

Blockchain

Will it revolutionise the energy market?

Mettā Nairobi, 22. november 2017

The Market for Energy: Is it Ready for Disruption?

Energy production is increasingly decentralized and community based...

...but grid balancing, trading and billing is still centralised, ...

FIGURE 5.17: GRID PARITY OF PV-STORAGE IN GERMANY

Source: EuPD Research/ BDEW 2013.

... although grid parity is here, ...

June 2017, Germany:

1 kWh solar PV (on field) costs 5,66 EUR cent

1 kWh mixed electricity from household retailer costs 29 EUR cent

Price of a solar panel per watt

Global solar panel installations

People won't accept being excluded from buying to cheap, renewable and local electricity for long.

This “Blockchain” thing

... could allow prosumers to trade electricity locally, without a central intermediary.

Finally, everybody can take part in the rapidly declining costs of electricity.

But how?

**How can the blockchain help
democratizing the energy market?**

A hand holding a pen and a magnifying glass over a document, with a red overlay.

Let's start with the basics:
transactions and ledgers.

Transactions

are the atoms of
global commerce.

And have been
for hundreds of years.

12 Oct 1651. Received 4 *sh.*
from Florian for flowers.

16 Oct 1651. Paid 6 *sh.*
to Fiorentina for flour.

18 Oct 1651. Paid 12 *sh.*
to Fernando for flounders.

19 Oct 1651. Received 3 *sh.*
from Franziska for fowl.

Moving forward into the internet age.

Transactions
are still being recorded
in ledgers: enterprise
“systems of record”

Some of them are even
in the cloud.

But each company still
records its own version
of the transactions.

12 Oct 1651. Received 4 *fl.*
from Florian for flowers.
16 Oct 1651. Paid 6 *fl.*
to Fiorentina for flour.
18 Oct 1651. Paid 12 *fl.*
to Fernando for flounders.
19 Oct 1651. Received 3 *fl.*
from Franziska for fowl.

12 Oct 1651. Received 4 *fl.*
from Florian for flowers.
16 Oct 1651. Paid 6 *fl.*
to Fiorentina for flour.
18 Oct 1651. Paid 12 *fl.*
to Fernando for flounders.
19 Oct 1651. Received 3 *fl.*
from Franziska for fowl.

12 Oct 1651. Received 4 *fl.*
from Florian for flowers.
16 Oct 1651. Paid 6 *fl.*
to Fiorentina for flour.
18 Oct 1651. Paid 12 *fl.*
to Fernando for flounders.
19 Oct 1651. Received 3 *fl.*
from Franziska for fowl.

12 Oct 1651. Received 4 *fl.*
from Florian for flowers.
16 Oct 1651. Paid 6 *fl.*
to Fiorentina for flour.
18 Oct 1651. Paid 12 *fl.*
to Fernando for flounders.
19 Oct 1651. Received 3 *fl.*
from Franziska for fowl.

12 Oct 1651. Received 4 *fl.*
from Florian for flowers.
16 Oct 1651. Paid 6 *fl.*
to Fiorentina for flour.
18 Oct 1651. Paid 12 *fl.*
to Fernando for flounders.
19 Oct 1651. Received 3 *fl.*
from Franziska for fowl.

Remote Server

Database

Florian's ledger:
"Paid 6 sh.
to Fiorentina."

Fiorentina's ledger:
"Received 4 sh.
from Florian."

But what if there's a conflict?

The diagram shows a stylized cloud with a thick black outline. Inside the cloud, there are several icons representing different devices: a mobile phone, a laptop, a desktop PC, a tablet, and a server rack. Orange arrows point from each of these device icons towards a central point located near the bottom center of the cloud. The background of the entire slide is a dark red color with a pattern of binary code (0s and 1s) in a lighter red shade.

Paid 6 *sh.*
to Fiorentina.

Received 4 *sh.*
from Florian.

**Florian paid 5 *sh.*
to Fiorentina.**

You can leave the resolution to a bank
(the famous “trusted intermediary” or “middleman”)

**Florian paid 5 sh.
to Fiorentina.**

Received 4 sh.
from Florian.

