizó un análisis econométrico por medio de una regresión lineal, con el fin de encontrar el término de correlación de una variable frente a otra, como lo han sugerido previamente varios autores. **RESULTADOS:** Se seleccionaron ocho estudios que utilizaban diferentes estatinas y placebo con resultados en los desenlaces analizados (IM y ECV) ajustados en periodos por año de exposición. Los pacientes de los estudios no eran diferentes en sus características generales, excepto el nivel de LDL-c. Se encontró que la tasa de presentación de IM presenta un coeficiente de correlación de 0,015 frente al cambio de 1 mg/dL de LDL-c para niveles de LDL-c>130 mg/dL ($p<0,05$). Para el riesgo de presentación de ECV, se presentó un coeficiente de 0,003 ante el cambio de 1 mg/dL, ($p<0,05$). **CONCLUSIONES:** Se evidenció una relación positiva estadísticamente significativa entre los niveles de LDL-c y la tasa de presentación de los eventos. Sin embargo la probabilidad de presentación de un IM es mucho más sensible comparado con el de ECV ante cambios en los niveles de LDL-c en prevención primaria. Aunque esta aproximación sugiere una corelación, es necesario estudios clínicos que lo comprueben.

CARDIOVASCULAR DISORDERS – Patient-Reported Outcomes & Patient Preference Studies

PCV31
PROXY UTILITY ASSESSMENT IN ACUTE HEART FAILURE

Swinburn P[1], Shingler SL[2], Ong SH[3], Lloyd AJ[4]
[1]*Oxford Outcomes, An ICON plc Company, Oxford, UK,* [2]*Oxford Outcomes, An ICON Plc Company, Oxford, UK,* [3]*Novartis Pharma AG, Basel, Switzerland,* [4]*Oxford Outcomes Ltd., an ICON PLC Company, Oxford, Oxon, UK*

OBJECTIVES: Acute heart failure (AHF) is amongst the most common causes of hospitalisation in the U.S. with direct costs estimated to be $20.9 billion in 2010. Reducing the duration of hospitalisation for such conditions can have a significant impact on resource use and may also have substantial benefit for individual patients.The aim of this study was to estimate quality of life (utilities) for patients hospitalised with AHF, expressed as a utility score between 0 [dead] and 1.0 [full health] . These data could be used to support an analysis of the cost effectiveness of an intervention in AHF. **METHODS:** Proxy assessments of HRQL were collected from 50 experienced cardiac nurses (formal caregivers) and 50 family caregivers of individuals who had experienced AHF events leading to hospitalisation (informal caregivers). Data were collected retrospectively for four time points (day 1, 3, 5 and 7 post cardiac event) using the EQ-5D health status instrument. **RESULTS:** The results suggest that HRQoL is poor for hospitalised patients but quickly improves over time in response to treatment. Formal caregivers reported HRQoL to be substantially poorer for individuals immediately after admission to hospital when compared to informal caregivers. By day 7 however, formal caregivers rated patients' HRQoL as being better when compared to informal caregivers' assessments. **CONCLUSIONS:** Collection of utility data in severe acute conditions is challenging. This study represents an attempt to capture such values through the use of proxy assessment. The data suggest that hospitalization due to AHF is associated with very poor HRQoL, at least in the short term. Utility values for early assessments approximate those for conditions such as advanced cancers or major stroke. By day 7 however these values demonstrate significant improvement and a return to near normal general population levels.

PCV32
DISPOSICIÓN A PAGAR Y ANÁLISIS DE CONJOINT PARA DETERMINAR LAS PREFERENCIAS POR LOS PRODUCTOS MEDLEY EN MÉXICO

Camacho A[1], Soto H[2]
[1]*Sanofi Mexico, Mexico, Mexico,* [2]*Iteliness, Mexico, Mexico*

OBJECTIVOS: Identificar los atributos que definen a un producto como Accesible. Considerando las preferencias de los médicos para prescribir y los pacientes. **METODOLOGÍAS:** Estudio analítico semi cuantitativo, cualitativo y prospectivo en pacientes con enfermedades crónicas que usan productos farmacéuticos y médicos prescriptores de productos de estas enfermedades, desde el punto de vista del sector privado en México. Se aplicaron dos técnicas complementarias, disposición a pagar y análisis de Conjoint. Se elaboraron instrumentos de recolección de datos tanto para la prescripción como adquisición por parte del paciente. Se utilizaron métodos estadísticos tanto descriptivos como inferenciales (regresiones simples, modelos ANOVA y modelos LOGIT). **RESULTADOS:** Se entrevistaron entre 15 y 20 médicos por cada especialidad. Los aspectos más importantes para los médicos al momento de prescribir un medicamento son tanto la eficacia como la seguridad, en tercer y cuarto lugar queda la tolerabilidad y el apego al fármaco. Cuando se les cuestionó sobre prescribir un fármaco genérico se encontró que para el 50% de los medicamentos el precio representa el principal atributo. Se entrevistaron 120 pacientes que padecieran alguna enfermedad crónico-degenerativa, los cuales dieron mayor pesos para elegir un medicamento de patente fueron la eficacia y la seguridad. Para los medicamentos genéricos, la eficacia fue el atributo mayor pero el precio desplazó a la seguridad. Se identificó que la cantidad a pagar por un medicamento Genérico es del 63.93% del precio del medicamento de patente. Por otra parte importa la escolaridad de la gente para elegir el medicamento. **CONCLUSIONES:** Al considerar los atributos de accesibilidad los productos Medley son productos que se consideran accesibles, ya que ofrecen eficacia y seguridad y a su vez, tienen un precio accesible para la población.

CARDIOVASCULAR DISORDERS – Health Care Use & Policy Studies

PCV33
EVOLUÇÃO DO USO DE MEDICAMENTOS GENÉRICOS NO TRATAMENTO DE DOENÇAS CRÔNICAS – PBM BRASILEIRA

Salles GRD[1], Ferreira CN[2], Santana CFSD[1], Paloni EDMP[2], Drago S[3], Bonachela F[4], Souza C[3], Abreu AA[3]
[1]*Orizon, Sao Paulo, Brazil,* [2]*ORIZON - Companhia Brasileira de Gestão de Serviços, Sao Paulo, Brazil,* [3]*ORIZON, Sao Paulo, Brazil,* [4]*Orizon, SAO PAULO, SAO PAULO, Brazil*

OBJETIVOS: Analisar a evolução na aquisição de medicamentos genéricos ao tratamento de doenças nos últimos quatro anos em amostra brasileira. **MÉTODOS:** Utilizou-se uma amostra de 14.425 participantes do programa de benefício de medicamentos da PBM (Programa de Benefício de Medicamentos) Orizon, que consumiram medicamentos de uso crônico para tratamento de Hipertensão Arterial Sistêmica Sistêmica (HAS), Dislipidemia (DL) e Diabetes Mellitus (DM), nos últimos 4 anos (2009 à 2012) e verificou a evolução do uso destes medicamentos. **RESULTADOS:** Houve aproximadamente 56% em unidades vendidas de medicamentos genéricos ao longo dos últimos 4 anos, contra 44% dos medicamentos de marca (referência ou similar). A diferença no percentual da quantidade de unidades de medicamentos genéricos vendidos, comparados com os de marca foi de 9,44% em 2009, 11,42% em 2010, 13,84% em 2011 e 16,28% em 2012. Os medicamentos genéricos atingiram cerca de 1% de aumento ao ano representou cerca de R$ 430mil nos anos de 2009 a 2011, sendo que em 2012 houve um decréscimo na quantidade de medicamentos utilizados no ano. **CONCLUSÕES:** A adesão ao tratamento das doenças crônicas HAS, DL e DM foi em sua maioria com o uso de medicamentos genéricos que representaram aproximadamente 56% das unidades vendidas nos últimos 4 anos, crescimento no qual foi progressivo e constante no período. Dado a vasta cadeia de descontos fornecida por fabricantes de medicamento genérico auxilia na adesão e persistência ao tratamento de crônicos, demonstrado que o valor do medicamento na compra influencia o tratamento.

PCV34
PROJEÇÃO DE GASTOS COM MEDICAMENTOS DE USO CRÔNICO (AMBULATORIAL)

Paloni EDMP[1], Ferreira CN[1], Santana CFSD[2], Drago S[3], Salles GRD[2], Souza C[3], Abreu AA[3], Bonachela F[4]
[1]*ORIZON - Companhia Brasileira de Gestão de Serviços, Sao Paulo, Brazil,* [2]*Orizon, Sao Paulo, Brazil,* [3]*ORIZON, Sao Paulo, Brazil,* [4]*Orizon, SAO PAULO, SAO PAULO, Brazil*

OBJETIVOS: Projetar gastos com medicamentos de uso contínuo para patologias crônicas, para usuários com plano de beneficio farmácia estimando o grau de sua utilização. **MÉTODOS:** Utilizou-se um estudo descritivo de uma população no total de 574.640 vidas, com alto subsidio na aquisição de medicamentos, utilizando o banco de dados da Orizon com mais de 16 milhões de vidas que captura informações de consumo de medicamentos pelo plano de beneficio farmácia (PBM) no ano de 2012. Foram estimadas as incidências e os gastos mensais com a compra de medicamentos para uso crônico de Hipertensão (HAS), Insuficiência Cardíaca Congestiva (ICC), Insuficiência Cardíaca Obstrutiva (ICO), Doença Pulmonar Obstrutiva Crônica (DPOC), Asma e Diabetes *Mellitus* (DM), transformando este consumo em dose diária definida (DDD), seguindo *a Anatomical Therapeutic Chemical Code*(ATC) e dividimos por faixa etária para chegar ao valor médio mensal de DDD por faixa etária. O valor da DDD para projeção do custo foi calculado baseado nos preços de janeiro de 2013, informados pela Câmara de Regulação do Mercado de Medicamentos (CMED) considerando medicamentos de A à Z. **RESULTADOS:** As patologias cardiovasculares HAS, ICC e ICO a incidência mensal foi de 6,03%, consumo médio de 89,63 DDDs e custo R$ 1,01 / DDD, as patologias repiratórias DPOC e Asma a incidência mensal foi de 0,39%, consumo médio de 35,45 DDDs e custo de R$ 3,50 / DDD e para a patologia de DM dividida em hipoglicemiantes orais e injetaveis (insulinas), o resultado para os orais foi: incidência mensal de 1,89%, consumo médio 47,14 DDDs e custo de R$ 2,26 / DDD e para os injetaveis (insulinas) a incidência foi de 0,32%, consumo médio de 35,21 DDDs e custo de R$ 7,47 / DDD. **CONCLUSÕES:** Modelo utilizado para projetar o grau de utilização e gastos com medicamentos de patologias crôncias, para beneficio de farmacia.

PCV35
ESTIMATING THE IMPACT OF STATIN THERAPY ON DIRECT AND SOCIETAL COSTS IN MEXICO: A COMPARISON TO SWEDEN

Semilla AP[1], Kowal S[2], Storm M[1], Blanchard T[1]
[1]*IHS Global Inc., Washington, DC, USA,* [2]*IMS Health, Redwood City, CA, USA*

OBJECTIVES: Recent studies have shown a high burden of cardiovascular disease (CVD) risk factors in Mexico, potentially signaling rising levels of CVD-related morbidity and mortality. This study models the cost-effectiveness of statins as a class of drugs for the secondary prevention of key coronary heart disease (CHD) and CVD events, to measure the impact of pharmaceutical innovation on a country-level basis. **METHODS:** The investigation uses a value of innovation model created for Sweden, the site of many early statin trials, and adapted to Mexico to allow a comparison between emerging and developed settings. An 8-state semi-Markov model was used to simulate the effect of statin use on key health events and disease-related societal impacts. Drug impact was modeled at the class level using relative risk reductions based on meta-analyses of international statin trials. The subject of the base-case analysis was a 55 year-old male with lifetime statin use. Individual level findings were scaled to the total population to enable an investigation of cost and health outcome trends at the country level for all incident cases in 2011. **RESULTS:** Over an individual's lifetime, the risk of subsequent myocardial infarctions (MIs) and revascularizations decreased in Mexico (MI, RVC: -3.3%,-0.5%) and Sweden (MI, RVC: -5.3%, -1.6%) due to the use of statins. At the population level, statin use produced lifetime direct cost savings (lowered outpatient, inpatient, and institutionalized costs) of USD$21M in Mexico, and USD$4M in Sweden, as well as indirect costs savings (increased productivity and reduced premature disease-related retirement) of approximately USD$50M (Mexico) and USD$88M (Sweden). **CONCLUSIONS:** In both countries, direct cost savings were smaller in scale than indirect savings, indicating the high value of societal benefits

in both developed and emerging settings. As Mexico's economy continues to grow, the value of investments in health innovation from both a public health and economic perspective will rise.

EVALUATION OF HOME MEDICATION REVIEW IN COMMUNITY OUT REACH PROGRAM

Naik V[1], Nagappa AN[2], Prabhu N[1], Reddy K[1]
[1]*Manipal Univiersity, Manipal, India,* [2]*Manipal University, MCOPS, Manipal, India*

OBJECTIVES: To Establish the value of WHO-FIP Pharmacuetical Care in chronic conditions like diabetes, Hypertnsion and Obesity in a community out reach program. The Pharmaceutical Care program is new concept proposed in 2005, to aid the patient in improving his knowledge in the area of Drug, Disease and Life style by pharmacist. **METHODS:** The patients are approched at thier homes by a panel of health care professionals led by pharmacists. the pharmacist after interacting with the patients make the documentation regarding patient current status of knowlegde, regarding disease, drugs and life style along with his/her condition of health and the life style. The care plan is made by taking into above facts and patients are explained the correct way of using the medicine, the correct life style habits and idea about diet and physical activity. The patients were again approched after a fortnight at thier homes and measurements of Blood pressure, Body Mass Index along with Random blood sugar were carried out . All these values are recorded in a Pharmacuetical care card, which was issued to individual patients. The patients were usually followed upto 3 months in which minimum 6 visits have beed carried out. **RESULTS:** The patients are able to asses the progress of thier condition by following the advice of a health care professional. **CONCLUSIONS:** It is expected that patient will under go a cycle of knowlegde attitude and practice model. For assesing the value of the program, the pre and post evaluation by EQ 5D questionnaire and clinical parameters will be applied.

PCV37

EVOLUCIÓN EN EL URUGUAY DE TAZAS DE UTILIZACIÓN DE CATETERISMO CARDÍACO DIAGNOSTICO PAR A CARDIOPATÍA CONGÉNITA EN MENORES DE 18 AÑOS (1995-2012)

Lombide I, Morales M, Fernandez G, Saona G, Perna A, Gambogi R, Gamboa R
Fondo Nacional de Recursos, Montevideo, Uruguay

OBJECTIVOS: Como resultado del advenimiento del ecocardiograma doppler color (EDC) a fines de los 90, muchas cardiopatías congénitas (CC) son tratadas sin Cateterismo cardíaco Diagnóstico (CCD). En el Uruguay el Fondo Nacional de Recursos financia CCD desde 1981, estando normatizada su autorización desde el 2008. Se cuenta con un registro único nacional de CCD. Objetivos: Conocer la evolución de la tasa de utilización de CCD en población pediátrica, períodos: 1°:1995 – 1999, 2°:2003 - 2007, 3°: 2008 - 2012. **METODOLOGÍAS:** Estudio descriptivo de solicitudes de CCD para CC en menores de 18 años.Las variables analizadas son : año de solicitud, edad, sexo, procedencia, cobertura asistencial, estado de autorización, y población nacional discriminada por edad en forma anual. Para analizar la evolución temporal de las tasas de solicitudes ajustada por edad y sexo se utilizó una regresión Binomial Negativa. **RESULTADOS:** Se observó un descenso significativo de la tasa de solicitudes en el devenir de los períodos analizados (RR= 0,93 IC95%= 0,91 - 0,95). Analizada la tendencia temporal y tomando como referencia el primer período se observa un descenso significativo en las tasas de solicitudes del segundo y tercer período (RR= 0,55 IC95%= 0,43 - 0,70 y RR = 0,37 IC95%= 0,29 - 0,47). Al tomar como referencia el segundo período, se observa un descenso significativo en el tercer período (RR =0,67 IC95%= 0.52- 0,85). **CONCLUSIONES:** El mayor descenso del número de CCD observado en el tercer período podría atribuirse a la introducción de normativas para autorizar la cobertura financiera de CCD por parte del FNR sumado al protagonismo del EDC. La utilización de la normativa resultó una herramienta útil para disminuir el uso de procedimientos innecesarios, optimizando la utilización de recursos.

PCV38

DESIGUALDAD EN SALUD RELATIVA AL INGRESO EN CHILE: ANÁLISIS DE DESCOMPOSICIÓN DEL ÍNDICE DE CONCENTRACIÓN EN HIPERTENSIÓN, DIABETES Y DEPRESIÓN

Cabieses B[1], Espinoza MA[2]
[1]*Universidad del Desarrollo, Santiago, Chile,* [2]*Pontificia Universidad Católica de Chile, Santiago, Chile*

OBJECTIVOS: Existe una clara asociación positiva entre ingreso per cápita y salud. Sin embargo, esta asociación no es tan clara cuando el Producto Interno Bruto percápita (PIBpc) supera de los US$18,000. Esta pérdida de asociación es en buena parte explicada por las grandes diferencias de resultados en salud entre subgrupos de la población, donde uno de sus determinantes más claramente establecidos es el ingreso económico. Chile es un país en vías de desarrollo que pretende llegar el año 2018 a un PIBpc >US$18,000. Toda evaluación de políticas en salud no debe estar circunscrita a promedios poblacionales sino a la distribución de dichos resultados en la población. El objetivo de este estudio fue estudiar la desigualdad en salud relativa al ingreso en Chile para tres enfermedades de alta prevalencia: hipertensión, diabetes y depresión. **METODOLOGÍAS:** A partir de la encuesta CASEN del 2009 (n=246 924), se estimó el índice de concentración de Erreygers ($IC_{Erreygers}$) para cada una de estas enfermedades y se realizó su descomposición basado en una regresión probit para estudiar factores asociados legítimos (edad, sexo, estado marital, número de miembros del hogar, etnia, rural/urbano) e ilegítimos (ingreso, ocupación, educación, calidad de vivienda, previsión de salud). **RESULTADOS:** El $IC_{Erreygers}$ estimado para hipertensión, diabetes y depresión fue de 0,0030; 0,0037 y -0,0012, respectivamente. La descomposición de $IC_{Erreygers}$ indica que la mayor parte de la desigualdad está explicada por la edad en todos los casos (legítimo). Ingreso y ocupación le siguieron de manera consistente en los tres problemas de salud estudiados (ilegítimos). **CONCLUSIONES:** La desigualdad en salud relativa al ingreso en hipertensión, diabetes y depresión en Chile muestra estar fundamentalmente explicada por factores legítimos como la edad. Sin embargo, factores ilegítimos como ingreso, tipo de ocupación y nivel educacional siguen explicando en algún grado la desigualdad observada en salud en esta población.

PCV39

EXPLORING GENDER DIFFERENCES IN POPULATION-BASED PREVALENCES OF CARDIOVASCULAR DISEASES IN CHILE AFTER THE HEALTH CARE REFORM OF 2005

Dressler C[1], Cabieses B[2]
[1]*University of York, York, UK,* [2]*Universidad del Desarrollo, Santiago, Chile*

OBJECTIVES: Cardiovascular diseases (CVDs) are the biggest killer worldwide. Since 2002 the Cardiovascular Health Program exists in Chile and more people with CVDs are treated over time. Few focused evaluations of the equity-centered health care reform of 2005 in Chile have been conducted and none of them with a gender focus. We aimed at analysing the existence of gender differences in the prevalence of CVDs in Chile after this reform. **METHODS:** Secondary analysis of the cross-sectional Chilean Health Survey 2009-2010 (downloaded after approval from the Ministry of Health in Chile; n=5293 adult participants). We explored the relationship between CVDs (hypertension and myocardial infarction) and gender (male/female), crude and adjusted by potential confounders (individual health-risk factors, demographics, socioeconomic status, health care provision). Odds Ratios (OR) were estimated by weighted logistic regressions in Stata 12.0. **RESULTS:** The crude prevalence of hypertensions were 28.13% (95%CI [26.11-30.24]) and myocardial infarcts 3.19% (95%CI [2.47-4.12]). More than half of the population were overweight/obese (39.20%/22.92%) and any alcohol consumption in the past month was high (58.42%). Around 40.19% currently smoke. Regression models indicated that gender was a significant risk factors for hypertensions (OR 1.58, 95% CI: 1.23-2.03) as well as having public health care insurance (OR1.45, 95% CI: 1.01-2.10). However, gender was not a significant predictor of myocardial infarcts, whereas age (OR 1.05, 95% CI: 1.03-1.06) and body mass index (OR 1.05, 95% CI: 1.02-1.09) were significant to this condition. **CONCLUSIONS:** This is the first study on gender patterns of CVDs after health care reform of 2005 in Chile. It uses a national representative survey and it controls for relevant confounders. Results suggest that men were less likely to report hypertension than women. This raises the hypothesis of whether men are being underdiagnosed and whether current CVD programmes in Chile need to attract men that are not defining themselves as sick.

PCV40

TREATMENT PATTERNS OF ATRIAL FIBRILLATION (AF) IN LATIN AMERICA

Leyva-Bravo V[1], Soriano MA[1], González-Rojas GL[1], Nieto WJ[2], Novo FA[3], Guerrero ML[4]
[1]*IMS Health, Mexico City, Mexico,* [2]*Sanatorio de la Trinidad San Isidro, Buenos Aires, Argentina,* [3]*Hospital Alemán, Buenos Aires, Argentina,* [4]*Servicio Medico de la Direccion Ejecutiva de La Magistratura (D.E.M.) Tribunal Supremo de Justicia, Caracas, Venezuela*

OBJECTIVES: Atrial Fibrillation (AF) is the most common chronic arrhythmia occurring worldwide in the presence of other cardiovascular disease. The objective of the current study is to determine real-life treatment patterns for patients with AF in Latin America. **METHODS:** We conducted 59 face-to-face interviews with cardiologists in four Latin American countries--Argentina, Brazil, Chile and Venezuela-- to assess medical treatment. Information from 240 patients from private and public institutions was evaluated using CHADS2 scores to identify patients' risk and to determine treatment. **RESULTS:** Patients with AF undergo a 3-step process to define their treatment course: 1) AF evaluation and diagnosis; 2) AF classification: paroxysmal, persistent, and permanent; 3) Clinical treatment focused on stroke prevention based on symptom relief, optimal treatment of concomitant cardiovascular disease, rate control and correction of rhythm disturbance. Overall in all four countries, analysis shows that the majority of patients with AF were diagnosed right before or at the time of first stroke. The most common type of AF was permanent, except in Chile which was paroxysmal. The preferred antiarrythmic was amiodarone; the primary vitamin K antagonist used was warfarin in Brazil and Venezuela and acenocumarol in Argentina and Chile. **CONCLUSIONS:** Results from the study suggest that there are no significant differences among countries and that the majority treat patients following international clinical guidelines. Although the individual health care systems need to be considered in terms of relationship of treatment patterns with resource use, it is reassuring to note that international standards of care are being embraced in major emerging markets.

INDIVIDUAL'S HEALTH – Clinical Outcomes Studies

PIH1

ANÁLISE COMPARATIVA DOS ANTICONCEPCIONAIS ORAIS COM DIFERENTES CONCENTRAÇOES DE ETINILESTRADIOL EM RELAÇÃO AOS PERFIS DE EFICÁCIA E DE ADESÃO

Freitas MG, Silva AS, Elias FTS
Brazilian Ministry of Health, Brasilia, Brazil

OBJETIVOS: Analisar as evidências científicas disponíveis sobre anticoncepcional oral com apresentação farmacêutica Etinilestradiol (EE) 20mcg + Levonorgestrel (LVG) 100mcg, em comparação com a preparação EE 30mcg + LVG 150mcg. **MÉTODOS:** Foi realizada ampla busca nas bases de dados Medline (via Pubmed), Cochrane Library, Rebrats e CRD. **RESULTADOS:** Dos 53 estudos encontrados na estratégia de busca, apenas uma RS disponível na base de dados The Cochrane Library foi selecionada por apresentar resultados comparados dos mesmos princípios ativos nas dosagens relacionadas à pergunta do estudo. Na RS foram incluídos 21 ECRs, comparando contraceptivos orais combinados com doses de estrógenos maiores ou menores/iguais a 20 µg. Não houve diferenças significativas em termos de eficácia contraceptiva entre os 13 diferentes anticoncepcionais. Encontrou-se risco elevado de distúrbios de sangramento para os ACO de baixa dose de estrógeno (amenorréia ou sangramento irregular, infrequente ou prolongado; sangramento frequente e spotting). Mulheres em uso de EE 20 µg e desogestrel 150 µg foram mais suscetíveis a sofrer sangramento irregular (OR 1.56; 95% IC 1.10 a 2.20) e a ter maior duração do sangramento irregular durante o terceiro ciclo (diferença média de 0.7 dias; 95% IC 0.30 a 1.10) que mulheres em

uso de EE 30 µg e desogestrel 150 µg (Akerlund, 1993). Muitos ACO contendo baixa dose de estrógeno resultaram em altas taxas de descontinuação (global e através de eventos adversos como sangramento irregular). Mulheres em uso de EE 20 µg e desogestrel 150 µg tiveram um OR de descontinuação através de sangramento irregular igual a 2.59 (95% IC 1.35 a 5.00) em relação ao grupo de mulheres em uso de EE 30 µg e desogrestrel 150 µg (Akerlund 1993). **CONCLUSÕES:** Reduzir a concentração de estrógenos para melhorar a segurança pode resultar em baixa adesão em função de mudanças inaceitáveis nos padrões de sangramento.

COST EFFECTIVENESS EVALUATION OF A ROTAVIRUS VACCINATION PROGRAM IN ARGENTINA

Garcia Marti S[1], Alcaraz A[2], Valanzasca P[3], Mc mullen M[1], Standaert A[4], Garay U[5], Lepetic AC[6], Gomez JA[7]

[1]*Institute for Clinical Effectiveness and Health Policy, Buenos Aires, Argentina,* [2]*Institute for Clinical Effectiveness and Health Policy (IECS), Buenos Aires, Argentina,* [3]*Institute for Clinical Effectiveness and Health Policy (IECS), CABA, Argentina,* [4]*GlaxoSmithKline, Wavre, Belgium,* [5]*IECS Institute for Clinical Effectiveness and Health Policy, Buenos Aires, Argentina,* [6]*GlaxoSmithKline, Buenos Aires, Argentina,* [7]*GlaxoSmithKline, Victoria, Argentina*

OBJECTIVES: Rotavirus diarrhea is one of the most important vaccine-preventable causes of severe diarrhea in children worldwide. There are two vaccines licensed Rotarix® (monovalent attenuated human rotavirus strain) by GlaxoSmithKline and RotaTeq® (pentavalent live human-bovine reassortant vaccine) by MSD with similar results. This study aim was to evaluate the cost-effectiveness of incorporating monovalent rotavirus vaccine 2-dose scheme (Rotarix®) compared with the pentavalent vaccine 3-dose scheme (Rota-Teq®) in the national immunization schedule of Argentina. **METHODS:** A deterministic Markov model based on the lifetime follow up of a birth cohort was used. QALYs as an effect measure, health care system perspective and a 5% discount rate for health benefits and costs have been used. A review of the literature to obtain epidemiologic and resources utilization data was performed. The sources used to estimate the epidemiologic parameters were the National Health Surveillance System, the national mortality statistics and national database of hospital discharges records. Costs are expressed in local currency. PAHO 2012 Revolving Fund vaccine prices were used. **RESULTS:** Rotarix® prevented 177,254 rotavirus cases, 19,376 hospitalizations and 31 deaths while Rotateq® prevented 165,022, 17,882 and 28 events respectively. Both vaccination strategies were less costly and more effective than the strategy without vaccination (total costs $69,700,645 and 2,575 total QALYs lost). When comparing vaccination schemes Rotarix® was less expensive ($ 60,174,508 vs. $ 67,545,991 total costs) and more effective (1,105 vs. 1,213 total QALYs lost) than Rotateq®, being the dominating strategy. Probabilistic sensitivity analysis showed results to be robust of being cost-effective at a WTP threshold of 1 GDP per capita when comparing the 2-dose scheme vs. no vaccination or the 3-dose scheme one. **CONCLUSIONS:** In Argentina both rotavirus vaccination schemes dominate the no vaccination strategy and Rotateq® (3-dose scheme) was dominated by Rotarix® (2-dose scheme), being this results robust in the sensitivity analysis.

ROLE OF ANTIOXIDANTS IN RECURRENT PREGNANCY LOSSES, LOW BIRTH WEIGHT, AND GESTATIONAL DURATION

Bhatti TA

Health Services Academy, Islamabad, Pakistan

OBJECTIVES: To study the impact of antioxidants on the maternal and child health of women with Recurrent Pregnancy Loss (RPL) and healthy pregnancies. The three main variables studied for the purpose included (i) low birth weight (LBW), (ii) gestational duration (GD) and (iii) RPL with a history of RPL. **METHODS:** The study was conducted in two parts. Study 1 focused on the impact of antioxidants on mothers with RPL with a sample size of 123 mothers out of 200 cases. Study 2 focused on the impact of antioxidants on LBW and GD included a sample of 900 women with healthy pregnancy of 6 months. Each of the study groups were divided in to experimental (active arm) and control group (placebo arm). It was hypothesized that 1) Oral antioxidant supplementation will reduce the rate of recurrent pregnancy loss; 2) Oral supplementation of antioxidants during pregnancy will increase the birth weight of the child; and 3) Oral supplementation of antioxidants will decrease premature births. **RESULTS:** it was found in study 1 that antioxidant supplementation reduced the chances of RPL as the chances of conception in women in the active arm increased by 36%. Study 2 revealed that the chance of LBW was reduced by 15% in women that received antioxidant supplements and the average weight of their infants in the active arm increased by 0.30kg. It was found that the gestational period for women in the active arm increased by 12 days and they were 30 times more likely to give birth within their expected date of delivery (EDD). Lastly, it was also found that maternal and neonatal mortality was also reduced by 4.4% and 2.9% respectively. **CONCLUSIONS:** It is conclusion that antioxidants be made mandatory for normal pregnant women and especially women of RPL.

CALIDAD DE PRESCRIPCIÓN DE ANTIBIÓTICOS EN EL SERVICIO DE PEDIATRIA DE UN HOSPITAL GENERAL DE CARDENAS, TABASCO, MÉXICO

Zavala-González MA[1], Sánchez-Santana R[2]

[1]*Consultor Independiente, Cárdenas, Tabasco, Mexico,* [2]*Secretaría de Salud del Estado de Tabasco, Cárdenas, Tabasco, Mexico*

OBJECTIVOS: Evaluar la calidad de la prescripción de antibióticos en el servicio de pediatría del Hospital General de Cárdenas, Tabasco, México, en el año 2010. **METODOLOGÍAS:** Estudio de utilización de medicamentos, de tipo transversal. Se estudió un universo de N=678 expedientes de pacientes atendidos durante 2010, se tomó una muestra probabilística simple (p=0.15, d=0.05, Z=1.6) de n=152 expedientes seleccionados sistemáticamente a intervalos de k=5. Se recopiló información sobre antibióticos prescritos, diagnóstico, uso del antibiótico y esquema terapéutico; se evaluó la calidad de la prescripción comparando el esquema prescrito contra las guías de práctica clínica y la farmacopea Pediadosis. La información se sistematizó y analizó utilizando Epi Info versión 3.5.1 para Windows, se obtuvo estadística descriptiva. **RESULTADOS:** El 80.3% de los pacientes recibió antibióticos (n=122). La media de antibióticos prescritos fue 1.8, en un intervalo de 1-4, la moda fue 2. Diagnósticos más frecuentes: gastroenteritis 16.4% y bronconeumonía 9.8%. Uso de los antibióticos: profiláctico 2% y terapéutico 98%. Antibióticos más frecuentes: amikacina 37.4%, ampicilina 25.6% y dicloxacilina 13.7%. Vía de administración más frecuente: intravenosa 87%. La calidad de la prescripción fue inadecuada en 93%. Errores de prescripción más frecuentes (individuales): duración inadecuada 79.9%, dosis inadecuada 63% y medicamento inadecuado 57.5%. **CONCLUSIONES:** La calidad de prescripción de antibióticos en la unidad médica es preponderantemente inadecuada, se requieren estretegias de intervención educativas y gerenciales para dar solución al problema. Se sugiere evaluar la calidad de prescripción de otros grupos de medicamentos en todos los servicios médicos del hospital.

ANÁLISIS DE IMPACTO PRESUPUESTAL DEL USO DE LNG SIU COMO MÉTODO DE CONTRACEPCIÓN EN COLOMBIA

Acero G, Romero M

Fundacion Salutia, Bogotá, Colombia

OBJECTIVOS: Analizar el impacto presupuestal de incorporar el Sistema Intrauterino Liberador de Levonorgestrel (SIU-LNG) en el sistema de salud colombiano como método de contracepción reversible de larga duración. **METODOLOGÍAS:** Tomando como referencia un modelo de costo-efectividad que muestra el beneficio del uso de SIU-LNG, se realizó un modelo de impacto presupuestal de la adición del SIU-LNG al sistema de salud. Tomando como referencia la población estimada en Colombia para 2012 y los datos de uso de estos métodos de planificación de la Encuesta Nacional de Demografía y Salud 2010, se estimó el impacto para una cohorte fija y con incremento poblacional del uso del SIU-LNG con una tasa de reemplazo anual del 30%, hasta 5 años, incluyendo costos directos de salud. Se realizó un análisis de sensibilidad univariado, realizando variaciones en la tasa de remplazo. **RESULTADOS:** El impacto que tendría SIU-LNG para el sistema de salud como método de contracepción usando cohorte fija sería de USD$ 30.422.297,03 (USD$ 0,65 per cápita) en el primer año, disminuyendo anualmente hasta llegar a un impacto acumulado de USD$ 0,31 per cápita a 5 años. Con incrementos anuales de población similar a la tasa de crecimiento poblacional, el impacto acumulado al quinto año sería de USD$ 0,42 per cápita, correspondiente a USD$ 19.969.830,10. Tomando como referencia el valor per cápita asignado para 2012, éste implicaría un impacto de 0,21% para el primer año, de -0,02% y -0,03% para el segundo año en cohorte móvil o fija, respectivamente. **CONCLUSIONES:** Los resultados muestran que la incorporación de SIU-LNG como método de planificación en el sistema de salud colombiano genera ahorro en el gasto a partir del segundo año en las condiciones del caso analizado y su impacto es bajo frente a los beneficios en calidad de vida que podría generar.

