CENTRE FOR BLUE GOVERNANCE

Outline

- ▶ Research context
 - Factors of change introduced by AEGIS
 - Use-cases in Denmark: SME ports
- ▶ Geographical context
 - Port of Aalborg
 - Port of Vordingborg
- ▶ Sustainability challenges

Factors of change from the seaside

- ▶ Modality
 - ▶ Short-sea shipping
 - ▶ Inland waterway transport
 - ▶ Small and medium-sized ports
- ▶ Technological
 - ▶ Alternative fuels (and respective infrastructure)
 - ▶ Autonomous vessels
 - ▶ Autonomous cargo handling

Relevant outcome of project AEGIS

For UC-C – AHL (Shortsea shipping in the Kattegat/Skagerrak region, RoRo – trailers):

- A RoRo vessel (electric version) with
 - o a capacity of 55 trailers
 - o no on-board cargo handling system
 - o a fully electric propulsion system with swappable batteries (5 FEU-sized rollable units)
 - o a low to medium autonomy level (1–2 according to IMO)
- A RoRo vessel (methanol version) with
 - o a capacity of 55 trailers
 - o no on-board cargo handling system
 - o a methanol-electric propulsion system
 - o a low to medium autonomy level (1–2 according to IMO), autonomy-ready

For UC-C – VH (Combined SSS and IWW in the Baltic and European hinterland, dry bulk, containers, project cargo):

- A SSS-IWW multi-purpose vessel with
 - o a capacity of 3,500 t or 156 TEU
 - o an on-board cargo handling system consisting of a movable gantry crane to lift the hatch covers and move the wheel-house
 - o a methanol-electric propulsion system
 - o a low to medium autonomy level (1–2 according to IMO), autonomy-ready

Synergies between the vessel concepts developed for one use case might be used in other use cases, e.g. the mother vessel in UC-A might also be used in UC-C.

Final vessel concepts–Aalborg

SSS Ro-Ro vessel with modern X-bow design, battery electric

Capacity	55 trailers: 37 main deck (incl. 5 Bat. Trailers) + 18 tank top; 730 lane meters
Main dimensions	L: 127.5 m B: 16.9 m T: 4.7 m
Deadweight, max	7835 DWT
Gross Tonnage	5700 GT
Propulsion	Battery electric 5 x 5350 kWh FEU-sized batterie-modules on trailer/cassettes 2 x 1200 kW stern azimuth thruster; 1 x 650 kW bow thruster
Design speed	12 kn
Range	120 nm
Operation	Baltic areal
Autonomy	medium autonomy level (2-3)
Intelligent Systems	route optimization (consumption, weather conditions), automated mooring, digital twin
Cargo handling	Access aft ramp: 15.0 m wide, 8.3 m long + 1.8 m flaps Internal fixed ramp (main deck -> tank top): 36.7 m long, 4.0 m wide, angle 7°

Figure 8 – RoRo vessel concept 1

Final vessel concepts–Aalborg

SSS Ro-Ro vessel with modern X-bow design, methanol combustion

Capacity	52 trailers: 37 main deck + 15 tank top; 730 lane meters
Main dimensions	L: 127.5 m B: 16.9 m T: 4.7 m
Deadweight, max	7835 DWT
Gross Tonnage	5700 GT
Propulsion	2 x 5000 kW methanol combustion engines (redundancy) 2 x 3500 kW stern azimuth thruster; 1 x 650 kW bow thruster
Service speed	16 kn
Range	Methanol → ca. 2600 nm
Bunkering	480 m³ in DB tanks
Operation	Baltic areal
Autonomy	medium autonomy level (2-3)
Intelligent Systems	route optimization (consumption, weather conditions), automated mooring, digital twin
Cargo handling	Access aft ramp: 15.0 m wide, 8.3 m long + 1.8 m flaps Internal fixed ramp (main deck -> tank top): 36.7 m long, 4.0 m wide, angle 7°

480 m³ fuel tanks in double bottom

18.05.2023

The project has received funding from the European Union's Horizon 2020 Research and Innovation program under Grant Agreement N°959993.

Sustainability **challenges** of waterfront development

- ▶ Citizen participation
- ▶ Public health
- ▶ Landscape rights
- ▶ Geographic isolation
- ▶ Economic stagnation
- ▶ Sector-wide unemployment
- ▶ Capacity building
- ▶ Disappearance of local industry
- ▶ Demographic mobility
- ▶ Policymaking and governance

