## Background

- Patients diagnosed with severe mental illness (SMI) have an excess mortality, primarily caused by cardiovascular disease.
- The majority of deaths are related to an increased incidence of coronary artery disease, but efforts to predict and manage cardiovascular risk in patients with SMI have been ineffective.
- Coronary artery calcification (CAC) is a clinical predictor for coronary artery disease, which can be measured by cardiac CT.
- CAC is widely used in the general population to predict future cardiovascular events, but no others have compared any outcomes between patients with SMI and the general population to date.

#### Aim

• To investigate the effect of coronary artery calcification on mortality in patients diagnosed with SMI compared to the effect in the general population.

## **Methods**

- Design
  - A Danish population based cohort study
- Study period
  - 1 January 2008 to 31 December 2016
- Study population
  - Patients diagnosed with SMI
    - Schizophrenia (ICD-10; F20)
    - Bipolar disorder (ICD-10; F30+F31)

Figure 1. Study flowchart for patient selection and eligibility.

### Results

	General population	Severe mental Illness	P
	(n=48,193)	(n=564)	
Coronary calcium score, n (%)			<0.01
0-100	36,049 (74.80)	452 (80.14)	
>100	12,144 (25.20)	112 (19.86)	
Number of deaths, n (%)	1009 (2.10)	21 (3.72)	
Causes of death, n (%)			<0.001
Cardiovascular death	343 (33.99)	6 (28.57)	
Other natural death	628 (62.24)	10 (47.62)	
Unnatural death	38 (3.77)	5 (23.81)	

Table 1. Follow-up characteristics of the individuals included. The variables are further divided into low coronary calcium score (0-100) and high coronary calcium score (>100).

Coronary calcium score	Crude HR	95% CI	Adjusted HR*	95% CI
General population				
0-100	1.0	Reference	1.0	Reference
>100	3.33	2.95-3.77	1.58	1.38-1.80
Severe mental Illness				
0-100	2.53	1.51-4.22	3.86	2.31-6.46
>100	4.43	1.98-9.90	3.07	1.37-6.87

Table 2. Cox proportional hazards model of mortality rates in the general population and patients with SMI. \*Adjusted for age, gender, and calendar period.

Figure 2. Kaplan-Meier estimates on survival following cardiac CT in low score- versus high score agatston groups for individuals in the general population and patients with SMI.

## Conclusion

- Patients with SMI are not demonstrating signs of early coronary artery calcification.
- Mortality rates were still markedly higher in patients with SMI compared to the general population, suggesting a more rapid progression of ischemic heart disease in SMI patients.