A TIME-MOTION COMPARISON OF ITEMIZED TREATMENT COSTS IN FIRST VERSUS SUBSEQUENT CYCLES OF IN VITRO FERTILIZATION (IVF): TREATMENTS CAN OPTIMIZED FOR IMPROVING OUTCOMES WHILE INCREASING PATIENT VOLUMES IN COST-CONSTRAINED REGIONS

Jones C[1], Carpinello O[1], Erten MZ[1], Sills ES[2]

[1]*University of Vermont - College of Medicine, Burlington, VT, USA,* [2]*Pacific Reproductive Center, Irvine, CA, USA*

OBJECTIVES: To anlayze the differences in initial versus subsequent fresh in vitro fertilization (IVF) cycles with regard to personnel time, consumables and other resources. **METHODS:** A cross-sectional observational study of 120 patients. Observations were made during regular clinic hours in the clinical rooms of a UK fertility centre and its affiliated embryology department from January 1, 2002 to December 31, 2002. The average time per task was determined for each component of treatment by averaging the observed duration for five distinct observations. For each member of staff and each component of treatment, the total time (in hours) was estimated by multiplying the duration of attendance by a) the percentage of patients undergoing each treatment component and b) the frequency of attendance by each staff member, which allowed for the weighted average of personnel time and costs along with standard deviations to be calculated. **RESULTS:** When consumables were included, each initial cycle cost the clinic approximately £2246.57 +/- £151.01. The total amount of time patients spent with staff during subsequent fresh IVF cycles was much less than initial cycles, at 6.94 +/- 2.44 hours. The time spent with staff equated to £257.53 +/- £90.77, while each subsequent fresh cycle cost the clinic approximately £1813.12 +/- £90.77. A total of 9.77 +/- 4.94 more staffing hours were spent with patients during initial IVF cycles compared to subsequent fresh IVF cycles. This decrease in staffing time created a £319.52 +/- £176.19 difference between initial and subsequent fresh cycles, while the diminished use of consumables on subsequent treatment cycles accounted for a cost-reduction of £113.93. Thus, subsequent fresh IVF cycles were, on average, £433.45 +/- £176.19 less than initial cycles. **CONCLUSIONS:** The details of our study give insight, particularly in cost-constrained regions, how clinic management may be conducted in a cost-efficient manner.

COSTO-EFECTIVIDAD DE CARBETOCINA EN COMPARACIÓN CON OXITOCINA PARA PREVENIR HEMORRAGIA POSPARTO POR ATONÍA UTERINA EN PACIENTES CON FACTORES DE RIESGO EN COLOMBIA

Rueda C, Caceres LA, Caicedo Navas AG

Independiente, Bogotá, Colombia

OBJECTIVOS: La hemorragia postparto (HPP) es la principal causa de mortalidad materna, el 75% de los casos de HPP son causados por atonía uterina, por lo

tanto seleccionar una terapia costo efectiva para prevenir la HPP, es vital para los países en vías de desarrollo. Los objectivos de este estudio son de evaluar lo costo-efectividad e impacto presupuestal de carbetocina en comparación con oxitocina para prevenir hemorragia posparto por atonía uterina en partos con factores de riesgo. **METODOLOGÍAS:** El modelo incluye un árbol de decisión en Excel y las medidas de efectividad fueron: el uso de dosis de uterotónicos adicionales, pérdida de sangre durante el parto y perfil de seguridad incluyendo los eventos adversos que se presentan durante la preparación y administración del medicamento, todos los parámetros clinicos fueron extraídos de evidencia científica y meta-análisis. El horizonte temporal corresponde a la duración de la estancia hospitalaria. Se incluyeron los gastos hospitalarios para atención de parto por cesárea, los costos de uterotonicos adicionales y los relacionados a la preparación y administración de medicamentos. Los valores se tomaron de manuales tarifarios y listados de precios (Farmaprecios, SISMED, ISS). A los costos de eventos adversos se les aplico un coeficiente de ajuste obtenido del Health at a Glance 2011: OECD (Organisation for Economic Co-operation and Development). **RESULTADOS:** Los pacientes que recibieron carbetocina requieren significativamente menos uterotónicos adicionales que los que recibieron oxitocina (RR 0,65, IC del 95%: 0,53 a 0,80). El costo promedio de tratamiento por paciente con oxitocina es 115USD, y con carbetocina 76USD. En una cohorte de 1000 pacientes el ahorro es de 38.530USD. El análisis de sensibilidad con +/- 10% no modifico los resultados. **CONCLUSIONES:** Carbetocina es una terapia costo ahorrativa en Colombia para prevenir HPP en pacientes con factores de riesgo.

ECONOMIC EVALUATION OF NASOGASTRIC HYDRATION VERSUS INTRAVENOUS HYDRATION FOR INFANTS WITH BRONCHIOLITIS: A RANDOMISED TRIAL

Murphy B[1], Carter R[1], Oakely E[2], Borland M[3], Neutze J[4], Acworth J[5], Dalziel S[6], Krieser D[7], Babl F[8]

[1]*Deakin University, Victoria, Australia,* [2]*Royal Children's Hospital, Melbourne, Australia,* [3]*Princess Margaret Hospital, Western Australia, Australia,* [4]*Kidz First Hospital, Auckland, New Zealand,* [5]*Royal Children's Hospital, Brisbane, Australia,* [6]*Starship Children's Hospital, Auckland, New Zealand,* [7]*Sunshine Hospital, Victoria, Australia,* [8]*Royal Children's Hospital, Victoria, Australia*

OBJECTIVES: Bronchiolitis is a disease of the lower respiratory tract with peak incidence in the winter. It is the leading cause of hospitalization during the first year of life and a major cause of morbidity and mortality. The estimated cost of the Victorian bronchiolitis hospital admissions for 2006 was $8.1 million dollars. Nasogastric hydration (NGH) and intravenous hydration (IVH) are two techniques for fluid replacement therapy, required in approximately 20% of children admitted with bronchiolitis, however there is a lack of agreement on which method is most beneficial. **METHODS:** The study was a multi-centre, three-year, open, randomized trial comparing NGH and IVH in children between two months and 12 months of age who were admitted to hospital with bronchiolitis and required non-oral fluid rehydration. The setting was seven hospitals in Australia and New Zealand between 2009 and 2011. The primary outcome was 'length of hospital stay', with secondary outcomes covering 'intensive care admission' (ICU), 'adverse events' (AEs) and 'number of attempts at insertion'. An economic evaluation was conducted alongside the trial to assess which approach is more cost-effective, as judged by their net 'cost per child ready for discharge' ratio. Each study site collected cost data covering treatment activities and outcome data including medical interventions, mediation received, complications, need for ICU admission and level of respiratory support. The reference year was 2009. **RESULTS:** A total of 759 infants were randomised: 378 to IVH and 381 to NGH. There was no statistically or clinically significant difference in the mean length of stay, ICU admission or AEs between treatment groups. Success at insertion on first attempt was higher in NGH (85.1%) compared to IVH (56.1%), p<0.001. **CONCLUSIONS:** The full results of the economic evaluation will be presented. With no significant difference in outcomes the economic analysis was reduced to a cost-minimisation study.

PIH9

COSTO-EFECTIVIDAD DE LAS CINTAS DE URETRA MEDIA COMPARADAS CON EL TRATAMIENTO CONVENCIONAL DE LA INCONTINENCIA URINARIA FEMENINA DE ESFUERZO EN COLOMBIA

Lopez-Ramos HE[1], Garcia-Perdomo H[2], Prieto-Martinez V[3], Rosselli D[4], Cortes V[5]

[1]*Universidad del Rosario, Bogotá, Colombia,* [2]*Universidad del Valle, Cali, Colombia,* [3]*Universidad Nacional de Colombia, Bogotá, Colombia,* [4]*Pontificia Universidad Javeriana, Bogotá, Colombia,* [5]*Clinica Colsubsidio, Bogotá, Colombia*

OBJECTIVOS: Estimar la costo-efectividad de las cintas de uretra media comparadas con la colposuspensión retropúbica y el cabestrillo pubovaginal en pacientes con incontinencia urinaria femenina de esfuerzo en Colombia. **METODOLOGÍAS:** Se construyó un árbol de decisión para comparar las cintas de uretra media con la colposuspensión retropúbica y el cabestrillo pubovaginal en el tratamiento quirúrgico de la incontinencia urinaria femenina de esfuerzo. La perspectiva fue la del tercero pagador, incluyendo todos los costos directos para el sistema de salud. Todas las cifras monetarias se expresaron en pesos Colombianos de 2011. La unidad de resultado fue la mejoría clínica definida como paciente continente o seca. Los datos de efectividad y seguridad se extrajeron de la literatura. Se calculó la razón de costo-efectividad incremental. Se realizaron análisis de sensibilidad univariados y probabilísticos para los costos, efectos y supuestos del modelo. **RESULTADOS:** Los resultados del modelo indican que el costo por un caso adicional de mejoría clínica del cabestrillo comparado con la colposuspensión fue de $10.967.742. El costo por un caso adicional de mejoría clínica de las cintas comparadas con el cabestrillo fue de $6.551.724. **CONCLUSIONES:** Desde el punto de vista económico, bajo los supuestos del modelo y desde el punto de vista del tercero pagador, las cintas de uretra media para el tratamiento de mujeres con incontinencia urinaria de esfuerzo son costo-efectivas para Colombia. Los resultados fueron sensibles a los costos de los procedimientos quirúrgicos y a la efectividad de los mismos.

EVALUACIÓN COSTO-EFECTIVIDAD Y DE VALOR SOCIAL DE UN PROGRAMA DE INTERVENCIÓN EN POBLACIÓN INFANTIL EN SITUACIÓN DE VULNERABILIDAD, REZAGO O DÉFICIT EN EL DESARROLLO INTEGRAL - CHILE 2012

Vallejos C[1], Reveco R[1], Bachelet VC[2], Goyenechea M[2], Velasquez M[1], de La Puente C[1], Bustos L[1], Zaror C[1]

[1]*Universidad de La Frontera, Temuco, Chile,* [2]*Medwave Estudios Ltda., Santiago, Chile*

OBJECTIVOS: En 2009 se crea el Sistema Intersectorial de Protección Social, para facilitar el pleno desarrollo de las potencialidades de los niños y niñas en Chile. Así, los niños tienen una evaluación periódica del desarrollo psicomotor, y ante la presencia de déficit o retraso, acceden a alguna de cuatro modalidades de intervención: Sala de Estimulación, Visita Domiciliaria, Ludoteca, y Servicio Itinerante de Estimulación. Estas modalidades se ejecutan en todo el país, y su implementación ha significado un importante costo. El objetivo del estudio es realizar un análisis costo-efectividad y de valor social de las intervenciones en Chile. **METODOLOGÍAS:** Se estudiaron los costos con técnica de microcosteo. Se determinaron costos sociales. La efectividad se estudió aplicando el Test Batelle antes y después de la intervención. Con estos datos se construye un modelo de simulación de la historia natural (no intervención) y de los efectos de la intervención en estudio. Para evaluar el valor social de las intervenciones, se aplica un instrumento de medición de deseabilidad y disponibilidad a pagar. **RESULTADOS:** Los costos de las intervenciones presentan importante variabilidad interregional. Las intervenciones son efectivas,y hay diferencias de efectividad entre ellas. La evaluación costo-efectividad muestra que la inversión por un niño recuperado es alta, y resulta costo-efectiva en la medición del efecto estimado a largo plazo (edad escolar y productividad). La disponibilidad a pagar y la deseabilidad social de este Programa es, en general alta, pero notoriamente mayor en las regiones más extremas del país. **CONCLUSIONES:** La evaluación costo-efectividad de un programa de intervenciones destinado a igualar oportunidades de desarrollo en las edades más precoces (0 a 4 años) es materia de desafío metodológico, pero necesario para el decisor político. Es importante destacar que además de las medidas de efectividad, se agrega la dimensión del valor social, lo cual pondera significativamente la costo-efectividad.

ANÁLISIS COSTO-UTILIDAD DE DOS ALTERNATIVAS PARA EL TRATAMIENTO DE BEBÉS PREMATUROS EN BOGOTÁ

Castillo M[1], Bernal AJ[1], Rios JJ[1], Ruiz JG[2], Charpak N[3], Córdoba MA[4], Córdoba MA[4]

[1]*Universidad de los Andes, Bogotá, Colombia,* [2]*Pontificia Universidad Javeriana, Bogotá, Colombia,* [3]*Kangaroo Foundation, Bogotá, Colombia,* [4]*Hospital Universitario San Ignacio, Bogotá, Colombia*

OBJECTIVOS: El manejo habitual que se les da a los bebés prematuros consiste en mantenerlos hospitalizados en una unidad neonatal. Como alternativa al tratamiento habitual se considera el Método Madre Canguro (MMC), el cual busca obtener una reducción importante en los costos de hospitalización y disminuir los riesgos de infecciones nosocomiales, entre otros. Se realizó un análisis de costo-utilidad de las alternativas, el cual considera aspectos cualitativos y cuantitativos. **METODOLOGÍAS:** Se diseñó una metodología para realizar un análisis de costo-utilidad de alternativas de tratamiento médico, la cual se aplicó a los manejos de bebés prematuros en Bogotá, Colombia. Para la medición de utilidad se utilizó el enfoque de Teoría de Utilidad Multiatributo que permite, a través de una función de utilidad aditiva, evaluar el desempeño de seis variables relevantes en la valoración del estado de salud de cada uno de los bebés incluidos en el análisis. El costo se estimó con base en un procedimiento de micro-costeo de los recursos consumidos por cada bebé, bajo cada tratamiento. Finalmente, se calcularon las razones incrementales de costo-utilidad (RICU) de los tratamientos. Los modelos se realizaron con base en los resultados del estudio Charpack, Ruiz, Calume, & Charpack, 1997, el cual registra datos de 593 prematuros con mediciones desde su nacimiento hasta cumplir el primer año. **RESULTADOS:** Los valores promedio estimados para MMC y el manejo habitual, en utilidad fueron 0.876 y 0.809, y en costos Col$2'810.531 y Col$2'997.643, respectivamente. La utilidad presentó diferencia estadística significativa, a diferencia de los costos. La RICU estimada fue Col$-2'783.236, lo cual indica que el MMC no solo es más efectivo sino menos costoso. **CONCLUSIONES:** Del análisis de Costo-Utilidad realizado, se puede afirmar que el MMC como alternativa al cuidado en incubadoras de prematuros estables, con peso de nacimiento menor de 2000g, domina al manejo habitual.

MEASUREMENTS OF ADHERENCE TO ORAL THERAPIES AMONG BRAZILIAN PATIENTS: A SYSTEMATIC REVIEW

Takemoto MLS, Guerra R, Fernandes RA, Pereira ACP, Santos PML, Amaral LM, Vasconcellos JF

ANOVA, Rio de Janeiro, Brazil

OBJECTIVES: To systematically review the measures of adherence to oral therapies employed in Brazilian observational studies. **METHODS:** Observational studies that evaluated adherence to oral therapies among Brazilian patients of any disease or condition were identified by searching Medline and LILACS, without time limits, using a combination of controlled vocabulary and text words for 'adherence'. To be included studies had to fully report methods to assess adherece to oral drugs and be conducted with Brazilian patients. Studies examing only persistence measures or using lost to follow-up as a proxy to adherence were not deemed eligible. Articles were independently reviewed by two researchers to identify relevant studies and abstract methodological data. **RESULTS:** Of the 472 records identified, 61 full-text articles were included in the final version of this review. The most frequent therapeutic areas were Infectious Diseases (37.7%), Cardiology (24.6%), and Endocrinology (8.2%) – HIV/AIDS represented 36.1% of all studies, while High Blood Pressure contributed with 13.1% of the included papers. Sixteen studies adopted more than one adherence measures (81 differente evaluations in 61 studies). The most frequently used adherence measures were: self-reported (n=30, 37.0%), the Morisky test (n=19,

23.5%), and pharmacy records (n=7, 8.6%). Different versions of the Morisky test were identified (modified, 4-item, and 8-item). Other validated adherence questionnaires identified within the studies (with more than one occurence) were: MAT (n=3) and MedTake (n=2). Pill counting, medical chart review, and serum drug determination were used in 4 studies each. None study used electronic monitoring of adherence. **CONCLUSIONS:** Data from the available Brazilian studies indicate a variety of methods adopted by local researchers for measuring adherence to treatment. Indirect measures are more common, particularly those based on patients' or caregivers' perception of adherence behaviors. Most studies enrolled HIV/AIDS or hypertension patients. Other chronic conditions with long term continuous oral therapies were underrepresented.

PROMETEX - PROMEVOZ, TOOL SUPPORT OF PHARMACEUTICAL CARE FOR THE SCOPE OF PROPER ADHESION IN COLOMBIA, 2009-2012

Estrada JI[1], Serna JA[2], Toro CM[3], Rios J[4], Sanchez L[3], Suarez JE[1]
[1]*CES University, Medellin, Colombia,* [2]*EAFIT University, Medellin, Colombia,* [3]*Antioquia University, Medellin, Colombia,* [4]*Granada University, Medellin, Colombia*

OBJECTIVES: To determine if the tool *Prometex – Promevoz*, helps in reducing the drug therapy use problems identified in the Pharmacotherapy Monitoring for pharmaceutics. **METHODS:** Prometex – Promevozis a tool for telephony (voice and text messages) you want, combined with other strategies, to maintain and increase drug compliance, remembering the exact times of taking medication. With prior consent, information is sent to all medications they are prescribed, coded for strictly personal interpretation and handling of confidential and bidirectional. A descriptive longitudinal, which includes users with at least two visits to Pharmacotherapy Monitoring, a pre and post-deployment of telephony tool. Demographic variables are analyzed and compared in an exploratory way in the same population type and amount of drug therapy use problems at the beginning and end of use of the tool. **RESULTS:** A total of 25.6% of patients had at least 1 drug therapy use problems during the first consultation of Pharmacotherapy Monitoring, a situation that changed after the use of *Prometex – Promevoz*, which decreased the proportion of patients with drug therapy use problems to 16.7%. A decrease between the two observations of 53.3% with a chi squeare (ji^2) of 9,56 and a p value of 0,002. **CONCLUSIONS:** The tool Prometex – Promevoz appears to contribute to the decline in drug therapy use problemsidentified in the Pharmacotherapy Monitoring.

PIH14

PATIENT-REPORTED OUTCOMES: ARE THEY WORTH IT? AN EXAMINATION IN PRO VALUE THROUGH CASE STUDIES

DeMuro C[1], Gnanasakthy A[2]
[1]*RTI Health Solutions, Research Triangle Park, NC, USA,* [2]*Novartis Pharmaceuticals, East Hanover, NJ, USA*

OBJECTIVES: Increasing competition, pressure from payers and greater regulatory constraints require pharmaceutical manufacturers to seek methods for product differentiation. One way of differentiating pharmaceuticals is the generation of patient-centric value messages utilizing patient-reported outcomes (PROs). PROs may be primary or nonprimary endpoints in clinical trials, and commercial use is typically dependent on PROs that support key endpoints and appear in labeling (US) or in the summary of product characteristics (EU) to support reimbursement. However, despite this obvious utility, the cost and logistical complexity of including PROs may deter clinical teams. The purpose of this research is to better understand the value of PROs and the ability of PROs to provide data critical to decision making for patients, clinicians, and payers. **METHODS:** A detailed case study was conducted of three marketed products: ivacaftor, mirabegron, and botulinum type A. Selection of these products represent a range of therapeutic areas and may provide insight into the differing roles of PROs. For each product available US and European submission and review documents were analyzed. **RESULTS:** PROs were included in all three submissions. A PRO labeling claim was granted for a primary endpoint for mirabegron, and while claims for nonprimary PROs were denied, the review documents indicate that the decision for drug approval was supported by results of the nonprimary endpoints. Ivacaftor was granted a claim based on a nonprimary PRO endpoint, though the tool did not meet the specifications of the FDA's PRO guidance. Finally, health authorities recognized the impact on health-related quality of life for botulinum type A for migraine in support of a positive appraisal. **CONCLUSIONS:** The results of this review indicate that PROs included in clinical trials may have a strong influence on the drug approval process, regardless of whether a PRO labeling claim is ultimately granted. Further research is warranted.

PIH15

THE PATIENT-REPORTED OUTCOMES MEASUREMENT INFORMATION SYSTEM IN SPANISH

Arnold BJ[1], Correia H[2], Pérez B[1], Lent L[1], Cella D[2]
[1]*FACITtrans, Elmhurst, IL, USA,* [2]*Northwestern University, Chicago, IL, USA*

OBJECTIVES: The Patient-Reported Outcomes Measurement Information System (PROMIS®) provides accurate and efficient measurement of patient-reported outcomes. Developed in English using qualitative methods, PROMIS tools measure symptoms, such as pain and fatigue, and aspects of health-related quality of life across a wide variety of chronic diseases and conditions. **METHODS:** To enable participation of Spanish-speaking populations the PROMIS banks were translated into Spanish using methods that would ensure linguistic equivalence and cultural appropriateness. The Spanish translation of 825 adult and 156 pediatric items was obtained through the FACIT Multilingual Translation Methodology which consists of the following ten steps: 1) creation of item definitions; 2) two simultaneous forward translations; 3) reconciliation of forward translations; 4) back-translation of reconciliation; 5) expert review of back-translation and previous steps; 6) preliminary finalization for pilot-testing; 7) cross-cultural harmonization; 8) quality assurance; 9) cognitive testing with native speakers of Spanish; and 10) finalization of translations based on analysis of qualitative data collected during pilot-testing. In an effort to create a universal Spanish version, linguists from various Spanish-speaking countries were recruited to achieve a translation that could be used in all regions in which Spanish is spoken. **RESULTS:** After the translation phase was completed, psychometric testing was carried out. 485 adult items and 139 pediatric items from 11 subdomains were tested with native Spanish speakers (2,500 adults and 1,200 children) from an online general population panel. Different item banks exhibited various levels of differential item functioning (DIF) across Spanish and English speaking populations. In order to retain all items in each bank, a hybrid approach was used in which English calibration metrics were used for non-DIF items and Spanish calibrations were used for items exhibiting DIF. **CONCLUSIONS:** Spanish Computer Adaptive Tests (CATs) for Anxiety, Depression, Fatigue, Physical Function and Sleep Disturbance are currently available in Assessment Center (www.assessmentcenter.net).

PRELIMINARY RESULTS QUALITY OF LIFE, PHYSICAL ACTIVITY, AND SEDENTARY BEHAVIOR IN COLLEGE STUDENTS

Mendoza FJ, Parra G, Bastardo YM
Universidad Central de Venezuela, Caracas, Venezuela

OBJECTIVES: Being physically active is associated with reduced risk of chronic diseases. In this study we examined the associations of physical activity and sedentary behavior with perceived quality of life (QoL) in college students in Venezuela. **METHODS:** A convenience sample of 64 students at Central University of Venezuela, ranging in age from 17 to 43 years was surveyed using a written questionnaire. Quality of life was measured using a single-item from the Health Survey Short-Form 36 (SF-36), EuroQol health states descriptive system (EQ-5D), and a visual analogue scale (EQ-VAS). The relationships between health status, physical activity, and sedentary behavior were estimated computing Kendall's τ correlation coefficients. Statistic analysis was performed by SPSS 13.0. **RESULTS:** The sample consisted of 41 females and 22 males. The sample had a mean age of 20.54 years (s.d. 3.99 years). Two subjects (3.2%) reported some problems with mobility. Three subjects (4.8%) reported some problems with usual activity. Ten subjects (15.9%) reported some problems with pain. One subject (1.6%) reported extreme problems and 10 reported some problems with anxiety. Three subjects (4.8%) rated health status of fair or poor. Subjects reported doing vigorous physical activities on a mean of 2.05 days during the past week. Subjects reported walking for a mean of 93.49 minutes during the past week. Subjects reported spending a mean of 301.31 minutes sitting during the past week. Neither physical activity nor sedentary behavior was associated with quality of life in our population. **CONCLUSIONS:** Study limitations include the sample size and the use of a convenient sample. Overall, this exploratory study demonstrates that the quality of life of college students in Venezuela was good.

COMPARED ANALYSIS OF INEQUALITIES IN HEALTH AND INFLUENCE OF SOCIAL DETERMINANTS OF HEALTH IN CUBA AND USA

Diaz de León-Castañeda C[1], Ramírez-Fernández DM[2], Pinzon Florez CE[1]
[1]*Instituto Nacional de Salud Pública, Cuernavaca, Mexico,* [2]*National Institute of Public Health, Cuernavaca, Mexico*

OBJECTIVES: Equity is a desirable goal for health systems performance and the comparison of them is important to learn lessons from the best. In the present study our goal was to analyze comparatively inequalities in health and the influence of social determinants of health in two countries with different social, economical and political contexts: Cuba and USA. **METHODS:** A compared inequalities analysis was made in three health indicators related with the performance of health systems: maternal mortality rate (MMR), infant mortality rate (IMR) and life expectancy at birth (LEB) using published geopolitical unities information from USA and Cuba in 2008 and through the computation of inequality indexes suggested in literature and statistical analysis. Also there were comparatively analyzed the effects on these health indicators of three proxy indicators of social determinants of health (PISDH's): percent of rural population (PRP), percent of non white population (PNW) and physicians rate (PHR), through the computation of effect indexes for significantly Pearson correlations. **RESULTS:** Cuba showed significantly higher inequality than USA in MMR; USA showed higher inequality in LEB; the inequality in IMR was statistically not different. The PRP was a risk factor for the LEB in USA but a protector factor in Cuba; PNW was a risk factor for MMR and IMR in USA only, although with low effect index; PHR was a risk factor for MMR in USA only, perhaps by his correlation with another PISDH's. **CONCLUSIONS:** Important inequalities were identified in both countries. The PISDH's analyzed affected health indicators principally in USA. Another economic PISDH's are required for more detailed comparative analysis in the effects of PISDH's in health inequalities. There are few comparative analysis of health systems in the literature that employ quantitative methodology as used in this study.

PIH19

ATENCIÓN INTERCULTURAL DEL PARTO VAGINAL EN MÉXICO: COSTOS ECONÓMICOS, DETERMINANTES Y RETOS DE LA IMPLEMENTACIÓN DE POLÍTICAS EFECTIVAS EN BENEFICIO DE LAS MUJERES INDÍGENAS

Heredia I[1], Meneses S[1], Montag D[2], Ibañez M[1], Hernández E[1], González Block MA[1]
[1]*Instituto Nacional de Salud Pública, Cuernavaca, Mexico,* [2]*School of Social and Cultural Anthropology, Oxford, UK*

OBJECTIVOS: Estimar los costos de atención del parto vaginal en unidades del sector público de salud de Oaxaca y Chiapas, para dos modelos asistenciales alternativos (convencional e intercultural), durante 2008-2012 e identificar los principales determinantes de la implementación efectiva y puesta a escala de modelos interculturales de atención materna en beneficio de la población indí-

gena. **METODOLOGÍAS:** Análisis transversal con información de expedientes clínicos de 488 usuarias de los servicios estatales de salud. Se realizó un microcosteo y se estimaron los costos de la utilización de recursos, desde la perspectiva del sector salud. Se realizaron pruebas estadísticas tipo X^2 de Pearson y prueba t para identificar diferencias en las variables de estudio. Los costos se expresan en pesos mexicanos del 2012. Se realizaron entrevistas semi-estructuradas a usuarias y actores de niveles estratégicos, tácticos y operativos involucrados en el diseño e implementación de modelos interculturales en salud materna en ambos estados. **RESULTADOS:** El 66% de las mujeres eran indígenas. 80% de los costos se concentraron en consultas y hospitalización. El costo promedio por este concepto fue de $4188 (modelo convencional) y $4002 (modelo intercultural). Se identificaron dos principales modelos interculturales: el parto vertical y la vinculación entre parteras tradicionales y prestadores de servicios. Existen divergencias entre las expectativas de las usuarias y sus familiares y los actores involucrados en el diseño e implementación de las intervenciones interculturales y escasa conciencia entre prestadores de servicios y tomadores de decisiones sobre la complejidad del significado de la atención intercultural en salud materna. **CONCLUSIONES:** Incorporar elementos interculturales en la atención al parto vaginal, no añade costos adicionales al sector salud, mientras sí puede asociarse con mayor aceptación de las usuarias. Se requiere una mayor coordinación entre los actores, para la implementación efectiva de intervenciones interculturales, en apoyo a las estrategias de reducción de la mortalidad materna.

DYNAMIC MODELING OF VECTOR-BORNE DISEASES (VBD): THE EXAMPLE OF MALARIA

Snedecor SJ
Pharmerit International, Bethesda, MD, USA

BACKGROUND: VBD, such as Chagas disease, dengue, or malaria, are transmitted from to humans by insects or other organisms and can be difficult to control. VBD transmission involves a combination of interactions among multiple factors including animal hosts, vectors, and humans. Dynamic modeling methodologies used to describe infectious disease transmission processes are amenable to a situation when infection and interaction of ≥1 species, as is the case of VBD. This work demonstrates the use of such methodology for the example of malaria. **METHODS:** A dynamic, compartmental model was developed to simulate malarial disease transmission among the human and mosquito populations. The model consists of a mosquito population divided into susceptible, exposed but not infectious, and infectious and a human population including susceptible, exposed but not infectious, infectious but immune and infectious susceptible individuals. Parameters include human and mosquito birth rates and life expectancies, probabilities of disease transmission between humans and mosquitoes, and number of mosquito blood meals per day. The effect of anti-malarial treatment was modeled to assess epidemiologic outcomes under various scenarios. The model was solved analytically to determine the expected number of cases per person per year under each scenario. **RESULTS:** When transmission intensity is low, treatment of infected individuals with a therapy providing a subsequent 15-day period of immunity reduces the incidence of disease from 0.481 with no treatment to 0.475 cases per person per year (pppy). In moderate and very high transmission settings the incidence of disease is reduced from 2.385 to 2.171 cases pppy and 9.899 to 7.007 cases pppy, respectively. **CONCLUSIONS:** This model demonstrates the utility of dynamic modeling methodology to examine the spread of VBD. Several model parameters may be varied to assess the epidemiologic impact of a number of treatments and vector control mechanisms. These models may be expanded for cost-effectiveness analysis.

PIN2
ALTERNATIVE HIGH LEVEL DISINFECTANTS TO PROCESSING FLEXIBLE ENDOSCOPES

Passeri LA, Psaltikidis EM, Leichsenring ML, Nakamura MHY, Burstoff JM
Unicamp, Campinas, Brazil

OBJECTIVES: Endoscopy is fundamental in different medical specialties, with increasing use. Endoscopes are expensive equipment, complex, thermo sensitive, delicate materials and submitted to high-level disinfection (HLD). The most commonly used disinfectant is glutaraldehyde (GLU) due to its high compatibility with the materials and low cost. However, evidence of toxicity to professionals and the identification of mycobacteria tolerant to GLU caused changes in Brazilian legislation on the issue, pressing health services to search for alternative desinfectants. Search for evidence on the effectiveness, toxicity and potential damage to endoscopes by alternative disinfectants to GLU available in the Brazilian market. **METHODS:** The study sample was semi-critical endoscopes flexible (digestive, respiratory and cystoscope), the intervention was HLD with peracetic acid (PA), Ortho-Phthalaldehyde (OP) and Electrolyzed Acid Water (EAW), compared to GLU, with outcomes HLD effectiveness, toxicity and damage to equipment. **RESULTS:** Were identified 822 publications (2008-2013) on 13 databases, 23 studies were selected considering the best quality of available evidence. As for effectiveness, the findings draw attention to the intrinsic resistance of subclass *Coccidia spp* to all evaluated disinfectants and acquired tolerance by GLU strain of *Mycobacterium massilienses* which caused an outbreak of infection with more than 2000 cases in Brazil. About toxicity, the most frequently reported adverse events are colitis (no definitive causal relationship with the germicide used) and anaphylactic reactions by OP in cystoscopy. There is lack of published data on damage caused in endoscopes by the disinfectants; the few studies on the theme indicate the importance of adequate handling of equipment for conservation of its functionality. **CONCLUSIONS:** The publications show superiority of the PA and OP for efficacy in HLD. Only the OP clearly had adverse event related to their use. There is insufficient evidence in literature to assert the inferiority of some disinfectant for damage to equipment.

BURDEN OF VARICELLA IN LATIN AMERICA: A SYSTEMATIC REVIEW AND CRITICAL ANALYSIS

Yang HK[1], Liaw KL[2], Manoff S[2], Kuter B[1]
[1]*Merck & Co, Inc., West Point, PA, USA,* [2]*Merck & Co, Inc., Upper Gwynedd, PA, USA*

OBJECTIVES: Varicella is a common, vaccine-preventable illness with significant public health impact in Latin America (LA). This study aimed to review the epidemiology and economic burden of varicella, and to perform a critical analysis of available data in LA. **METHODS:** A comprehensive literature review was conducted in major databases and government websites to identify published data on epidemiology and economic burden of varicella in LA. Study data were extracted systematically including incidence rates, lifetime prevalence, mortality, type and rates of complications, as well as use of health care resources (hospitalizations, physician office visits, others) and both direct and indirect costs associated with varicella. Critical analyses of study quality and data availability are performed for each country. **RESULTS:** Published studies were identified from ten countries including Argentina, Bolivia, Brazil, Chile, Colombia, Ecuador, Mexico, Paraguay, Uruguay, and Venezuela. Annual incidence rates ranged from 20 per 100,000 in Uruguay up to 381 per 100,000 in Mexico. Incidence was highest among children <10 years of age, bearing increased utilization of healt health care resources. Bimodal seasonal patterns of varicella were reported in Argentina, Mexico and Uruguay. Most frequent complications among hospitalized patients were skin and soft tissue infections, respiratory infections and neurological complications. Patients hospitalized for varicella stayed generally between 1-5 days. Critical analysis suggested that most published studies had limitations including data representativeness and study design issues. Data gaps in the epidemiology and economic burden of varicella were also found on the country level. **CONCLUSIONS:** Currently there is limited information available on burden of varicella in Latin America, potentially due to the lack of mandatory reporting and active surveillance systems for varicella in the region. Country-specific epidemiological information and varicella-related health care resource utilization data are needed to elucidate the disease burden for developing appropriate immunization recommendations and informing decision makers about the value of varicella vaccination.

COSTS AND OUTCOMES ASSOCIATED WITH MULTIDRUG RESISTANT STAPHYLOCOCCUS AUREUS BACTEREMIA

Singh S[1], Tiwari P[2]
[1]*National Institute of Pharm. Edu & Res (NIPER), S.A.S. NAGAR, Punjab, India,* [2]*National Institute of Pharmaceutical Education and Research (NIPER), S.A.S Nagar, India*

OBJECTIVES: There is a dearth of studies in India that quantifies the impact of multidrug resistance on key economic and clinical outcomes. The aim of this retrospective cohort study was to determine the costs of treatment and evaluate the clinical outcomes in patients suffering from multidrug resistant (MDR) *Staphylococcus aureus* bacteremia and compare these with the costs and clinical outcomes of patients suffering from non-MDR *S. aureus*bacteremia. **METHODS:** Data was collected from 2007 through October 2010 from a private tertiary care hospital in India. Multidrug resistance was defined as resistance to ≥3 classes of antimicrobial drugs. Resistance within a class was defined as resistance to ≥1 antimicrobial agent. **RESULTS:** A total of 42 cases were included in the study of which 19 belonged to the MDR cohort and 23 to the non-MDR cohort The total mean cost for treating patients in the MDR cohort was 1.35 times higher compared to the non-MDR cohort (INR 230,000 [170,000-623,000] versus INR 171,000 [91,000-310,000]; P = 0.049). Death was reported in similar number of patients in both the groups (5 patients and 4 patients in the MDR cohort and non-MDR cohort, respectively). The number of deaths attributable to sepsis was also similar between the groups (16% vs. 13%). The total mean length of stay in hospital was significantly longer for the MDR cohort compared with non-MDR cohort (19 days [16-28] vs. 14 days [9.2-18.5]; P = .024). However, after the onset of bacteremia, the difference in the length of stay between the groups was not statistically significant (16 days [14-21] vs. 11 days [8-15.5]; P = 0.12). **CONCLUSIONS:** Multidrug resistance in *S. aureus* bacteremia was associated with a significant increase in hospital costs.