Paid 6 sh.
to Fiorentina.

...or to the blockchain.

16 Oct 1651.

Florian paid 5 *sh.*
to Fiorentina.

The blockchain
records, time-stamps, validates,
and persists transactions which happen
directly in-between the parties.
("peer-to-peer").

So how does a blockchain work?

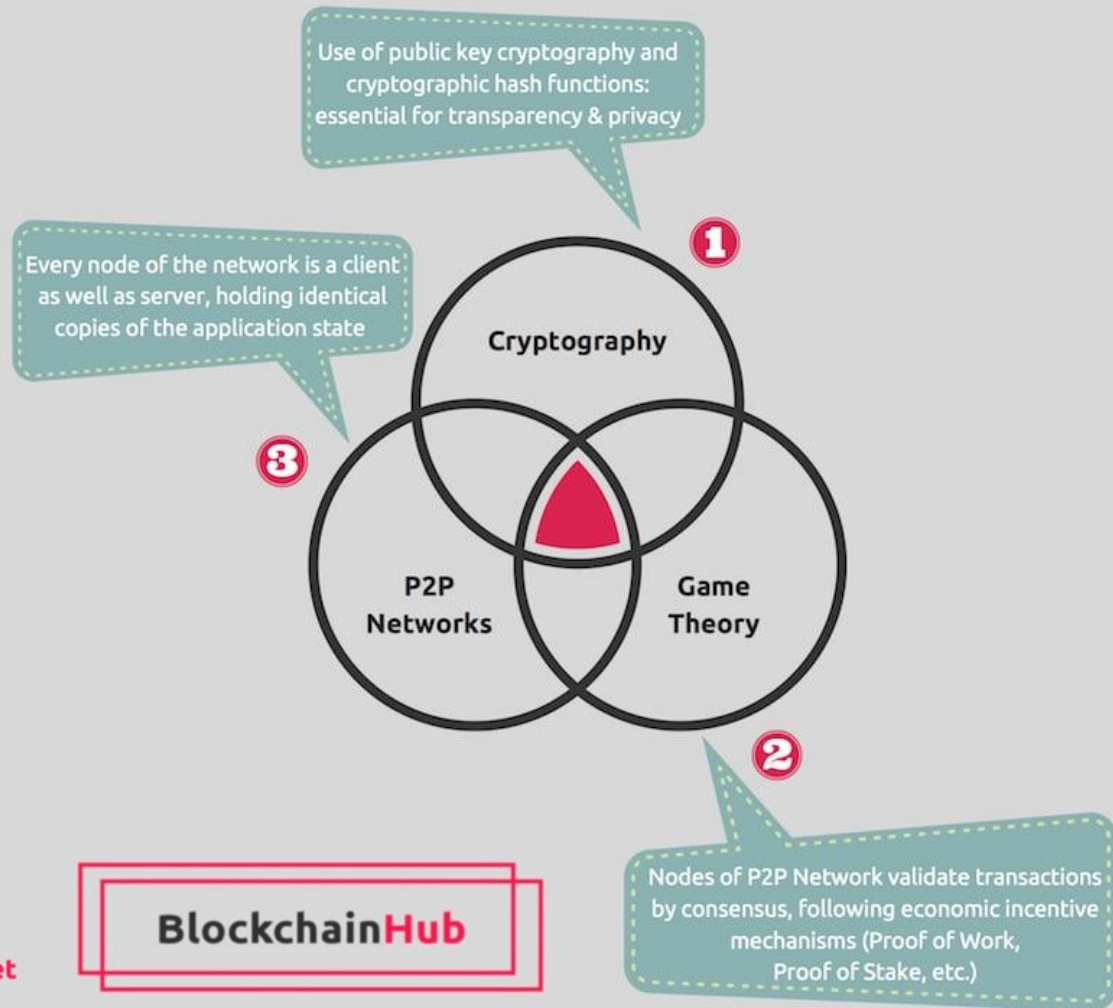

BlockchainHub

Like a Spreadsheet in the Sky

All network transactions get stored in the blockchain

Combination of three technologies

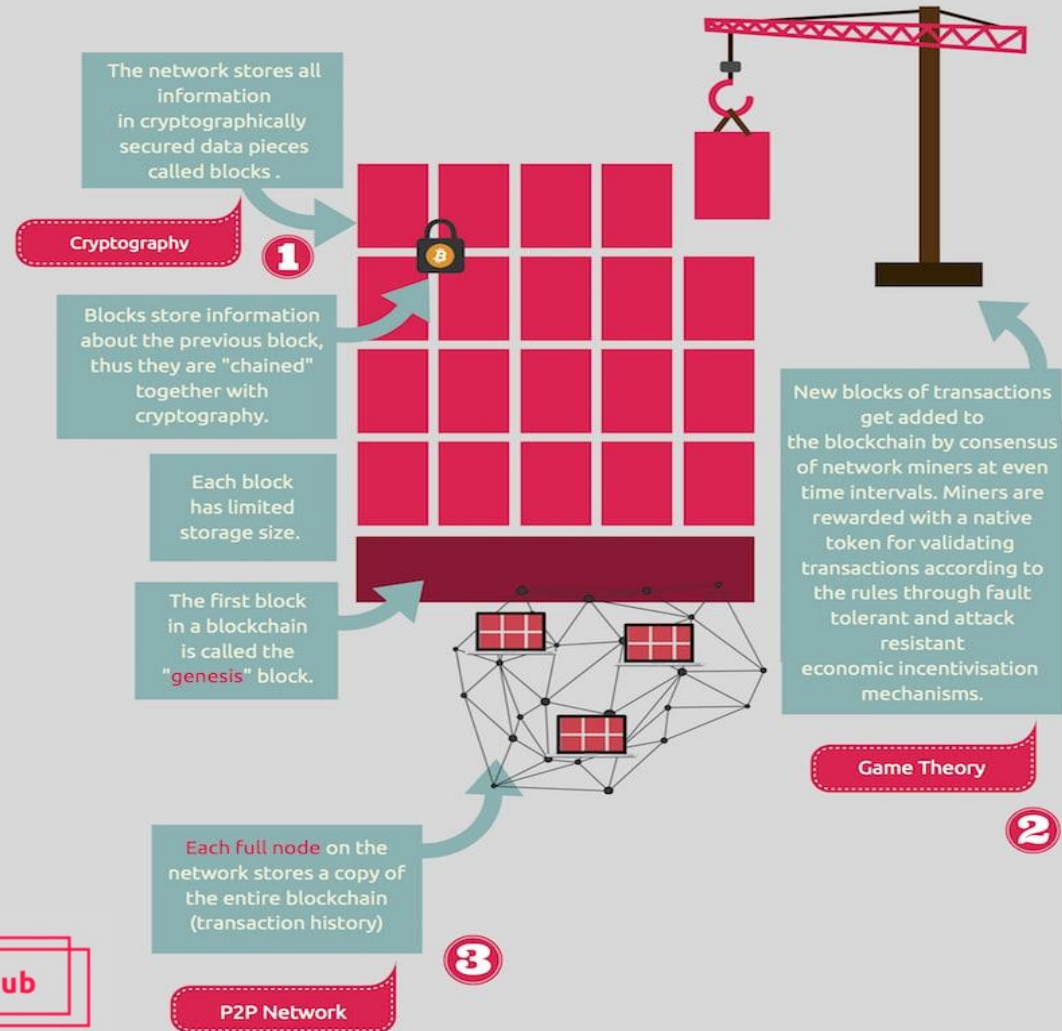

Authors: Shermin Voshmgir, Valentin Kalinov

Creative Commons Licence: Attribution, Share Alike 

Owned and originally published by: <https://blockchainhub.net>

Why is it called a blockchain?

Why is Blockchain Tamper Resistant?

Each network participant keeps a copy of the entire blockchain - the file where all past transactions are recorded. Consensus of network validators verifies new transactions. In the Bitcoin network transactions are validated by network miners who are incentivised to verify transactions through PoW (Proof of Work).