Port of Aalborg
Region of Nordjylland

**PORT OF
AALBORG**

**PORT OF
AALBORG**

Terminal area

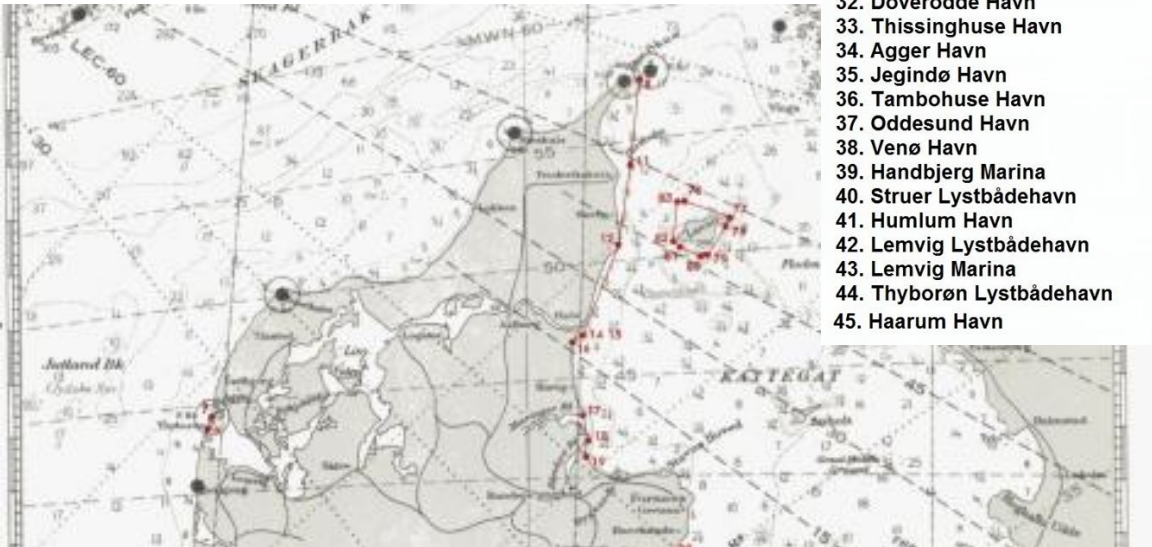

- **Yellow:** Containerterminal area with capacity of 75.000 TEU
 - Interface with Road, Rail and Ro-Ro.
- **Blue:** Future Ro-Ro terminal with capacity to service up to 75 trailer vessel
- **Red:** Railway tracks with unfold capacity and possibilities for huge expansion.

from the European Union's Horizon 2020
under Grant Agreement N°855993.

Stort produktionsanlæg er kommet nærmere

På Vordingborg Havn er der planer om verdens første power-to-X anlæg i stor skala.

Det oplyser Vordingborg Buisiness. Det er Arcadia eFeuls og de skal producere co2-neutralt flybrændstof hvor man bruger en masse strøm for vindmøllerne.

Firmaet har indgået kontrakt med den franske virksomhed Technip Energies som skal være med til at finde ud af, hvordan og med hvilke materialer anlægget skal bygges.

Arcadia eFuels og Technip Energies forventer, at produktionsanlægget i Vordingborg er i drift i 2026.

- Vordingborg - Ruhr area, Germany
- Vordingborg – Elblag, Poland

Figure 7 – Considered routes from Vordingborg to northern Europe

A close-up photograph of a DNA microarray. The array consists of a grid of small, colorful spots (red, blue, green, orange) on a white background. A magnifying glass is positioned over the array, and a pipette tip is visible in the foreground, pointing towards the array. The word "Analysis" is overlaid in a white box in the center of the image.

Analysis

Sustainability **challenges** of waterfront development

- ▶ Citizen participation
- ▶ Public health
- ▶ Landscape rights
- ▶ Geographic isolation
- ▶ Economic stagnation
- ▶ Sector-wide unemployment
- ▶ Capacity building
- ▶ Disappearance of local industry
- ▶ Demographic mobility
- ▶ Policymaking and governance

Sustainability **promises** of waterfront development (from AEGIS cases)

- ▶ Being **informed** of the vision of the port and what can change in terms of navigation around the area.
- ▶ Less air **pollution** because of alternative propulsion types.
- ▶ Smaller vessels are better for **visual pollution/noise** (especially for residents in the waterfront).
- ▶ Increased **economic activity** in the region can benefit local industries associated with transport and energy.
- ▶ Local industries may have facilitated access to new markets because of the proposed **new routes**.
- ▶ Potential for **new job types** in the region (namely in the energy industry).
- ▶ Autonomous terminals may link well with other such terminals (e.g. Aalborg) and create **new industrial partnerships to develop isolated regions** in DK.
- ▶ Having ports who are first-movers in new tech **forces public authorities to regulate and create new policy** and this opens the field for other ports.

Conclusion

- ▶ Waterfront changes driven by logistics: new waterborne transport systems
- ▶ Rehabilitation of smaller ports brings new life
 - Smaller ports were lost in competition and get a revival driven by reduction of CO2 strategies and by “coastal” shipping that was once outcompeted by trucks
- ▶ Challenge of coexistence between SME ports and Danish cities:
 - In **Aalborg**, to minimize potential risks to various aspects of urban life, the planning law requires the municipality to enforce strict zoning regulations, ensuring that industrial activities are kept separate from other urban functions.
 - In **Vordingborg**, the port negotiates with the city and residents to set terms to expand its maritime operations (new pier) and green energy production facilities (biofuels and efuels) in the periphery of the city, opting for a new concept of popup terminals.
- ▶ Coexistence can be achieved by *relocation* (Aalborg) or by *mitigation* (Vordingborg): every strategy has a price and depends on urban pressures