PIN5
COSTOS ECONÓMICOS ASOCIADOS A SECUELAS DE MENINGITIS EN COLOMBIA

Alvis-Guzmán N[1], Coronell-Rodriguez W[1], Castañeda-Orjuela CA[2], De la Hoz-Restrepo F[2]
[1]*Universidad de Cartagena, Cartagena de Indias, Colombia,* [2]*Universidad Nacional de Colombia, Bogotá, Colombia*

OBJECTIVOS: Estimar los costos económicos asociados al tratamiento de secuelas de meningitis en una serie de casos en Colombia. **METODOLOGÍAS:** De la base de datos de 253 pacientes atendidos entre 2009 y 2012 en una institución de rehabilitación ubicada en Cartagena de indias Colombia, se identificaron 37 diagnóstico de meningitis bacteriana y entre estos se confirmaron 19 casos de secuelas. De estos, se microcostearon 13 pacientes con secuelas asociadas a un episodio de meningitis meningocócica verificada por pruebas de laboratorio. Las perspectivas del costeo fueron del sistema de salud y la sociedad. En la primerara se consideraron todos los costos médicos directos originados durante el primer año de tratamiento de la secuela y en los años subsiguientes. En la perspectiva social, adicionalmente se consideraron la compra de órtesis y prótesis, adecuaciones del hogar, gastos de transporte y perdida de de productividad, cuando el cuidador tuvo que abandonar el trabajo para asistir al paciente. Los costos se expresaron en US dólares de 2012 (Tasa de cambio 31 dic 2012 1 USD por COP$ 1768.23). **RESULTADOS:** De los 13 pacientes considerados, 5 tenían secuelas de retardo psicomotor, cuatro de hipoacusia neurosensorial, tres de epilepsia y un trastorno del comportamiento. Desde la perspectiva del sistema de salud, los costos directos de tratamiento para el primer año y cada año subsiguiente fueron US$ 3,106.27 (IC95%: 454.5 – 5,758.0) y US$ 496.1 (IC95%: 449.2 - 509.3); desde la perspectiva social fueron US$ 4,647.1 (IC95%: 4,183.8 – 5,082.3)

y US$ 1,085.7 (IC95%: 1,059.9 – 1,109.14). **CONCLUSIONES:** Los costos incrementales, desde la perspectiva social, revelan una carga económica importante para las familias en el tratamiento de las secuelas de meningitis en Colombia.

COST OF ADULTS> 50 YEARS COMMUNITY-ACQUIRED PNEUMONIA IN ARGENTINA

Giglio ND[1], Micone P[2], Giorgi MA[3], Cursio D[4], Ramirez J[5], Peyrani P[5], Cané A[2]
[1]*hospital de niños ricardo gutierrez, Buenos Aires, Argentina,* [2]*universidad austral, Buenos Aires, Argentina,* [3]*CEMIC, Buenos Aires, Argentina,* [4]*Infectología-Hospital Municipal Chivilcoy, Chivilcoy, Argentina,* [5]*Division of Infectious Diseases, University of Louisville,, Kentucky, KY, USA*

OBJECTIVES: Community-acquired pneumonia (CAP) is an important cause of mortality and morbidity worldwide especially in adults > 50 years. The total cost of CAP in this population is unknown in Argentina **METHODS:** We constructed a Markov model to estimate argentinean health care services use and costs of CAP in 2010 adults > 50 years cohort. Data about incidence and health care utilization were obtained from published reports and a local database. Costs were obtained for the public, social security and private health care subsectors and are expressed in 2012 US dollars **RESULTS:** We estimated that CAP caused 321.321 illness episodes, 24.710 deaths, 189.579 hospitalizations, and 642.643 outpatient visits. Direct medical costs totaled $ USD 340.961.862,9. According to epidemiological data, the public subsector accounted for 32%, the social security for 36.20% and the private for 31.8%. **CONCLUSIONS:** Based on our model the economic burden of CAP is huge in Argentina and it remains an important cause of morbidity, mortality as well.

PIN7

APPROACHES FOR ESTIMATING BURDEN OF PNEUMOCOCCAL AND ROTAVIRUS DISEASES: CONCEPTUAL FRAMEWORK AND SYSTEMATIC REVIEW

Garcia Marti S[1], Alcaraz A[2], Valanzasca P[2], Ciapponi A[3], Bardach A[2], Sinha A[4], Augustovski F[2]
[1]*Institute for Clinical Effectiveness and Health Policy, Buenos Aires, Argentina,* [2]*Institute for Clinical Effectiveness and Health Policy (IECS), Buenos Aires, Argentina,* [3]*Institute for Clinical Effectiveness and Health Policy (IECS), CABA, Buenos Aires, Argentina,* [4]*New Jersey Medical School, Newark, NY, USA*

OBJECTIVES: Country level estimation of disease burden promotes the understanding of the problem and can help prioritize the planning and implementation of programs, and thus foster the better use of scarce resources. Our aim was to review burden of disease (BoD) estimation methods and develop a guidance for conducting local disease burden exercises for pneumococcal and rotavirus diseases in Latin America and the Caribbe (LAC). **METHODS:** We developed an algorithm to guide in a BoD study based on the availability of the different data sources and a systematic review of the different approaches used in the estimation of BoD pneumococcal and rotavirus disease studies worldwide. We followed the MOOSE guidelines for systematic reviews of observational studies, and the PRISMA statement for systematic reviews and meta-analyses. We searched studies published between January 1995 to September 2010 without language restriction on MEDLINE, EMBASE, LILACS, generic and academic Internet search and meta-search engines. **RESULTS:** The algorithm developed include five approaches: based on end results; based on the end and intermediate results (using health services); based on incidence and end results; partial approach; and based on incidence. The systematic review retrieves 1728 articles. After pair assessment, we include 92 in title/abstract phase and finally 35 in full text phase for extraction. Single or multiple approaches based on incidence were the most used (57%), based on intermediate results are in the second place (53%) and based on final results are the least used (43%). 48% of the based on final results studies/substudies, 46% of those based on intermediate results, and 36% of those based on incidence were considered to be representative for the jurisdiction of interest. **CONCLUSIONS:** The present work describes a taxonomy of BoD estimation and provides guidance for LAC and other LMIC countries according to local data availability.

PIN8

A COST-CONSEQUENCE ANALYSIS OF DIFFERENT PROTEASE INHIBITORS SCHEMES FOR HIV TREATMENT FROM THE COLOMBIAN HEALTH CARE SYSTEM PERSPECTIVE

Rueda JD[1], Ariza JG[2]
[1]*Pontificia Universidad Javeriana, Bogotá, Colombia,* [2]*Janssen Cilag, Bogotá, Colombia*

OBJECTIVES: First-line antiretroviral therapy selection provides the greatest opportunity to fully suppress HIV replication and prevent the emergence of drug-resistant strains that lead to treatment failure and compromise future drug treatment strategies. Currently, two alternative protease inhibitors PIs, lopinavir (LPV) and atazanavir (ATV), are included in the Colombian national formulary for the treatment of HIV patients. Darunavir (DRV) boosted with low-dose ritonavir has demonstrated to be an efficacious PI alternative for treatment of experienced and naïve patients. The objective of this study is to compare costs and benefits among different PI sequential algorithms of DRV, ATV and LPV from the Colombian Health Care System. **METHODS:** A decision tree was designed using the insurer perspective to estimate costs and benefits throughout a three years time horizon. Clinical data were obtained from the pivotal trials in order to model second line and rescue progression and benefits were measured as probability of virological response (VR). Only direct costs were considered, such as medications (first line, second line and rescue medications), laboratory tests and rescue related inpatient care costs using national tariffs and prices from Ministry of Health medication database. Four PI schemes were assessed: 1) DRV followed by ATV, 2) ATV followed by DRV, 3) LPV followed by ATZ and 4) LPV followed by DRV. Discount rate 3% and exchange rate (1 USD = 1,794 COP). **RESULTS:** *Direct costs (USD):* DRV-ATV (29,747), ATV-DRV (30,191), LPV-ATV (24,507) and LPV-DRV (24,157). *VR:* DRV-ATV (51%), ATV-DRV (49%), LPV-ATV (43%) and LPV-DRV (43%). *Cost per VR (USD / VR):* DRV-ATV (58,327), ATV-DRV (61,614), LPV-ATV (56,993) and LPV-DRV (56,179). **CONCLUSIONS:** Using DRV after LPV as a first line agent is the sequencing strategy which demonstrates the better cost per virological response. DRV in first line position save costs and improves VR versus ATV in first line position.

PIN9

COSTO EFECTIVIDAD DEL ANTIBIÓTICO ORAL VS. LOCAL EN MUJERES NO GESTANTES CON FLUJO VAGINAL SUGESTIVO DE VAGINOSIS BACTERIANA EN COLOMBIA

Diaz JA[1], Garcia-Molina M[2], Chicaiza L[2], Moreno Calderon JA[2], Prieto Martinez V[2], Gaitán H[3], Ruiz AI[3], Rodríguez A[3], Rincón CJ[2], Urrego J[2]
[1]*Facultad de Ciencias, Universidad Nacional de Colombia, Bogotá, Colombia,* [2]*Facultad de Ciencias Económicas, Universidad Nacional de Colombia, Bogotá, Colombia,* [3]*Facultad de Medicina, Universidad Nacional de Colombia, Bogotá, Colombia*

OBJECTIVOS: Estimar la costo-efectividad del antibiótico oral vs local en mujeres no gestantes con flujo vaginal sugestivo de vaginosis bacteriana. **METODOLOGÍAS:** Se compararon cuatro combinaciones de antibióticos para primera opción y ante falla clínica: clindamicina vaginal y tinidazol oral dosis única; clindamicina vaginal y secnidazol oral dosis única; tinidazol oral dosis única y clindamicina vaginal; secnidazol oral dosis única y clindamicina vaginal. Se construyó un modelo de Markov para representar de manera general la historia natural de la vaginosis bacteriana. El cambio en el tratamiento ante recurrencia sin eventos adversos se modeló como un caso particular mediante un árbol de decisión. La perspectiva fue la del sistema de salud incluyendo todos los costos directos. Todas las cifras monetarias se expresaron en pesos colombianos de 2010. La unidad de resultado fue la mejoría clínica. Los datos de efectividad, seguridad, persistencia y recurrencia se extrajeron de la literatura. Se calculó la razón de costo-efectividad incremental y se realizaron análisis de sensibilidad univariados y probabilísticos. **RESULTADOS:** Tanto para el caso general como el particular, el esquema clindamicina vaginal como primera opción y tinidazol oral dosis única, para tratar persistencia con eventos adversos y recurrencia es una estrategia dominante ya que es menos costosa y más efectiva comparado con los demás esquemas de tratamiento. Para 1.000 pacientes, el costo de la alternativa dominante es de $16.795.411 con mejoría en 985 casos en el modelo general y de $23.979.230 con mejoría en 903 casos en el caso particular. **CONCLUSIONES:** Clindamicina vaginal como primera opción para el tratamiento de la vaginosis bacteriana y tinidazol vía oral dosis única para tratar persistencia con eventos adversos a la clindamicina y recurrencia es costo-efectiva para Colombia. Los resultados fueron robustos a variaciones en los parámetros del modelo.

PIN10

ANÁLISIS DE COSTO-EFECTIVIDAD DE LAS VACUNAS NEUMOCÓCICAS CONJUGADAS 10 Y 13 VALENTE PARA NIÑOS EN ANTIOQUÍA, COLOMBIA

Ordoñez Molina JE, Orozco Giraldo JJ
CES University, Medellin, Colombia

OBJECTIVOS: El *Streptococcus pneumoniae* es responsable de la enfermedad neumocócica invasiva [ENI] (meningitis, bacteremia) y no invasiva (neumonía, otitis media aguda [OMA]). El objetivo de este análisis es estimar la costo-efectividad de las vacunas neumocócicas conjugadas 13-valente (PCV13) y 10-valente (PCV10), en una cohorte de recién nacidos en Antioquia, Colombia. **METODOLOGÍAS:** Se desarrolló un árbol de decisiones. Los comparadores fueron: PCV13 y PCV10 (esquema de vacunación 2 + 1) contra no vacunación (NV); cobertura de vacunación del 90%. Se simuló una cohorte de recién nacidos en Antioquia (85.955 niños), con horizonte de 5 años y 3% de descuento anual. El análisis se realizó desde la perspectiva del sistema de salud. Los valores de eficacia de las vacunas fueron tomados de la literatura. Los costos médicos (US$ 2013) fueron proveídos por una aseguradora nacional, para las vacunas fueron tomados de la OPS. Los desenlaces medidos fueron: casos de enfermedad evitados y muertes prevenidas por ENI, neumonía, OMA y Años de Vida Ganados (AVG) **RESULTADOS:** En 5 años, PCV13 prevendría 52 muertes por infección neumocócica vs NV (PCV10 prevendría 41 muertes vs NV), evitaría 71 casos de ENI vs NV (PCV10 evitaría 55 casos vs NV) y generaría 3.096AVG (691AVG más que PCV10). Los costos médicos evitados serían de US$2.5M con PCV13 y US$1.8M con PCV10. PCV13 y PCV10 son alternativas costo-efectivas vs la no vacunación, con una razón de costo efectividad incremental de US$511.84 y US$737.64 por AVG respectivamente, teniendo en cuenta un umbral de disposición a pagar de 1PIB per cápita por AVG (US$7,235). PCV13 fue dominante frente a PCV10 debido al menor costo total y mejores desenlaces. **CONCLUSIONES:** PCV13 es una alternativa dominante (costo-ahorradora) vs PCV10, como parte de un programa de vacunación masiva para niños de Antioquía, menores de 1 año PCV13 generaría una mayor reducción en la mortalidad infantil a causa de enfermedades neumocócicas.

PIN11

THE HEALTH AND ECONOMIC IMPACT OF A QUADRIVALENT HUMAN PAPILLOMAVIRUS VACCINE (6/11/16/18) IN COLUMBIA: A TRANSMISSION DYNAMIC MODEL-BASED EVALUATION

Kothari S[1], Nwankwo C[1], Pillsbury M[1], Shcheprov A[2], Posso H[3]
[1]*Merck & Co., Whitehouse Station, NJ, USA,* [2]*Reveille Technologies Inc., Durham, NC, USA,* [3]*Nueva Granada University, Bogatá, Colombia*

OBJECTIVES: To estimate the potential impact of a quadrivalent human papillomavirus (HPV) (6/11/16/18) vaccine for the prevention of cervical cancer, cervical intraepithelial neoplasia grades 2 and 3 (CIN2/3), CIN1 and genital warts in Colombia. **METHODS:** We adapted a previously developed transmission dynamic model (Elbasha & Dasbach; 2010) to evaluate the health and economic consequences of routine vaccination of nine year old girls in a dynamic Columbian population over the course of 100 years. We calibrated the model to the observed data of the crude incidence and mortality of cervical cancer, and genital warts attributable to HPV 16/18 and 6/11 respectively. The model assumed 85% vaccine coverage rate. **RESULTS:** At 50 years the model shows cumulative reduction in HPV 16/18 related cervical cancer cases and deaths by 18.1% and 13.9% respectively, and cumulative reduction in the CIN2/3 and HPV 6/11 related CIN1 cases by 46.9% and 59.9% correspondingly. At year 100, the vaccination reduces the annual incidence of HPV 6/11/16/18 related cervical cancer, deaths, CIN2/3 and CIN1 cases by about 99%. At

50 years the model shows 99.5% and 98% reduction in the annual incidence of HPV 6/11 related genital warts cases in females and males respectively. **CONCLUSIONS:** In Colombia, a quadrivalent HPV vaccination program for 9 year old girls can significantly reduce the incidence of cervical cancer, CIN and genital warts.

PIN12

PUBLIC HEALTH IMPACT AND COST EFFECTIVENESS OF PNEUMOCOCCAL VACCINATION FOR ADULTS IN PUERTO RICO

Yang HK[1], O'Brien M[1], Chen J[2], Grabenstein J[1], Dasbach E[2]
[1]*Merck & Co, Inc., West Point, PA, USA,* [2]*Merck & Co, Inc., North Wales, PA, USA*

OBJECTIVES: In 2012, the U.S. Advisory Committee on Immunization Practices (ACIP) revised their 1997 adult pneumococcal vaccination recommendation for certain high-risk adults with immunocompromising conditions to include a sequential regimen of 13-valent pneumococcal conjugate vaccine (PCV13) followed by 23-valent pneumococcal polysaccharide vaccine (PPSV23), while continuing routine PPSV23 use for healthy and immunocompetent adults with comorbidities. This study aims to examine the public health impact of pneumococcal vaccination for adults in Puerto Rico (PR), and cost-effectiveness of 2012 ACIP recommendation relative to 1997 recommendation. **METHODS:** A static cohort model that incorporated lifetime costs, health outcomes, and quality-adjusted life-year (QALY) losses associated with invasive pneumococcal disease (IPD) and non-bacteremic pneumococcal pneumonia (NBPP) was developed for a cohort of 50,000 adults 50 years of age in PR. Cost-effectiveness of three vaccination strategies: 2012 and 1997 ACIP recommendations, and no vaccination, were evaluated using incremental cost-effectiveness ratios (ICERs). Public health impact of the pneumococcal vaccination strategies were examined by estimating net costs and burden of disease prevented by pneumococcal vaccination in PR. **RESULTS:** Compared to no vaccination, pneumococcal vaccination with 2012 ACIP recommendation would reduce IPD cases by 4.4%, NBPP hospitalizations by 0.6%, NBPP outpatient visits by 0.9%, and deaths by 1.0% with a net cost of $1,721,533. Compared to 1997 ACIP recommendation, vaccination with 2012 ACIP recommendation would reduce IPD cases by 0.7%, NBPP hospitalizations by 0.1%, NBPP outpatient visits by 0.1%, and deaths by 0.2% with a net cost of $228,346. Cost-effectiveness analysis showed that compared to 1997 ACIP recommendation, 2012 ACIP recommendation is a more economically efficient strategy (ICER of $14,780 per QALY gained vs. no vaccination). **CONCLUSIONS:** Pneumococcal vaccination in adults would prevent a substantial portion of pneumococcal-related morbidity, mortality, and health care resource utilization use in PR. The 2012 ACIP recommendation appears to be a cost-effective vaccination policy for PR.

PIN13

EFECTO DE LA DETERMINACIÓN DE LA CONCENTRACIÓN CAPILAR DE PROTEÍNA C REACTIVA EN LA TASA DE PRESCRIPCIÓN DE ANTIBIÓTICOS PARA EL TRATAMIENTO DE INFECCIÓN DE VÍAS RESPIRATORIAS ALTAS (ANÁLISIS DE COSTO-EFECTIVIDAD)

Mendez GF[1], Contreras I[2], Keymur-Landeros E[3], Mejia-Arangure E[4]
[1]*Instituto Mexicano del Seguro Social, Jalapa, Mexico,* [2]*Instituto Mexicano del Seguro Social, México City, Mexico,* [3]*Instituto Mexicano del Seguro Social, Mexico, Mexico,* [4]*HOS Health Outcomes Solutions S.A de C.V., Mexico, Mexico*

OBJECTIVOS: En Infección de Vías Respiratorias Altas (IVRA) frecuentemente se prescriben innecesariamente antibióticos, lo que favorece la resistencia e incrementa los costos. Se ha demostrado que la proteína C reactiva (PCR) -marcador de respuesta inflamatoria aguda-, orienta en la prescripción de antimicrobianos. El estudio estimó desde la perspectiva del proveedor de servicios de salud el costo-efectividad de contar con la determinación de PCR en una unidad de atención primaria del Instituto Mexicano del Seguro Social(IMSS). **METODOLOGÍAS:** Entre febrero y junio de 2012, se realizó un estudio comparativo en pacientes con diagnóstico de IVRA, quienes fueron asignado aleatoriamente a un grupo con la determinación de PCR, cuyo punto de corte para apoyar el uso de antibiótico fue > 100 mg/L; o, sin la prueba. En ambos grupos la atención siguió el proceso habitual y los médicos tuvieron libertad de decisión. El seguimiento fue por 7 días. Se midió la tasa de prescripción de antibióticos y la satisfacción del paciente. Los costos se estimaron con los recursos utilizados durante el seguimiento y se expresaron en dólares norteamericanos (tasa de cambio 12.65 pesos/dólar). Se realizó análisis de sensibilidad probabilístico. **RESULTADOS:** Se incluyeron 103 pacientes con PCR y 118 sin PCR. La tasa de prescripción de antibióticos en el grupo de PCR fue 0.33(IC95% 0.23–0.42) y sin PCR 0.81(IC95% 0.73–0.88) p <0.05. El grado de satisfacción con PCR fue 79%(IC95% 71% - 86%) y sin PCR 63% (IC95% 54% - 71%), p = 0.04. El costo promedio de atención con PCR fue US$52(IC95% US$48 – US$57) y sin PCR US$49(IC95% US$45 – US$54), p< 0.05. La utilización de PCR fue dominante en ambos casos y costo-efectivo independientemente de la disposición a pagar. **CONCLUSIONES:** Incluir al proceso de atención de IVRA la determinación capilar de PCR es una alternativa costo-efectiva en el IMSS.

PIN14

ESTIMACIÓN DE LA COSTO-EFECTIVADAD DEL USO DE DAPTOMICINA VS VANCOMICINA EN PACIENTES CON BACTERIEMIA Y/O ENDOCARDITIS POR S. AUREUS RESISTENTE A METICILINA

Paula Micone PM
Universidad Austral, Buenos Aires, Argentina

OBJECTIVOS: Evaluar la CE del uso de D vs V para el tratamiento de B/EI por SAMR en Argentina. **METODOLOGÍAS:** Se consideraron los datos de eficacia y seguridad de D y V en B/EI del estudio de Fowler, VG y col. (NEJM 2006; 355:653). La estrategia de análisis de costos (C) se tomó del estudio de CE publicado por Bhavnani SM y col. (CID 2009; 49:691) en 3 estratos (E): E1 C de drogas; E2 C de fallas de tratamientos y complicaciones; y E3 C de internación. La utilización de recursos médicos y los patrones de tratamiento se estimaron para los tres subsectores de salud (público, seguridad social, y privado) a través de la metodología de casos promedio con panel Delphi de expertos en infectología. Los datos de C se tomaron de una base de datos con prestadores de todo el país y de la base K@iros. Se adoptó la perspectiva del financiador. **RESULTADOS:** La eficacia (curación) reportada fue de 44% para D y 32% para V. Ante falla de tratamiento con D se rotó a V o linezolid y en el caso de V se rotó a D o linezolid. La media estimada de días de tratamiento fue de 24.4, y la de días de internación de 13, con 11.8% promedio de ingreso a UTI. Se estimó el tratamiento con dos ampollas/día de D y 4 de V. Los C por estrato (V vs D) fueron: E1= 31.112$ vs 10.655$; E2=817$ vs 81,4$; y E3=23.292$ vs 23.292$. La CE global por caso de B/EI tratado fue: V=13.5187 $/caso y D=70.901$/caso. **CONCLUSIONES:** Nuestra estimación de CE, indica que una estrategia basada en el uso inicial de daptomicina para el tratamiento de las infecciones mencionadas es más costo-efectiva que utilizar vancomicina, principalmente por los costos relacionados a la falla de tratamiento de vancomicina.

PIN15

COSTO-EFECTIVIDAD DEL DIAGNOSTICO ETIOLÓGICO CON PRUEBAS RAPIDAS VS. SINDROMICO EN MUJERES NO GESTANTES CON SINTOMAS DE INFECCIÓN CERVICAL EN COLOMBIA

Diaz JA[1], Garcia-Molina M[2], Chicaiza L[2], Moreno Calderon JA[2], Prieto Martinez V[2], Gaitán H[3], Ruiz AI[3], Rodríguez A[3], Rincón CJ[2], Urrego J[2]
[1]*Facultad de Ciencias, Universidad Nacional de Colombia, Bogotá, Colombia,* [2]*Facultad de Ciencias Económicas, Universidad Nacional de Colombia, Bogotá, Colombia,* [3]*Facultad de Medicina, Universidad Nacional de Colombia, Bogotá, Colombia*

OBJECTIVOS: Estimar la costo-efectividad de la aproximación etiológica con pruebas rápidas en el sitio de atención vs el diagnóstico sindrómico en mujeres no gestantes con síntomas de infección cervical. **METODOLOGÍAS:** Se construyó un árbol de decisión para determinar la razón de costo-efectividad incremental de la aproximación etiológica con pruebas rápidas: Acon®Plate (Neisseria-Chlamydia), Acon®Duo (Neisseria-Chlamydia) y Acon®Plate (Neisseria)+ QuickVue® (Chlamydia) comparadas con el diagnóstico sindrómico, incluyendo tratamiento con antibióticos a la paciente índice y su contacto sexual, según el resultado. La perspectiva fue la del sistema de salud incluyendo todos los costos directos. Todas las cifras monetarias se expresaron en pesos Colombianos de 2010. La unidad de efectividad fue la mejoría clínica. Los datos de las características operativas de las pruebas se extrajeron de una cohorte de mujeres sexualmente activas (n=1.444). Los resultados de las alternativas diagnósticas se compararon con el patrón de oro (PCR). Los datos de efectividad de los tratamientos fueron tomados de la literatura. Se realizaron análisis de sensibilidad univariados y probabilísticos. **RESULTADOS:** La alternativa más eficaz y más costosa fue Acon®Plate + QuickVue®, seguida de Acon®Duo y del manejo sindrómico. Acon®Plate fue una estrategia dominada. La razón de costo-efectividad incremental de Acon®Plate + QuickVue® fue de $2.782.690 y la de Acon®Duo fue de $597.886. La sensibilidad probabilística confirmó el ordenamiento de las alternativas. **CONCLUSIONES:** Si la disponibilidad a pagar (DAP) por un caso adicional de mejoría clínica es mayor que $2.782.690, Acon®Plate + QuickVue® sería la mejor alternativa en términos de costo-efectividad; de otro lado, si la DAP por un caso de mejoría clínica adicional está entre $ 597.886 y $ 2.782.690, Acon®Duo sería la alternativa costo-efectiva; finalmente, si la DAP por un caso de mejoría clínica adicional es menor que $ 597.886 el manejo sindrómico sería costo-efectivo.

COST-EFFECTIVENESS OF TELAPREVIR IN GENOTYPE 1 CHRONIC HEPATITIS-C VIRUS INFECTION IN VENEZUELA

Garcia Marti S[1], Alcaraz A[1], Valanzasca P[1], Garay OU[2], McMullen M[1], Rey Ares L[1], Obando CA[3], Caporale J[1]
[1]*Institute for Clinical Effectiveness and Health Policy (IECS), Buenos Aires, Argentina,* [2]*IECS Institute for Clinical Effectiveness and Health Policy, Buenos Aires, Argentina,* [3]*Janssen (Johnson & Johnson), Panama City, Panama*

OBJECTIVES: Direct acting antiviral therapies (DAA) in addition to PEG 2a + RBV (PR) are a new therapeutic option with higher rates of sustained virological response (SVR) than dual therapy (PR) alone in chronic hepatitis C. Currently, two alternatives of DAA, telaprevir (TVR) and boceprevir (BOC), are available in Venezuela. The aim of this study was to evaluate the cost-effectiveness of adding TVR to PR in treatment naive and previously treated patients with HCV in Venezuela compared to PR alone and with the addition of BOC. **METHODS:** A lifetime Markov model was developed including HCV, cirrhosis, liver transplant and death as health states. QALYs as an outcome measure, a health care system perspective and a 5% discount rate for health benefits and costs have been used. Costs are expressed in local currency. A review of the literature to obtain epidemiologic and resources utilization data was performed and when data were not available or validation was needed a Delphi panel with local experts was carried out. Deterministic and probabilistic sensitivity analysis was performed. **RESULTS:** In comparison with PR, TVR avoided 174 cirrhosis cases and 20 deaths per 1,000 patients and shown an ICER of $70,149/QALY and $29,689/QALY for the naïve and for the previously treated patients respectively. TVR dominated BOC in naïve patients and in most of the previously treated ones (was less costly and more efficacious), except in the partial responders subgroup. These results were robust in the sensitivity analysis. **CONCLUSIONS:** TVR dominated BOC and was cost-effective against WHO 3GDP criteria in comparison to double therapy from the national health care system perspective in Venezuela.

PHARMACOECONOMICS OF CERVARIX VACCINES AGAINST HUMAN PAPILLOMA VIRUS IN THE REPUBLIC OF KAZAKHSTAN

Nurgozhin T, Gulyaev A, Yermekbayeva B, Kushugulova A, Akhmetova A, Supiev A
Nazarbayev University, The Center for Life Sciences, Astana, Kazakhstan

OBJECTIVES: Based on the pharmacoeconomic analysis determine the feasibility of vaccine against HPV-associated diseases in Kazakhstan. **METHODS:** The number of prevented cases of HPV-related diseases, disability, death, and the size of damage avoided due to vaccination was determined using static pharmacoeconomic MS Excel model which focuses on 4 types of HPV-associated diseases that are targeted by the vaccine "Cervarix" (ASCUS, cervical intraepithelial neoplasia of grades 1, 2, 3 and cervical cancer), 2 outcomes of CC - disability and death. Number of CC cases expected in the cohort for the period of survival was determined based on the relative incidence rates (16.0 per 100 000 female population in Kazakhstan), the cohort of 12 year old girls (122799), and the life expectancy in Kazakhstan (73 years). To determine the value of the case of

HPV-associated diseases, medical technologies used in CC, CIN 1, CIN2, CIN3, ASCUS, the frequency of their use and the price for the services were determined. **RESULTS:** Vaccination cost for cohort of girls (122,799) resulted in 23.2 million USD. The cost of prevented damage is estimated 16.5 million. Additional cost - 6.7 million. Years of life saved - 11172. The coefficient of "cost-effectiveness" of using Cervarix vaccine was calculated for 598 USD for one year of life saved. The cost of prevented damage was identified to be 38.5 million based on the number of prevented cases of CC, CIN 1, CIN2, CIN3, ASCUS and the cost of each case of illness, disability, and death. **CONCLUSIONS:** The cost of potential annual preventative damage/gain as a result of Cervarix vaccine application may reach 38.5 million USD. When comparing the annual preventative damage to the annual cost of vaccination for 12 year old girls in Kazakhstan, the cost of prevention was estimated to be 1.7 times more than the cost of one vaccine cohort.

PIN18

ANÁLISE CUSTO-MINIMIZAÇÃO (ACM) DO CLORIDRATO DE VALGANCICLOVIR COMPARADO COM GANCICLOVIR NA PROFILAXIA DA INFECÇÃO POR CMV EM TRANSPLANTADOS RENAIS

Alves Carvalho L[1], Andrade AM[1], Monteiro WMS[2], Maia RCF[2], Secoli SR[3], Diaz MDM[3]
[1]*Secretaria de Saúde do Estado da Bahia - Brasil, Salvador, Brazil,* [2]*Secretaria de Saúde do Estado do Ceará, FORTALEZA, Brazil,* [3]*Universidade de São Paulo, São Paulo, Brazil*

OBJETIVOS: Realizar Análise Custo-Minimização (ACM) do Cloridrato de Valganciclovir comparado com Ganciclovir na profilaxia da infecção por CMV em transplantados renais. **MÉTODOS:** Os dados acerca da eficácia semelhante dos antivirais foi obtido por meio de Revisão Sistemática. Foram elencadas as seguintes categorias de custo direto: medicamento e materiais descartáveis. Foram simulados três esquemas de profilaxia: Ganciclovir 1g intravenoso (IV) 3x/dia durante período de internação e Ganciclovir 1g VO por 3x/dia até cem dias (Esquema A); Ganciclovir 1g IV 3x/dia durante internação seguido pelo Valganciclovir 900mg VO uma vez/dia até cem dias (Esquema B) e Valganciclovir 900mg VO na internação e após a alta até completar cem dias de uso (Esquema C). Foram feitos os cálculos relativos aos anos de 2010 e 2011 com base no número estimado de pacientes submetidos a transplante de um hospital do Sistema Único de Saúde – Brasil. Os valores dos medicamentos foram obtidos no Banco de Preços em Saúde (BPS) do DATASUS e a lista de conformidade da Câmara de Regulação do Mercado de Medicamentos (CMED) da ANVISA. **RESULTADOS:** Em 2010, o custo médio por paciente do esquema A foi de R$ 18.097,79, do segundo foi de R$ 22.754,63 e do terceiro foi de R$ 21.096,00. Em 2011, o custo médio por paciente do primeiro esquema foi de R$ 16.393,27, do segundo foi de R$ 22.603,35 e o terceiro foi de R$ 22.346,00. **CONCLUSÕES:** Os resultados demonstraram menor custo de profilaxia para CMV com Ganciclovir 1g IV, e o segundo menor com Valganciclovir 900 mg VO. A administração IV do Ganciclovir versus a VO do valganciclovir devem ser analisadas com outros estudos, considerando-se também os riscos inerentes à administração e reações adversas.

ECONOMIC EVALUATION OF TREATMENTS FOR CHRONIC HEPATITIS B

Wiens A, Venson R, Lenzi L, Correr CJ, Pontarolo R
Universidade Federal do Paraná, Curitiba, Brazil

OBJECTIVES: To conduct a cost-utility study in the context of Brazil's Public Health Care System of the drugs adefovir, entecavir, interferon alpha, pegylated interferon alpha, lamivudine and tenofovir for chronic hepatitis B. **METHODS:** For efficacy and safety data, a systematic review was carried out. Utility data and transition probabilities between health states were searched in the literature. The Markov model was developed in a time horizon of 40 years with annual cycles for three groups of patients with chronic hepatitis B: HBeAg positive, HBeAg negative, and all patients. These strategies were compared to a fourth group that received no treatment. Discount rates of 5% were applied and sensitivity analyses were performed. **RESULTS:** Tenofovir offered the best cost-utility ratio for the three evaluated models: U$397, U$385 and U$384 (per QALY, respectively for HBeAg positive, negative, and all patients). All other strategies were completely dominated. The sequence of cost-utility in the three models was: tenofovir, entecavir, lamivudine, adefovir, telbivudine, pegylated interferon alpha, and interferon alpha. In the sensitivity analysis, adenofovir became less cost-utility than telbivudine in some situations. **CONCLUSIONS:** In this study, tenofovir presented the best cost-utility ratio. The results obtained in this study will be valuable in decision-making and in the review of the clinical protocol, mainly involving the allocation of available resources for health care.