If a malicious party makes unauthorized changes to his copy of the blockchain on one computer, other members of the network will refuse the transaction since that malicious version of the blockchain data will differ from the rest of the network.

To manipulate data on the blockchain, one will have to manipulate data on the majority of the network. This is possible, but prohibitively expensive, especially if you need to manipulate old data and go back many blocks!

Data Monarchy <> Data Democracy

Server:
Unique Point of Failure!

P2P Network: If parts of the network fail, the rest of the network will still be functional and safe

Types of blockchains

Equivalent to Internet
in 1990ies?

Public Blockchains

Bitcoin
Ethereum
Litecoin
etc...

Equivalent to Intranet
in 1990ies?

Federated Blockchains

R3, B3i
EWF

Private Blockchains

Company
internal

Distributed
Ledger
Technologies?

Internet of
Blockchains?

Smart Contracts

*“The handshake
seals the contract.
From the contract
there’s no turning back.”*

Depeche Mode: “Everything Counts” (1986)

“Let’s commit ourselves now
that if this event happens
this transaction will be
triggered automatically.”

.....
Signed.

.....
Signed.

```
60     var s = document.getElementsByTagName("script")[0];
61     s.parentNode.insertBefore(ga, s);
62 }
63 </script>
64 <?php
65     if (is_singular() && get_option('thread_comments')) {
66         wp_enqueue_script('comment-reply');
67     }
68     ?>
69     <?php wp_head(); ?>
70 </head>
71 <body <?php body_class(); ?>>
72     <div id="header">
73         <div class="wrapper">
74             <h1>
75                 <?php if (is_front_page() && Spaced < 2): ?>
76                     
77                 <?php else : ?>
78                     Root
79             </h1>
80             <form id="search" method="get">
81                 <div>
```

