recumbent position. Airway (Paw) and esophageal (Pes) pressures and flow were continuously recorded during 2 minutes by a data logger (Biopac 150). Then, end-expiratory and end-inspiratory occlusions were performed for 5 seconds each, then respiratory system was slowly inflated at constant flow from the ventilator. Finally, patient was allowed to breathe out freely to atmosphere by using a three-way stop lock by-passing expiratory valve. AC and airway opening pressure (AOP) were determined according to Chen et al. (1) from the pressure-volume curve. EFL was assessed by the atmospheric method (2). Dynamic elastances of chest wall (Edyn,cW) and lung (Edyn,L) were obtained from least square linear regression method over 10 consecutive breaths. Static elastances (Est,cW and Est,L) were determined by classic formulas and also by taking into account AOP (Est,cW_aop and Est_L_aop, respectively). The performance of Ecw/EL ratio to predict EFL and AC was assessed by area under receiver operating characteristic (AUCROC) curve.

RESULTS. Among 21 included ARDS patients EFL was observed in 7 (33%) and AC in 15 (71%). Median AOP was 7.8 (95%CI 7.6-11.7) cmH2O. The AUCROCs for Ecw/EL ratio to detect EFL and AC are shown in table 1. Edyn,cW/Edyn,L ratio has the best performance to detect EFL (Edyn,cW/Edyn,L≥0.16 100% sensitivity and 85% specificity). Correction for AOP worsened the performance of Est,cW/Est,L ratio. AC was poorly predicted but prediction was improved with AOP correction. AOP values had an AUCROC of 1 (0.84-1) (P<0.0001) to predict EFL at the threshold of 8.3 cmH2O.

CONCLUSION. Low Edyn,cW/Edyn,L ratio and AOP predicted EFL occurrence. However, EFL and AC are two distinct phenomena in ARDS patients and should be assessed together to identify specific ARDS subphenotypes in terms of small airway contribution in ARDS.

INTRODUCTION. Oxygen therapy is part of the invasive mechanical ventilation strategy in the intensive care unit (ICU). Hyperoxaemia may however increase mortality.

OBJECTIVES. To assess degrees of hyperoxaemia, adjustments of fraction of inspired oxygen (FiO2) in response to hyperoxaemia, and associations between hyperoxaemia and mortality in invasively mechanically ventilated ICU patients.

METHODS. We conducted a retrospective study of all invasively mechanically ventilated patients in 5 ICUs admitted from January 2011 to June 2016, retrieving all oxygen tension (PaO2) and FiO2 data. Time between arterial blood gas (ABG) samplings, proportions of hyperoxaemia (PaO2 > 16 kPa), FiO2 adjustments upon hyperoxaemia, and associations between mechanically ventilated exposure-time-divided area-under-the-curve (AUC) PaO2 and ICU mortality was assessed. Primary ICU admissions were included in the mortality analyses, which used a multi-state illness-death model with transition intensities estimated by Cox proportional hazards models. The exposure-time-divided AUC measure represents the average PaO2 level during invasive mechanical ventilation. Permission to use data without patient consent was obtained from the Danish Patient Safety Authority.

RESULTS. The study included 4,998 patients and 177,769 ABGs. Median time between ABGs was 3 hours (inter-quartile range: 2-4 hours), PaO2 was 11.3 kPa (9.8-13.6 kPa), and FiO2 was 0.40 (0.35-0.50). Hyperoxaemia was present in 11.9% of the ABGs. In 15.4% of the hyperoxic ABGs with FiO2 > 0.50, the subsequent ABGS remained hyperoxic with uncorrected FiO2 whereas this was the case in 64.6% of hyperoxaemic ABGs with FiO2 < 0.40. Exposure-time-divided AUC PaO2 > 16.0 kPa was associated with increased ICU mortality (Table 1). This association was accentuated when censoring at the first PaO2 < 8 kPa to diminish the impact of hypoxaemia (adjusted HR: 1.90 (95% CI: 1.27-2.86)).

CONCLUSION. ABG samplings were frequent and hyperoxaemia was common in invasively mechanically ventilated ICU patients. While FiO2 in general was adjusted upon hyperoxaemia, several patients remained hyperoxic, especially at FiO2 < 0.40. This may not be optimal as hyperoxaemia was associated with increased ICU mortality in the cohort.