EVOLUCIÓN DEL CONSUMO Y VENTAS DE ANTIBIÓTICOS EN CHILE 1998-2012

Villagra G, Jirón M
Universidad de Chile, Santiago, Chile

INTRODUCTION: Desde el año 1999 en Chile se exige la receta médica para la venta de antibióticos (ATB) en farmacias. Hasta el momento se desconoce el efecto a largo plazo de esta medida sobre el consumo y las ventas de ATB. **OBJECTIVOS:** Determinar los niveles y tendencias de consumo y ventas de ATB en Chile antes y después de implementar la venta con prescripción médica. **METODOLOGÍAS:** Mediante un estudio retrospectivo de la base de datos del International Marketing System (IMS), se analizaron las ventas de ATB en farmacias entre 1998-2012. Las unidades vendidas se transformaron en Dosis Diaria Definidas (DDD), DDD/1000 habitantes/día (DHD) y costo/DDD. Las tendencias se analizaron mediante regresiones lineales. **RESULTADOS:** Se observó una disminución del 17% en el consumo de ATB con la aplicación de las medidas regulatorias (11.8 a 9.8 DHD, en 1998 y 2012, respectivamente). No obstante, las quinolonas, cefalosporinas y macrólidos aumentaron un 298%, 31%, 27%, respectivamente, durante el periodo estudiado. La mayor disminución respecto al año 1998 ocurrió en el año 2002 (-38%), mientras que entre 2002 y 2012 hubo un incremento del 34% en el consumo. El costo/DDD disminuyó un 15% entre 1998 y 2003 (0.71 a 0.60 USD/DDD), mientras que entre 2003 y 2012 aumentó en un 47% llegando a 0.88 USD/DDD en 2012. Durante el periodo 2000-2012 el consumo de ATB aumentó un 32% (de 7.4 a 9.8 DHD). El patrón de consumo total estuvo dado principalmente por las penicilinas de amplio espectro (53%, 61.1 DHD), siendo la amoxicilina el ATB más usado (44%, 50,5 DHD). **CONCLUSIONES:** Las medidas regulatorias permitieron disminuir el consumo y los costos/DDD de ATB en Chile. Sin embargo, el aumento progresivo observado indica la necesidad de revisar la calidad en la utilización de los ATB y el cumplimiento de la regulación vigente.

TREATING PSORIATIC ARTHRITIS WITH BIOLOGICAL DISEASE MODIFYING ANTIRHEUMATIC DRUGS: SYSTEMATIC REVIEW AND META-ANALYSIS TO EVALUATE EFFICACY AND SAFETY

Lemos LLP, Reis CAL, Barbosa MM, Oliveira H, Almeida AM, Acurcio FA
Universidade Federal de Minas Gerais, Belo Horizonte, Brazil

OBJECTIVES: To evaluate the efficacy and safety of biological disease modifying antirheumatic drugs (DMARDs) adalimumab, etanercept, golimumab and infliximab in the treatment of psoriatic arthritis (PA) in adults. **METHODS:** We conducted a systematic review of controlled clinical trials to access the efficacy and safety of these agents in patients with active PsA which have or have not been treated with biological DMARDs before. The databases MEDLINE, EMBASE, LILACS and Central Cochrane where searched until February 2013 to identify articles that reported data on clinical improvement measurements and adverse events. Metanalysis were performed using Review Manager® 5.1 and the Random Effect Model. **RESULTS:** Seven RCTs comparing biological DMARDs with placebo where included; two comparing either adalimumabe, etanercept and infliximab to placebo, and one comparing golimumab to placebo. After 12 weeks of treatment, adalimumabe and etanercepte were more effective than placebo with respect to 20% improvement from baseline in the American College of Rheumatology response criteria (ACR 20); Risk Ratio 3.42 ([2.08, 5.63]; I^2 38%) and 4.15 ([2.71, 6.36]; I^2 0%), respectively. After 16 weeks, infliximab patients also achieved ACR20 in a greater rate than placebo; RR 5.71 ([3.53, 9.25]; I^2 0%). However, results after 54 weeks of treatment showed no significant differences between infliximab and placebo; RR 0.98 ([0.82, 1.18]; I^2 0%). Golimumab was more effective than placebo at 24 weeks; ACR20 RR 4.53 ([2.75, 7.48]). After 16 weeks infliximab shown a 50% reduction in the psoriasis area and severity index (PASI50) in a greater rate than placebo, RR 10.67 ([5.52, 20.64]; I^2 1%), however, once again 54 weeks results have shown no significant differences between infliximab and placebo, RR 0.94 ([0.80, 1.12] I^2 66%). Adverse events where similar between the biological and placebo groups, nevertheless the placebo group showed a slightly higher rate of adverse events than adalimumabe; RR 0.68 ([0.50, 0.92]; I^2 0%). **CONCLUSIONS:** Results show clinical improvement with the use of biological DMARs in the treatment of PA. Still, there is a lack of evidence to support the spread the use of these medicines especially in synthetic DMARD naïve patients.

ESTIMATING THE BUDGET IMPACT IN BRAZILIAN PUBLIC HEALTH CARE SYSTEM OF TOCILIZUMAB REIMBURSEMENT AS A RHEUMATOID ARTHRITIS FIRST-LINE BIOLOGICAL THERAPY

Tsuchiya CT, Tobaruella FS, Ramos LA, Buschinelli CT, Maximo MFM, Gonçalves TM
Roche Brazil, São Paulo, Brazil

OBJECTIVES: Rheumatoid arthritis (RA) is a systemic autoimmune disease which affects 0.5% of the population in developing countries. In Brazilian public health care system (SUS) infliximab, etanercept, adalimumab, golimumab, certolizumab (anti-TNF), abatacept (T-lymphocyte activation inhibitor) and tocilizumab (IL-6 inhibitor) are available as biological treatment. However, only anti-TNF therapies are indicated as standard of care for first-line biologic therapy. As tocilizumab is a known effective and cost-saving drug for this indication, the present study aims to evaluate the budget impact of its inclusion in public RA biologics first-line setting. **METHODS:** A model was developed in order to assess the budget impact of tocilizumab reimbursement as a first-line biological therapy under SUS perspective from 2014-2018. Only expenditures with biologics were accounted according to posology presented in Brazilian Ministry of Health RA Guideline considering a mean 67kg-weighted patient. Prices were obtained from public disclosures. Forecasts were made pursuant to government sources (IBGE, DataSUS) and market research-based data. Different mix scenarios based on varying growth rate of tocilizumab usage were assessed to evaluate total savings. A two-way sensitivity analysis was conducted changing diagnosis and biologics use rates. Costs were reported in Brazilian currency (BRL1.00~USD0.51 Feb2013). **RESULTS:** Annual costs per patient were BRL20,002, BRL25,625, BRL26,899, BRL18,330, BRL22,386, BRL15,232 and BRL27,391, for tocilizumab, etanercept, adalimumab, infliximab, abatacept, certolizumab and golimumab, respectively. Concerning different tocilizumab public usage scenarios, if it reaches 20% in 2018, savings could sum BRL143,058,554 (-2.8%) in the analyzed period. Nonetheless by achieving a 40% usage savings would be even higher resulting in a potential BRL318,643,978 (-6.3%) economy in the same period. Sensitivity analysis showed savings ranges of: BRL101,782,493-BRL262,029,470 (20% usage scenario) and BRL228,085,067-BRL579,597,311 (40% usage scenario). **CONCLUSIONS:** The public inclusion of tocilizumab in 2014 as a RA first-line biologic therapy and its usage enhance would result in increasingly savings arousing significant impacts in public health care budget.

AVALIAÇÃO DO IMPACTO ORÇAMENTÁRIO COM A INCORPORAÇÃO DE IMUNOBIOLÓGICOS EM UMA OPERADORA DE PLANOS DE SAÚDE – 2012

Reis HPLC, Magalhães DDP, Vieira JB, Sartori DP, Fonseca DB, Filho AEAM, Barsi UD, Gontei M, Alcantara ACDC, Maciel JAP, Alencar JLL
Unimed Fortaleza, Fortaleza, Brazil

OBJETIVOS: Avaliar o impacto orçamentário com a incorporação de imunobiológicos endovenosos (IMB-EV) em uma Operadora de Planos de Saúde de Fortaleza

- Brasil, no ano de 2012. **MÉTODOS:** Foi delineado em janeiro/2012 um cenário sob a perspectiva da operadora e com os pacientes potenciais de utilização de IMB-EV em primeira linha de tratamento para (Artrite Reumatóide, Espondilite Anquilosante, Artrite Psoriática e Doença de Crohn) em sua maior posologia/doses. Somente custos diretos foram considerados em Reais ($) e utilizou-se um paciente padrão com peso médio de 70 kg para o IMB-EV peso-dependente na dose. A análise da incidência das doenças na cartela epidemiológica de clientes da operadora permitiu uma extrapolação para determinação do custo/tratamento em relação ao número de infusões em relação a cada tipo de IMB-EV (Infliximab, Tocilizumab, Abatacepte). Utilizou-se Brasindice 741 para precificação dos medicamentos. **RESULTADOS:** A partir dos dados coletados foram projetados atendimentos de 50 pacientes em uso de infliximabe com um custo anual de R$ 5.051.886,00 e per capta de R$ 101.037,72. Em uso de Tocilizumab o custo anual seria de R$ 2.338.944,00 (per capta de R$ 46.778,88) e com Abatacepte o custo anual seria de R$ 2.997.498,00 (per capta R$59.949,96). Assim o total geral da incorporação com IMB-EV teve um custo projetado de R$ 10.388.328,00. **CONCLUSÕES:** A avaliação de custos com medicamentos de alto impacto nos orçamentos das instituições de saúde, como os imunobiológicos, nas operadoras tem se tornado uma importante ferramenta para um planejamento estratégico e sustentável financeiramente. A partir das análises e monitorizações, teve-se a tomada de decisão para inclusão de outros IMB subcutâneos como Etanercept, Golimumab e Certolizumabe, os quais podem apresentar uma relação custo-minimização mais favorável.

PMS4

COMPARING COSTS PER CLINICAL REMISSION OF TOCILIZUMAB MONOTHERAPY VERSUS ADALIMUMAB MONOTHERAPY IN PATIENTS WITH RHEUMATOID ARTHRITIS: A BRAZILIAN PRIVATE PERSPECTIVE

Buschinelli CT, Tsuchiya CT, Maximo MFM, Tobaruella FS, Gonçalves TM
Roche Brazil, São Paulo, Brazil

OBJECTIVES: Rheumatoid Arthritis (RA) is an autoimmune disease that causes chronic inflammation of the joints. Disease progression leads to a significant socioeconomic impact for the individual and for society. In Brazil, there are eight approved biologic drugs indicate to treat patients with moderate/severe RA that presented previous inadequate response to therapy with DMARDs, including tocilizumab (TCZ) and adalimumab (ADA). ADACTA trial (Gabay et al, 2012) showed positive results related to TCZ monotherapy for the treatment of moderate/severe RA in patients who presented inadequate response to methotrexate therapy or were MTX intolerant. This study aims to evaluate costs of TCZ monotherapy vs. ADA monotherapy to achieve remission after one year of treatment for adult RA, according to ACR70 and DAS28 outcomes. **METHODS:** An economic evaluation based on ADACTA study was performed. Drugs ex-factory prices were used to estimate treatment costs. Regimen was 8 mg/kg every 4 weeks TCZ and 40 mg every 2 weeks ADA. Costs to achieve remission in one year according to ACR70 and DAS28 outcomes were compared. The study was conducted from a Brazilian private health care perspective, considering only drug costs. Costs were reported in Brazilian Reais (BRL1.00=USD0.51 Feb/2013). **RESULTS:** Annual costs were BRL39,100.06 TCZ vs. BRL63,134.76 ADA. After one year of treatment, ACR70 response rates were achieved in 32.50% in TCZ group and 17.90% in ADA group. DAS28 remission was achieved in 39.90% and 10.50% in TCZ and ADA group, respectively. TCZ presented better results in costs per clinical remission than ADA (ACR70 BRL120,307.88 vs. BRL352,708.16 and DAS28 BRL97,995.14 vs. BRL601,283.43). **CONCLUSIONS:** TCZ presented better response rates in both ACR70 and DAS28 outcomes and lower annual costs per clinical remission compared to ADA, suggesting that TCZ is a better single-agent alternative to treat moderate/severe rheumatoid arthritis in Brazilian private health care system.

PMS5

ANALYZING COSTS PER CLINICAL REMISSION OF TOCILIZUMAB MONOTHERAPY VERSUS ADALIMUMAB MONOTHERAPY IN RHEUMATOID ARTHRITIS FROM A PUBLIC PERSPECTIVE IN BRAZIL

Buschinelli CT, Maximo MFM, Tsuchiya CT, Tobaruella FS, Gonçalves TM
Roche Brazil, São Paulo, Brazil

OBJECTIVES: Rheumatoid Arthritis (RA) is a chronic systemic autoimmune disease which affects around 0.5% of adult population worldwide. ADACTA (Gabay et al, 2012) is the first study designed to compare two approved biologic drugs in monotherapy for the treatment of RA. The trial compared tocilizumab monotherapy (TCZ) vs. adalimumab monotherapy (ADA) and presented results that support TCZ alone as a single-agent therapy for RA patients who are either intolerant to methotrexate (MTX) or in whom previous MTX therapy was inadequate. Based on ADACTA, this study aims to compare annual costs per clinical remission of TCZ vs. ADA in moderate/severe adult RA treatment considering ACR70 and DAS28 outcomes. **METHODS:** Remission data of ACR70 and DAS28 outcomes were taken from ADACTA study. Annual costs of TCZ and ADA therapies considered labeled dosage and public drugs acquisition's prices. Based on these data, costs per clinical remission after one year of treatment were compared. Regimen was 8 mg/kg every 4 weeks TCZ and 40 mg every 2 weeks ADA. The average weight of 67 kg was assumed. A public health care system perspective was considered and only drug costs were evaluated. Drug acquisition prices were assessed from public disclosures. Costs were reported in Brazilian Reais (BRL1.00=USD0.51 Feb/2013). **RESULTS:** After one year of treatment, annual costs were BRL26,898.56 ADA and BRL19,945.90 TCZ. Therapy with TCZ as a single-agent showed better response rates in both outcomes (ACR70 32.50% TCZ vs. 17.90% ADA and DAS28 39.90% TCZ vs. 10.50% ADA). Costs per clinical remission considering ACR70 results were BRL61,372.00 TCZ vs. BRL150,271.28 ADA. Costs per clinical remission of DAS28 were BRL49,989.72 TCZ vs. BRL256,176.76 ADA. **CONCLUSIONS:** The analysis suggests that TCZ represents an effective strategy to treat moderate/severe adult RA patients in Brazil's public health care system and presents lower costs per clinical remission compared to ADA.

PMS6

COSTOS ASOCIADOS A EVENTOS CARDIOVASCULARES EN PACIENTES CON ARTRITIS REUMATOIDE AFILIADOS AL RÉGIMEN SUBSIDIADO EN COLOMBIA

Urrego Novoa JR[1], Prieto Martinez V[2], López L[3]
[1]*Universidad Nacional de Colombia, Bogotá D,C., Colombia,* [2]*Pfizer S.A.S., Bogotá DC, Colombia,* [3]*Pfizer S.A.S, Bogotá, Colombia*

OBJECTIVOS: Los pacientes con Artritis Reumatoide (AR) tienen un número importante de manifestaciones extrarticulares incluyendo la enfermedad cardiovascular, la cual conduce del 30-50% de todas las muertes. El objetivo de este trabajo es estimar los costos asociados a eventos agudos (infarto al miocardio y pericarditis) y crónico (falla cardíaca) de la enfermedad cardiovascular en pacientes con AR en Colombia. **METODOLOGÍAS:** Este estudio se realizó desde la perspectiva del tercer pagador. Se identificaron los eventos generadores de costo de guías de atención aprobadas por el ministerio de salud, con ayuda de un experto clínico se construyeron los casos tipo de infarto al miocardio, pericarditis y falla cardíaca, se utilizó un costeo por actividades siguiendo la metodología del botton-up, para la valoración de procedimientos se emplearon los manuales tarifarios ISS y SOAT, los costos de los medicamentos se tomaron del SISMED y el costo de los dispositivos médicos se obtuvo de licitaciones públicas. Todas las cifras monetarias se expresan en pesos colombianos de 2013. La prevalencia de la AR y el riesgo de ocurrencia de los eventos cardiovasculares se tomaron de la literatura. Los datos de aseguramiento provienen de estadísticas nacionales. **RESULTADOS:** El costo promedio de atención de los eventos cardiovasculares objeto de estudio en pacientes con AR fueron: infarto al miocardio $ 8.518.192 (procedimientos: $ 4.364.209; medicamentos: $ 4.004.331; insumos: $ 149.652); pericarditis $ 2.638.233 (procedimientos: $ 2.430.875; medicamentos: $ 207.357); falla cardíaca $ 26.435.947 (procedimientos: $ 9.348.420; medicamentos: $ 17.087.526). Los costos globales de atención en pacientes con AR afiliados al régimen subsidiado de los eventos cardiovasculares de interés serían: infarto al miocardio $ 38.106.493.677; pericarditis $ 5.447.190.660; y falla cardíaca $ 54.582.612.447. **CONCLUSIONES:** La enfermedad cardiovascular en pacientes con AR representa una carga económica de gran impacto para el régimen subsidiado en el sistema de salud Colombiano.

PMS7

COSTOS ASOCIADOS A NEUMONÍA SEVERA Y TUBERCULOSIS EN PACIENTES CON ARTRITIS REUMATOIDE QUE HAN RECIDO TRATAMIENTO CON TERAPIA BIOLOGICA ANTI-TNF

Varon FA[1], Urrego Novoa JR[2], Prieto Martinez V[3]
[1]*Fundación Neumológica Colombiana, Bogotá DC, Colombia,* [2]*Universidad Nacional de Colombia, Bogotá D,C., Colombia,* [3]*Pfizer S.A.S., Bogotá DC, Colombia*

OBJECTIVOS: Los pacientes con artritis reumatoide (AR) tienen un mayor riesgo de padecer infecciones severas, debido a factores de mal pronóstico de la enfermedad que han sido identificados como predictores de infección y al tratamiento farmacológico con inmunosupresores. En la literatura se encuentran reportados como eventos adversos frecuentes respecto a infecciones, la neumonía severa y la tuberculosis (TBC) en pacientes que han recibido tratamiento con terapia biológica anti-TNF, el objetivo de este trabajo es presentar una estimación de costos médicos directos de dichos eventos. **METODOLOGÍAS:** Este estudio se realizó desde la perspectiva del tercer pagador. Los eventos generadores de costo para neumonía severa se identificaron a partir de una guía de práctica clínica Colombiana y para TBC se empleó un protocolo de manejo avalado por el ministerio de salud. Se construyeron los casos tipo para cada patología con ayuda de un clínico experto y se utilizó un costeo por actividades siguiendo la metodología botton-up. La valoración de los procedimientos se realizó teniendo en cuenta los manuales tarifarios ISS y SOAT, los costos de los medicamentos se tomaron del SISMED y el costo de los dispositivos médicos se obtuvo de licitaciones públicas. Todas las unidades monetarias se expresan en dólares americanos (1 US$ = 1.785 COP). **RESULTADOS:** El costo promedio de atención de la neumonía en pacientes que van a la unidad de cuidado intensivo (50%) fue US$ 2410 (procedimientos US$ 2194; medicamentos US$ 191; insumos US$ 25). El costo promedio de atención de la neumonía en pacientes que van a hospitalización (50%) fue US$ 1854 (procedimientos US$1425; medicamentos US$392; insumos $ US 37). El costo de atención de TBC fue US$16,438 (procedimientos US$ 299; medicamentos US$ 16,139). **CONCLUSIONES:** Los costos asociados a la atención de la neumonía severa y TBC representan un gran impacto económico para el sistema de salud.

PMS9

CUSTOS DAS FRATURAS OSTEOPORÓTICAS NO SISTEMA PÚBLICO DE SAÚDE BRASILEIRO

Brandão CMR[1], Machado GPDM[1], Drumond HA[2], Alemão MM[2], Acurcio FDA[1]
[1]*Universidade Federal de Minas Gerais, Belo Horizonte, Brazil,* [2]*Fundação Hospitalar do Estado de Minas Gerais, Belo Horizonte, Brazil*

OBJETIVOS: Descrever o custo do tratamento hospitalar das fraturas de baixa energia, típicas da osteoporose, no Sistema Único de Saúde do Brasil. **MÉTODOS:** Foi realizado um estudo de custos por procedimentos nas unidades do complexo de urgência e emergência da Fundação Hospitalar do Estado de Minas Gerais (Fhemig). O período de coleta dos dados foi de janeiro a maio de 2012. O estudo foi composto de cinco etapas seqüenciais, que englobam: i. Identificação e definição dos macroprocessos, processos e atividades relacionados às fraturas de quadril, ombros, punhos e vertebrais, decorrentes da osteoporose; ii. Elaboração de Mapeamento de Processos típicos de pacientes acometidos pela doença submetidos a tratamento cirúrgico; iii. Identificação dos recursos consumidos em cada atividade, como tempo gasto para cada atividade, materiais médico-hospitalares, órteses e próteses; iv. Construção da base de informações interligada com o Sistema de Gestão Hospitalar (SIGH – Custos ABC); e v. Realização de Painel de Especialistas para validação do estudo. Os valores foram descritos em dólar americano (31 de março de 2012 – taxa de cambio: 1 dólar =1,82 real). **RESULTADOS:** Os maiores custos encontrados foram para as fraturas vertebrais, seguido das fraturas dos quadris, ombros e punhos. Custos de fraturas vertebrais variaram de $10,054.57 a 20,313.73; das fraturas de

quadris de $2,126.41 a 11,012.42. Os custos para as fraturas de ombros variaram de $1,355.64 a 4,436.57. E, custos das fraturas de punhos variaram de $454.75 a 3,869.94. O maior percentual do custo, na maioria das vezes, estava relacionado às próteses e ao tempo de permanência pós-cirúrgico no ambiente hospitalar. **CONCLUSÕES:** Apesar de os maiores custos estarem relacionados às fraturas vertebrais, os desfechos clínicos mais relevantes da osteoporose são as fraturas de quadris, devido à sua elevada incidência. Fraturas osteoporóticas são, em grande parte, evitáveis, a partir do controle dos fatores de risco e medicação preventiva adequada.

PMS10

CUSTO-EFETIVIDADE DO TRATAMENTO PARA OSTEOPOROSE NA POS-MENOPAUSA NO BRASIL

Brandão CMR[1], Machado GPDM[1], Saturnino LTM[2], Oliveira GLAD[1], Acurcio FDA[1]
[1]*Universidade Federal de Minas Gerais, Belo Horizonte, Brazil,* [2]*Instituto Nacional de Cardiologia, Rio de Janeiro, Brazil*

OBJETIVOS: Realizar uma avaliação de custo-efetividade dos medicamentos disponíveis para o tratamento da osteoporose na pós-menopausa, sob a perspectiva do Sistema Único de Saúde, do Brasil. **MÉTODOS:** Utilizou-se um modelo de Markov para simular a progressão da osteoporose na pós-menopausa presumindo-se uma coorte hipotética de mulheres de diferentes faixas etárias (40-49 anos, 50-59 anos, 60-69 anos, 70-79 anos e 80 ou mais) com fraturas prévias. O modelo levou em consideração a eficácia do tratamento nos diferentes sítios de fraturas (quadris, punhos, ombros e vértebras). Foram comparados o alendronato, risedronato, ibandronato, calcitonina, raloxifeno, calcitriol, teriparatida e denosumabe com não oferecer tratamento medicamentoso. O modelo foi utilizado para estimar os benefícios clínicos em termos de anos de vida ganhos e os custos associados ao tratamento medicamentoso. Os dados de eficácia foram baseados em revisões sistemáticas com metanálise; os custos do tratamento e com internações decorrentes das fraturas referiram-se aos custos do Sistema Único de Saúde. O tempo de seguimento foi de 50 anos ou até a morte. Utilizou-se taxa de desconto de 5% nos custos e benefícios. Foram feitas análises de sensibilidade probabilística e considerando-se diferentes taxas de desconto. **RESULTADOS:** As estratégias terapêuticas não foram custo-efetivas na faixa etária de 40-49 anos. Aos 50-59 anos, foram custo-efetivos o alendronato e denosumabe; nas faixas etárias mais avançadas (60 anos ou mais), somente o alendronato foi custo-efetivo. **CONCLUSÕES:** As estratégias terapêuticas foram custo-efetivas para algumas situações. E, apesar de existirem diferentes opções terapêuticas para o tratamento da osteoporose na pós-menopausa, poucas tem efeito em todos os sítios de ação. Nenhuma das estratégias apresentou-se *cost-saving*.

PMS11

ASSESSMENT OF COST-EFFECTIVENESS MODELS FOR BIOLOGICS IN THE MANAGEMENT OF PSORIATIC ARTHRITIS

Gokhale S[1], Jalapu A[1], Mallya U[2], Mpofu S[3]
[1]*Novartis Healthcare Pvt. Ltd., Hyderabad, India,* [2]*Novartis Pharmaceuticals Corporation, East Hanover, NJ, USA,* [3]*Novartis Pharmaceuticals AG, Basel, Switzerland*

OBJECTIVES: Given biological therapies in psoriatic arthritis (PsA) treatment paradigm are expensive, cost-effectiveness evaluations can be a valuable tool in payer health care decision making. We sought to review the economic evidence and cost-effectiveness of all available biologics developed for treatment of PsA. **METHODS:** We conducted a structured literature search of published and unpublished literature from year 1996 to 2012. We included modeling and other economic studies that assessed cost-effectiveness of biologics and excluded studies that evaluated therapies other than biologics. **RESULTS:** A total of 9 studies involving moderate to severe active PsA patients were analyzed. Most of the cost-effectiveness studies were conducted in the UK (N=6) using direct payer perspective. As no head-to-head trials between biological therapies were present, either indirect comparison with Bayesian technique or network meta-analyses were used to synthesize evidence. Treatment clinical effectiveness was measured by psoriatic arthritis response criteria (PsARC) and/or psoriasis area and severity index (PASI). Functional status was measured by health assessment questionnaire (HAQ). Decision analytical model with underlying Markov modeling was considered by majority of the studies to build the cost-effectiveness model using cohort of patients, while few studies used patient level simulations. Disease-modifying anti-rheumatic drugs (DMARDs) were primarily considered as comparators. Time horizon varied from 10 years to lifetime. All studies employed quality adjusted life years (QALYs) as their measure of effectiveness. Costs and QALYs discounting rate varied from 3.5 to 6% and 1.5 to 3.5% respectively. Incremental cost-effectiveness ratio per QALY varied from £17,000 to £40,000. **CONCLUSIONS:** Although biologics are considered expensive, they improve patient's quality of life in the long-run. Existing cost-effectiveness studies have differences in their assumptions and methodologies, and provide valuable inputs towards building the set of disease related parameters. Next generation of biologic therapies in the near future can benefit from these analyses.

PMS12

ASSESSMENT OF COST-EFFECTIVENESS MODELS FOR BIOLOGICS IN THE MANAGEMENT OF SEVERE ANKYLOSING SPONDYLITIS

Gokhale S[1], Mallya U[2], Mpofu S[3]
[1]*Novartis Healthcare Pvt. Ltd., Hyderabad, India,* [2]*Novartis Pharmaceuticals Corporation, East Hanover, NJ, USA,* [3]*Novartis Pharmaceuticals AG, Basel, Switzerland*

OBJECTIVES: Current biologics provide effective clinical benefits to patients with ankylosing spondylitis (AS). We sought to review economic evidence supportive of cost-effective evaluation for currently available biologics developed for treatment of severe AS that aid in disease management decision-making. **METHODS:** A structured literature search of published and unpublished literature from year 1996-2012 was conducted. We included modeling and other economic studies that assessed cost-effectiveness of biologics and excluded studies evaluating other therapies. **RESULTS:** Ten studies (infliximab=5, etanercept=2, infliximab and etanercept=1, adalimumab=1, golimumab=1) were analyzed. Majority of studies (N=7) were conducted from societal perspective. Health payer perspective was employed by 2 studies and one study incorporated both. Cohort simulation of patients with severe AS was employed to build cost-effectiveness model by most of the studies and few used patient-level simulation. Non-steroidal anti-inflammatory drugs were considered as comparators in all economic models. Studies employed quality adjusted life years (QALY) as their unit of outcome. Euro-quality-of-life-5 dimensions was used as the instrument for quality weightings by most studies and health utilities index-3 and general health rating scale were used by others. Bath ankylosing spondylitis disease activity index and Bath ankylosing spondylitis functional index were used as response and efficacy parameters. Costs and QALYs discounting rate varied from 3%-6% and 1.5%-5% respectively. Over a longer time horizon (25-40 years), the incremental cost-effectiveness ratio per QALY varied from €7,500-€56,000 for infliximab, €22,000-€32,000 for etanercept, €23,000 for adalimumab, and €30,000 for golimumab. **CONCLUSIONS:** Although biologics are considered expensive, they are the only approved therapy options for patients with severe AS. Even though existing cost-effectiveness studies have differences in their assumptions and methodologies, they do provide valuable inputs towards building set of disease related parameters useful for economic evaluation of next generation biologic agents.

PMS13

COST-EFFECTIVENESS ANALYSIS OF ETANERCEPT IN THE TREATMENT OF RHEUMATOID ARTHRITIS IN INSTITUTIONAL MARKET IN ECUADOR

Albuja MF[1], Torres FG[2], Mould J[3], Estévez C[4]
[1]*Pfizer, Quito, Ecuador,* [2]*Makroscopio Cia. Ltda, Quito, Ecuador,* [3]*Pfizer, New York, NY, USA,* [4]*Pfizer INC, Quito, Ecuador*

OBJECTIVES: Rheumatoid arthritis is an autoimmune, inflammatory and chronic disease associated with significant morbidity. Due its chronic and progressive nature, functional limitations and physical disability cause an important social and economic impact. In Ecuador, the prevalence of AR is 0.9%; The incidence is higher in women (6.4:1) and the average age is 53.6 years, representing a Public Health problem. Biologic treatments represent a therapeutic alternative for patients who failed disease-modifying antirheumatic drugs. However, their high cost and the high risk of tuberculosis are the challenges for clinicians and decision makers. The aim of this study was to assess the cost-effectiveness of biologic alternatives in Ecuador from an institutional perspective. **METHODS:** A Markov model was developed to simulate the clinical course of patients treated with etanercept (25mg twice a week), adalimumab (40 mg every 15 days) and infliximab (3mg/kg initial and at 2nd and 6thweek, every 8 weeks) as first-line therapies combined with Metotrexate 20 mg/kg per week after DMARDs failure, as well as associated costs over one-year period. Effectiveness measures were: proportion of patients achieving 70% improvement in both, tender or swollen joint counts following the ACR70 criteria and quality adjusted life years gained. Costs considered included: biologics, concomitant drugs, medical follow-up and side effects management. Clinical response of alternatives was extracted from published literature, while costs were collected from Official Ecuadorian databases. **RESULTS:** The cost-effectiveness analysis showed the utility in QALYs gained of etanercept, adalimumab and infliximab is 0.79; 0,77; and 0,73 respectively, the net costs are: USD$ 17092.39 for Etanercept; USD$ 17,940.39 for Adalimumab and USD$32979.60 for Infliximab. Resulting etanercept the dominant option. **CONCLUSIONS:** The cost effectiveness analysis results determinate that etanercept is the most cost effectiveness option. Due the less production of adverse events including tuberculosis, easy and ambulatory application and differential price for institutional market.

PMS14

EVALUACIÓN DE COSTO-EFECTIVIDAD DE CERTOLIZUMAB PEGOL COMPARADO CON ETANERCEPT EN EL TRATAMIENTO DE ARTRITIS REUMATOIDEA EN COLOMBIA

Guzman R[1], Jaramillo LF[2], Otero W[3]
[1]*Instituto de Enfermedades Autoinmunes Renato Guzman, Bogotá, Colombia,* [2]*Clínica de Artritis Temprana, Cali, Colombia,* [3]*Servimed E.U., Bucaramanga, Colombia*

OBJECTIVOS: Los Anti TNF alfa son terapia de primera línea para el tratamiento de pacientes con Artritis Reumatoidea Activa (AR) con inadecuada respuesta a metotrexate u otros DMARs no biológicos, el objetivo del presente estudio es evaluar la costo efectividad de certolizumab pegol (CZP) en comparación con el anti TNF incluido en el listado de medicamentos del plan de salud en Colombia etanercept (ETA), bajo la perspectiva del sistema de salud con un horizonte temporal de un año. **METODOLOGÍAS:** Se construyó modelo basado en árbol de decisiones no probabilístico en Excel, la medida de efectividad fue la tasa de respuesta ACR20 a la semana 52 la cual fue extraída de los estudios pivotales de cada una de los medicamentos (TEMPO y RAPID 1), se siguió la metodología para comparaciones indirectas de Glenny et al. en donde se ajusta por metotrexato como comparador común. Se incluyen costos directos, el costo anual de la terapia se estimó usando los valores de la Circular 04 de Noviembre de 2012 de la Comisión Nacional de Precios y Dispositivos Médicos y las tarifas SOAT 2012 para gastos médicos complementarios. Se calculó la razón de costo efectividad promedio e incremental y se realizó análisis de sensibilidad con +/- 10% de los valores del caso base. **RESULTADOS:** El costo anual fue estimado en 19.270USD para ETA y 25.692USD para CZP, la tasa de respuesta ACR 20 ajustada fue de 45% para ETA Vs 77% para CZP, la razón de costo efectividad fue de 42.755USD para ETA y 33.434USD para CZP y el costo por respondedor adicional de CZP comparado con ETA es 201 USD, las conclusiones se mantienen en el análisis de sensibilidad. **CONCLUSIONES:** En Colombia certolizumab pegol resulta costo efectivo frente a etanercept en pacientes con Artritis Reumatoidea activa que han tenido respuesta inadecuada a DMARs no biológicos.

PMS15

ESTIMATED COST EFFECTIVENESS OF LOWER-DOSE SUBMICRON DICLOFENAC COMPARED WITH TRADITIONAL DICLOFENAC IN BRAZIL

Mladsi DM[1], Ronquest N[1], Tannus G[2], Fonseca M[3], Saag K[4]
[1]*RTI Health Solutions, Research Triangle Park, NC, USA,* [2]*Axia.Bio Consulting, São Paulo, Brazil,* [3]*Federal University of São Paulo / Axia.Bio Consulting, São Paulo, Brazil,* [4]*The University of Alabama at Birmingham, Birmingham, AL, USA*

OBJECTIVES: Nonsteroidal anti-inflammatory drugs (NSAIDs) are commonly prescribed to treat pain and inflammation.Despite their effectiveness, concerns exist regarding their safety. Worldwide health authorities, including the Brazilian Society of Rheumatology, (Henrique da Mota et al., 2012) advise that NSAIDs should be prescribed at lower doses and for shorter durations. Effectively lowering NSAID dose without compromising pain relief has been demonstrated in randomized controlled trials of an investigational NSAID, lower-dose submicron diclofenac (LDSD). The objective of this study was to estimate the potential reduction in risk of NSAID dose-related adverse events (AEs), corresponding savings in health care costs, and the incremental cost-effectiveness of LDSD compared with conventional diclofenac (CD) in Brazil. **METHODS:** A decision-analytic cost-effectiveness model was developed that considered a subset of potential AEs that may be avoided by lowering NSAID dosage. Prediction equations estimating the relative risk of upper GI bleeding/perforation and major CV events, by diclofenac dosage versus non-NSAID use, were estimated by meta-regressions using data from systematic literature reviews. Utilities, lifetime costs, and health outcomes associated with AEs in Brazil were literature based. The model was validated with clinical experts in Brazil. Results were evaluated in one-way and probabilistic sensitivity analyses. **RESULTS:** The model predicted that LDSD vs CD could reduce the occurrence of modeled gastrointestinal events (by 18%), cardiovascular events (by 7%), and acute renal failure (by 19%), leading to a 10% reduction in costs of treating AEs. LDSD was predicted to be cost-effective, with a robust incremental cost-effectiveness ratio relatively insensitive to parameter uncertainty. **CONCLUSIONS:** LDSD has the potential to provide clinical and economic value to patients using NSAIDs in Brazil. Further investigation regarding the potential effect of LDSD on the risk of additional NSAID dose-related toxicities should be explored.