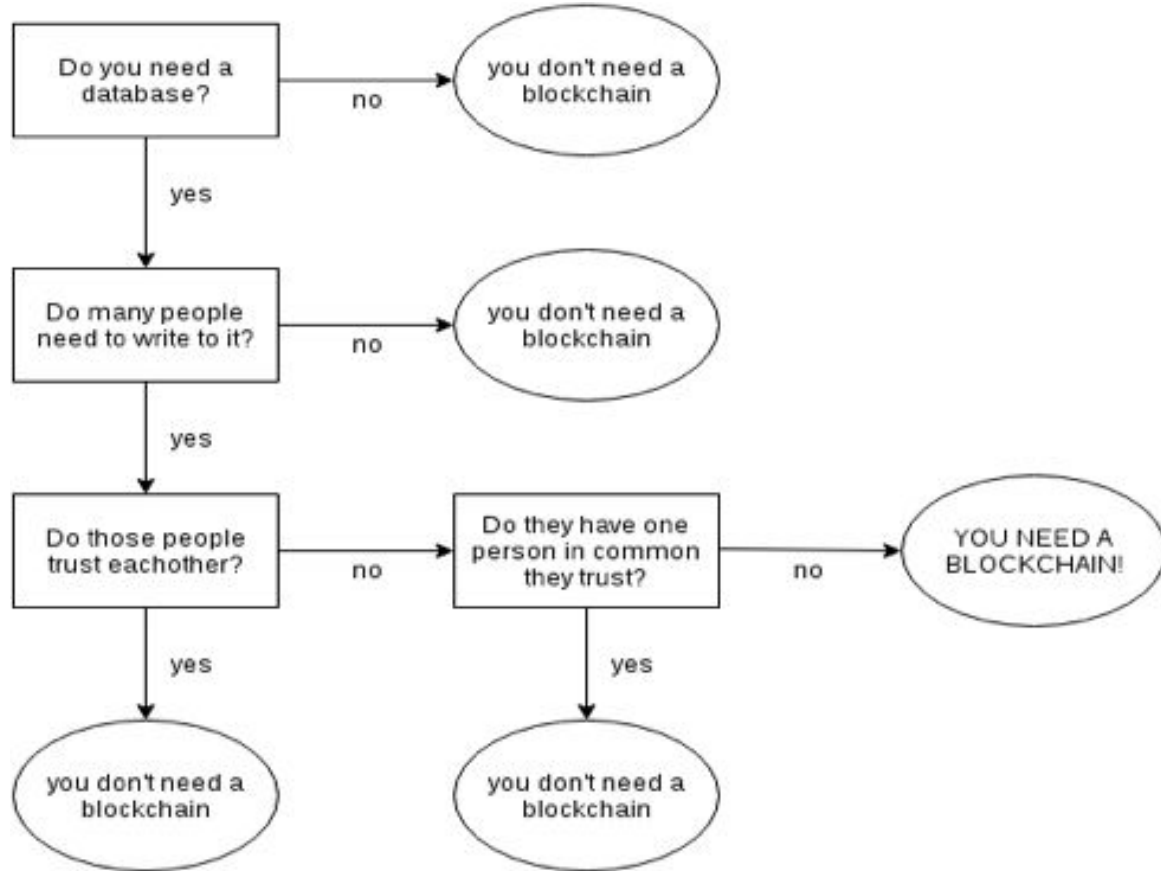

Enter Ethereum.

The background is a dark-themed code editor. On the left, a vertical sidebar shows line numbers from 60 to 81. The main area contains two snippets of code. The top snippet is JavaScript, showing a function that inserts a new node before an existing one in a DOM tree. The bottom snippet is PHP, showing HTML output for a web page, including a header, a main content area with a login form, and a footer.

```
60 var s = document.getElementById('s');  
61 s.parentNode.insertBefore(ga, s);  
62 })  
63 </script>  
64 <script>  
65     option('thread_comments'))(  
66     comment-reply');  
67 }  
68 ?>  
69 <?php wp_head();  
70 </head>  
71 <body <?php body_class();  
72 <div id="header">  
73     <div class="site-header">  
74         <h1>  
75             <?php if (is_front_page()) <?php bloginfo('template_title');  
76             <?php else : <?php bloginfo('template_title'); <?php endif>  
77         <div class="site-title">  
78             <?php bloginfo('name');  
79             <?php bloginfo('description');  
80             <div>  
81                 <div>
```

Ethereum uses a scripting language called Solidity to allow simple drafting of smart contracts which are executed (for a fee) on the Ethereum blockchain.

Finally the key question: (When) do you **really** need a blockchain?

Hypothesis:

**Peer-to-peer transactions without a middleman
= Democratization of energy trading?**

The Platform quote that became an Internet Meme:

Source: Tom Goodwin,
Havas Media, 3.3.2015,
“The Battle Is For The
Customer Interface”

”Uber, the world’s largest taxi company, owns no vehicles. Facebook, the world’s most popular media owner, creates no content. Alibaba, the most valuable retailer, has no inventory. And Airbnb, the world’s largest accommodation provider, owns no real estate. Something interesting is happening.”

BUSINESS LANDSCAPE

A COMPARISON OF EXISTING AND EMERGENT BUSINESS MODELS

TRADITIONAL

Business model is based on resource extraction.

Value is created by products or services. Consumers and workers have minimal power over technology.

PLATFORM

Not based on extraction. Value is created by users sharing content in an online network, giving them power over technology to communicate.

SHARING PLATFORM

Consciously not based on resource extraction, but rather on facilitating the exchange of resource. Value is created by users - consumers and workers - sharing access to underused assets or human resource as part of an online network. An intermediary connects users and oversees activity on a platform, but users have some power over technology to change how they live and work.

CO-OPERATIVE SHARING PLATFORM

Similar to a sharing platform, but the online network is co-operative. No intermediary is needed, in some cases because of blockchain technology. Users, but particularly workers, have power over technology to change how they live and work.

Blockchain as Commons 3.0

Source: Potts, De Filippi
& Davidson: The Economics
of Blockchain (2016)

*"Blockchain is Commons 3.0
in that it provides a
technical solution
(cryptographic consensus)
to the problem of
cooperation in joint or
group production at scale
(...)"*