PMS16

COSTO-UTILIDAD DE COLÁGENA-POLIVINILPIRROLIDONA EN EL TRATAMIENTO DE OSTEARTROSIS DE RODILLA I-II FRENTE AL CUIDADO ESTANDAR ESTABLECIDO EN LOS PROTOCOLOS VIGENTES DE LAS INSTITUCIONES PUBLICAS EN MÉXICO

Burbano-Levy X[1], Cardona DP[2], Palacios E[3], Rico-Alba I[3], Zapata L[3]
[1]*Zilonis Health, Inc, Boca Raton, FL, USA,* [2]*Universidad de Antioquia- Facultad De Quimica Farmaceutica, Medellín, Colombia,* [3]*Guia Mark, S. A. de C. V., Mexico, DF., Mexico*

OBJECTIVOS: Osteoartrosis es la enfermedad reumática más prevalente en México. El surgimiento de alternativas terapéuticas buscando un mejor pronóstico frente a los protocolos convencionales, requiere generar información científica para establecer el costo-efectividad/utilidad de las mismas. Este estudio evalúa el costo-utilidad de colágena-polivinilpirrolidona (colágena-PVP), producto desarrollado en México, frente a las alternativas del protocolo institucional del Instituto Mexicano de Seguridad Social (IMSS) en el tratamiento de la osteoartrosis de rodilla (OAR). **METODOLOGÍAS:** Se diseñó un modelo probabilístico de Markov para evaluar los costos y resultados/utilidades (QALYs) del tratamiento con colágena-PVP comparado con AINES en pacientes con OAR I-II. La selección del comparador se basó en las recomendaciones de las Guías de Práctica Clínica vigentes en México. Las utilidades y probabilidades se fundamentan en la evidencia disponible en la literatura nacional e internacional. El horizonte temporal fue el tiempo de sobrevida de la cohorte (53 años) y los costos fueron obtenidos de los listados de adquisiciones y GRDs del IMSS y de las tarifas del diario oficial. Se aplicó una tasa de descuento del 5% para costos y utilidades. Se realizaron análisis de sensibilidad que con el modelo probabilístico estableció el efecto de la incertidumbre **RESULTADOS:** Para colágena-PVP, el costo por tratamiento de OAR es de MEX$ 734,572.86. En el grupo AINES, el costo del tratamiento fue de MEX$ 806,584.02. El grupo con colágena-PVP presentó 9.88 QALYs comparado con 7.99 en el grupo AINES, con un radio costo-utilidad mayor en este último ($100,949.19/QALY versus MEX$74,349.48/QALY en colágena-PVP). El costo ahorrado para obtener un QALY adicional con colágena-PVP (RCUI) es de MEX$ 38,101. **CONCLUSIONES:** Al considerar el referente de un PIB/cápita como guía para determinar el costo-utilidad cuando no hay medidas de disponibilidad a pagar establecidas en un sistema de salud, colágena-PVP es una alternativa costo-ahorradora en el tratamiento de OAR en México.

PMS17

ESTUDIO DE COSTO/UTILIDAD DEL TRATAMIENTO HABITUAL DE LA ARTRITIS REUMATOIDEA MAS ETANERCEPT VERSUS TRATAMIENTO HABITUAL MÁS OTROS BIOLÓGICOS DEL MERCADO CHILENO Y VERSUS TRATAMIENTO HABITUAL SIN BIOLÓGICOS

Biagini L, Pezzani M, Rojas R, Hoffmeister L, Fuentes R
Universidad Mayor, Santiago, Chile

OBJECTIVOS: Determinar el costo/utilidad incremental (ICER) del esquema habitual de tratamiento en la Artritis Reumatoide (AR) más etanercept y compararlo con otros esquemas de tratamiento que incluyan agentes biológicos, usando como base el esquema habitual sin agentes biológicos. **METODOLOGÍAS:** Se realizó un estudio de costo/utilidad usando un modelo de Markov con tres estados de salud: AR activa, AR inactiva y Retiro. El punto de vista del estudio fue el del sistema público más gasto de bolsillo de los pacientes. Las utilidades fueron medidas en una muestra de pacientes chilenas con AR utilizando el instrumento EQ-5D y los costos fueron determinados de acuerdo a los costos del Sistema Público de Chile. El horizonte temporal del análisis fueron 75 años y se usó una tasa de descuento de 3%. **RESULTADOS:** Las utilidades obtenidas fueron de 0,52±0,27 para la AR inactiva (n=46) y de 0,15±0,33 para la AR activa (n=35). Usando el criterio del American College of Rheumatology de mejoría del 20% en relación a la condición basal (ACR 20), se obtuvo, usando el tratamiento habitual como base, un ICER de $24.572.914 (US$ 49.146) para etanercept; de $272.758.563 (US$ 551.614) para Adalimumab; y de $441.333.820 (US$ 932.067) para certolizumab. Rituximab, infliximab y golimumab resultaron más costosos pero menos efectivos que el tratamiento habitual. Estos resultados no fueron sensibles ni a la variación de las utilidades, ni a la variación en el número de ciclos, ni a la variación de la tasa de descuento, ni a la variación en el criterio de mejoría (ACR20 vs. ACR50). **CONCLUSIONES:** Etanercept es el producto con el menor ICER en relación al tratamiento habitual de la AR en Chile.

PMS18

IMPACTO EN LA PRODUCTIVIDAD LABORAL DE UNA COHORTE DE PACIENTES CON ARTRITIS REUMATOIDE TRATADOS CON ETANERCEPT (ENBREL®) EN COLOMBIA

Jauregui E[1], Upegui A[2], Romero M[2], Mantilla R[1], Maldonado MC[1], Gonzalez A[1], Dominguez A[1], Valero Y[1], Morales C[1], Trouchon MC[1], Cardona C[1], Muñoz Y[1]
[1]*Riesgo de fractura S.A-CAYRE IPS, Bogotá, Colombia,* [2]*Fundacion Salutia, Bogotá, Colombia*

OBJECTIVOS: La Artritis Reumatoide (AR) es una enfermedad inflamatoria crónica, progresiva, incapacitante, asociada con altos costos. El objetivo de este estudio es analizar los cambios de la productividad laboral (en tiempo) y su impacto económico, en una cohorte de pacientes con AR tratados con Etanercept (Enbrel®) durante un año en el programa de gerenciamiento de la enfermedad "Evaluación día" en la Institución Prestadora de Salud Riesgo de Fractura S.A-CAYRE en Bogotá, Colombia. **METODOLOGÍAS:** En el análisis se incluyeron pacientes con AR que iniciaron tratamiento con Enbrel® entre Agosto-2009 y Enero-2011. Como criterio de inclusión se requirió la aplicación de una herramienta para medir productividad laboral: Work Productivity and Activity Impairment Questionnarie (WPAI), al menos en dos oportunidades: al inicio y a los 9-12 meses del tratamiento; los supuestos utilizados fueron: pérdida de productividad en la misma proporción que pérdida laboral, cambio del estatus laboral debido sólo a la enfermedad, productividad individual equivalente al PIB per cápita. Se calculó la pérdida económica utilizando como referencia el valor de las horas pérdidas estimadas a partir del PIB per cápita de Colombia. **RESULTADOS:** Al inicio del tratamiento, 32% de los pacientes eran trabajadores, el ausentismo fue del 12,38% y el porcentaje de discapacidad total en el trabajo (presentismo y ausentismo) fue 11,89%. A los 9-12 meses, 28% de los pacientes eran trabajadores, el ausentismo fue de 3,26% y la discapacidad total en el trabajo de 3,17%. Asumiendo que los resultados obtenidos mediante WPAI no cambian de manera importante en el tiempo, se estima que al utilizar Enbrel® los pacientes recuperan anualmente $1.086.308 (9%) del PIB per cápita/año. **CONCLUSIONES:** El uso de Enbrel® afecta de manera positiva la productividad laboral de los pacientes analizados. Los supuestos permiten apreciar el efecto de Enbrel® en la productividad, sin hacer referencia a las diferencias salariales entre pacientes.

IMPROVEMENTS IN PHYSICAL FUNCTION, HEALTH RELATED QUALITY OF LIFE AND WORK PRODUCTIVITY IN PATIENTS WITH RHEUMATOID ARTHRITIS TREATED WITH GOLIMUMAB: SUB-ANALYSIS OF LATIN AMERICAN PATIENTS ENROLLED IN MULITCENTRE PHASE III CLINICAL TRIALS

Strusberg I[1], Pons-Estel BA[2], Miranda P[3], Genovese M[4], Fleischmann RM[5], Puig A[6], Han C[7], Hsia E[8]
[1]*Centro Reumatológico Strusberg, Córdoba, Argentina,* [2]*Hospital Provincial de Rosario, Rosario, Argentina,* [3]*Universidad de Chile and Centro de Estudios Reumatologicos, Santiago, Chile,* [4]*Stanford University, Palo Alto, CA, USA,* [5]*University of Texas Southwestern Medical Center, Dallas, TX, USA,* [6]*Johnson and Johnson World Headquarters, New Brunswick, NJ, USA,* [7]*Janssen Global Services LLC, Malvern, PA, USA,* [8]*Janssen R&D, Inc, Spring House, PA, USA*

OBJECTIVES: To examine physical function, health-related quality of life(HRQOL) and work productivity in patients enrolled from Latin American countries (Argentina,Chile and Mexico) in Phase III clinical trials for golimumab(GLM) in rheumatoid arthritis(RA). **METHODS:** Active RA patients not previously treated with methotrexate(MTX)(GO-BEFORE,N=637) or with inadequate response to MTX(GO-FORWARD,N=444) were randomized to SC GLM(50 or 100mg)+MTX or PBO+MTX, q4wks.At wk24(GO-FORWARD) or wk52(GO-BEFORE), PBO+MTX group switched to GLM 50mg+MTX. Physical function was assessed using HAQ(0-3). HRQOL was assessed using SF-36 PCS(0-100) and SF-36 MCS(0-100). Impact of disease on work productivity was assessed using a productivity VAS (0-10). Clinically meaningful improvement was defined as improvement of $\geq$0.25 point in HAQ, or $\geq$5 points in SF-36 PCS and MCS. **RESULTS:** At baseline, both MTX naive (N=96) and MTX experienced (N=56) RA patients enrolled in Latin American region experienced moderate to severe physical disability (mean HAQ score of 1.60 to 1.75) and impaired HRQOL (mean PCS of 30.0 to 30.3 and mean MCS of 9.4 to 42.6). The impact of RA on productivity was severe (mean VAS score of 6.3-6.7). Patients treated with GLM (50 or 100 mg)+MTX had significantly greater mean improvement than PBO+MTX group in HAQ (0.87 vs. 0.56, p=0.01), PCS (12.44 vs. 6.93, p<0.01) and work productivity (-3.69 vs. -2.25, p<0.01) at wk 24, and greater proportions of patients in GLM+MTX group than PBO+MTX achieved clinically meaningful improvement in HAQ (84.04% vs. 65.45%, p=0.01), PCS (74.47% vs. 49.09%, p<0.01) and MCS (45.74% vs. 41.82%, p=0.73). Similar results were observed in patients who were MTX naïve and experienced although the magnitudes of improvements were greater in MTX naïve patients than MTX-experienced patients. The improvements were sustained over wk52 and 104. **CONCLUSIONS:** MTX naïve and MTX experienced RA patients from Latin America treated with GLM demonstrated improved physical function, HRQOL, and work productivity.

QUALIDADE DE VIDA DOS PACIENTES QUE UTILIZAM MEDICAMENTOS ANTI-TNF PARA O TRATAMENTO DE DOENÇAS REUMÁTICAS NO SISTEMA ÚNICO DE SAÚDE EM MINAS GERAIS, BRASIL

Oliveira Junior HA
Universidade Federal de Minas Gerais, Belo Horizonte, Brazil

OBJETIVOS: Descrever o perfil epidemiológico e qualidade de vida dos pacientes em tratamento com bloqueadores do fator de necrose tumoral (TNF) no Sistema Único de Saúde, em Minas Gerais, Brasil. **MÉTODOS:** Os entrevistados foram pacientes que receberam a primeira dispensação de anti-TNF para o tratamento de artrite reumatoide (AR), artrite psoriática(AP) e espondilite anquilosante(EA) nas Gerências Regionais de Saúde (GRS) de Belo Horizonte e Juiz de Fora, no período de agosto de 2011 a março de 2013. Foi utilizado formulário padronizado para investigação

sobre os medicamentos e reações adversas, comorbidades, atividade das condições reumatológicas e avaliação da qualidade de vida. Para avaliação da qualidade de vida foi utilizado o HAQ (*Health Assessment Questionary*), e o EuroQol 5-D (EQ-5D) um instrumento genérico de medida de qualidade de vida. **RESULTADOS:** Foram entrevistados 204 pacientes ao todo. Desses, 70,2% tinham diagnóstico de AR, 11,7% AP e 18% EA. Aproximadamente 74,8% eram do sexo feminino. A média de idade foi de 50,71 anos (DP 13,52). O tempo médio com diagnóstico da doença foi de 119,56 meses (DP=102,54). A maioria, 67,8%, utilizou adalimumabe, 25% etanercept e 7,2% Infliximabe. O valor médio do EQ-5D foi de 0,6247 (DP=0,178) no total dos pacientes. Para os pacientes com AR a média do EQ-5D foi 0,6238 (DP=0,179), para EA 0,6579 (DP=0,178) e para AP 0,5790 (DP=0,169). **CONCLUSÕES:** população predominantemente do sexo feminino e com uma média de idade de cerca de 51 anos. No geral, o score do EQ-5D foi considerado moderado e, dentre as doenças, a que apresentou score menor foi a AP.

MUSCULAR-SKELETAL DISORDERS – Health Care Use & Policy Studies

DESCRIPCIÓN DE UNA COHORTE DE PACIENTES CON ARTRITIS REUMATOIDE TRATADOS CON ETANERCEPT (ENBREL®) DENTRO DE UN PROGRAMA DE ATENCIÓN EN UN CENTRO ESPECIALIZADO EN COLOMBIA

Jauregui E[1], Sanchez O[2], Romero M[2], Mantilla R[1], Maldonado MC[1], Gonzalez A[1], Dominguez A[1], Valero Y[1], Morales C[1], Trouchon MC[1], Cardona C[1], Muñoz Y[1]
[1]*Riesgo de fractura S.A-CAYRE IPS, Bogotá, Colombia,* [2]*Fundacion Salutia, Bogotá, Colombia*

OBJECTIVOS: La Artritis Reumatoide (AR) es una enfermedad articular inflamatoria que afecta al 0,5-1,0% de la población adulta mundial. El objetivo de este estudio es realizar un análisis descriptivo de la actividad de la enfermedad (DAS28), calidad de vida (HAQ – Health Assessment Questionnaire) y depresión (escala de Zung), tras un año de seguimiento del programa de gerenciamiento de la enfermedad "Evaluación día" para pacientes con AR que iniciaron tratamiento con Etanercept (EnbrelÒ) en la Institución Prestadora de Salud Riesgo de fractura S.A-CAYRE en Bogotá, Colombia. **METODOLOGÍAS:** En el programa se incluyeron 91 pacientes colombianos con AR que iniciaron tratamiento con Enbrel®, tuvieron 4 visitas de seguimiento durante un año; como parte del manejo integral de la enfermedad se incluyeron paraclínicos, evaluación por reumatólogo, psicólogo, terapeutas y clinimetría (DAS28, HAQ y Zung entre otras). Un total de 52 pacientes (57,14%) cumplieron criterios de inclusión para el análisis, con una edad promedio de 53,5 años y evolución promedio de la enfermedad de 12,2 años. **RESULTADOS:** Al año, 25% de los pacientes alcanzó el porcentaje de remisión DAS28 con una reducción de 52,9% en alta actividad entre la visita de ingreso y la última visita; 19 pacientes (37,5%) presentaron una reducción >1,2 del DAS28 respecto al inicio del tratamiento. El HAQ inicial promedio fue 1,07 y mejoró al disminuir a 0,96 en el último control. Al inicio 33,3% de los pacientes tenían algún grado de depresión mayor (Zung) y al año de la observación disminuyó a 21,9%. **CONCLUSIONES:** Los resultados obtenidos nos permiten inferir que Enbrel® afecta de manera positiva la evolución de AR en un programa de gerenciamiento de la enfermedad. Es importante contar con la descripción de programas de gerenciamiento de la enfermedad, con el fin de tener data propia de AR en Colombia y brindar el manejo integral que requieren las enfermedades crónicas.

BARRIERS OF ACCESS TO ELECTIVE ORTHOPEDIC PROCEDURES IN RIO DE JANEIRO, BRAZIL

Fernandes RA[1], Takemoto MLS[2], Sauberman MV[3], Amaral LM[1], Vasconcellos JF[2], Haas LC[2], Silva MA[2], Takemoto MMS[1]
[1]*ANOVA, Rio de Janeiro, Brazil,* [2]*ANOVA - Knowledge Translation, Rio de Janeiro, RJ, Brazil,* [3]*Hospital Municipal Lourenço Jorge, Rio de Janeiro, Rio de Janeiro, Brazil*

OBJECTIVES: Currently, in Rio de Janeiro state, barriers to patient care who require elective surgical procedures in orthopedics are found, thus many patients remain long periods on hold until the attendance. This study aims to analyze the frequency of hospitalization procedures (HP), total inhospital cost (IC), and total number of inhospital days (ID) related to orthopedic elective procedures in Rio de Janeiro state, Brazil, from the public perspective in order to identify potential barriers of access. **METHODS:** Orthopedic procedures that require hospitalization were selected from the public official hospital information system, for the year 2011. These procedures were separated into elective or urgent according to treatment indication, and validated by an expert panel. Costs are expressed in 2012 Brazilian Real (BRL). A public secondary database was accessed to evaluate HP, IC, and ID separated by cities. **RESULTS:** Rio de Janeiro state is composed by 92 municipalities. Total population consists of 15,989,929 inhabitants, and 6,320,446 (39.53%) live in the capital (Rio de Janeiro city). In 2011, 18,564 elective HP were performed, with a total IC of 21,977,085 BRL, and 145,295 ID. Data from the capital show 10,724 elective HP, total IC of 14,399,281 BRL, and 98,458 ID, which represent 57.77%, 65.52%, and 67.76% of the state, respectively. When only urgency procedures were analyzed, these rates fell to 43.73%, 46.46%, and 49.35%, respectively. **CONCLUSIONS:** Hospitalizations for elective orthopedic procedures in Rio de Janeiro state do not present homogeneous distribution among municipalities. The capital houses less than 40% of total population and accounts for more than 65% of costs and inhospital days. Data suggest that municipalities are able to absorb urgency occurrences, but not elective ones, creating difficulties for the treatment of patients in need of elective procedures. Decentralization of care may be able to reduce such barriers.

PMS23

DRIVING AFTER DRINKING: HOSPITALIZATION, MORTALITY RATE, AND COSTS PRE AND POST PROHIBITION IN RIO DE JANEIRO, BRAZIL

Fernandes RA[1], Takemoto MLS[1], Sauberman MV[2], Amaral LM[1], Silva MA[1], Vasconcellos JF[1], Haas LC[1], Takemoto MMS[1]
[1]*ANOVA, Rio de Janeiro, Brazil,* [2]*Hospital Municipal Lourenço Jorge, Rio de Janeiro, Rio de Janeiro, Brazil*

OBJECTIVES: In Rio de Janeiro, the prohibition on driving after drinking alcoholic beverage began on March 19th 2009. Media has reported since then a decrease in the number of vehicle accidents. A study on hospitalization profile and costs was developed from the public perspective to compare pre and post beginning of prohibition periods. **METHODS:** A public secondary database was accessed to evaluate three periods: pre prohibition (PRE; April 2008 to March 2009); first (FAP; April 2009 to March 2010) and second (SAP; April 2011 to March 2012) years after prohibition. For each period, number of hospitalizations, related costs and mortality rate were evaluated. Costs are presented in 2012 Brazilian Real (BRL). Filters for city (Rio de Janeiro), and group (external causes – transport accidents) were applied. No limits for procedure type, ICD-10 or patient's age were used. **RESULTS:** In FAP and SAP, total number of hospitalizations related to transport accidents showed a discrete decrease (4,485 and 4,729, respectively) when compared to PRE number (4,783). However, hospitalization costs showed a small increase in FAP (5,812,999BRL; mean cost per patient: 1,296BRL) and SAP (6,596,924BRL; mean cost per patient: 1,398BRL), when compared to PRE (5,677,670BRL; mean cost per patient: 1,187BRL). Mortality rate, as well as absolute number of deaths has decreased in FAP (165; rate: 3.7) and SAP (211; rate: 4.5) if compared to PRE (224; rate: 4.7). Surgical treatment of tibia fracture was the most impacting procedure in number of hospitalizations (294; 246; and 255 for PRE, FAP and SAP, respectively), and two most impacting cost disease were surgical treatment of politrauma (956,435BRL; 1,190,927BRL; 1,491,951BRL), and surgical treatment of tibia fracture (475,117BRL; 396,793BRL; 391,756BRL), for all three studied periods. **CONCLUSIONS:** No significant impact in costs were observed after prohibition on driving after drinking alcohol. Absolute number of hospitalizations and mortality rate showed a discrete fall.

PMS24

ESTIMACIÓN DE LA PREVALENCIA DE ARTRITIS REUMATOIDE EN MÉXICO

Galindo-Suárez RM[1], Peniche-Otero G[2], Herrera-Rojas J[2], Gryzbowski E[2], Muciño-Ortega E[1], Aguirre A[3]
[1]*Pfizer S.A. de C.V., Ciudad de México, Mexico,* [2]*Customized Premium Products S.A. de C.V., México D.F., Mexico,* [3]*UCB de Mexico, S.A. de C.V., Mexico, D.F., Mexico*

OBJECTIVOS: Estimar la prevalencia de artritis reumatoide (AR) en adultos en México durante el año 2009. **METODOLOGÍAS:** Se estimó la prevalencia de pacientes con AR en México, basada en los registros de casos nuevos (consulta de especialidad en segundo nivel de atención de primera vez y subsecuente) de la base de datos de la Secretaría de Salud (datos de 2009, clasificación CIE-10). Se excluyeron los casos reportados en consulta familiar ya que de acuerdo a guías de práctica clínica, el diagnóstico de artritis reumatoide requiere de validación por parte de un reumatólogo. La estructura poblacional se extrajo de fuentes gubernamentales oficiales. Los datos fueron analizados con el software DISMOD II para generar estimados consistentes de los parámetros epidemiológicos de la AR. **RESULTADOS:** La prevalencia estimada de AR para el año 2009 fue de 0.8% de la población adulta, equivalente a 879,776 personas. La prevalencia estimada por género fue de 0.7% en hombres y de 0.9% en mujeres. De acuerdo a la edad, la prevalencia se acentúa después de los 45 años. Según el grado de discapacidad 10% de los casos se consideraron como enfermedad severa, 60% AR moderada y 30% AR leve. El 97% de los pacientes recibió atención médica institucional: 49% derechohabientes de empresas privadas, 36% del Seguro Popular, 9% trabajadores del gobierno federal, 2% trabajadores petroleros y fuerzas armadas y 1% trabajadores de gobiernos estatales. **CONCLUSIONES:** La prevalencia estimada para México es consistente con lo reportado a nivel internacional. El número estimado de casos por sexo, edad y severidad pueden emplearse como base para diseñar políticas específicas, así como gestionar estrategias de atención y realizar la planificación de los recursos necesarios para atender a esta población.

PMS25

UNMET NEEDS AND BIOLOGIC USE AMONG PATIENTS WITH RHEUMATOID ARTHRITIS IN BRAZIL

de Renteria J[1], DiBonaventura M[2], Suponcic S[2], Pomerantz D[2]
[1]*Kantar Health, Munich, Germany,* [2]*Kantar Health, New York, NY, USA*

OBJECTIVES: Despite their availability, it is unclear the extent to which biologic treatments are being used in Brazil. The current study assessed the unmet needs of patients with rheumatoid arthritis (RA) in Brazil and the degree to which biologic treatments are currently used. **METHODS:** Data were obtained from the Brazil 2011 and 2012 National Health and Wellness Surveys (NHWS; N=24,000). The Brazil NHWS is a self-reported nationally representative patient survey of the adult population (aged 18+), weighted to correct for any socioeconomic sampling bias. Respondents in NHWS who reported a diagnosis of RA (n=137) were examined with respect to their sociodemographics, current treatments, health outcomes (e.g., Short Form 12v2), and biologic-related attitudes. Differences in health outcomes as a function of severity were examined using general linear models. **RESULTS:** Patients with RA were mostly female (59.12%) and had a mean age of (43.76 years). 36.50%, 43.07%, and 20.44% of patients were mild, moderate, and severe, respectively. Mean levels of physical health status decreased as severity increased (Mild=45.12; Moderate=41.50; Severe=38.49, $p<.05$). All severity levels were significantly lower than the population norm of 50 (ps<.05). Similar effects were observed for other health outcomes. Despite these unmet needs, only 60.92% of moderate-to-severe patients were currently being treated with a prescription medication and only 6.90% were using biologic therapy. Post-hoc analyses examined potential reasons for low biologic uptake among moderate-to-severe patients including significantly poorer access (20.27% of RA patients vs. 27.74% of non-RA patients had monthly household incomes above R$10,000) and attitudinal factors (29.33% reported a fear/strong fear of needles). **CONCLUSIONS:** Our analyses suggest significant decrements in health outcomes among patients with RA in Brazil and poor uptake in biologic therapies. Although future research would need to more directly test our hypotheses, preliminary analyses suggest that poor access and attitudinal factors may play a role.

NEUROLOGICAL DISORDERS – Clinical Outcomes Studies

MIXED TREATMENT COMPARISON OF ADVERSE EVENTS FOR BG-12, GLATIRAMER, AND TERIFLUNOMIDE FOR THE TREATMENT OF RELAPSING FORMS OF MULTIPLE SCLEROSIS

Zagmutt FJ[1], Carroll CA[2]
[1]*EpiX Analytics, Boulder, CO, USA,* [2]*Teva Pharmaceuticals, Kansas City, MO, USA*

OBJECTIVES: Clinical trials of two new oral treatments (Teriflunomide and BG-12) for relapsing-remitting multiple sclerosis (RRMS) have been recently published. As efficacy is similar between these products and glatiramer, a comparison of their relative safety is relevant to physicians, patients, and providers. Our objective was to conduct a mixed treatment comparison of adverse event (AEs) in placebo-controlled randomized clinical trials of BG-12 240mg BID and TID, Glatiramer 20mg SID, and Teriflunomide 7mg and 14 mg SID in RRMS. **METHODS:** Articles were selected and reviewed following Cochrane guidelines. Placebo-controlled phase III RRMS clinical trials were eligible for inclusion. Data collected were the total number of patients experiencing at least one AE. The odds ratio (OR) of AEs, Credible Interval (CrI), and confidence in OR >1 for all drug pairs were estimated using a Bayesian random effects network meta-analysis with placebo as baseline comparator, and multi-arm adjustment. The mean rank (1-5) and probability of ranking lowest (PrL) of all treatments were calculated. The Surface Under Cumulative Ranking (SUCRA) summarized overall strength of evidence of the ranking of each treatment (best 100%, worst 0%). **RESULTS:** A total of 384 studies were identified and reviewed, and 3 studies (3737 patients) were included for analysis. Preliminary results are reported. Glatiramer exhibited the lowest AEs of all treatments (OR >1 for all comparisons with ≥ 90% confidence), except for borderline non-significantly lower AEs vs. placebo (OR=.73;95%CrI=.18-1.98;PL=89.6%). Patients receiving glatiramer had the lowest AEs (rank=1.4,PrL=80.3%,SUCRA=91.7%), followed by placebo (rank=2.9,PrL=4.2%,SUCRA=62.6%), BG-12 240mg TID (rank=3.2,PrL=4.8%,SUCRA=56.8%), Teriflunomide 7mg (rank=4.2,PrL=5.5%,SUCRA=35.3%), BG-12 240mg BID (rank=4.7,PrL=1.2%,SUCRA=26.9%), and Teriflunomide 14mg (rank=4.7,PrL=4.0%,SUCRA=26.7%). **CONCLUSIONS:** Preliminary results suggest that RRMS patients treated with Glatiramer have the lowest risk of experiencing AEs, while patients taking Teriflunomide 14mg have the highest AEs risk. This evidence may be useful to perform net clinical benefit analyses on alternative RRMS treatments.

PND2

EPIDEMIOLOGY AND ECONOMIC STUDIES ON PATIENTS DIAGNOSED WITH INSOMNIA: A REVIEW OF THE LITERATURE

Greene N[1], Greene M[2]
[1]*Massachusetts College of Pharmacy and Health Sciences, Boston, MA, USA,* [2]*Georgia State University, Bethel, MA, USA*

OBJECTIVES: To conduct a systematic review of literature in peer-reviewed journals on epidemiology and economic studies on patients diagnosed with Insomnia. **METHODS:** The initial search strategy was developed in the PubMed/MEDLINE database, and was then translated for the Cochrane and Embase database searches. Search strings for epidemiology and economics studies for Insomnia were constructed using varied approaches that included the use of MeSH terms, as well as keywords that would afford the best retrieval. Additional parameters were placed on the final search strategy to limit the retrieval to articles written in English, involving human subjects and published between 2000 and 2010. **RESULTS:** The initial search identified 225 articles for epidemiology and 144 articles for economic studies on Insomnia from PubMed/Medline/Embase/Cochrane databases. After removing duplicates and non-relevant articles, 40 articles for epidemiology and 13 for economic studies were included in the study. Twenty-three studies were focused on the prevalence of insomnia and the estimates among all of the studies ranged from 6.6% to 56%. Two studies focused on one year incidence rates of insomnia; one in Canada and the other in the UK. There were 4 studies each on burden of illness and cost effectiveness and 5 studies on retrospective claims analysis. The average annual direct and indirect per-person costs were $5,010 for individuals with insomnia syndrome, $1,431 for individuals presenting with symptoms, and $421 for good sleepers. **CONCLUSIONS:** There was a significant variation in the prevalence rates of Insomnia across different studies and in different countries. Insomnia results in significant direct and indirect costs and indirect costs in comparison to patients who were not diagnosed with Insomnia.

NEUROLOGICAL DISORDERS – Cost Studies

PND3

NATALIZUMAB FOR 2ND LINE TREATMENT IN RELAPSING-REMITTING MULTIPLE SCLEROSIS PATIENTS: 5-YEAR BUDGET IMPACT ANALYSIS (BIA) FROM THE BRAZILIAN PUBLIC PAYER PERSPECTIVE

Nishikawa AM[1], Paladini L[1], Liamas AL[2], Bueno CC[1], Clark OAC[1]
[1]*Evidencias, Campinas, Brazil,* [2]*Biogen Idec Brasil, São Paulo, Brazil*

OBJECTIVES: Multiple sclerosis (MS) is a neurodegenerative disease associated with long-term disability and economic impact. With the addition of new agents for the MS treatment (e.g. natalizumab), there is a need to evaluate the relative value of newer therapies in terms of cost, given health care resource constraints in Brazil. Natalizumab is an effective therapeutic option for RRMS patients. Compared to other drug options, it shows better efficacy in terms of disease progression and relapse rates. Although natalizumab is indicated for 2nd line, the Ministry of Health public guidelines recommend natalizumab only in 3rd line treatment for MS. Therefore, a BIA has been created to analyze the impact of introducing natalizumab in 2nd line treatment in the public system. **METHODS:** BIA was based in a Markov model with monthly cycles and 5-year time horizon and MS epidemiological data were obtained from DATASUS. The model compared current MS treatment options reimbursed by the Brazilian government - interferon, glatiramer acetate and natalizumab (3rd line) with an alternative scenario with natalizumab in 2nd line. **RESULTS:** Number of Brazilian patients eligible for Relapsing-Remitting Multiple Sclerosis (RRMS) treatment was estimated to be around 7,098, 2,397 and 498 patients (1st, 2nd and 3rd line treatment, respectively) in the first year. Compared to the current scenario, the inclusion of natalizumab in the reimbursement protocol for 2nd line shows an additional budget through the 5 years consecutively as: 124.9K, 365.7K, 652.3K, 912.8K and 1.0M (USD). It is expected that during the 5-year analysis, the inclusion of natalizumab as 2nd line will increase the budget for MS by 4% with average cost per MS patient of USD50.60 (USD13.061 vs USD13.112 per patient/year). **CONCLUSIONS:** The estimated budget impact to include natalizumab as a 2nd line treatment option was USD3.1M in five years (increment of 4.0% of the current budget) for MS treatment.

PND4

ANÁLISIS DE COSTO-EFECTIVIDAD DE DOS FORMULACIONES DE TOXINA BOTULÍNICA TIPO A (TBA) EN COLOMBIA PARA EL TRATAMIENTO DE LA PARÁLISIS CEREBRAL INFANTIL (PCI)

Serizawa E[1], Galeano C[2]
[1]*Instituto Nacional de Rehabilitacion Servicio de Fisiatria "J.J. Arvelo" adscrito al Ministerio para el Poder Popular para la Salud (INR-MPPS), Caracas, Venezuela,* [2]*BIOPAS Laboratoires, Bogotá, Colombia*

OBJECTIVOS: La incidencia de PCI es de 1.5 a 5/1000 nacidos vivos, esta representa la mayor causa de discapacidad infantil con un alto impacto en salud pública y la TBA hace parte del tratamiento integral. Los objectivos de este estudio son de comparar la costo-efectividad e impacto presupuestal del tratamiento con TBA Dysport 500U y Botox 100U en pacientes pediátricos con PCI, bajo la perspectiva del sistema de salud colombiano en un horizonte temporal de un año. **METODOLOGÍAS:** Para valorar la efectividad y seguridad se realizó revisión sistemática de la literatura; para la estimación de costos se utilizó la metodología de caso tipo, validado por tres fisiatras. Se estimó el costo de tratamiento anual basados en la "Circular 04 de Noviembre de 2012 de la Comisión Nacional de Precios". El análisis de sensibilidad incluye una variación entre el 25% y 30% de las dosis y escenarios sin optimización de unidades. Se calculó y comparó el costo promedio de tratar un paciente con PCI durante 1 año y el impacto presupuestal en una cohorte 1000 pacientes con cada medicamento. **RESULTADOS:** Las dos alternativas son equivalentes en términos de respuesta clínica y seguridad de acuerdo a lo encontrado en la evidencia científica. El costo promedio de tratamiento por paciente con TBA 500U es USD 2592 vs USD 3888 con TBA 100U, lo que representa un ahorro anual del 33% con el uso de TBA 500U. Si se considera una cohorte de 1000 pacientes, la elección de tratar PCI con TBA 500 proyecta un ahorro de USD 1,296,000 para el sistema de salud colombiano. En el 83% los escenarios del análisis de sensibilidad el uso de TBA 500U se mantuvo costo-ahorrativa. **CONCLUSIONES:** Desde la perspectiva del sistema de salud Colombiano el tratamiento de la PCI con TBA 500U resulta costo-ahorrativo vs el tratamiento con TBA 100U.

PND5

ANÁLISIS DE COSTOS MEDIANTE UN MODELO LINEAL GENERALIZADO DE PACIENTES MEXICANOS CON SINDROME DE WEST

Pizarro M[1], Soto H[2], Bastida-Mercado E[1], Salazar A[3]
[1]*Hospital Infantil de Mexico Federico Gomez, México D.F., Mexico,* [2]*Health Solutions Consulting, D. F., Mexico,* [3]*Iteliness Consulting, D. F., Mexico*

OBJECTIVOS: Realizar un análisis de costos del Síndrome de West (SW) mediante un modelo lineal generalizado desde la perspectiva institucional del Sector Salud de México. **METODOLOGÍAS:** Se identificaron los costos médicos directos de la atención de pacientes con SW (CIE-10 G40X) en el período comprendido entre 2000 y 2010, en el Hospital Infantil de México Federico Gómez (HIMFG). Los costos de recursos se obtuvieron del tabulador de cuotas de recuperación del HIMFG ajustados por el índice de precio del Sector Salud al 2011, los costos se reportan en MxP.Se realizó un modelo lineal generalizado para conocer la distribución de los valores de cada concepto evaluado y con estos resultados se realizó un análisis de sensibilidad Bootstrap para observar el comportamiento en los costos y la variabilidad de los mismos, además de una simulación de Monte Carlo con los intervalos de confianza generados. **RESULTADOS:** Se revisaron 86 expedientes de pacientes con SW, 60,7% de sexo masculino, la edad de inicio de los espasmos fue en promedio 4.9 meses, el tiempo promedio de seguimiento de los pacientes fue de 2.67 años. El costo total promedio del seguimiento fue de $45.425,73 correspondiendo el 73,79% del gasto a uso de fármacos antiepilépticos, 24,39% a estudios de extensión y el 2,2% restante a atención ambulatoria, hospitalizaciones y consulta de urgencias. En relación al tiempo de seguimiento, el medicamento con mayor costo durante el seguimiento fue la vigabatrina (media $21.924,24, rango $1.051,27 - $101.347,70), seguida del valproato de magnesio (media $6.914,75, rango $50,41 - $108.176,50). El análisis de sensibilidad realizado mostró que el modelo de costos es robusto y eficaz. **CONCLUSIONES:** La mayor proporción del coste de tratamiento en pacientes con SW correspondió al tratamiento antiepiléptico, lo que coincide con otros reportes de la literatura en relación al costo generado por el tratamiento farmacológico en pacientes epilépticos.

PND6

BURDEN OF MULTIPLE SCLEROSIS AND UNMET NEEDS IN BRAZIL: COST OF ILLNESS STUDY

Silva NL[1], Takemoto M[2], Damasceno B[3], Fragoso YD[4], Finkelsztejn A[5], Gomes M[1]
[1]*Novartis Biociências S.A., São Paulo, Brazil,* [2]*ANOVA - Knowledge Translation, Rio de Janeiro, Brazil,* [3]*UNICAMP - Hospital de Clínicas, Campinas, Brazil,* [4]*UNIMES - Universidade Metropolitana de Santos, Santos, Brazil,* [5]*Hospital de Clínicas de Porto Alegre, Porto Alegre, Brazil*

OBJECTIVES: To assess both direct medical and non-medical costs of Brazilian multiple sclerosis (MS) patients. **METHODS:** This was a cross-sectional, multicenter study conducted in 8 Brazilian major MS treatment sites. Costs due to MS treatment were calculated based on the resource utilization related to inpatient days, outpatient visits, laboratory and imaging tests, disease modifying therapies (DMTs), co-medication, OTC medications, aids and/or home modifications, and professional caregiver. Unit costs derived from Brazilian official price lists were applied to the

yearly frequency and average consumption. **RESULTS:** The study enrolled 210 MS patients, mean age was 40.7 [standard deviation=11.5] years and 70.7% female. Patients with mild disability (according to self-reported Expanded Disability Status Scale [EDSS]) represented 40.4% of patients, 43.7% had moderate disability and 15.9% had severe disability. The overall yearly direct costs (mean [CI95%]) associated to patients with mild, moderate and severe disabilities were: USD18,475 [2,293-34,657], USD19,371 [4,651-34,090], and USD19,545 [0-57,659] (1BRL = 0.4937USD), respectively. Disease modifying therapies (DMTs) were the major component of the total yearly cost, ranging from 93.5% among mild patients to 53.9% in the severe group (85.5% in the total sample), followed by aids and home modifications (mild: 2.3%; moderate: 2.3%; severe: 15.1%; total sample: 4.3%). Patients with moderate disability had higher absolute costs related to inpatient care, emergency visits, laboratory and imaging tests, and DMTs than the other disability groups, while those with severe disabilities presented higher costs in the remaining categories (consultations, co-medications and OTC medications, aids and home modifications, and professional caregiver). **CONCLUSIONS:** To our knowledge, this is the first Brazilian study investigating the cost of MS patients. Our findings indicate that MS represent a significant economic burden for both the health care system and patients and their families, with different expenditures profiles depending on the EDSS level.

PND7

ARGENTINIAN SURVEY IN COST OF ILLNESS AND UNMET NEEDS IN MULTIPLE SCLEROSIS: TREATMENT EXPERIENCE & THE COSTS OF MS PATIENTS IN ARGENTINA

Kuperman G

Novartis Argentina, Buenos Aires, Argentina

OBJECTIVES: The objective of the study was to assess the cost of MS patients in Argentina categorized by disease severity using a societal perspective. **METHODS:** This was a cross-sectional study including MS patients from 21 MS centers in 12 cities of Argentina conducted to collect information on demographics, disease characteristics, disease severity, comorbidities, relapses, resource utilization and patient reported outcomes, associated with MS. Patients were stratified by disease severity using the EDSS (group 1 with EDSS score between 0 and 3; group 2 with EDSS >3 and <7; group 3 with EDSS ≥7). Direct and indirect costs included in the analysis were: inpatient and outpatient care for relapses, inpatient care for other reasons than relapses, consultations, investigations, specific MS treatments, wheelchair, professional care, informal care, sick leave and retirement due to MS. Second quarter 2012 costs were obtained from public sources and converted to US Dollars. **RESULTS:** A total of266 patients were included. 87.6% had relapsing remitting MS. Mean annual cost per MS patient was USD 36,025 (95% CI 31,985-38,068) for patients with an EDSS between 0-3; USD 40,705 (95% CI 37,199-46,300) for patients with EDSS >3 and <7, and USD 50,712 (95% CI 47,825-62,104) for patients with EDSS ≥7. **CONCLUSIONS:** This is the first Argentine study evaluating the costs of MS considering disease severity.

PND8

CHARACTERISTICS OF HOSPITALIZATIONS DUE TO AN EPISODE OF RELAPSE IN MULTIPLE SCLEROSIS BRAZILIAN PATIENTS: A RETROSPECTIVE ADMINISTRATIVE CLAIMS ANALYSIS UNDER THE PUBLIC PAYER PERSPECTIVE

Takemoto MLS, Guerra R, Fernandes RA, Takemoto MMS, Santos PML, Haas LC, Silva MA

ANOVA, Rio de Janeiro, Brazil

OBJECTIVES: To describe hospital admissions for managing multiple sclerosis (MS) relapses in the Brazilian Public Healthcare System (BPHS). **METHODS:** Data from the 2009-2012 period were collected from the BPHS Hospital Information System (SIH/SUS), which aggregates administrative data from inpatient admissions in public hospitals in the entire country. Individual claims coded as "MS Relapse Inpatient Treatment" in the SIH/SUS (regardless ICD-10 codes) were identified in the database and compiled by state and year. **RESULTS:** We obtained data on 5,922 individual MS relapse-related claims, homegenously distributed among the 4 years. They represented an overall cost of BRL3,729,921 for the 2009-2012 period (ranging from BRL806,722 in 2010 to BRL1,033,649 in 2012). The 4-year national average cost per inpatient admission BRL629, with mean LOS of 7.51 days and ICU days of 0.22. The in-hospital mortality rate ranged from 0.65%-1.60%. The 2012 national rate of MS relapse-related hospitalization in the general population (per 100,000, absolute number of admissions / total population) was 0.79, varying from 0.03/100,000 in Alagoas (Northeast region) to 1.78/100,000 in Santa Catarina (South region). All parameters were consistently different among Brazilian states. In-hospital deaths were very rare in this sample not allowing robust conclusions. It was possible to identify significant outliers in the mean cost per admission when states were separately considered (2012 data: from BRL323 [n=3] in Sergipe to BRL 4,596 in Espírito Santo [n=4]). São Paulo was the state with higher absolute number of hospitalizations in all years. In 2012, the state had 526 admissions, mean cost per event of BRL810, 4 in-hospital deaths (0.76%), mean LOS=6.16, and mean ICU days of 0.36. **CONCLUSIONS:** BPHS administrative hospital database can provide insightful information about MS relapse-related admissions. Both geographical and time trends can be examined using SIH/SUS secondary data, particularly for diseases with highly specific procedure codes.

PND9

ANÁLISIS DE COSTO-EFECTIVIDAD DEL TRATAMIENTO PROFILÁCTICO VERSUS A DEMANDA EN ADOLESCENTES CON HEMOFILIA A SEVERA EN COLOMBIA

Ordoñez Molina JE, Orozco Giraldo JJ

CES University, Medellin, Colombia

OBJECTIVOS: Algunos adolescentes con hemofilia A moderada reciben profilaxis con Factor VIII (FVIII), pero los resultados económicos de esta estrategia de tratamiento son desconocidos. El objetivo de este estudio fue estimar la razón de costo-efectividad incremental (ICER) de profilaxis con FVIII versus tratamiento a demanda para prevenir episodios de sangrado y hemorragias articulares en adolescentes con hemofilia A moderada en Colombia. **METODOLOGÍAS:** Se utilizó un árbol de decisión desde la perspectiva de un tercer pagador y con tasas de eventos anuales. La eficacia de la profilaxis se tomó de la literatura. Los costos incluyeron FVIII, hospitalización, consultas por urgencias, colocación y complicaciones del catéter venoso central y consultas médicas. La tasa de descuento fue 3% y la utilización de recursos se identificó del grupo económico de hemofilia Europeo y se valoró a partir de tarifarios locales. La prevalencia de hemofilia se determinó con datos locales. Dosis de profilaxis con FVIII: 25U/kg tres veces semanales. Dosis del tratamiento a demanda: 40U/kg dos veces diarias por 3,5 días. **RESULTADOS:** En adolescentes de 10 años y 33kg, la profilaxis con FVIII evitará 118 episodios de sangrado y 47 hemorragias articulares durante el resto de sus vidas, versus a demanda; ICER para el sangrado fue $6.749 y $17.178 para hemorragias articulares. En adolescentes de 19 años y 54kg, la profilaxis con FVIII versus a demanda, evitará 87 episodios de sangrado y 34 hemorragias articulares durante el resto de sus vidas; ICER para el sangrado fue $11.750 y para hemorragias articulares $29.938. **CONCLUSIONES:** La profilaxis con FVIII es una estrategia costo-efectiva en niños con hemofilia A moderada y que presenten 6,4 episodios de sangrado y 2,3 hemorragias articulares, en promedio cada año. Si la profilaxis se inicia a una edad más temprana, se prevendrán más episodios de sangrado y de hemorragia articular.

PND10

ANÁLISIS DE COSTO-EFECTIVIDAD DL TRATAMIENTO PROFILÁCTICO VERSUS A DEMANDA EN ADULTOS JÓVENES CON HEMOFILIA A SEVERA EN COLOMBIA

Ordoñez Molina JE, Orozco Giraldo JJ

CES University, Medellin, Colombia

OBJECTIVOS: La profilaxis con Factor VIII (FVIII) en hemofilia A severa se utiliza en países desarrollados, en países en desarrollo hay controversia por sus costos. El objetivo de este estudio fue estimar la razón de costo-efectividad incremental (ICER) de profilaxis con FVIII versus tratamiento a demanda para prevenir episodios de sangrado y hemorragias articulares en adultos con hemofilia A severa en Colombia. **METODOLOGÍAS:** Se utilizó un árbol de decisión desde la perspectiva del tercer pagador y con tasas de eventos anuales. La eficacia de la profilaxis se tomó de la literatura. Los costos incluyeron FVIII, hospitalización, consultas por urgencias, colocación y complicaciones del catéter venoso central, consultas médicas y días de trabajo perdidos. La tasa de descuento fue 3% y la utilización de recursos se identificó del grupo económico de hemofilia Europeo y se valoró a partir de tarifarios locales. La prevalencia de hemofilia se determinó con datos locales. Dosis de profilaxis con FVIII: 25U/kg tres veces semanales. Dosis del tratamiento a demanda: 50U/kg tres veces diarias por una semana durante la hospitalización y 25U/kg tres veces semanales por tres semanas ambulatoriamente. **RESULTADOS:** En adultos de 20 años y 70kg, la profilaxis con FVIII evitará 168 episodios de sangrado y 66 hemorragias articulares durante el resto de su vida, versus a demanda; ICER para el sangrado fue $5.676 y $14.463 para hemorragias articulares. En adultos de 40 años y 70kg, la profilaxis con FVIII evitará 79 episodios de sangrado y 31 hemorragias articulares durante el resto de su vida, versus a demanda; ICER para el sangrado fue $5.244 y para hemorragias articulares $13.417. **CONCLUSIONES:** La profilaxis con FVIII en pacientes adultos mejora los resultados clínicos versus a demanda. Si la profilaxis se inicia a una edad más temprana, se prevendrán más episodios de sangrado y de hemorragia articular.

COST-EFFECTIVENESS ANALYSES OF NATALIZUMAB FOR 2ND LINE VERSUS GLATIRAMER ACETATE IN THE TREATMENT OF RELAPSING-REMITTING MULTIPLE SCLEROSIS PATIENTS IN BRAZIL

Nishikawa AM[1], Paladini L[1], Liamas AL[2], Bueno CC[1], Clark OAC[1]

[1]*Evidencias, Campinas, Brazil,* [2]*Biogen Idec Brasil, São Paulo, Brazil*

OBJECTIVES: Multiple sclerosis (MS) is a neurologic disease that can dramatically affect patients. The aim of this study is to conduct a cost-effectiveness analysis of natalizumab (Tysabri®) versus glatiramer acetate (Copaxone®) for treatment of Relapsing Remitting Multiple Sclerosis (RRMS) patients from the Brazilian Public Healthcare System (SUS) perspective. **METHODS:** A Markov model with a 20-year time horizon comparing natalizumab to glatiramer acetate was developed. Health states were based on EDSS and relapses (moderate or severe). We obtained relapse and disability progression transition probabilities from natural history studies on RRMS patients. In each monthly cycle, patients can discontinue treatment, remain stable, progress to higher MS EDSS state, experience Progressive Multifocal Leukoencephalopathy (PML) or die. Patients with EDSS score ≥ 7.5 receive best supportive care. Resource use and costs were validated by an expert's panel and valued using Brazilian public official lists (DATASUS and BPS). Costs and outcomes (5%) were discounted. Probabilistic sensitivity analyses (PSA) covered variability in efficacy and costs. **RESULTS:** Use of natalizumab was associated with slower EDSS progression and reduced relapse burden. The life years gained (LYG) with natalizumab and glatiramer acetate was 10.65 and 10.09, respectively. Costs associated with natalizumab were USD 119.330 and USD 102.275 for glatiramer acetate. Incremental cost-effectiveness rate for natalizumab versus glatiramer acetate was USD 30.251/LYG. PSA has confirmed the consistency of base case results. **CONCLUSIONS:** For a patient with RRMS, this model shows that natalizumab was cost-effective when compared to treatment with glatiramer acetate, assuming the threshold of USD 50.000/LYG commonly mentioned by the Ministry of Health in Brazil.

PND12

COST-EFFECTIVENESS ANALYSES OF NATALIZUMAB FOR 1ST LINE VERSUS INTERFERON BETA-1A 44 MCG IN THE TREATMENT OF HIGHLY ACTIVE RELAPSING-REMITTING MULTIPLE SCLEROSIS PATIENTS IN BRAZIL

Nishikawa AM[1], Paladini L[1], Liamas AL[2], Bueno CC[1], Clark OAC[1]

[1]*Evidencias, Campinas, Brazil,* [2]*Biogen Idec Brasil, São Paulo, Brazil*

OBJECTIVES: Multiple sclerosis (MS) is a neurologic disease that can dramatically affect the patient. The aim of this study is to conduct a cost-effectiveness analysis of natalizumab (Tysabri®) versus interferon beta-1a (IFNB1a) 44mcg (Rebif®) for treating Highly Active Relapsing Remitting Multiple Sclerosis (HARRMS) patients. IFNB1a

44mcg was chosen as comparator since it is the most widely prescribed disease modifying therapy for 1st-line treatment in HARRMS patients in Brazil. **METHODS:** We developed a Markov model with 20-year time horizon comparing natalizumab to IFNB1a 44mcg. Health states were based on EDSS and relapses (moderate or severe). Since there are no published data evaluating long-term course specifically in HARRMS, we assumed transition probabilities on EDSS states based on natural history studies on unselected RRMS patients, and relapse probabilities based on a post-hoc analysis of the pivotal natalizumab AFFIRM trial. This is a rather conservative approach, since disability progression may be slower in this proposed model then expected for patients with HARRMS and so the benefit from natalizumab could be underappreciated. In each monthly cycle, patients can discontinue treatment, remain stable, progress to higher EDSS state, experience Progressive Multifocal Leukoencephalopathy or die. Patients with EDSS score≥7.5 receive best supportive care. Resource use and costs were validated by an expert's panel and valued using Brazilian public official lists (DATASUS and BPS). Costs and outcomes were discounted (5%). Probabilistic sensitivity analyses (PSA) covered variability in efficacy and costs. **RESULTS:** Use of natalizumab was associated with slower EDSS progression and reduced relapse burden. Life years gained with natalizumab and IFNB1a 44mcg were 10.90 and 10.54, and costs were USD119,977 and USD132,446, respectively. In the base-case, natalizumab was dominant versus IFNB1a 44mcg. PSA has confirmed the consistency of results. **CONCLUSIONS:** For a patient with HARRMS, the model shows that natalizumab was dominant when compared to IFNB1a 44mcg in the Brazilian Public Healthcare System.

PND13

BURDEN OF MULTIPLE SCLEROSIS AND UNMET NEEDS IN BRAZIL: HEALTH CARE RESOURCE UTILIZATION

Silva NL[1], Takemoto M[2], Damasceno B[3], Fragoso YD[4], Finkelsztejn A[5], Gomes M[1]
[1]*Novartis Biociências S.A., São Paulo, Brazil,* [2]*ANOVA - Knowledge Translation, Rio de Janeiro, Brazil,* [3]*UNICAMP - Hospital de Clínicas, Campinas, Brazil,* [4]*UNIMES - Universidade Metropolitana de Santos, Santos, Brazil,* [5]*Hospital de Clínicas de Porto Alegre, Porto Alegre, Brazil*

OBJECTIVES: To assess the health care resource utilization (HRU) of Brazilian multiple sclerosis (MS) patients. **METHODS:** This was a cross-sectional, multicenter study conducted in 8 Brazilian major MS treatment sites. HRU was evaluated as the percentage of patients self-reporting the consumption of resources. The main categories were: hospitalization, consultations, laboratory and imaging tests, disease modifying therapies (DMTs), co-medication, aidsand/or home modifications. Frequency and average consumption were annualized. **RESULTS:** The study enrolled 210 MS patients, mean age was 40.7 [standard deviation=11.5] years and 70.7% female. Patients with mild disability (according to self-reported Expanded Disability Status Scale [EDSS]) represented 40.4% of patients, 43.7% had moderate disability and 15.9% had severe disability.Hospitalization was reported by 23%, 33% and 15% of mild, moderate and severe MS patients, with average length of stay of: 7.53, 10.41, and 7.40 days, respectively. Most patients (>96%) had at least one neurologist consultation per year (average 4.94 visits/year in the total sample). Physical therapy was the most consumed non-medical consultation (mild: 11%; moderate: 38%; severe: 64%). Magnetic resonance imagingwas reported by 60%, 68%, and 55% of mild, moderate and severe patients. Patients using at least one DMT during the previous year were: 89%, 93%, and 61% of mild, moderate and severe MS patients, respectively. The most prescribed DMT was glatiramer acetate (38%, total sample). The most frequent co-medications were: anti-depressants, anti-spasticity, and analgesics. Home modification was reported by 19% and 45% of patients with moderate and severe disability, respectively. For ambulation, walking stick was used by 35% of moderate patients, while wheelchair was needed by 58% of severe patients. **CONCLUSIONS:** To our knowledge, this is the first Brazilian study investigating the HRU of MS patients. The findings can be useful to better understand MS patients' needs in terms of comprehensive care.

NEUROLOGICAL DISORDERS – Patient-Reported Outcomes & Patient Preference Studies

PND14

WHICH CYSTIC FIBROSIS INHALED ANTIBIOTIC MEDICINE FEATURES MATTER MOST TO ADULT PATIENTS AND PARENTS OF PEDIATRIC PATIENTS?

Mohamed AF[1], Johnson FR[1], Balp MM[2], Calado F[2]
[1]*RTI Health Solutions, Research Triangle Park, NC, USA,* [2]*Novartis Pharma AG, Basel, Switzerland*

OBJECTIVES: To quantify patient and parent preferences and adherence for different administration features of inhaled antibiotic medicines for cystic fibrosis (CF). **METHODS:** Adult patients with a self-reported physician diagnosis of CF and parents of pediatric CF patients (6 to 17 years) who had *Pseudomonas aeruginosa* in their lung culture at least twice in one year completed a web-enabled, discrete-choice experiment survey in the United States. Respondents answered 5 treatment-choice questions with known statistical properties. Each question required evaluating a pair of hypothetical CF treatment profiles defined by device type (nebulizer, dry powder inhaler (DPI)), total daily administration and cleaning time, dosing frequency, dry cough side effect, and personal cost per cycle. Lung function measured as forced expiratory volume in one second (FEV_1) was held constant between the hypothetical CF treatment profiles. Stated adherence questions followed two randomly selected treatment-choice questions. Random-parameters logit models were used to estimate preference weights for all feature levels and the mean relative importance of each feature for both samples. **RESULTS:** A total of 209 adult patients and 271 parents completed the survey. Mean age of adult patients was 32 (SD = 10) years and mean age of pediatric patients was 12 (SD = 3) years. Among all respondents, the average time spent taking inhaled antibiotic medicines was approximately 40 minutes. Relative importance estimates indicated that switching from a 30-minute nebulizer twice daily to a 10-minute DPI twice daily was 6.3 times more important for adult patients and 2.0 times more important for parents than an improvement in dry cough from moderate to mild. Stated adherence for adult and pediatric patients was 20-30% higher for DPIs versus nebulizers. **CONCLUSIONS:** Treatments administered with more convenient devices such as DPIs and shorter administration times are associated with higher utility and higher stated adherence in adult and pediatric patients.

PND15

BURDEN OF MULTIPLE SCLEROSIS AND UNMET NEEDS IN BRAZIL: MEASUREMENT OF FATIGUE USING MODIFIED FATIGUE IMPACT SCALE

Silva NL[1], Takemoto M[2], Damasceno B[3], Fragoso YD[4], Finkelsztejn A[5], Gomes M[1]
[1]*Novartis Biociências S.A., São Paulo, Brazil,* [2]*ANOVA - Knowledge Translation, Rio de Janeiro, Brazil,* [3]*UNICAMP - Hospital de Clínicas, Campinas, Brazil,* [4]*UNIMES - Universidade Metropolitana de Santos, Santos, Brazil,* [5]*Hospital de Clínicas de Porto Alegre, Porto Alegre, Brazil*

OBJECTIVES: Fatigue is one of the most frequent symptoms in patients with multiple sclerosis (MS). This study aimed to examine the severity and impact of fatigue in MS Brazilian patients. **METHODS:** This was a cross-sectional, multicenter study conducted in 8 Brazilian major MS treatment sites. Fatigue was assessed using the Brazilian version of the Modified Fatigue Impact Scale (MFIS), which evaluates the impact of fatigue on 3 dimensions of patients' daily life: physical, cognitive and psychosocial. The patient scores 0 (lower impact) to 84 points (higher impact). The final score was classified according to the level of impact: absent (0-38), low (39-58), and high (>58). **RESULTS:** The study enrolled 210 MS patients, of which the mean age was 40.7 [standard deviation = 11.5] years and 70.7% were female. Patients with mild disability (according to self-reported Expanded Disability Status Scale [EDSS]) represented 40.4% of patients, 43.7% had moderate disability and 15.9% had severe disability. In the overall sample, the impact of fatigue was considered absent, low and high in 49%, 32% and 19% of patients, respectively. Any impact (both low and high summed) was reported by 33%, 63%, and 66% of patients with mild, moderate and severe disability, respectively. The mean MFIS total score for mild, moderate and severe patients was 29.3, 45.0, and 45.4 (38.6 in the total sample). The mean impact scores for each domain in the total sample were 20.0 (physical, range 0-36), 14.7 (cognitive, range 0-40), and 3.9 (psychosocial, range 0-8), meaning that fatigue has a proportionally higher impact in the physical than the cognitive or psychosocial domains. **CONCLUSIONS:** Our findings indicate that over 50% of MS Brazilian patients notice some adverse impact of fatigue in their daily lives, particularly related to the physical domain.

PND16

BURDEN OF MULTIPLE SCLEROSIS AND UNMET NEEDS IN BRAZIL: MEASUREMENT OF HEALTH-RELATED QUALITY OF LIFE USING EQ-5D

Silva NL[1], Takemoto M[2], Damasceno B[3], Fragoso YD[4], Finkelsztejn A[5], Gomes M[1]
[1]*Novartis Biociências S.A., São Paulo, Brazil,* [2]*ANOVA - Knowledge Translation, Rio de Janeiro, Brazil,* [3]*UNICAMP - Hospital de Clínicas, Campinas, Brazil,* [4]*UNIMES - Universidade Metropolitana de Santos, Santos, Brazil,* [5]*Hospital de Clínicas de Porto Alegre, Porto Alegre, Brazil*

OBJECTIVES: To measure the health-related quality of life (HRQL) of multiple sclerosis (MS) patients and examine potential associations between HRQL and patients' characteristics. **METHODS:** This was a cross-sectional, multicenter study conducted in 8 Brazilian major MS treatment sites. HRQL was assessed using the Brazilian version of the EQ-5D and patients self-evaluated their HRQL and health status using five dimensions (mobility, self-care, usual activities, pain/discomfort and anxiety/depression) and a visual analog scale (VAS). The EQ-5D index was calculated based on the value set derived from the UK population, since the Brazilian value set is not available. **RESULTS:** The study enrolled 210 MS patients, of which the mean age (standard deviation [SD]) was 40.7 [11.5] years and 70.7% were female. Patients with mild disability (according to self-reported Expanded Disability Status Scale [EDSS]) represented 40.4% of patients, 43.7% had moderate disability and 15.9% had severe disability. Among the 5 assessed HRQL dimensions, the ones with higher frequency of self-reported severe limitations were usual activities and anxiety/depression (11.0% each). The least impaired dimension was self-care, with 63.0% of patients reporting absence of limitation. The mean [SD] VAS score was 71.6 [18.9]. The mean EQ-5D index for each level of EDSS (mild, moderate or severe disability) was 0.73 [0.21], 0.49 [0.30], and 0.30 [0.34], respectively. In the multivariate analysis, variables related to patients' characteristics were explored and the following were associated with the presence of any limitation in at least one dimension: older age, unemployment/retirement, relapses in the previous year, emergency department visits in the previous 6 months and lower educational level. **CONCLUSIONS:** MS adversely impact patients' HRQL, especially with disability progression and clinical features that can be linked to more severe disease.

EVALUATION OF TREATMENT PATTERNS AND CLINICAL TRIALS PUBLISHED ON PATIENTS DIAGNOSED WITH INSOMNIA: A LITERATURE UPDATE

Greene N[1], Greene M[2]
[1]*Massachusetts College of Pharmacy and Health Sciences, Boston, MA, USA,* [2]*Georgia State University, Bethel, MA, USA*

OBJECTIVES: To conduct a systematic review of literature in peer-reviewed journals on real world treatment patterns and clinical trials on patients diagnosed with Insomnia. **METHODS:** A comprehensive literature search was performed using relevant search terms to identify articles published from 2000 to 2010 on the real world treatment patterns and clinical trials conducted on patients with Insomnia. Studies were identified through electronic Embase, Cochrane, Medline, and PubMed databases. Additional parameters were placed on the final search strategy to limit the retrieval to articles written in English, involving human subjects. **RESULTS:** Our search yielded 1,153 articles for treatment patterns and clinical trials on patients diagnosed with Insomnia from PubMed/Medline/Embase/Cochrane databases. After removing duplicates and non-relevant articles, 65 articles were included for final review. A total of 16 studies had some focus on

real world treatment patterns in Insomnia patients and majority of these studies focused on benzodiazepine users. The rate of medication use in Insomnia patients is fairly low and rates were ranging from 17% to 75%. There were a total of 11 trials published testing Eszopiclone use, 10 trials each on Ramelteon and Zolpidem, 4 trials on Indiplon, 3 trials on Gaboxadol, 3 trials on Doxepin use in patients diagnosed with Insomnia. Several patient reported outcomes measures were used in the assessment of various clinical trials. **CONCLUSIONS:** There were a variety of agents being used to treat insomnia; while benzodiazepines and non-benzodiazepines were largely popular. Products in development need to be studied further to determine whether their new mechanisms of action were truly beneficial for treatment.

ACUTE ASTHMA CHARACTERISTICS AND ASTHMA CONTROL IN LATIN AMERICA

Montealegre-Golcher FJ[1], Gold L[2], Camacho R[3], Muñoz S[4]
[1]*MSD, Carolina, PR, USA,* [2]*University of Washington, Seattle, WA, USA,* [3]*MSD, White House Station, NJ, USA,* [4]*Universidad de la Frontera, Temuco, Chile*

OBJECTIVES: To investigate the patient's acute asthma characteristics, and identify predictors of asthma control in a population of asthma patients from five Latin American countries. **METHODS:** Adults and parents of adolescents (12-17 years) with a physician diagnosed asthma and asthma medication use or asthma attacks in the past year were surveyed as part of the 2011 Latin America Asthma Insights and Management (AIM) survey. Using Global Initiative for Asthma (GINA) guidelines as a reference, respondents were categorized into three levels of asthma control: well-controlled, partly- controlled, and uncontrolled. Chi-square tests and adjusted logistic regression were used to determine odds ratios (ORs) to assess the relation of degree of asthma control with frequency of sudden asthma episodes, frequency of asthma symptoms, duration of episodes, day-and night time symptoms, utilization of rescue medications, and asthma episodes seasonality. **RESULTS:** Data from 2168 adults and parents from asthma patients ≥12 years survey was analyzed. Seven percent (7%) of the patients are controlled, 57% partially controlled, and 36% uncontrolled. Adjusted logistic regression models showed that patients whose asthma was uncontrolled were significantly more likely to have acute sudden asthma episodes compared to patients whose asthma was controlled either partially or fully. Similarly, patients with uncontrolled asthma were significantly more likely to have higher frequency of asthma episodes in most days of the week, increased day and night symptoms than those asthmatics who were controlled **CONCLUSIONS:** Patients who did not have well-controlled asthma had more acute episodes as compared to patients whose asthma was well-controlled. Our results strongly suggest that the acute asthma requires a significant effort to decrease its severity.

PRS3
GRAPHIC HEALTH WARNINGS ON CIGARETTE PACKS IN QATAR: PRE-IMPLEMENTATION AWARENESS AND PERCEPTION AMONG THE GENERAL PUBLIC

Awaisu A, Hagi A, Ashour MA, Kheir AN
Qatar University, Doha, Qatar

OBJECTIVES: Graphic health warnings (GHWs) on cigarette packages have been found to be significantly associated with increased awareness of smoking-related health hazards as well as behavior change. Legislations on GHWs have recently been endorsed and GHWs have now been introduced in Qatar. This study aims to evaluate the general public's awareness, beliefs and perceptions on anti-tobacco GHW labels on cigarette packs prior to the introduction of the new law. **METHODS:** A cross-sectional survey using a pretested 23-item questionnaire was conducted among randomly approached adults in Qatar. Data were analyzed using the IBM SPSS® version 19. Responses were analyzed by smoking status (ever-smokers vs. never-smokers) to ascertain how these two distinct groups differed in their awareness and perceptions related to health warning messages. The demographic characteristics and other outcomes of interest were compared using χ^2 or Fishers Exact tests. **RESULTS:** A total of 500 participants (59% male) responded to the survey. Most notably, ever-smokers did not significantly differ from never-smokers on awareness of GHW. About one-third of the respondents had no idea about any specific text warning messages on tobacco products sold and nearly 45% of them did not know what a GHW was. Furthermore, a substantial proportion (more than 20%) of the respondents in both groups did not believe that introducing GHWs will enhance smoking behavior change. Non-smokers generally tended to have more positive attitudes than smokers toward the perceived impact of GHWs ($p < 0.05$). **CONCLUSIONS:** A substantial proportion of the general public in Qatar had poor awareness about GHWs. This study has important implications on the needs to increase awareness about the value of GHWs as well as calls for further research to determine the effectiveness of GHW labels on cigarette packages in Qatar and the greater Middle Eastern region, where legislations on GHWs are still at infancy.

IMPACTO DO USO DO MICRODEBRIDADOR NOS DESFECHOS E CUSTOS NAS CIRURGIAS ENDOSCÓPICAS NASAIS

Costa JDB[1], Limoeiro ACO[2], Silva FB[2], Teich V[3], Marques SA[2]
[1]*ALBERT EINSTEIN HOSPITAL, SÃO PAULO, Brazil,* [2]*Albert Einstein Hospital, SÃO PAULO, Brazil,* [3]*Medinsight – Decisions in Health Care, SÃO PAULO, Brazil*

OBJETIVOS: O objetivo deste estudo foi comparar as técnicas cirúrgicas com uso do microdebridador em relação à técnica convencional nos procedimentos de septoplastia com turbinectomia e sinusectomia, quanto ao tempo de cirurgia, tempo de hospitalização, uso de colas e hemostáticos, escore de dor, taxa de readmissão hospitalar e custo do procedimento. **MÉTODOS:** A partir do sistema de faturamento do HIAE foram selecionados 538 procedimentos de septoplastia com turbinectomia e sinusectomia realizados no ano de 2011 que utilizaram as técnicas comparadas neste estudo. Foram incluídos na análise 517 pacientes, 56 procedimentos utilizando o microdebridador e 461 utilizando a técnica convencional. Em média, os pacientes que utilizaram o microdebridador possuíam uma faixa etária mais elevada e um percentual maior dos pacientes apresentaram diagnóstico de sinusite crônica. **RESULTADOS:** Em relação à média de tempo de permanência hospitalar esta foi maior no grupo do microdebridador (28 horas versus 22 horas no grupo da técnica convencional, p= 0,002). A quantidade média de unidades de cola e de hemostático foi maior no grupo que utilizou o microdebridador. Não houve diferença estatística entre os grupos nos desfechos de tempo de cirurgia e nas taxas de readmissão hospitalar. No desfecho de dor no pós operatório imediato a diferença entre os grupos foi estatisticamente significativa (p = 0,006), indicando um percentual maior de pacientes com escore de dor acima de 5 sendo tratados com o microdebridador, quando comparado com o grupo convencional. Considerando-se o custo do procedimento com a técnica convencional como referência, o uso do microdebridador resultou em um aumento médio de 17,4% em relação à técnica convencional. **CONCLUSÕES:** O uso do microdebridador não se mostrou favorável nos desfechos avaliados, tendo em vista um aumento do tempo de permanência do paciente, uso de colas e hemostáticos em maior quantidade que a técnica convencional e o custo do procedimento foi significativamente mais alto.

COMPARING COPD COSTS BY EXACERBATION FREQUENCY AND DYSPNOEA LEVEL IN A PRIMARY CARE SETTING IN THE UNITED KINGDOM

Punekar YS[1], Shukla A[2], Muellerova H[3]
[1]*GlaxoSmithKline, Uxbridge, UK,* [2]*GlaxoSmithKline, Upper Providence, PA, USA,* [3]*GlaxoSmithKline R&D, Uxbridge, UK*

OBJECTIVES: Economic burden in Chronic Obstructive Pulmonary Disease (COPD) patients with varying levels of dyspnoea is largely unknown. The objective of this retrospective analysis was to estimate the resource use and the associated costs incurred by COPD patients with increasing levels of dyspnoea with or without frequent exacerbations. **METHODS:** A retrospective cohort of prevalent COPD patients was identified in the Clinical Practice Research Datalink (CPRD). All patients who had at least 12 month pre- and post- cohort entry date (1st prevalent COPD diagnosis confirmed by spirometry ≥April 1, 2009) recorded were included in the analysis. Patients were categorised as having none, 1 or 2+ exacerbations in the 12 months post cohort entry and further classified using Medical Research Council (MRC) dyspnoea scale. Study outcomes included general practitioner (GP) visits, community treated exacerbations (medical dg for exacerbation or ATB+OCS Rx), hospital treated exacerbations and all-cause hospitalisations excluding COPD exacerbations. The costs associated with the estimated resource use were calculated using National Health Service (NHS) reference costs for 2010-11. **RESULTS:** The cohort consisted of 51,641 COPD patients with 27,764 (53.8%), 12,585 (24.4%) and 11,292 (21.9%) having experienced none, 1 and 2+ annual exacerbations post cohort entry. Among all patients, the estimated annual COPD management costs, excluding the costs of medications, were £1,597, £1,849, £2,298, £2,745 and £3,579 with increasing levels of dyspnoea (MRC grade 1-5). The equivalent cost ranges by exacerbation frequency were £1,267-£2,235, £2,021-£3,447 and £2,627-£4,709 for patients with none, 1 or 2+ annual exacerbations, respectively. **CONCLUSIONS:** Increase in COPD management costs with increase in level of dyspnoea occurred in all exacerbation frequency groups. Better symptom control and disease management strategies in primary care setting may help reduce COPD costs significantly.

OBJECTIVES: Smoking is the single most preventable cause of disease and death all around the world. Our objective was to quantify the disease burden associated with smoking in Argentina, Bolivia, Brazil, Chile, Colombia, Mexico and Peru. **METHODS:** The project began with a survey to health Decision Makers (DM) to explore country-specific information needs. The development stage involved the harmonization of a methodology to retrieve local relevant parameters and develop the model structure. A microsimulation HEM was built considering the availability and quality of epidemiological data and relevant outcomes were conceived to suit the identified information needs of DMs . It considers all tobacco-related diseases: heart, cerebrovascular and chronic obstructive pulmonary disease, pneumonia/influenza, lung cancer and nine other neoplasms. A systematic search on effectiveness, local epidemiology and costs studies was undertaken to populate the model. Calibration and validation was performed for each country. Predicted event rates were compared to the published rates used as model inputs. External validation was undertaken against epidemiological studies not used to provide input data. **RESULTS:** The calibrated model showed all simulated event rates falling within ±10% of the sources and a high correlation between published data and model results. In these seven LA countries, tobacco is responsible of 259,126 deaths each year. The diseases attributable to smoking cause a total of 1·90 million years of life lost due to premature death, 0·64 million years of life lost due to disability and at least 27 billion dollars (USD dollars 2013) in direct medical costs each year. **CONCLUSIONS:** Tobacco use is

responsible for an enormous burden of disease in the region. This evidence-based, internally and externally valid HEM showed to be an adequate tool for the assessment of the effects of smoking and could be a useful policy-making tool to estimate the cost-effectiveness of tobacco control interventions.

CUSTOS DE PNEUMONIAS HOSPITALIZADAS NO BRASIL: ANÁLISE COMPARATIVA POR DIFERENTES MÉTODOS DE CUSTEIO

Nunes S[1], Itria A[2], Minamisava R[3], Vieira MA[4], Pessoa Junior V[5], Andrade AL[2], Toscano CM[2]

[1]*Universidade Estadual do Maranhão, Centro de Estudos Superiores de Imperatriz (UEMA/CESI). Universidade Federal de Goiás. Pesquisadora do Instituto de Avaliação de Tecnologia em Saúde (IATS), Goiânia- Goiás, Brazil,* [2]*Departamento de Saúde Coletiva do Instituto de Patologia Tropical e Saúde Pública, Universidade Federal de Goiás. Pesquisador do Instituto de Avaliação de Tecnologia em Saúde (IATS), Goiânia - Goiás, Brazil,* [3]*Faculdade de Enfermagem, Universidade Federal de Goiás, Goiânia - Goiás, Brazil,* [4]*Departamento de Enfermagem, Pontifícia Universidade Católica de Goiás, Goiânia, Brazil,* [5]*Instituto de Patologia Tropical e Saúde Pública, Universidade Federal de Goiás. Hospital da Criança, Goiânia - Goiás, Brazil*

OBJETIVOS: Comparar os custos do tratamento de crianças hospitalizadas por pneumonia bacteriana adquirida na comunidade, considerando diferentes metodologias de custeio. **MÉTODOS:** Estudo prospectivo realizado em Goiânia, Goiás/Brasil. Crianças com 28 dias a 35 meses internadas em 2 hospitais foram avaliadas. Três metodologias de custeio foram consideradas na perspectiva do Sistema Único de Saúde: (i) *bottom-up/micro-costing* através da revisão de prontuários; (ii) *top-down/micro-costing* através de diretriz terapêutica; e (iii) *top-down/gross-costing* através de ressarcimento pago pelo SUS. Casos foram pacientes internados com suspeita clínica de pneumonia, receberam antibioticoterapia durante a internação e não tiveram diagnóstico final de pneumonia viral. Casos graves foram aqueles internados em enfermaria enquanto os internados em unidade de terapia intensiva foram considerados muito graves. Foram considerados custos diretos (medicamentos, honorários médicos e de fisioterapia respiratória, exames e diárias hospitalares em UTI e enfermaria) e não-médicos (diárias de acompanhantes). Os custos foram estimados em dólares americanos (USD) e reais (R$) considerando a taxa de câmbio oficial (1 USD = R$ 1,875) em dezembro de 2011. O teste de Friedman foi utilizado para comparar os resultados. **RESULTADOS:** Foram analisados 59 casos (52 graves e 7 muito graves). Os custos de casos graves foram R$ 781 (USD 416) por *bottom-up/micro-costing*, R$ 641 (USD 342) por *top-down/micro-costing* e R$ 597 (USD 318) por *top-down/gross-costing (p=0,015)*. Para os casos muito graves, os custos foram R$ 3.539 (USD 1.887) por *bottom-up/micro-costing*, R$ 3.369 (USD 1.796) por *top-down/micro-costing* e R$ 3.175 (USD 1.693) por *top-down/gross-costing* (p=0,018). Para ambos os grupos, houve diferença significativa apenas entre *bottom-up/microcosting e top-down/gross-costing*. **CONCLUSÕES:** Nossos resultados sugerem a estimativa de custos por *top-down/micro-costing* através de diretriz terapêutica pode ser uma alternativa que se aproxima à estimativa considerando o *bottom-up/microcosting* através de revisão de prontuários, considerado o padrão ouro para estimativa de custos de doença.

EFFECTIVENESS AND COST ANALYSIS OF THE SMOKING CESSATION PROGRAM IN THE PUBLIC HEALTH SYSTEM IN BRAZIL

Mendes ACR[1], Barcellos RMS[2], Ritzel JB[3], Ribeiro AP[3], Pereira NM[4], Oliveira VC[5], Toscano CM[6]

[1]*Federal University of Goias, Goiânia - Goiás, Brazil,* [2]*Secretaria Municipal de Saúde de Goiânia, Goiânia - Goiás, Brazil,* [3]*Ministério da Saúde, Brasília, Brazil,* [4]*Universidade Federal de Goiás, Goiânia - Goiás, Brazil,* [5]*Instituto Nacional de Câncer, Rio de Janeiro, Brazil,* [6]*Departamento de Saúde Coletiva do Instituto de Patologia Tropical e Saúde Pública, Universidade Federal de Goiás. Pesquisador do Instituto de Avaliação de Tecnologia em Saúde (IATS), Goiânia - Goiás, Brazil*

OBJECTIVES: To assess the effectiveness and costs of the Smoking Cessation Program (SCP) in the Public Unified Health System (SUS) and to estimate the cost for its full implementation in the city of Goiânia, Brazil. **METHODS:** The SCP intervention targets group of smokers, and includes medical visits, cognitive-behavioral group therapy, and medication use, lasting six months. Costs for SCP intervention and management were estimated. The SCP full implementation was defined as the program's expansion to meet the demand of all smokers motivated to quit smoking in the city of Goiânia. Direct medical and non-medical direct costs were considered, including staff, medications, consumables, general expenses, transportation, travel, events and capital costs. Microcosting and activity-based costing methods were used. Cost for the federal, state and municipal levels were estimated. The SUS perspective was considered. Two-way sensitivity analysis was conducted. Data sources included a convenience sample of primary health facilities, municipal and state health departments, and the Ministry of Health. Costs were estimated in Reais (R$) and U.S. Dollars (USD), considering the exchange rate of December/2010, which was 1.67. Quitting rates were estimated as the percentage of patients who reported not smoking at the end of the intervention. Costs of the SCP are presented as total cost of the intervention; costs stratified by component and level of funding source; cost per patient; and cost per quitter. **RESULTS:** The average quitting rate was 37.2%. The cost of SCP in Goiânia was R$428,580 (US$257,220), of which 23% were program management costs. Cost per patient was R$534 (US$320) and cost per quitter was R$1,433 (US$860). The SCP's full implementation reaching the estimated 37,455 smokers in Goiânia motivated to quit would cost R$21.5 million (US$13). **CONCLUSIONS:** The SCP is highly effective. Additional efficiency could be gained by expanding patient's access to the program.

CLINICAL AND ECONOMIC ANALYSIS OF MOMETASONE FUROATE NASAL SPRAY IN THE TREATMENT OF RHINOSINUSITIS IN MEXICO

Rely K[1], Blandon V[2], Fonseca A[3], Cañedo A[4], Salinas GE[5], Alexandre PK[6]

[1]*CEAHealthTech, Mexico City, Mexico,* [2]*Merck Sharp & de Mexico, México D.F., Mexico,* [3]*Merck Sharp & Dohme, Mexico City, Mexico,* [4]*Instituto Nacional de Neurología y Neurocirugía, México D.F., Mexico,* [5]*Hospital Infantil de México Federico Gómez, Secretaría de Salud, Mexico, D.F., Mexico,* [6]*Johns Hopkins University, Baltimore, MD, USA*

OBJECTIVES: Little information exists on the acute treatment provided for rhinosinusitis and its associated costs. We hypothesize that introducing the administration of mometasone furoate (MFNS) as a treatment for rhinosinusitis will have a substantial impact on medical resource costs, outcomes and possibly cost-effectiveness. The goal of this paper is to estimate the cost-effectiveness of treating patients with rhinosinusitis with MFNS versus amoxicillin. **METHODS:** A decision-analytic model was developed to estimate lifetime costs and outcomes associated with MFNS 200µg twice daily and amoxicillin 500mg three times daily in treating rhinosinusitis from the Mexican health care perspective. This study further do not included MFNS 200µg once daily as a treatment arm because it was not found to be superior to amoxicillin. Data sources included published literature, clinical trials, official price/tariff lists, and Delphi panel data. The time horizon was 2 weeks. The effectiveness outcomes of the study were modeled as changes in the Major Symptom Score (MSS). MSS consists of five questions concerning rhinorrhoea, post-nasal drip, nasal congestion, sinus headache, and facial pain. Costs were valued in US dollar, year 2012 values. Multiple 1-way sensitivity analyses and a probabilistic sensitivity analysis using Monte Carlo simulation were performed to handle uncertainty. **RESULTS:** The projected costs were US$ 258 with MFNS and $US 272 with. The benefits (changes in the MSS) were 0.52 with MFNS 0.45 with Amoxicilin. MFNS was associated with a cost savings per patient of US$ 14 versus amoxicillin over a period of 2 weeks from a health care perspective. The incremental cost-effectiveness ratio for MFNS dominated Amoxicilin. Sensitivity analysis confirmed the overall cost savings and gains in effectiveness. **CONCLUSIONS:** Our analysis suggests MFNS improves health outcomes in a cost-effective manner compared with Amoxicilin. The economic value of Amoxicillin is influenced by difficulties involved in diagnosing the condition, effectiveness, resistance, patient compliance with treatment, and treatment failure associated with antibiotics.

THE IMPACT OF PUBLIC FORMULARIES & GUIDELINES ON COMMUNITY ACQUIRED PNEUMONIA (CAP) DRUGS IN MEXICO

Stevens CA[1], Bache G[2]

[1]*PAREXEL Consulting, Waltham, MA, USA,* [2]*PAREXEL Consulting, Uxbridge, UK*

OBJECTIVES: Pharmaceutical spending in Mexico represents approximately 25% of total health expenditures, with this number expected to grow by 14% from 2009-2014. 90% of Mexico's population receives health care from the public health system or Popular Health Insurance (PHI). A private insurance market has begun to take root. This study looks at how the increase in price controls and guidelines may impact access to newly approved Community Acquired Pneumonia (CAP) drugs. **METHODS:** An array of published data such as pricing process, current policies, sector-specific research articles contributed towards a framework to understand the key factors affecting access to CAPs drugs, were gathered. The data then informed a telephone survey of national and regional health care stakeholders (N=6). **RESULTS:** Findings show that in Mexico: 1) New pressures through price negotiations are occurring due to economic challenges facing PHI; 2) Private purchasing of pharmaceutical products represents 56% of sold units worth 79% of total spend versus public purchase representing 44% of sold units and 21% of total spend; 3) Formularies used by public coverage schemes require newly approved drugs for CAP to achieve marketing authorization, meet safety requirements and be cost effective versus comparator agents; and 4) International reference price serves as a benchmark for establishing a price threshold. **CONCLUSIONS:** Drugs used to treat CAP are compared to comparator agents based on cost effectiveness. This will determine placement in the public formulary. The private pharmaceutical market may use data from the public formulary system when making a determination on price. Existing clinical guidelines in the public sector are non-binding, leaving the final decision on use to physicians. However, patient access to drugs for CAP may be impacted based on price negotiations and cost effectiveness analysis.

PRS13

ASSESSMENT OF THE PERCEPTION AND PRACTICES WITH RESPECT TO ANTIBIOTIC USAGE IN PUBLIC THROUGH SOCIAL MEDIA

Priyendu A[1], Koundin A[2], Nagappa AN[1]

[1]*Manipal University, MCOPS, Manipal, India,* [2]*Indegene Life Systems Pvt. Ltd., Bangalore, India*

OBJECTIVES: To assess the knowledge, perception and practices with respect to antibiotic usage amongst the Indian population with an aim to sensitize the survey participants about the consequences of misuse of antibiotics. **METHODS:** A questionnaire was designed around the use, misuse and consequences of antibiotic resistance based on latest National Policy for Antimicrobial Resistance of India. The survey was conducted using social media sites like facebook, twitter etc. The responses collected were classified as geographical locations, gender, age and occupation. Survey is designed in such a way that all the prevailing practices and views of the general public with respect to antibiotic usage are covered. **RESULTS:** The prescription for antibiotic was 25% for common cold. Empirical antibiotic prescription was reported for 61% of the respondents. 14% preferred for a diagnostic test for guiding antibiotic prescription by doctors. 50% of the respondents preferred to purchase antibiotics directly from the chemist shops without the prescription of a doctor. Almost half of the respondents were not aware about the antibiotic resistance development due to environmental contamination. 35% of the respondents affirmed to stopping the antibiotic regimen as soon as their symptoms subsided. **CONCLUSIONS:** The antibiotic resistance is a global phenomenon requiring the immediate reforms to curb as the danger of multi-drug resistant bacteria is a ticking time bomb. Our results have clearly indicated the misuse of antibiotics by public and practitioners which needs to be monitored and corrected immediately to prevent the catastrophe of epidemics by MDR bacteria as the new antibiotics are not invented and old drugs are becoming ineffective.

LEVEL OF ASTHMA CONTROL AND HEALTH CARE UTILIZATION IN LATIN AMERICA

Montealegre-Golcher F[1], Gold L[2], Allen-Ramey F[3], Jardim JR[4], Sansores Martinez RH[5], Sullivan S[2]

[1]*MSD, Carolina, PR, USA,* [2]*University of Washington, Seattle, WA, USA,* [3]*Merck & Co., Inc., West Point, PA, USA,* [4]*Federal University of Sao Paulo, Sao Paulo, Brazil,* [5]*Centro Respiratorio de México S.C., Delagacion Tlalpan, Mexico*

OBJECTIVES: Data on the impact of asthma in Latin American countries is limited. The purpose of this study was to examine the association between partly- and uncontrolled asthma and asthma-related health care outcomes among patients residing in Argentina, Brazil, Mexico, Venezuela and the Common wealth of Puerto Rico. **METHODS:** Adults and parents of adolescents (12-17 years) with physician diagnosed asthma and asthma medication use or asthma attacks in the past year were surveyed as part of the 2011 Latin America Asthma Insights and Management (AIM) survey. Using Global Initiative for Asthma (GINA) guidelines as a reference, respondents were categorized into three levels of asthma control: well-controlled, partly- controlled, and uncontrolled. Chi-square tests and adjusted logistic regression were used to determine odds ratios (ORs) to assess the relation of degree of asthma control with utilization of asthma medications, health care outcomes, and productivity. **RESULTS:** Data was available for 2169 completed surveys. Overall, 7% of the patients surveyed had asthma that was classified as well-controlled, with the highest proportion in Mexico (9.4%) and the lowest in Venezuela (3.0%). Patients whose asthma was not well-controlled were significantly more likely to report use of asthma medications (ORs ranging from 1.5-42) and to have had emergency health care visits or hospitalizations for their asthma in the previous year (ORs ranging from 2.1-5.9). Respondents with uncontrolled asthma also reported significant decreases in productivity due to asthma compared to patients with well-controlled asthma. **CONCLUSIONS:** Patients who did not have well-controlled asthma had greater utilization rates of asthma medications and emergency health care services compared to patients whose asthma was well-controlled. These associations strongly suggest that emphasis on improving asthma control could have substantial effects on patient productivity and utilization of health care resources.

PRS15

CARACTERÍSTICAS SOCIOECONÓMICAS DE PACIENTES CON ENFERMEDAD VASCULAR CEREBRAL Y ANTECEDENTES DE TABAQUISMO TRATADOS EN UN HOSPITAL DE TERCER NIVEL DE MÉXICO

Quintana Carrillo RH[1], Matamoros Márquez M[2], Quintana Carrillo EA[3], San-Juan D[4], Aguirre-Cruz L[4]

[1]*Universidad Nacional Autónoma de México, Instituto Nacional de Enfermedades Respiratorias, Mexico, Mexico,* [2]*Universidad Nacional Autónoma de México, Mexico, Mexico,* [3]*Universidad Autónoma de Campeche, Campeche, Mexico,* [4]*Instituto Nacional de Neurología y Neurocirugía, Mexico, Mexico*

OBJECTIVOS: Determinar las variables socioeconómicas asociadas a pacientes con enfermedad vascular cerebral (EVC) y antecedentes de tabaquismo, tratados en un centro neurológico de tercer nivel en México. **METODOLOGÍAS:** Es un estudio cuantitativo, descriptivo, transversal y retrospectivo. Los pacientes debían tener edades ≥ 35 años, antecedentes de tabaquismo y diagnóstico de EVC; clasificados por el sistema CIE-10 (I60-I69). Se revisaron 174 expedientes del 2011. Se utilizó el análisis de componentes principales para estimar los pesos de las variables socioeconómicas. La adecuación del modelo se realizó mediante la medida de Kaiser-Meyer-Oklin (KMO), la prueba de Bartlett y la consistencia interna mediante el alpha de Crombach (α). **RESULTADOS:** De los 174 pacientes 78(45%) presentaron antecedentes de tabaquismo y de estos 49(63%) fueron hombres, con 58±14 (media, DE) años de edad y 9.4±5.3 de escolaridad, nivel socioeconómico de 2.3±1.1, 71(91%) habita en departamentos populares y 37(47%) se dedicaron al hogar o fueron trabajadores no calificados. Se obtuvo un α =0.80, KMO= 0.78 y Bartlett (p=0.000). Dos componentes explicaron 58.3% de la varianza total. El primero; (42.02%), se integró por las variables servicio intra-domiciliario (Ponderación;0.763), estatus socioeconómico (0.749), escolaridad (0.748), zona de ubicación (0.673), material de construcción (0.707), ubicación de la vivienda (0.673) y ocupación (0.437). el segundo; (16.24%), con el tipo de vivienda (0.564) y número de habitaciones (0.460). **CONCLUSIONES:** Los pacientes atendidos por EVC se caracterizaron por niveles bajos de escolaridad y clasificación socioeconómica, ocupaciones poco remunerables y edad avanzada; que los hace vulnerables a la enfermedad.

AGRANULOCYTOSIS DETECTION OUTCOME BY CLOZAPINE TREATMENT (ADOC STUDY) IN PSYCHIATRY: A COST-EFFECTIVENESS STUDY

Girardin F, Poncet A, Blondon M, Vernaz N, Combescure C

University of Geneva Hospitals, Geneva, Switzerland

OBJECTIVES: White Blood Cell (WBC) monitoring in schizophrenic patients treated by Clozapine aims to prevent agranulocytosis. We assess the cost-effectiveness of WBC monitoring strategies based on three national regulations and an additional weekly short-run monitoring compared to the absence of monitoring. **METHODS:** A decision analytic model was built to perform a cost-utility analysis comparing distinct monitoring strategies from a health care perspective with a 3-year time horizon. Clinical and resources used parameters were based on national Clozapine patients' registries, cohorts, and pharmacovigilance data; health-related quality of life and mortality estimates were derived from literature reviews. Robustness of results was challenged with one-way and probabilistic sensitivity analyses. **RESULTS:** Compared to the absence of monitoring, the number needed to treat of all strategies to avoid one death was 5,000. The gains in survival time adjusted on quality of life were less than 1 day, resulting in prohibitive incremental cost-effectiveness ratios (ICER) of at least 1 million USD per QALY gained,. The ICER increased with higher frequency and longer monitoring duration. The results remain robust in the one-way sensibility analyses and the probabilistic sensitivity analysis indicating that the absence of monitoring strategy has the highest probability of cost-effectiveness **CONCLUSIONS:** Long-run WBC monitoring based on current national detection guidelines is not cost-effective, even by unrealistically high agranulocytosis prevalence. New guidelines are needed to improve WBC monitoring in schizophrenic patients receiving Clozapine.

PSY2

OSTEOTOMIA DE ACORTAMIENTO RADIAL EN LA ENFERMEDAD DE KIENBOCK (SEGUIMIENTO DE 5 AÑOS)

Vazquez Alonso F

imss hospital de traumatologia y ortopedia lomas verdes, naucalpa edo de mexico, Mexico

OBJECTIVOS: evaluar los resultados clinicos y funcionales (grado de satisfacción) de paciente con enfermedad de kienbock ttratados con osteotomia de acortamiento radial. **METODOLOGÍAS:** estudio realizado en la umae de traumatologia y ortopedia lomas verdes del imss, en el servicio de cirugia de mano, en un periodo comprendido entre 2000 al 2003, con seguimiento de 5 años.estudio retrospectivo, observacional, transversal. se estudiaron ´18 pacientes de ambos sexos con diagnostico de enfermedad de kienbock utilizando la clasificacion de litchman, evaluados con las escala de wrist mayo score y QDash. pba estadistica de wiscolson **RESULTADOS:** se obtuviero 18 paciente 9 mujeres y 9 hombres, el 84% obreros 16% al hogar, de acuerdo al resultados de la escla funcional wrist mayo score fueron 56% buenos, 33% excelentes, 5.5% malo, 5% regulares, con 25 puntos de grado de satifaccion de acuerdo al QDash. un paciente fue reintervenido 2 años posteriores al cual se le realizo una artrodesis delas cuatro esquinas. **CONCLUSIONES:** la evaluacion clinica y funcional, sugiere una eficacia aceptable de la osteotomia de acortamiento radial y provee datos alentadorespara continuar con este tipo de tratamiento.

THE RELATIONSHIP BETWEEN SPECIFIC ANNUAL BLEED RATES AND HEALTH OUTCOMES AMONG CHILDREN WITH SEVERE HEMOPHILIA A IN LATIN AMERICA

Perez Bianco PR[1], Berges A[2], Linares A[3], Moreno B[4], Arvizu J[5], Brabata C[5], Xiong Y[6], Ito D[6]

[1]*Instituto de Investigaciones Hematologicas - Academia Nacional de Medicina, Buenos Aires, Argentina,* [2]*Instituto Mexicano del Seguro Social. Centro Medico Nacional La Raza Hospital General, Azcapotzalco, Mexico,* [3]*Clinica Infantil Colsubsidio, Bogotá, Colombia,* [4]*Fundacion Panamena de Hemofilia/Hospital del Nino, Panama City, Panama,* [5]*Baxter Healthcare Corporation, Miami, FL, USA,* [6]*Baxter Healthcare Corporation, Westlake Village, CA, USA*

OBJECTIVES: Recurrent bleeding among severe hemophilia A children can lead to disability and lower health-related quality of life (HRQOL). Little is known about how many bleeds can be endured before patients report an impact on health outcomes. The objective was to assess health outcomes of pediatric patients reporting a zero annual bleed rate (ABR) to identify the impact of higher ABRs on outcomes. **METHODS:** This cross-sectional survey of parents of severe hemophilia A patients aged 2-17 was conducted in Argentina, Chile, Colombia, Mexico and Panama. Eligible, consenting patients completed a questionnaire: from October-November 2009 (Argentina), June-August 2011 (Chile, Colombia, Mexico) and September-October 2012 (Panama). HRQOL was measured by the Pediatric Quality of Life Inventory (PedsQL). ABR, target joints and school days missed were also assessed. **RESULTS:** A total of 211 parents of severe hemophilia A children completed the survey. Compared to patients with a 0 ABR who reported a mean PedsQL Total score of 76.6, patients with ABR categories of: 3-4, 5-10, 11-20, 21-30, 31-50, 51 or more showed significantly worse mean PedsQL Total scores of: 66.4, 63.5, 67.4, 62.5, 62.4 and 59.9 respectively (all $p<0.05$). Similarly, compared to patients with 0 ABR who reported a mean number of target joints of 0.69, patients with higher ABR categories showed significantly higher mean target joints: 1.49, 2.57, 3.42, 3.47, 3.74, 4.67 (all $p<.05$). Differences in missed days from school showed the same significant trend when comparing 0 ABR to ABR categories of 3-4 and beyond. There were no significant differences between patients with zero compared to 1-2 ABR on these health outcomes. **CONCLUSIONS:** This analysis suggests that even 3-4 bleeds/year may have a negative impact on a patient's joint health, missed school days and HRQOL. Efforts to maintain a 0 ABR among pediatric patients with severe hemophilia A may help ensure optimal outcomes.

PSY4

EFFICACY AND SAFETY OF BELIMUMAB FOR THE TREATMENT OF SYSTEMIC LUPUS ERYTHEMATOSUS

Borba HHL, Wiens A, Correr CJ, Pontarolo R

Universidade Federal do Paraná, Curitiba, Brazil

OBJECTIVES: To evaluate the efficacy, safety and tolerability of 1 and 10 mg/kg belimumab, a biologic drug, for the treatment of Systemic Lupus Erythematosus (SLE) through a meta-analysis, comparing these treatments with placebo. **METHODS:** A systematic review and meta-analysis of randomized, placebo-controlled trials of belimumab was conducted. Data were collected from several databases until August 2012. Efficacy outcomes included the SELENA-SLEDAI score (Safety of Estrogens in Lupus Erythematosus National Assessment version of the SLE Disease Activity Index), SRI (Systemic Lupus Erythematosus Responder Index), normalization of low C3 (<90 mg/kg), and anti-dsDNA positive to negative. Data on safety included any adverse events, serious adverse events, severe adverse events, death, malignancy, infections, and infusion reactions. We also evaluated withdrawals from treatment due to lack of efficacy or adverse events. **RESULTS:** Fours studies were included in this study. Anti-dsDNA positive to negative was the most significant efficacy outcome in our meta-analysis for both of the evaluated concentrations. No significant differences in the safety data were observed between the belimumab (1 and 10 mg/kg) and placebo groups. Tolerability results revealed no significant differences in withdrawals due to lack of efficacy and adverse events between the belimumab and placebo groups. **CONCLUSIONS:** Belimumab exhibited good efficacy results, especially at 10 mg/kg, a good safety profile, and adequate tolerability, which indicates that this biologic drug is a promising therapy

for the treatment of SLE. Additional randomized placebo-controlled trials should be conducted to establish the efficacy and safety of belimumab.

IMPACTO FINANCIERO DEL TRATAMIENTO FARMACOLÓGICO EN PACIENTES ADULTOS CON ENFERMEDAD DE GAUCHER TIPO 1 EN MÉXICO

Soto-Molina H[1], Pizarro M[2], Huicochea-Bartelt JL[3], Rubio-Borja ME[3], Muciño-Ortega E[3], Galindo-Suárez RM[3]
[1]*Comercializadora Iteliness S.A. de C.V., Ciudad de México, Mexico,* [2]*Hospital Infantil de Mexico Federico Gomez, México D.F., Mexico,* [3]*Pfizer S.A. de C.V., Ciudad de México, Mexico*

OBJECTIVOS: La enfermedad de Gaucher (EG) es una enfermedad de baja prevalencia caracterizada por deficiencia de la enzima glucocerebrosidasa ácida, que promueve la acumulación del sustrato glucocerebrósido en lisosomas de monocitos-macrófagos, lo que conduce a hipertrofia del sistema lisosomal celular, infiltrando tejido esquelético, medula ósea, bazo, hígado, pulmones y cerebro, causando disfunción orgánica. El uso de la terapia de remplazo enzimático (TRE) revierte la organomegalia, previene complicaciones e incrementa la calidad de vida. El propósito del estudio fue evaluar el impacto económico de la TRE en pacientes con EG tipo 1 desde la perspectiva institucional Mexicana. **METODOLOGÍAS:** La prevalencia en México de pacientes con EG se extrajo de fuentes publicadas. Se estimaron los costos promedio del tratamiento de las TRE disponibles en México en pacientes de alto riesgo (60UI/Kg cada 2 semanas durante 6 meses, posteriormente 30UI/Kg durante 6 meses) y de bajo riesgo (30UI/Kg cada 2 semanas durante 6 meses, posteriormente 20UI/Kg durante 6 meses). Los costos de adquisición de las TRE se extrajeron de fuentes gubernamentales y se expresan en US$ de 2012. Se estimó el impacto presupuestal del uso de TRE a nivel institucional en base al Presupuesto de Egresos de la Federación (2012). **RESULTADOS:** El número de pacientes con EG tipo 1 fue de 22 para bajo riesgo y 8 para alto riesgo. El costo promedio anual de la TRE por paciente de bajo riesgo fue de US$153,265, para pacientes de alto riesgo fue de $260,551, un 70% más. La carga financiera para las instituciones de salud pública fue aproximadamente US$338,000 para pacientes de bajo riesgo y US$575,000 para pacientes de alto riesgo, lo que agregado representa el 0.016% del gasto público en salud de México. **CONCLUSIONES:** La estimación del impacto presupuestal de la TRE en México es relevante para la planeación de los recursos financieros necesarios.

PSY6
ANÁLISIS DE LA CARGA FINANCIERA DE LAS PRINCIPALES ENFERMEDADES REUMATOLÓGICAS

Goycochea M[1], García O[1], Peláez I[1], Tobón U[1], Julian F[1], Rodriguez Mendoza MM[2], Soto H[3]
[1]*Hospital Regional de Alta Especialidad Oaxaca, Oaxaca, Mexico,* [2]*Universidad Autónoma Metropolitana, Distrito Federal, Mexico,* [3]*Health Solutions Consulting, D. F., Mexico*

OBJECTIVOS: Realizar un análisis de la carga financiera desde la perspectiva del paciente de las principales enfermedades reumatológicas y qué impacto tiene en el gasto de las familias en el estado de Oaxaca, México. **METODOLOGÍAS:** Se evaluó el gasto catastrófico de las enfermedades reumáticas. En 2011 se encuestó a nueve pacientes diagnosticados con enfermedades reumatológicas del hospital de especialidades de la SSA y hospitales privados (tres de artritis reumatoide (AR), cuatro de Lupus eritomatoso sistémico (LES), uno de Dermatomiositis y uno de Espondilitis Anquilosante (EA)). El instrumento de recolección de datos se centró en la carga financiera del manejo de la enfermedad. Se evaluaron los costos médicos directos (fisioterapia, estudios de laboratorio y tratamiento farmacológico), intervenciones quirúrgicas y costos de transporte. Se estimó el costo anual del tratamiento con rituximab (2 infusiones de 1000mg por año) y qué impacto representaría para el ingreso familiar. **RESULTADOS:** El costo médico promedio anual ascendió a $43,271.00, el costo promedio anual con gasto en transporte ascendió a $55,537.78, montos que representan el 61% y 79% del ingreso promedio de las familias. El 83% de los gastos médicos son causados por gasto en medicamentos. Las enfermedades que generaron mayores gastos médicos fueron LES ($7,339.44 promedio mensual), Dermatomiositis $4,800 y AR con $1,405.56 promedio mensual. Los gastos inesperados como intervenciones quirúrgicas causadas por la enfermedad $9,000 promedio y las hospitalizaciones por complicaciones $8,500. El costo anual del tratamiento con rituximab asciende a $117,66.60 monto que representa el 167% del ingreso de las familias. **CONCLUSIONES:** El costo de las enfermedades reumatológicas genera una carga financiera importante, los pacientes diagnosticados por una causa reumatológica ven mermada su situación financiera, es decir, incurren en gastos catastróficos en salud. El uso de tratamientos biológicos sobrepasa los ingresos anuales de las familias.

PSY7
ANÁLISIS ECONOMICO DE LA PROFILAXIS SECUNDARIA VERSUS EL TRATAMIENTO A DEMANDA DE UNA COHORTE DE PACIENTES COLOMBIANOS CON HEMOFILIA A Y B SEVERA

Ruiz AF[1], Guarin NE[2], Diaz JA[3], Arevalo HO[2], Portilla A[1], Machado JE[1]
[1]*Audifarma, Bogotá, Colombia,* [2]*Salud Total, Bogotá, Colombia,* [3]*Facultad de Ciencias, Universidad Nacional de Colombia, Bogotá, Colombia*

OBJECTIVOS: Evaluar las diferencias en efectividad y costos de la profilaxis secundaria vs el tratamiento a demanda en pacientes con hemofilia severa. **METODOLOGÍAS:** Pacientes: Seguimiento retrospectivo durante 30 meses a una cohorte de 52 pacientes con diagnóstico confirmado de Hemofilia A y B severa, atendidos por una institución prestadora de servicios de alta complejidad a nivel nacional. La permanencia minina dentro de la cohorte fue de 12 meses. Perspectiva: Asegurador. Desenlaces en salud: promedio de sangrado articular/pacientes/mes. Costos: Se evaluaron los costos médicos directos (atención hospitalaria, atención ambulatoria, urgencias, medicamentos), tomados del sistema de información del asegurador y del prestador a precios de 2012, en COP. **RESULTADOS:** Desenlaces en Salud: Los 52 pacientes aportaron 847 meses de tratamiento en demanda con 154 sangrados y 539 meses en profilaxis con 93 sangrados. La tasa de sangrado paciente/mes fue de 0,18 para demanda y de 0,17 para profilaxis (p=0,627), con un RR de 0,949 (IC95% 0,78 - 1,15). Costos: Si se toma en cuenta la administración de antinhibidores, el costo promedio por paciente/mes en demanda es de $ 26,427,616 y el costo promedio paciente/mes en profilaxis secundaria es de $ 23,032,817 (p=0,456). Sin contabilizar los medicamentos antinhibidores el costo promedio por paciente/mes en demanda es de $ 4,143,308 y el costo promedio paciente/mes en profilaxis secundaria es de $ 19,113,948 (p<0,0001). **CONCLUSIONES:** No se observa diferencia significativa en la tasa de sangrados en los grupos de profilaxis secundaria y demanda. El grupo de pacientes con inhibidores experimenta el mayor costo dentro de la población observada. Al excluir los inhibidores el costo promedio/paciente/mes en profilaxis secundaria es 4,6 veces mayor que el costo en tratamiento a demanda.

PSY8
BIOLOGICAL AGENTS IN THE TREATMENT OF MODERATE TO SEVERE PSORIASIS: A PHARMACOECONOMIC ANALYSIS

Riveros BS, Souza TT, Godoy RR, Garcia M, Gonçalves P, Rotta I, Otuki MF, Pontarolo R, Correr CJ
Universidade Federal do Paraná, Curitiba, Brazil

OBJECTIVES: To evaluate the cost-effectiveness of biologic agents in the treatment of moderate to severe psoriasis. **METHODS:** Four biologics were assessed: adalimumab, etanercept, infliximab and ustekinumab. Direct costs were obtained from the perspective of Brazilian Public Health Service (SUS). Probabilities and efficacy were extrapolated from literature. Unit costs is the Brazilian currency – Real (R$) – and the outcomes considered were PASI90 and PASI75 response (rPASI90 and rPASI75, respectively). For each outcome one Markov Model was created with 12 cycles of 3 months (3 years). Annual discounting of 5% was applied for costs and outcomes. The model considered patients with moderate to severe psoriasis who had *Psoriasis Severity Index* or *Dermatology Quality of Life Index* greater than 10 or were unable to take standard systemic therapies. Univariate and probabilistic sensitivity analysis was applied to evaluate parametric uncertainties. **RESULTS:** Results were expressed as the financial resources demanded for each patient that have achieved and kept rPASI90 or rPASI75. Regarding rPASI90, adalimumab showed to be dominant against the other biologics with a total cost of R$ 64,588.79 (U$ 32,714.78) and 33,7% of patients with rPASI90 after 3 years of treatment (R$ 191,658.13/rPASI90, U$ 97,076.50/rPASI90). When rPASI75 is considered as the measure of outcome, adalimumab and ustekinumab were dominant against infliximab and etanercept, with R$ 124,200.41/rPASI75 (U$ 62,908.58/rPASI75) and R$ 114,230.59/rPASI75 (U$ 57,858.78/rPASI75), respectively. Univariate sensitivity analysis pointed acquisition cost of biologics as the main critical variable. Probabilistic sensitivity analysis shows robustness of our findings. **CONCLUSIONS:** From the perspective of SUS, adalimumab is the most cost-effective biological agent for rPASI90. Threshold up to R$ 124,000/rPASI75 (U$ 62,807.07/rPASI75) favors ustekinumab as the most cost-effective drug, while threshold greater than that point to adalimumab. Is being conducted a new Markov modelling to evaluate which sequence of biologic agents is the most cost-effective when failure of initial biological treatment occurs.

PSY9
A COST-EFFECTIVENESS MODEL COMPARING SUB-CUTANEOUS BIOLOGIC TREATMENT FOR SEVERE PLAQUE PSORIASIS IN MEXICO

Valencia A[1], Hernandez A[1], Puig A[2]
[1]*Janssen, Mexico City, Mexico,* [2]*Johnson and Johnson World Headquarters, New Brunswick, NJ, USA*

OBJECTIVES: To evaluate the cost-effectiveness of different sub-cutaneous biologic treatments for severe plaque psoriatic patients in public institutions in Mexico. **METHODS:** A Markov model was developed to simulate patients with moderate-to-severe plaque psoriasis. Biologic therapies compared were ustekinumab 45mg every 12 weeks, adalimumab 40mg every two weeks, and etanercept 50mg twice a week. Measured by the Psoriasis Area and Severity Index (PASI), clinical response was derived from the latest published meta-analysis. PASI response was translated into QALYs in two steps: (1) defining the correlation between PASI levels and the Dermatology Life Quality Index (DLQI); and (2) using a formula to predict utility from DLQI score derived from a mapping exercise of the DLQI with the EQ-5D. The model considered expenditure on drugs, monitoring visits, adverse events and inpatient stays. Costs were obtained from Mexican public institutions. Health and economic outcomes were estimated over a 10-year time horizon with cycle length of 12 weeks. Cost and QALYs were discounted at 5% annually. **RESULTS:** Etanercept is the least costly treatment in Mexican public institutions followed closely by adalimumab and ustekinumab. Cost-effectiveness analysis shows that adalimumab was an extended dominated strategy by ustekinumab. The incremental cost-per-QALY of ustekinumab versus etanercept was US$19,542. **CONCLUSIONS:** Considering the GDP per-capita of Mexico in 2010 (US$9,123), and according to the WHO Commission on Macroeconomics and Health, ustekinumab is a cost-effective strategy (≤3xGDP per-capita /QALY gained) versus etanercept, and a more cost-effective strategy vs adalimumab by extended dominance. Probabilistic sensitivity analysis results did not change the conclusions.

PSY10
ANÁLISIS COSTO-EFECTIVIDAD DEL TRATAMIENTO FARMACOLÓGICO PARA LAS MANIFESTACIONES CLÍNICAS MUCOCUTÁNEAS DE LA ENFERMEDAD DE BEHCET

Quirland Lazo C
Universidad de Chile, Santiago, Chile

OBJECTIVOS: Determinar la efectividad de la intervenciones farmacológicas disponibles en Chile para tratar las manifestaciones clínicas de tipo mucocutáneas, esto es úlceras orales (UO) y genitales (UG), en la Enfermedad de Behcet (EB). Conducir un análisis de costo-efectividad para determinar la alternativa superior entre los dos tratamientos que resulten más efectivos. **METODOLOGÍAS:** Se efectuó una revisión de la literatura de los trabajos publicados entre 1980-2010, disponibles en las bases de dados MEDLINE y Cochrane Library. Se incluyeron en los criterios de selección todos los estudios clínicos controlados, aleatorizados, además de revisiones sistemáticas y meta-análisis disponibles bajo las palabras claves enfermedad

de Behcet y tratamiento farmacológico. La evaluación farmacoeconómica se llevó a cabo, utilizando un modelo de efecto fijo, desde la perspectiva de un paciente adulto, con sistema previsional de salud público, EB activa y las manifestaciones clínicas seleccionadas, diagnosticado según el criterio del International Study Group, en un horizonte temporal de un año. El análisis de decisión para las dos alternativas más efectivas se llevó a cabo a través de DATA 3.5. **RESULTADOS:** De los 38 estudios encontrados en cada una de las bases de datos, 15 cumplieron los criterios de selección, con los cuales se calculó el efecto de la intervención. Las alternativas más efectivas resultaron ser talidomida de 100 y 300 mg y la suspensión de sucralfato. Una vez realizado el análisis costo-efectividad, la suspensión de sucralfato fue dominada por talidomida de 100 mg. **CONCLUSIONES:** A pesar de la falta de evidencia en enfermedades raras y eficacia de tratamientos clásicos, fue posible proponer una alternativa costo-efectiva para la EB. No obstante, dada la heterogeneidad de las manifestaciones clínicas en enfermedades raras y los costos de los tratamientos, resulta necesario proponer análisis alternativos a la costo-efectividad, que permitan apoyar a toma de decisiones para estos grupos de pacientes.

PSY11

ANÁLISIS DE COSTO-EFECTIVIDAD PARA EL MANEJO FARMACOLÓGICO DE LA HEMOFILIA A SEVERA EN 5 ENTIDADES DE ASEGURAMIENTO EN COLOMBIA

Bryon A, Leisewitz T, Salgar L, Rodriguez F
HEORT, Miami, FL, USA

INTRODUCTION: La Federación Mundial de la Hemofilia indica que existen registrados 137.352 pacientes hemofílicos en 77 países, sin embargo se estima que deben existir cerca de 400.000 personas en todo el mundo. Un reciente estudio de carga de enfermedad genética estima que existirían 2931 colombianos con hemofilia, considerando el período de 1996 a 2025. **OBJECTIVOS:** Evaluar la costo-efectividad de tres tratamientos: Kogenate, Advate y Recombinate para el tratamiento de Hemofilia tipo A Severa en una población de 1 a 78 años. Describir los resultados de pacientes con Hemofilia Severa que reciben profilaxis con distintos productos del Factor VIII. **METODOLOGÍAS:** Se adaptó un modelo de Markov que describe la historia natural y los resultados de la Hemofilia A Severa. El modelo considera siete estados de salud caracterizados por el estado del inhibidor (3 niveles: HR, LR, Ninguno), daño articular (Si o no) y la muerte (estado absorbente). **RESULTADOS:** Um total de 1.186 pacientes con Hemofilia A, lo que representaría una prevalencia del 0,009% dentro de la población afiliada. La ganancia en términos de AVACs es similar para los tres tratamientos. Los componentes con el mayor impacto en los costos son profilaxis y control de sangrado. Del análisis de sensibilidad determinístico, el parámetro con el mayor impacto es la dosis de Advate con profilaxis. Del análisis de sensibilidad probabilísticos, Kogenate es una alternativa dominante respecto a Advate en 45% de las simulaciones, y en 70.4% de las simulaciones respecto a Recombinate. **CONCLUSIONES:** Se encontró que los costos de Kogenate y Recombinate son en su mayoría atribuidos a la profilaxis y aquellos a Advate al tratamiento de sangrado. Aunque la eficacia clínica de los productos es similar, las diferencias en la incidencia del desarrollo del inhibidor significan menores costos y mejor calidad de vida para los pacientes que son tratados con Kogenate.

SYSTEMIC DISORDERS/CONDITIONS – Patient-Reported Outcomes & Patient Preference Studies

PSY12

BETA-THALASSEMIA PATIENTS SURVEY ON DEFERRIZATION THERAPY

Xia S[1], Huang L[1], Zhang W[2]
[1]*Medical School of Jinan University, Guangzhou, China,* [2]*Beijing Novartis Pharma Co. Ltd., Beijing, China*

OBJECTIVES: To investigate family burden, awareness and treatment status of ß-thalassemia patients in China. **METHODS:** The families with major ß-thalassemia received investigation. The questionnaire involved medical management of ß-thalassemia, economic burden, life quality and recognition, attitude and behavior of the relatives to the disease. **RESULTS:** Currently, the mainstay treatment of major thalassemia remains transfusion and deferrization therapy, so that the treatment cost is about 60,000 to 70,000 RMB per year for a 10-year-old-child and this number even rises with the increasing of the age. Therefore, the family burden and life quality of the patients is significantly involved during the treatment of this disease. Among different diferrization treatment, deferasirox was first choice of the patients concerning the cost-effect factors and lower incidence of adverse events, exemplified as local injection reactions which are commonly occurred in the patients receiving desferrioxamine. Most of the patients chose the convenience as the most important factor for the compliance to the treatment. And in addition to disease related factors and symptoms as discussed below, convenience was also considered as important issue for life quality. Although until now, 70.7% of the patients received intravenous desferrioxamine treatment, over half of the patients would like to change to a more convenient oral deferrization treatment, and deferasirox was considered as the first choice due to the low price of this medicine in China. **CONCLUSIONS:** ß-thalassemia as a hereditary disease severely influenced the life quality of the patients, increased economic and social burden to the family. The medical utility and society should pay more care to the patients and their families, especially the grass-root ones. The government should take the responsibility to improve the medical reimbursement system for this disease.

PSY13

EFFICACY AND TOLERABILITY OF CT-GUIDED EPIDURAL STEROID INJECTIONS AND PHARMACOTHERAPY FOR MANAGING CHRONIC LOW BACK ACHE WITH RADICULOPATHY

Bansal D[1], Purohit V[1], Ghai B[2]
[1]*National Institute of Pharmaceutical Education and Research, Mohali, India,* [2]*Post Graduate Institute of Medical Education and Research, Chandigarh, Chandigarh, India*

OBJECTIVES: Substantial number of patients with persistent low back pain (LBP) are treated with multimodal spectrum of conservative and invasive therapies. Few have investigated the utility of pharmacotherapy and epidural steroid injections (ESI) in large practice setting. We sought to gather comprehensive data about the characteristics, efficacy, tolerability and quality of life (QoL) of patients with LBP with these therapies. **METHODS:** Information was collected on a standardized form. Information included patient characteristics, type and duration of therapies, adverse events, pain relief using visual analogue scale (VAS) and QoL by measuring disability using modified ODQ at each month of follow-up. **RESULTS:** Consecutive 81 patients were recruited and followed for 6 months. Average baseline pain duration was found to be 45.5 months. Combination of drugs and ESI was given in 75 (92%) patients. Anticonvulsants (75%) and Antidepressants (57%) were most commonly prescribed medications. Change in VAS & ODQ score from baseline to each follow-up at 3 months (VAS - 15), 6 months (VAS -25) was significantly ($P < 0.05$) improved. **CONCLUSIONS:** Pregabalin and amitriptyline were most commonly used drugs with maximum pain relief and improved Qol. Desired pain relief fluctuated with time. ESI can be promising choice when desirable pain relief is not achieved with medications.

MULTI-CRITERIA BENEFIT-RISK ASSESSMENT OF BIOLOGICAL AGENTS IN THE TREATMENT OF MODERATE TO SEVERE PSORIAIS: A STOCHASTICAL APPROACH

Riveros BS, Rotta I, Garcia M, Souza TT, Godoy RR, Gonçalves P, Otuki MF, Pontarolo R, Correr CJ
Universidade Federal do Paraná, Curitiba, Brazil

OBJECTIVES: To evaluate the benefit-risk of biological agents (BA) in the treatment of moderate to severe psoriasis. **METHODS:** It was performed a mixed treatment comparison (MTC) based on all available clinical trials of psoriasis treated with BA. The common agent comparator was placebo and the time-horizon was up to 24 weeks of treatment. This indirect meta-analysis was followed by a stochastic multicriteria acceptability analysis (SMAA) to compare adalimumab, etanercept, infliximab and ustekinumab on two benefit and two risk criterias. Efficacy was evaluated by means of *Psoriasis Area Severity Index* 90 and 75 response (rPASI90 and rPASI75, respectively) and the risks corresponded to any adverse event (AAE) and serious adverse event (SAE). MTC/SMAA analysis was performed for two scenarios: one with missing outcome preference and the other with ordinal preference information established by experts in psoriasis (SAE > rPASI90 > rPASI75 > AAE). **RESULTS:** Results show the same tendency for both created scenarios. Infliximab 5 mg/kg had the highest probability of being the 1st-place in MTC/SMAA ranking (84% to 67%). It was followed by ustekinumab 90 mg for the 2nd-place (54% to 50%), ustekinumab 45 mg for the 3rd-place (51% - 50%), adalimumab 80 mg followed by 40 mg (51% - 47%), etanercept 50 mg TW (74% to 62%) and placebo in the 6th-place(97% - 94%). **CONCLUSIONS:** From all available evidence on treatment with BA for psoriasis, the designed method was enabled to point that infliximab 5 mg/kg is the BA with the highest probability of having the best benefit-risk ratio in the short-term follow up. It is followed by ustekinumab 90mg, ustekinumab 45 mg, adalimumab 80-->40 mg, etanercept 50 mg TW and placebo, respectively. Our findings can be useful to help on deciding which sequence of BA must be defined by guidelines and health services when therapy failure happens.

PSY15

DIRECT HEALTH CARE COSTS OF PATIENTS SWITCHING BIOLOGIC THERAPIES IN CHRONIC PLAQUE PSORIASIS

Qureshi A[1], Mallya U[2], Zhang X[3], Li L[3], Lahoz R[4]
[1]*Harvard Medical School, Boston, MA, USA,* [2]*Novartis Pharmaceuticals Corporation, East Hanover, NJ, USA,* [3]*Beijing Novartis Pharma Co., Ltd., Shanghai, China,* [4]*Novartis Pharmaceuticals AG, Basel, Switzerland*

OBJECTIVES: To describe patient characteristics and costs associated with first year biologic therapy use in psoriasis patients who switched or remained on biologic therapy. **METHODS:** Adult patients with psoriasis diagnosis (ICD-9 CM 696.1 or 696.8 codes, excluding psoriatic arthritis (ICD-9-CM 696.0), rheumatoid arthritis(ICD-9-CM 714.x), ankylosing spondylitis(ICD-9-CM 720.0), Crohn's disease(ICD-9-CM 555.x) or ulcerative colitis(ICD-9-CM 556.x)) with continuous insurance coverage for one year pre and post first biological therapy prescription, having at least one prescription of adalimumab, etanercept, infliximab or ustekinumab and no previous use of biologic were selected from a privately insured MarketScan® commercial and Medicare database, 2012 . Two patient cohorts of switchers and non-switchers were defined based on gap of 60 days of therapeutic benefit. Analyses included descriptive statistics and per member per year costs. **RESULTS:** Of the 2848 patients who met the study criteria, 8.32% (n=237) switched(S) to another biologic therapy, 1305 (45.82%) remained on initial biologic therapy (non-switched (NS)) and 1,306 (45.86%) discontinued their treatment within the first year of initiating biologic therapy. The mean age(SD) was 46.9(13.3) years with a higher percentage of males in the non-switched group than switched and discontinued groups (59.4% vs. 51.1% and 52.5%, respectively). One year post start of biologic therapy, total health care cost per patient (S: US$38,529(24,328), NS: US$32,822(15,913)), all cause hospitalization cost per patient (S: US$1713(12,528), NS: US$911(4663)) and all cause emergency room cost per patient (S: US$447 (1300), NS: US$266 (1000)) were higher among patients who switched to another biologic therapy than among patients who remained on their initial biologic therapy. **CONCLUSIONS:** Although few patients switched from their initial biologic therapy within first year of initiating treatment, higher direct health care costs were observed in this patient group compared to those who remained on their initial therapy. These results suggest an unmet need among patients that switch biologic therapies in psoriasis.

PSY16

ORPHAN DRUG ACCESS: RISK/REWARD ANALYSIS OF LOCAL CLINICAL DEVELOPMENT IN CHILE

Ismail A, Dummett H
Double Helix Consulting, London, UK

BACKGROUND: As many orphan drug (OD) manufacturers expand their businesses across emerging markets(EM) they are faced with restrictive and often non-existent funding pathways. As a result pricing and reimbursement (P&R) negotiations remain very challenging, pushing manufactures to explore the value of local clinical development in supporting access. **OBJECTIVES:** To a) understand the value of local clinical development for payers, to support reimbursement in Chile, and b) compare and contrast against four other emerging markets: Russia, Turkey, India and China. **METHODS:** In-depth interviews were conducted with 3 stakeholders per market including national payers, reimbursement committee advisors and rare diseases clinical specialists, to understand a) Current OD funding pathways; b) P&R decision drivers; and c) Impact of local development on reimbursement. Selected value drivers were used to develop a scale and qualitatively measure the risk/reward analysis of local clinical development on OD access. **RESULTS:** The impact of local development on OD reimbursement varies across markets. Respondents in Chile (n=3) highlighted that clinical development will have a strong influence on future willingness to pay, but the opportunity will remain small due to lack of clarity around long-term funding. In Turkey (n=3), providing access to patients through compassionate use schemes, prior to obtaining registration, positively impacts reimbursement.While in Russia, conducting a local clinical trial adds no value to the P&R decision process as cited by payers (n=3). As for India and China where price remains the overriding factor, respondents (n=6) stated that national reimbursement remains a distant prospect. **CONCLUSIONS:** High clinical experts' awareness, strong influence of advocacy groups and developing OD funding pathways renders Chile and Turkey the most attractive EM for local development. While in comparison, the generation of local patient data is also favoured across the remaining markets, price remains the overriding factors influencing access and reimbursement.

PSY18

TOXOCARIASIS: A DISEASE OF HIGH PREVALENCE BUT FORGOTTEN

Passeri LA, Fialho PMM, Correa CRS
Unicamp, Campinas, Brazil

OBJECTIVES: Toxocariasis is a anthropozoonosis that occurs in various regions of the world, often found in developing countries and in regions where sanitation conditions are poor. This disease affects dogs and cats, whose etiologic agents are, respectively, *Toxocara canis* and *cati*. These mammals are the definitive hosts of this geohelminth and a person it's a paratenic host. Infection in humans can cause acute clinical severity varied and eventually chronicity. The diagnosis is made by means of the ELISA and the classical treatment is done with benzimidazole anthelmintics. The toxocariasis, despite not being on the list of neglected diseases of WHO, has aroused little interest in academia and even less in health services, despite its prevalence in various regions of Brazil. Some studies have discussed the possible association between parasitic infections and allergic / atopic diseases and asthma, working with the hypothesis that exert immunomodulatory role. To review the literature on the current prevalence of toxocariasis in Brazil and its association with other diseases. **METHODS:** A search was performed in electronic databases, Medline, Lilacs, PubMed and Embase. The words were: "toxocariasis and Brazil", in the period from 2008 to 2013, and found 406 articles, with the inclusion criteria of studies done with humans and presenting epidemiological aspects. **RESULTS:** We selected 90 articles that prove the current high prevalence of toxocariasis in various regions, ranging from 11.1% to 65.4%. Several studies point to an association of toxocariasis with other diseases of high public health relevance. Despite this evidence the Brazilian Public Health System does not repayment diagnostic tests for the detection of anti-*Toxocara*, complicating the clinical and leading to no treatment. **CONCLUSIONS:** The review provides grants for the revision of public policies for prevention, diagnosis and treatment of toxocariasis.

ISPOR 4TH LATIN AMERICA CONFERENCE RESEARCH ABSTRACTS AUTHOR INDEX

GUIDE FOR AUTHORS

Increasingly, health care decision makers and policy makers are seeking outcomes research information (comparative treatment effectiveness, economic costs and benefits, and patient-reported outcomes) that can guide them in health care resource allocation, and in evaluating alternative treatments and health services interventions. *Value in Health* contains original research articles in the areas of economic evaluation (including drugs and other medical technologies), outcomes research ("real world" treatment effectiveness, and patient-reported outcomes research), and conceptual, methodological, and health policy articles. All published articles must be conducted in a rigorous manner and must reflect valid and reliable theory and methods. Empirical analyses and conceptual models must reflect ethical research practices and provide valuable information for health care decision making as well as the research community. As the official journal of the International Society for Pharmacoeconomics and Outcomes Research (ISPOR), *Value in Health* provides a forum for researchers, health care decision-makers, and policy makers to translate pharmacoeconomics and outcomes research into health care decisions. Given that the ultimate purpose of health care is to increase the overall health-related well being of individuals and society as a whole in an efficient manner, the content of *Value in Health* focuses on health care value.

Value in Health welcomes papers that make substantial contributions by providing new evidence or ideas that extend the current knowledge base. As such, manuscripts should describe the unique contribution of the article and place the current paper in context with prior publications. *Value in Health* does not consider papers reporting data series or data sets that do not include appropriate statistical analyses. The journal uses the peer review process to assure rigorous and transparent use of statistical methods. *Value in Health* also requires that papers reporting modeling results include sensitivity analysis of key and influential model parameters.

Value in Health publishes all papers in English and authors are responsible for assuring that the paper reflects good grammar prior to submission. Authors for whom English is a second language may choose to have their manuscript professionally edited before submission. Authors wishing to pursue a professional English-language editing service should make contact and arrange payment with the editing service of their choice. For more details regarding recommended services, please refer to http://support.elsevier.com/

I. ETHICS IN PUBLISHING

For information on Ethics in Publishing and Ethical guidelines for journal publication see http://www.elsevier.com/publishingethics and http://www.elsevier.com/ethicalguidelines.

II. CONFLICT OF INTEREST

All authors must disclose any financial and personal relationships with other people or organizations that could inappropriately influence (bias) their work. Examples of potential conflicts of interest include employment, consultancies, stock ownership, honoraria, paid expert testimony, patent applications/registrations, and grants or other funding. See also http://www.elsevier.com/conflictsofinterest.

III. SUBMISSION DECLARATION

Submission of an article implies that the work described has not been published previously (except in the form of an abstract or as part of a published lecture or academic thesis), that it is not under consideration for publication elsewhere, that its publication is approved by all authors and tacitly or explicitly by the responsible authorities where the work was carried out, and that, if accepted, it will not be published elsewhere including electronically in the same form, in English or in any other language, without the written consent of the copyright-holder.

IV. RETAINED AUTHOR RIGHTS

As an author you (or your employer or institution) retain certain rights; for details you are referred to: http://www.elsevier.com/authorsrights.

V. FUNDING BODY AGREEMENTS AND POLICIES

Elsevier has established agreements and developed policies to allow authors whose articles appear in journals published by Elsevier, to comply with potential manuscript archiving requirements as specified as conditions of their grant awards. To learn more about existing agreements and policies please visit http://www.elsevier.com/fundingbodies.

VI. MANUSCRIPT SUBMISSION AND SPECIFICATIONS

To submit a manuscript to *Value in Health*, please go to: http://mc.manuscriptcentral.com/vih. For assistance, authors may contact the *Value in Health* editorial office at: viheditor@ispor.org.

If submissions are larger than 500 KB, they should be compressed using PKZIP or WINZIP.

Authors will be required to assign copyright of their papers. Copyright assignment is a condition of publication and papers will not be passed to the publisher for production unless copyright has been assigned. An appropriate copyright assignment form can be found at the following address: http://www.ispor.org/publications/value/Value-In-Health-Copyright-Transfer-Form_2012.pdf. A faxed copy of this completed and signed form is acceptable; fax to 609-586-4982 or email to: viheditor@ispor.org.

If excerpts from other copyrighted works are included, the author(s) must obtain written permission from the copyright owners and credit the source(s) in the article. Elsevier has preprinted forms for use by authors in these cases: please consult http://www.elsevier.com/permissions.

Each Submission should contain separate documents as follows:

i. COVER LETTER. The cover letter should include: 1) title of the manuscript; 2) name of the document file(s) containing the manuscript and the software (and version) used; 3) name and all contact information for the corresponding author and a statement as to whether the data, models, or methodology used in the research are proprietary; 4) names of all sponsors of the research and a statement of all direct or indirect financial relationships the authors have with the sponsors; and 5) if applicable, a statement that the publication of study results was not contingent on the sponsor's approval or censorship of the manuscript.

ii. TITLE PAGE. The title page should contain the following: 1) title; 2) full names (first and surname) of all authors including academic degrees and affiliation(s); 3) name, mailing and email addresses, telephone and fax numbers of corresponding author (with whom all correspondence will take place unless other arrangements are made); 4) all sources of financial or other support for the manuscript (if no funding was received, this should be noted on the title page); 5) at least four key words for indexing purposes; and 6) a running title of not more than 45 characters including spaces.

iii. MANUSCRIPTS. Manuscripts must be written in English, typed in Microsoft Word (2003 or later; .doc or .docx file formats). Manuscripts should be in 8.5x11-inch page format, double-spaced with 1-inch margins on all sides and size 10 font (Arial or Times New Roman fonts are preferred). Minimal formatting should be used, i.e., no justification, italics, bold, indenting, etc. There should be no hard returns at the end of lines. Double-spacing after each element is requested (e.g., headings, titles, paragraphs, legends). The 'Uniform Requirements for Manuscripts Submitted to Biomedical Journals' should be consulted for specific style issues not addressed here (www.acponline.org, Ann Intern Med 1997;126:36-47).

a. ABSTRACT. An abstract of 250 words or less is required, summarizing the work reported in the manuscript. Original research manuscripts should use a structured format for the abstract, i.e., Objectives, Methods, Results, and Conclusions.

b. TEXT. The body of the manuscript should be divided into sections that facilitate reading and comprehension of the material. This should normally include sections with the major headings: Introduction, Methods, Results, Conclusions, Acknowledgments (if needed), and References. There should be no footnotes. Figures (inclusive of figure legends) and Tables must be submitted each as separate documents.

c. REFERENCES. References should be listed in a separate section and numbered consecutively with Arabic numerals in the order in which they are cited in the text. Referencing software, superscripts, or any other electronic format should not be used when referencing, neither in the text nor the reference list. Citing unpublished or non-peer-reviewed work such as abstracts and presented papers is discouraged. Personal communications may be indicated in the text as long as written acknowledgment from the authors of the communications accompanies the manuscript. Reference style should follow that of *Index Medicus*. Spell out single-word journals and abbreviate all others according to the style of *Index Medicus*. If there are more than four authors, use only the names of the first three, followed by et al.

The four most common types of references are illustrated below for example.

Journal article: Surname and initials of author(s), title of article, name of journal, year, volume number, first and last page.

Arocho R, McMillan CA. Discriminant and criterion evaluation of the U.S.-Spanish version of the SF-36 Health Survey in a Cuban-American population with benign hyperplasia. Med Care 1998;36:766-72.

GUIDE FOR AUTHORS – *continued*

***Book*:** Surname and initials of author(s)/editor(s), title and subtitle, volume, edition (other than first), city, publisher, year.

Johnston J. Econometric Methods (3rd ed.). New York: McGraw-Hill, 1984.

Chapter in Book: Surname and initials of author(s), title of chapter, author(s)/editor(s) of book, title of book, volume, edition (other than first), city, publisher, year.

Luce BR, Manning WG, Siegel JE, et al. Estimating costs in cost-effectiveness analysis. In: Gold MR, Siegel JE, Russell LB, et al., eds., Cost-effectiveness in Health and Medicine. New York: Oxford University Press, 1996.

***Website:* WWW Document. Available from:** http://www . . . **[Accessed Month Day, year].**

International Society for Pharmacoeconomics and Outcomes Research (ISPOR). ISPOR Good Outcomes Research Practices Index. Available from: http://www.ispor.org/workpaper/practices_index.asp. [Accessed January 1, 2011].

iv. TABLES. Tables should be clearly labeled, neatly typed, and easy to understand without reference to the text. Each should be double-spaced and presented on a separate page. Statistical estimates should indicate parameter estimates and, as appropriate, t ratios or standard error, statistical significance, sample size, and other relevant information. All abbreviations must be explained below each table. Each table should be numbered and have a self-explanatory title.

v. FIGURES. Figures should each be submitted as a separate image file, not embedded in the manuscript document or in a slide presentation. Cite figures consecutively, as they appear in the text, with Arabic numbers (Figure 1, Figure 2, Figure 3A, etc.). If, together with your accepted article, you submit usable color figures then the Journal will ensure, at no additional charge, that these figures will appear in color on the Web (e.g., ScienceDirect and other sites) regardless of whether or not these illustrations are reproduced in color in the printed version. There will be a charge for color reproduction in print; you will receive information regarding the costs from Elsevier after receipt of your accepted article. Please indicate your preference for color in print or on the Web only. Each figure must be assigned a brief title (as few words as possible, and reserving abbreviations for the legend) as well as a legend. The corresponding legend should be typed double-spaced on a separate page. All symbols, arrows, and abbreviations must be explained in the legend. Please submit files with a resolution of at least 300 DPI. Line artwork should contain a resolution of least 1000 DPI. Elsevier recommends submitting figures in the following formats: TIFF, JPG, EPS, and PDF. Please be sure to delete any identifying patient information such as name, social security number, etc. Photographs in which a person's face is recognizable *must* be accompanied by a letter of release from that person explicitly granting permission for publication in the Journal. For any previously published material, written permission for both print and electronic reprint rights must be obtained from the copyright holder. For further explanation and examples of artwork preparation, see Elsevier's Author Artwork Instructions at www.elsevier.com/artwork.

vi. SUPPLEMENTARY MATERIAL OR SUPPLEMENTARY DATA. You may submit appendixes that describe either methods or results in more detail if these are needed for clarity of understanding by either peer reviewers or readers. If appropriate, materials suitable for Web publication but not print publication (e.g., audio or video files, see below) can also be submitted. If you do so, indicate the particular reasons for the appendix and whether you are submitting it for possible Web publication or simply for peer review purposes. *Value in Health* accepts audio and video files as ancillaries to the main article. Audio files should be in .mp3 format; the recommended upper limit for the size of a single file is 10 Mb. Video files should be submitted in .mpg or .mp4 format, the recommended upper limit for the size of a single file is 10Mb. Any alternative format supplied may be subject to conversion (if technically possible) prior to online publication.

vii. SURVEY INSTRUMENT. For papers analyzing preferences, *Value in Health* requires the submission of a copy of the survey instrument (translated into English in case of different original language) used to generate the preference data. This is to help in the review process and the survey instrument need not appear in a final publication. If the authors wish the questionnaire to be published with the paper, it should be submitted through ScholarOne Manuscripts as part of the paper. If they do not wish it to be published, it should be submitted through ScholarOne Manuscripts as Supporting Information and then will be sent to the reviewers as a reviewer's appendix.

VII. DATA, MODELS, AND METHODOLOGY

All authors must agree to make their data available at the Editor's request for examination and re-analysis by referees or other persons designated by the Editor. All models and methodologies must be presented in sufficient detail to be fully comprehensible to readers.

VIII. AUTHOR ANONYMITY

From September 15, 2003, it is the policy of *Value in Health* that peer review of submitted manuscripts is double blinded, i.e., the reviewers do not know the names of the authors of manuscripts and the authors do not know the names of the reviewers. Blinded reviews are common practice at many important scientific and medical journals.

IX. THE REVIEW PROCESS

All manuscripts deemed appropriate for *Value in Health* after initial screening will be reviewed by at least two peer reviewers. The objective of the journal is to complete peer review and reach editorial decision within ten to twelve weeks of submission, at which time the corresponding author will receive written notification, including anonymous reviewer commentary.

X. AUTHOR TRACKING SERVICES

Authors may track accepted articles at http://www.elsevier.com/trackarticle and set up e-mail alerts to inform them when an article's status has changed. Contact details for questions arising after acceptance of an article, especially those relating to proofs, will be provided by the publisher.

XI. PROOFS

Proofs will be sent electronically to the Authors to be carefully checked for printer's errors. Substantive **changes or additions to the edited manuscript cannot be allowed at this stage**. Corrected proofs should be returned to the publisher within 2 days of receipt.

XII. OFFPRINTS

The corresponding author, at no cost, will be provided with a PDF file of the article via e-mail. For an extra charge, paper offprints can be ordered via the offprint order form which is sent once the article is accepted for publication. The PDF file is a watermarked version of the published article and includes a cover sheet with the journal cover image and a disclaimer outlining the terms and conditions of use.
